NOTE.—The above observations, taken at 7 a. m., Washington time, were received too late for publication in the DAILY BULLETIN, and are given here in full.

REVIEW.

INTERNATIONAL METEOROLOGY.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade; wind-force by scale of* 0–10.]

The following description refers to chart ii. for the month of September, 1883, issued with this SUMMARY. This chart continues the series of international charts begun in January, 1877, and exhibits the mean pressure, mean temperature, and prevailing wind-direction over the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich, mean time.

Three areas of barometric minima appear on the chart for September, 1883; the first of these is indicated by the isobar for 29.6 (751.8) and is situated in Alaska, where the mean pressure, at Fort Saint Michael's, was 29.58 (751.3). The remaining areas of least mean pressure are shown in Greenland and in British India, respectively, and are both indicated by the isobar for 29.7 (754.4). In the first-mentioned region, the mean pressure ranges from 29.61 (752.1) at Godthaab to 29.7 (754.4) over the ocean north of the fifty-fifth parallel; in British India the means range from 29.61 (752.1) to 29.67 (753.6) over that part of the country lying between the parallels of 20° and 30° north latitude and the meridians of 70° and 90° east longitude; in southern India the mean pressure exceeds 29.75 (755.6). In northern and western Europe the means range from 29.8 (766.9) to 29.9 (759.4); in the central, southern, and northeastern districts they vary from 29.9 (759.4) to 30.0 (762.0), and in the Iberian peninsula and the greater part of Russia they exceed 30.0 (762.0). In the North American continent the mean pressure is everywhere above 30.0 (762.0) except in the region west of 105° west longitude and south of the forty-fifth parallel.

No marked areas of barometric maxima are exhibited on the chart; the most extensive is that which occupies the Atlantic ocean and is enclosed by the isobar for 30.1 (764.5), which extends from W. 65° eastward to W. 10°, and from N. 20° northward to N. 40°; at the centre of this area, which is near the Azores, the pressure is 30.19 (766.8). Three small areas of high barometer are shown in the United States; one occupies Montana, where the mean pressure is 30.12 (765.0); another is shown in southern Tennessee and the northern parts of Georgia and Alabama, while the third area occupies the middle Atlantic states; in both areas the means vary from 30.1 (764.5) to 30.13 (765.3).

A comparison with the chart for the preceding month (August) shows a slight increase of pressure to have occurred in Montana and Wyoming and in the middle and south Atlantic states; in all other districts the pressure has remained nearly stationary, at stations where the pressure was below that of the preceding month, the deficiencies were extremely slight. Over the Atlantic ocean from the coasts of the United States eastward to about the sixty-fifth meridian there has been an increase of pressure, but to the eastward of that meridian there has been an extensive decrease, averaging .1 inch. In Europe, the pressure in Scandinavia and Russia exceeded that of August by about .1 inch, while in all other countries of the continent there has been a decrease ranging from .04 inch in the Iberian peninsula to .18 inch in the British Isles. In British India, there has been an increase of about .08 inch, and a corresponding increase has occurred throughout the continent of Asia.

Compared with the corresponding month of previous years, the mean atmospheric pressure in the United States was slightly below the normal on the Pacific coast, and in the east Gulf and south Atlantic states; in all other districts the mean pressure exceeded the September normal, the greatest departures being .1 inch in Wyoming. In Canada the mean pressure was slightly above the normal. In Europe, the pressure was about normal in Russia and the Iberian peninsula, and in all other districts, it was below the normal. In British India, it was .03 inch below the six years' mean.

The following table gives the mean pressure and mean temperature, with corresponding departures for September, 1883, in the several countries of the eastern hemisphere, compared with the normal as determined from observations taken during the last six years:

Countries.	Mean pressure.			Mean temperature.		
	Sept. mean of 6 (1877–'82) years.	Sept., 1883.	Departure.	Sept. mean of 6 (1877–'82) years.	Sept., 1883.	Departure.
				°	°	°

* Mean for five years only.

In the United States the mean temperature of the air was below the normal in the districts east of the Rocky mountains, and normal or slightly above normal over the country to the westward. In Canada it was below the normal. In Europe the mean temperature differed but slightly from the normal; in the southern peninsulas and in Scandinavia, it was slightly below, and in Russia and the other districts it was above the normal. In Hindostan it was 0°.3 above the six-year normal; the highest mean reported was 91°.8 Fahr. (33°.2 Cent.) at Agra, and the lowest was 71°.0 Fahr. (21°.7 Cent.) at Belgaum.

The following are some of the extreme mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Cairo, Egypt	89.1	31.7	Edmonton, N.W.Territory, B.A.	34.7	1.5
Freetown, Africa	86.8	30.4	York Factory, B. A.	30.8	2.7
Bridgetown, Barbadoes, W. I.	84.0	28.9	Qu 'Appelle, N. W. Ter., B. A.	37.0	2.8
Nassau, Bahamas	82.2	27.9	Godthaab, Greenland	37.6	3.1
Beirut, Syria	81.5	27.5	Fort Saint Michael's, Alaska	43.1	0.2

The accompanying table shows the deviations in pressure and temperature at isolated stations during the month of September, 1883, as compared with the means for six years:

Stations.	Mean pressure.			Mean temperature.		
	Sept. mean of 6 (1877–'82) years.	Sept., 1883.	Departure.	Sept. mean of 6 (1877–'82) years.	Sept., 1883.	Departure.

* Means for five years only.

In the United States, the prevailing winds were northeasterly along the Atlantic coast, and northerly and northeasterly in the lake region, and the Ohio and Mississippi valleys. In other districts east of the Rocky mountains, they were from east and southeast; on the Pacific coast they were northeasterly and northwesterly. In Canada, the winds were mostly from southwest to northwest. Over the Atlantic ocean the prevailing wind-directions were: easterly, southeasterly and southerly from W. 70° to W. 40°, and between N. 10° and 40°; mostly northeasterly from W. 40° to W. 10°, and from N. 10° northward to N. 40°. North of the fortieth parallel, northwesterly winds prevailed. In Europe, the winds were mostly southerly, southwesterly and westerly. In Japan, they were northerly and easterly.

The rainfall during September, 1883, was in excess of the average in the Atlantic coast states, except Florida and New England. It was also excessive on the middle slope of the Rocky mountains; on the Pacific coast and the Rio Grande valley; the excess being greatest in the Rio Grande valley and middle slope districts. In all other parts of the United States the rainfall was less than the average, the greatest deficiency having occurred in the eastern Gulf states. In Canada, the rainfall was less than the average, except in the Province of Quebec, where there was a slight excess. In Europe the rainfall was greater than the average, especially in the southern districts, where more than double the average amount of rain fell.

With this REVIEW is issued international chart iii. for the month of March, 1882. This chart continues the series of international charts begun in November, 1877, and exhibits the paths of the principal atmospheric depressions that have appeared in the northern hemisphere. The data are charted for each day of the month on the maps accompanying each issue of the "International Bulletin," and from those charts and additional miscellaneous data are traced the movements of the the centres of barometric minima.

The paths of thirty-four depressions have been traced for the month of March, 1882, and are distributed as follows: ten are charted in the North American continent; of these, four are traced from the Pacific coast eastward or southeastward to the lake region and thence northeastward over Canada to the Atlantic, and one depression is traced from the Gulf of Mexico northeastward to the maritime provinces. Two appear in the lake region, one of these being a continuation of a disturbance shown on the chart for February, while the remaining depressions are traced from the northern slope of the Rocky mountains eastward and southeastward to the Atlantic. Of the depressions traced over the Atlantic ocean seven are continuations of storms which first passed over the United States or Canada; of these, two appear to have reached the European coasts, while the others either filled in or became merged in larger depressions which existed north of the sixtieth parallel.

Thirteen depressions are shown in Europe; of this number, seven approached the Scandinavian coast from the Atlantic, and moved northeastward along the coast to northern Scandinavia, and thence southeastward into eastern Russia. One disturbance entered the British Isles, and passed southeastward over France to the Mediterranean, and one occupied the Italian peninsula. The depression traced as number xix. first appeared in Finland, and passed eastward to the White sea; number xxi. developed in southwestern Russia and moved northeastward; number xxx. appeared north of the British Isles, and passed southward over the North sea at the close of the month, and number xxvii. was a cyclonic storm of great intensity which occupied the Netherlands and Germany during the 26th and 27th. Four disturbances are traced in eastern China and Japan, and one is shown in Asiatic Turkey. The meteorological features of the month of March, 1882, resembled those of the preceding months (January and February) in that the majority of the storm tracks appeared to the northwestward of the British Isles, and passed over Scandinavia, thus causing the mean pressure for the month to remain below the normal in northern Europe, while areas of high pressure prevailed over the central and southwestern parts of the continent, where the mean pressure was consequently above the normal. The departure above normal was, however, not so marked as in the preceding months, while the decrease of pressure in the Scandinavian peninsula was greater than in those months.

The following descriptions refer to the depressions which appeared in the United States and Canada:

I.—This was a continuation of the disturbance traced as low-area xiv. on the chart for February. At the close of that month the depression occupied Missouri, whence it moved northeastward and by the morning of March 1st, was central near Georgian Bay, Ontario. During the day the disturbance moved slightly south of east over New England, attended by heavy rains there and in the middle Atlantic states; owing to the presence of an area of high pressures over the Maritime Provinces and near the New England coast, steep gradients were formed to the eastward of the depression, so that strong southerly and easterly gales occurred along the Atlantic coast north of Hatteras, North Carolina, and heavy rains occurred in the Saint Lawrence valley. By the morning of the 2d the disturbance was off the New England coast; the winds at the Atlantic coast stations had now changed to northwesterly and blew with the force of a strong breeze. As the depression moved slowly and with increasing energy northeastward over Nova Scotia, it was attended by rainy weather in that district and strong east to north gales over the Gulf of Saint Lawrence, with equally strong westerly gales to the southward of the centre. During the 4th the depression passed into the Atlantic and is hereafter described as low area xi.

II.—This depression probably developed west of the Rocky mountains prior to the 4th, but its centre could not be located until that day, when it appeared in Nebraska, where the barometer read 29.63 (752.6). The disturbance moved northeastward attended by snow storms in the districts to the northwestward of its track and cloudy or rainy weather eastward to the lower lake region by the 5th. On the morning of that day the centre was near Saint Paul, Minnesota, where the barometer read 29.38 (746.2). An area of high pressure existed to the northward of Manitoba, the barometer at York Factory, Hudson's bay, reading 30.95 (786.1); very steep barometric gradients were thus formed over the region north of the storm-centre, and furious snow storms with violent gales were reported from Manitoba and the Northwest Territories. The storm-centre moved eastward over the lakes, and on the 6th it was in Ontario, the pressure having risen to 29.78 (756.4); during the day it passed eastward to Maine and thence into the Atlantic, where it appears to have gathered fresh energy. This disturbance is hereafter referred to as low area xii.

III.—This disturbance developed in the western part of the Gulf of Mexico during the 8th, having been preceded by heavy rains in southern Texas during the 6th and 7th. As the depression moved northeastward it was attended by heavy rains in the Gulf and south Atlantic states, with rain or snow in the lake districts. On the 9th the storm-centre was in southern Illinois, and the rain area had extended to the lower lakes and middle Atlantic states; by the 10th the disturbance was shown as an elongated depression occupying the Saint Lawrence valley, New England, and the Maritime Provinces, in which districts the barometer ranged from 29.4 (746.7) to 29.55 (750.6); rain continued to fall in the Maritime Provinces and the Saint Lawrence valley, while clearing weather and high winds had set in over the lake region. The depression passed off the Nova Scotia coast during the day, and is hereafter described as low area xiii.

IV.—This depression probably developed in the Northwest Territories during the 11th and moved rapidly southeastward over the lake region. On the 12th the region of minimum pressure was north of Lake Huron, and rain or snow prevailed at stations in the lower lake region and along the Saint Lawrence valley. During the 12th the disturbance moved with increas-

ing energy eastward, and on the 13th the centre was over the Bay of Fundy. On the 14th the storm-centre was east of Cape Breton Island, where the barometer had fallen to 29.13 (739.9); strong n. and nw. breezes to moderate gales prevailed in the western semi-circle of the disturbance, while strong s. gales were reported at sea. This depression, which crossed the Atlantic and reached the European coasts, is hereafter described as low area xiv.

V.—This disturbance appeared in Dakota on the morning of the 14th, at which time the minimum barometric reading was 29.6 (751.8). As the depression moved east-southeastward during the day the pressure gradually increased, and on the 15th the readings ranged from 29.87 (758.7) to 29.95 (760.6), the lowest being in Illinois. During its passage south of the lakes this disturbance caused strong easterly winds in the lake region and light snow in the vicinity of Lake Erie. By the morning of the 16th the disturbance had passed into the Atlantic and was central off the Virginia coast. Its subsequent movements are described under low area xv.

VI.—From the 13th to the 16th an area of low pressure, with barometric readings ranging from 29.5 (749.3) to 29.7 (754.4). hovered off the California coast; on the last-mentioned date the area of decreasing pressure spread eastward and by the 17th the disturbance had entered Dakota, while another depression, probably a secondary development of vi., had appeared off the North Pacific coast. On the 17th the centre of number vi. was enclosed by the isobar for 29.6 (751.8) and strong winds, with threatening weather, prevailed from Dakota eastward to the lakes. Moving east-southeastward from Dakota, the disturbance reached Iowa on the 18th, the minimum readings being about 29.64 (752.8). A moderately steep gradient existed over the eastern part of the lower lake region, eastern Canada and New England, thus causing moderate se. and e. gales, with rain or snow throughout the former district. From Iowa the disturbance moved northeastward to the Saint Lawrence valley, attended by increasing pressure and, as the gradients decreased, by moderate winds. During the 19th the depression passed down the Saint Lawrence and entered the Gulf, where the pressure appears to have again decreased; on the 20th it was to the northward of Newfoundland, the pressure at the centre being now below 29.6 (751.8). This disturbance apparently moved north-northeastward towards Greenland, and is hereafter described as low-area xvi.

VII.—This was probably a secondary development of the preceding disturbance; on the 17th, the pressure, which had increased at stations to the north Pacific coast region after the passage of low area vi., again decreased to 29.9 (751.8), and by the 18th, the barometer had fallen below 29.4 (746.7). On the 19th, the disturbance spread eastward to the Rocky mountains and by the morning of the 20th, it was central as a storm of decided energy in Nebraska where the pressure was below 29.6 (751.8). The depression moved eastward causing heavy and disastrous rains in southern Indiana, Ohio, and Kentucky; on the 21st the storm-centre was in Michigan, where the minimum pressure was 29.49 (749.0) at Port Huron, the isobar for 29.6 (751.8), extending from Iowa eastward to Lake Erie. Steep barometric gradients existed over the regions to the southwest, west, and northwest of the storm-centre, and strong w. and nw. gales prevailed in the upper Mississippi and Missouri valleys, with violent e. gales in the upper lakes; during the 20th and 21st, heavy snow occurred in Minnesota, Michigan, and Wisconsin, and extended, on the 22d, to the lower lake region and New England. During the 21st, the pressure began to increase and by the 22d the minimum readings were reported from New England, but were not below 29.8 (756.9). Snow continued in that district and in the lower lake region during the 22d, but was followed by clearing weather during the night. During the 22d, the disturbance passed into the Atlantic, and filled up on the 23d, when the pressure over the Atlantic, south of the fiftieth parallel, was about 30.0 (762.0).

VIII.—This disturbance moved over the Northwest Territories of Canada during the 22d, and by the morning of the 23d its centre, which was enclosed by the isobar for 30.00 (762.0), occupied the Lake Superior region. During the 23d it moved with increasing energy over the provinces of Ontario and Quebec, and by the morning of the 24th was central between Quebec and Father Point, where the barometer read, respectively, 29.49 (749.0) and 29.53 (750.0). The disturbance was followed by an area of high pressure which caused moderate w. and nw. gales, with snow, over the lake region and along the Saint Lawrence valley. During the 24th the depression passed over the Gulf, and reached Newfoundland on the 25th, passing thence into the Atlantic during that day. Its subsequent movements are described under low area xvii.

IX.—By the morning of the 23d, the pressure at stations on the Alaskan coast, had decreased about .68 inch since the morning observation of the 22d. By the 24th, the area of decreasing pressure had reached the northern boundary of the United States, and on the following day a well-defined disturbance, at the centre of which the pressure was below 29.6 (751.8), occupied Minnesota. The storm centre moved in a southerly direction, and on the 26th, it was shown in Kansas, the central pressure remaining below 29.6 (751.8); during the 26th, strong s. to e. winds prevailed in the lake region and Ohio valley, with generally cloudy or rainy weather. On the 26th the disturbance moved to the northeastward, developing increased energy as the depression became deeper; on the 27th, the storm centre was in Michigan, where the minimum barometric reading was 29.29 (744.0), while the isobar for 29.4 (746.7) enclosed within its limits Lakes Michigan and Huron, and the southeastern part of the province of Ontario. Rainy weather continued in the Southern states and along the coast, and disastrous tornadoes occurred in Alabama and Georgia. As the disturbance moved over Ontario and Quebec to the mouth of the Saint Lawrence, it caused heavy rains in the lower lake region and Saint Lawrence valley, and moderate to strong w. and nw. gales in the former region and along the Atlantic coast from Hatteras northward. On the morning of the 28th, the centre of disturbance was over the Gulf of Saint Lawrence, the lowest reported barometer reading 29.19 (741.4) at Dalhousie, New Brunswick; at Father Point, the wind reached a velocity of fifty-five miles an hour from the west, and of forty miles sw. at Sidney, Cape Breton Island; heavy rain also fell at most stations in the Maritime Provinces. During the 28th, this disturbance probably moved north-northeastward, and united with a deep depression which was in southern Greenland on the 29th.

X.—On the 27th the barometer at Sitka, Alaska, read 29.29 (743.2), being a fall of about .65 inch; by the morning of the 28th the pressure had increased to 29.55 (750.6) in Alaska, while a fall of about .7 inch had occurred in Manitoba, where the barometer now read 29.26 (743.2), with high s. winds in Minnesota. The disturbance moved eastward, and on the 29th it was central over the northern part of Lake Superior, causing brisk to high southerly winds at stations in the upper lake region. On the 30th the disturbance passed down the Saint Lawrence valley, giving showery weather in that region, and followed in the lake region by an area of high pressures, which caused high w. and nw. winds in both districts. By the 31st the depression had passed northeastward over Labrador.

The following descriptions refer to the storms traced over the Atlantic ocean and in Europe.

XI.—This was a continuation of the disturbance described above as low area i. After leaving the coast of Nova Scotia on the 4th, it moved slowly eastward, and by the 5th it was shown as an elongated area of low pressures enclosed by the isobar for 29.4 (746.7) and extending from N. 38°, W. 60° northward and eastward to N. 50°, W. 50°. Within the area of minimum pressures the winds were light and variable, but moderate to strong gales were reported on either side of the disturbance, being from n. in the Maritime Provinces and off the coast of the United States, and from s. and sw. over the ocean east of 45° W. The disturbance moved slowly northeastward, and on the 6th it was central near N. 50°, W. 42°, the lowest reported

reading being 29.18 (741.2). A somewhat steep gradient existed to the southeastward of the centre, so that in that region moderate to fresh sw. gales occurred; in other quadrants the gradient was of moderate inclination, and brisk to high winds only (15 to 30 miles) were reported. During the 6th the disturbance appears to have moved north-northeastward towards Iceland; on the 7th the barometer at Stykkisholm read 28.73 (729.7), being a fall of .8 inch in twenty-four hours. A decided increase of pressure occurred during the 6th over western Europe, and this extended to Great Britain, so that steep gradients were formed over the British Isles and the North sea, causing strong sw. gales between W. 25° and 15° and strong breezes to moderate gales from W. 15° eastward to the British Isles.

On the 8th the disturbance remained in the neighborhood of Iceland, while stormy weather prevailed over the Atlantic. On the 9th the depression, having been joined by low area xii., which had moved over the ocean during the 7th and 8th, was now shown as an unusually large and deep depression, with its centre in Iceland, where the barometer read 28.03 (711.9). An area of high pressures, 30.6 (777.2), occupied the Maritime Provinces, the Atlantic coast, and the ocean eastward to about W. 45°, while another high area, 30.4 (772.1), covered central and western Europe; as a result of this distribution of pressure, exceedingly steep gradients were formed over the British Isles and the Atlantic ocean north of W. 45°, so that strong nw. gales prevailed over the Atlantic from the Banks of Newfoundland eastward to the fortieth meridian; w. gales occurred between that meridian and W. 20°, and strong ssw. and sw. gales over the British Isles and North sea. During the 10th and 11th the disturbance moved northeastward to northern Scandinavia, attended by rain or snow at stations in the peninsula, and showery weather over the northern parts of the British Isles; near the centre of disturbance the pressure remained below 29.0 (736.6). By the 12th the depression had moved, with increasing pressure, east-southeastward, over the White Sea, and had passed into western Siberia, where it disappeared.

XII.—This was a continuation of the depression previously described as low area ii. After passing to the eastward of the New England coast during the 6th the pressure began to decrease, and by the morning of the 7th the region of least pressure was enclosed by the isobar for 29.6 (751.8), the centre of depression being about N. 42°, W. 56°. During the 7th fresh breezes to moderate gales prevailed within the storm-area, but on the 8th, owing to the eastward advance of an area of high pressures from the United States, the barometric gradient increased, and the n. and nw. winds in the western semi-circle of the disturbance increased to the force of a strong gale. On the 8th the centre of this disturbance was apparently near N. 49°, W. 38°, whence it moved northward and probably became merged in low area xi., then central near Iceland.

XIII.—This was a continuation of the depression first charted and described as low area iii. The disturbance entered the Atlantic from the Maritime Provinces on the 10th, and by the 11th it was on the Banks of Newfoundland; fresh to strong n. and w. breezes prevailed in the Maritime Provinces and to the southward of Newfoundland, while strong sw. gales were reported over the region to the eastward of W. 45°. During the 11th, 12th, and 13th the depression moved nearly due northward, this movement being probably caused by the presence of an area of barometric maxima which lay in front of the disturbance, and stretched from about N. 35°, W. 40° northeastward to the British Isles and the Danish peninsula. During this period moderate to strong gales, mostly from w. and sw., prevailed over the Atlantic from W. 50° to the British Isles; on the 13th this disturbance became merged in the extensive depression which occupied the Arctic regions.

XIV.—This was a continuation of an important depression which passed over the Maritime Provinces and Newfoundland on the 14th, and is the only disturbance during this month that reached the European coasts at a lower latitude than N. 60°. On the 14th s. and sw. gales, of force 8 to 10, occurred between W. 55° and 45°, and in the latitude of the Banks; by the 15th the winds over that region had shifted to n. and nw., and were moderate in force, while those to the eastward of W. 40° became southerly and blew with a force of 8 to 10. On the 16th the centre of disturbance, where the pressure had now risen to 29.8 (756.9), was clearly indicated by the movement of the winds in about N. 51°, W. 37°. The area of barometric maxima, at the centre of which the pressure was 30.6 (777.2) was becoming smaller in extent and gradually withdrawing to the eastward with decreasing pressure, so that on the 17th, when the centre of depression was near N. 51°, W. 31°, the barometric gradient in front of the disturbance was slight and the winds moderated to fresh breezes. On the 18th the disturbance was near N. 52, W. 18°, and a rapid decrease of pressure set in over the British Isles; during the day the depression moved northeastward, and on the 19th it was central near the northwest coast of Ireland. Owing to the advance of an area of high barometer from the Maritime Provinces, the barometric gradient became steep in the southwest quadrant of the disturbance, and the nw. winds which prevailed in that region increased to force 9. During the 19th the disturbance apparently moved northward and united with a deep depression which was moving eastward from Iceland.

XV.—This is a continuation of a disturbance which passed into the Atlantic from the Virginia coast on the 16th (low area v.); on the 17th the circulation of the winds showed the storm-centre to be near N. 38°, W. 68°, the lowest reported pressure in that region being 29.84 (757.9). On the 18th the centre was well-defined south of Nova Scotia, the pressure having decreased to 29.7 (754.4); heavy e. and ne. gales prevailed over the Banks and several vessels on George's Banks lost anchors, cables, etc., and sustained other damage; vessels on the fortieth parallel and between W. 68° and 70° had n. gales of force 7 to 8, and those to the eastward had se. gales of force 6 to 7, with heavy rains. On the 19th the disturbance remained near N. 40° and between W. 60° and 65°; but the pressure was increasing, and during the day the depression either filled up or united with low area vi. which occupied Newfoundland on the 20th.

XVI.—This is a continuation of the disturbance described above as low area vi; it passed over Newfoundland during the 29th, and moved northward to southern Greenland, where, on the 21st, the pressure read 29.03 (737.3), a fall of .88 inch; at the same time a subsidiary disturbance, which was attended by strong s. gales, apparently existed near N. 45°, W. 45°. On the 22d, the region of least pressure was in Greenland, where the barometer was steadily falling, and the subsidiary disturbance, above referred to, had disappeared and pressure was generally high over the Atlantic south of N. 50°, except in the vicinity of Newfoundland and Nova Scotia, where it remained below 30.0 (762.0). During the 22d, the disturbance began to move eastward and by the 23d, the barometer at Stykkisholm, Iceland, had fallen to 28.75 (730.2), a decrease of about .4 inch in twenty-four hours. On the 24th the minimum barometric reading was 28.52 (724.4) at Stykkisholm, and decreasing pressure with showery weather and fresh w. and sw. breezes set in over the British Isles; over the Atlantic near the fiftieth parallel the winds were w. and blew with the force of a strong breeze to moderate gale. During the 25th and 26th, the disturbance moved to the Scandinavian coast and passed thence northeastward to the Arctic regions. During its passage along the coast the pressure near the centre of disturbance was below 29.0 (736.6), and strong s. winds with rain or snow occurred in Scandinavia.

XVII.—This is a continuation of a disturbance which crossed the Gulf of Saint Lawrence and entered the Atlantic during the 25th (low area viii.). On the 26th it was shown near N. 45°, W. 50°, as a small area of low pressures enclosed by the isobar for 29.6 (751.8) and attended by moderate to strong breezes from s. to nw. During the 27th and 28th it apparently passed northward and joined the depression which existed north of the sixtieth parallel.

XVIII.—This is a continuation of a disturbance which appeared off the Irish coast at the close of February, and is shown on the chart for that month as low area xxxvii. On March 1 the depression occupied the British Isles, the barometric minima being reported in Ireland, where the pressure was below 28.8 (731.5); strong e. breezes prevailed in northern England and Scotland and over the North sea, while strong w. and sw. gales occurred in the channel, the Bay of Biscay, and off the Irish coast, with heavy rains in all districts. By the 2d the centre of disturbance had moved slowly northeastward to the northwestern part of England, but the pressure had increased to 29.0 (736.6); the gales of the preceding day continued without any material diminution of force, attended by generally unsettled, rainy weather. During the 2d the disturbance appears to have moved southward over the southern counties of England, and by the 3d the centre was shown near Brest, France, with pressure about 29.2 (741.7); brisk to strong e. and ne. winds prevailed over England, with moderate n. gales in Ireland and over the ocean westward to the seventeenth meridian; in the Iberian peninsula strong w. breezes were reported, while moderate s. and se. winds prevailed along the French coast. The depression moved southeastward over France, and on the 4th it was central in the Mediterranean districts of that country; continuing its southeasterly course during the day the centre reached the neighborhood of Sicily on the 5th, the pressure having increased to 29.8 (756.9). During the 6th and 7th the disturbance occupied southern Italy, and finally dissipated on the last-mentioned date; moderate gales and rainy weather prevailed over the Mediterranean and the Italian peninsula during its passage.

XIX.—This depression appeared in Finland on the morning of the 1st, the pressure near the centre being below 29.5 (749.3); northerly gales prevailed over the Gulf of Bothnia, and moderate to strong w. winds in the Baltic. By the 2d the disturbance had moved to the White Sea region, the pressure at Archangel reading 29.52 (749.8), wind wsw.; during the day the depression apparently filled in.

XX.—By March 2d, the barometer at Godthaab, Greenland, had fallen to 29.12 (739.6), a fall of about .65 inch in twenty-four hours, and by the 3d the decrease had extended to Iceland, while an increase set in over Greenland. The chart for the 4th showed an elongated area of low pressures enclosed by the isobar for 28.8 (731.8), stretching from the east coast of Iceland to the Färöe Islands, with rainy weather and strong sw. to w. breezes over the British Isles and s. winds in Scandinavia. On the 5th the depression was off the Norwegian coast; moving northeastward it passed into northern Scandinavia on the 6th, causing strong w. and nw. gales over the North Sea, British Isles, and Denmark, with generally unsettled, rainy weather over the districts named; at the centre of disturbance the pressure was below 28.4 (721.3). During the 7th and 8th the storm-centre moved southeastward into northern Russia, attended by gradually rising pressure and strong nw. and n. gales in its rear. On the 9th the disturbance was in the Ural region, pressure at Ekaterinburg, 29.24 (742.7); after that date it passed into northern Siberia and disappeared.

XXI.—This depression appeared in southwestern Russia on the 4th, the barometric minimum being 29.19 (741.4) at Kiev, province of Little Russia; on the 5th, the disturbance was central near and to the eastward of Moscow, where the barometer read 29.42 (747.3) and, by the following day, it had apparently joined low area xx. which then occupied northern Europe.

XXII.—This area was a disturbance which appeared off the northwestern coast of Scotland on the 7th, and was probably a secondary development of low area xx. It moved northeastward, attended by rain or snow and strong sw. winds in the northern districts of the British Isles and, on the 8th, the centre was shown off the Norwegian coast near Bergen. The disturbance then moved east-southeastward over Scandinavia and the Baltic and passed into northern Russia, where the pressure remained below 29.6 (751.8) for several days.

XXIII.—On the 12th, the region of least pressure was in Iceland where the barometer read 29.15 (740.4); by the following day the low-area was transferred to northern Scandinavia, the barometer near the centre of disturbance having fallen to 28.98 (736.1), while rainy weather and strong w. and nw. winds prevailed over the northern part of the British Isles and southern Scandinavia. On the 14th, the centre of disturbance maintained about the same position as on the previous day, with pressure slightly lower; on the 15th, the isobar for 28.8 (731.5) extended from the extreme northern part of Scandinavia southeastward over Lapland and the White Sea, while a considerable increase of pressure had occurred over the countries to the southwestward of the low area. On the 16th, the depression remained over the White Sea, and as the barometric gradient became steeper over the Baltic and Scandinavia, strong w. and nw. breezes to gales occurred in these districts. By the 17th, the storm centre had moved southeastward to the government of Kasan, where the barometer now read 28.51 (724.1); strong nw. winds to moderate gales prevailed over the Black Sea and at stations lying southwest of Kasan. Moving eastward with decreasing pressure, the centre was shown in the Ural region on the 18th, the barometer at Ekaterinburg, reading 28.34 (719.8); strong nw. winds to gales continued at stations from Kasan southwestward to the Caucasus, and westward to the thirtieth meridian east of Greenwich. During the 19th, the depression crossed the Ural mountains and disappeared in Siberia.

XXIV.—This was a slight depression which occupied northern Arabia and the regions near the Suez canal on the 15th. On that day the atmospheric pressure in the above districts ranged from 29.72 (754.9) to 29.76 (755.9), which was about .2 inch less than on the preceding day. On the 16th the minimum reading was 29.73 (755.1) at Beirut, Syria, and at Suez the pressure varied from 29.74 (755.4) to 29.77 (756.1); during the day the pressure began to increase and the depression filled in.

XXV.—During the 17th and 18th the falling barometer at Stykkisholm, Iceland, indicated the development of a disturbance in that region. On the 19th the centre was in Iceland, and by the 20th it was near the Färöe Islands, where the pressure had decreased to 28.98 (736.1). The disturbance moved slowly northeastward to the Norwegian coast, having been joined by low area xiv, and during its passage caused showery weather and strong nw. winds to moderate gales in the British Isles, and s. and sw. gales with snow in Scandinavia. On the 22d the centre of disturbance was shown in Sweden, the pressure having increased to 29.3 (744.2); a steep gradient was formed over the northeast coast coasts of Great Britain and the North sea, and strong nw. gales were reported over the last-mentioned. During the day the disturbance moved northeastward, and disappeared in the White Sea region on the 24th.

XXVI.—On the 22d there was a decrease of pressure in northern Italy, and from that date until the 30th, the decrease spread southward and occupied the peninsula. During this period the pressure ranged from 29.65 (753.1) to 29.9 (759.4), and rainy weather and strong winds prevailed over Italy and the adjacent seas.

XXVII.—On the 26th, a deep depression with a well-defined cyclonic movement of the winds, appeared in the Netherlands; at the centre of disturbance the barometer read 29.0 (736.6), and abundant rain fell in France, the Netherlands and northern Germany. In England, over the Channel, and in western France, strong n. and nw. gales occurred, causing more or less damage to property at sea and on shore; in southern and eastern France the winds were w. and sw., and in Germany they were s., while, in Denmark they were e. and se., blowing with the force of a gale in nearly all districts. The disturbance moved northeastward over northern Germany, attended by increasing pressure and decreasing energy; and apparently passed into the Baltic during the 27th, after which it could not be traced as a distinct storm-centre.

XXVIII.—This disturbance appeared to the northward of Scotland on the 27th, the minimum barometric reading being

29.07 (738.4) observed on board the ship "Festina Lente," in N. 62° 28′, W. 2° 27′; Captain Andersen, commanding that vessel reported: "on the 26th, 27th, 28th, and 29th, the wind blew a brisk gale from the north between 8 a. m. and 6 p. m., but from 6 p. m. to 8 a. m. every night it hauled around the compass with the sun." Strong w. winds with rain, snow or sleet prevailed in the northern districts of Scotland, and brisk s. and sw. winds with rain or snow occurred in Scandinavia. During the 28th and 29th the disturbance passed rapidly northeastward along the coast, and disappeared in the region north of Scandinavia on the last-mentioned date.

XXIX.—This disturbance developed near the Norwegian coast immediately after the passage of low area xxviii. on the 28th; showery weather prevailed in northern Scotland and on the west coast of Norway, but no very high winds were reported. On the 29th the centre was over the Baltic, enclosed by the isobar for 29.6 (751.8) and causing rainy weather at stations to the southward. During the 29th it passed over the Baltic Provinces of Russia and, on the 30th, it was in the vicinity of Lake Ladoga where it dissipated.

XXX.—This disturbance appeared off the northwestern coast of Scotland on the 29th, the central pressure being below 29.5 (749.3), while moderate sw. winds and occasional rains prevailed over the British Isles. On the 30th the area of least pressure was shown in southern Norway, where the barometer read 29.39 (746.5). During the day the disturbance appears to have moved south-southwestward, the centre being over the northern part of the English channel on the 31st, while another disturbance appeared to be approaching the Irish coast. Rainy weather continued during the 30th and 31st, but the winds remained moderate in force.

The following descriptions refer to the depressions traced in Asia:

XXXI.—This depression was shown in southeastern Siberia on the 15th, by the decrease in pressure at Vladisvostok, where the barometer read 29.67 (753.6), or about .3 inch lower than on the preceding day. On the 16th the area of low pressure occupied the country between Vladivostok and Nikolaevsk, on the Amoor, where the barometer read, respectively, 29.57 (751.1) and 29.56 (750.8). On the 17th, the disturbance apparently passed into the Pacific, giving cloudy weather and snow in northern Japan.

XXXII.—This depression appeared in the Yellow Sea on the 18th, the barometer at Chee-Foo reading 29.79 (756.7), a fall of about .23 inch. The depression apparently passed eastward, and on the 19th the region of least pressure occupied the northern part of Niphon, where the barometer read 29.5 (749.4), and rainy weather prevailed generally throughout Japan. During the day the storm-centre passed into the Pacific, giving a nw. wind of 30 miles an hour at Nobiru, on the eastern coast of Niphon.

XXXIII.—This depression appeared off the eastern coast of Niphon on the 22d, when the barometer fell about .35 inch at stations on that island. The storm-centre appears to have moved north-northwestward, since, on the following day the minimum barometric readings were reported from the island of Yesso, and the circulation of the winds indicated the presence of the centre to the northwest of the island. By the 24th the pressure had increased to 29.8 (756.9).

XXXIV.—The chart for the 26th showed a considerable decrease of pressure to have occurred in northern Japan; on that day the barometric minima were enclosed by the isobar for 29.4 (746.7), and cloudy, rainy weather was general in nearly all parts of the country. On the 27th the storm-centre was to the northeast of Yesso, and a gradual increase of pressure set in; by the following day the disturbance had passed beyond the range of the observations.

GENERAL REMARKS.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in meters per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometers per hour, to meters per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations. In the MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS the position of stations (latitude and longitude) are obtained from Keith Johnson's "Index Geographicus," except where more exact information is furnished. The elevation of stations is obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the original, is carefully computed at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

On February 1, 1883, the following change was made in publishing marine data in the "Daily International Bulletin":

All marine reports are classified as to districts, which are designated as follows: District No. 1, North Atlantic; District No. 2, South Atlantic, &c., under which headings the respective reports are printed.

BOUNDARIES OF DISTRICTS.

District No. 1 comprises the Atlantic ocean, its arms and tributaries, from the equator northward to the pole, and in the arctic from 100° E., westward to 100° W., of Greenwich.

District No. 2 comprises the Atlantic ocean, its arms and tributaries, from the equator southward to the pole, and in the antarctic from 20° E., westward to 70° W., of Greenwich.

District No. 3 comprises the Pacific ocean, its arms and tributaries, from the equator northward to the pole, and in the arctic from 100° W., westward to 100° E., of Greenwich.

District No. 4 comprises the Pacific ocean, its arms and tributaries, from the equator southward to the pole, and in the antarctic from 70° W., westward to 145° E., of Greenwich.

District No. 5 comprises the Indian ocean, its arms and tributaries, from the Asiatic continent southward to the pole, and in the antarctic from 20° E., eastward to 145° E., of Greenwich.

INTERNATIONAL CHARTS ACCOMPANYING DAILY BULLETIN AND MONTHLY SUMMARY

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

International chart iii. shows tracks of centres of low barometer. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date.

In the above charts broken lines indicate that the lines so drawn are doubtful.

Arrows show direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
	1, 2	0 to 9	0 to 4
	3, 4	9.1 to 22.5	4.1 to 10.1
	5, 6	22.6 to 40.5	10.1 to 18.1
	7, 8	40.6 to 67.5	18.1 to 30.2
	9, 10	67.6 up.	30.2 and over.

The following remarks relate to the individual peculiarities in the *methods* of recording, and the *times* of taking, the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of Brig. General Bézíat, Commandant Supérieur du Génie in Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour. Adelaide, furnished by co-operation of Charles Todd, C. M. G., F. R. A. S. The observations are taken at 9 p. m., local time.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemberg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind-direction is given to 32 points and weather by the Beaufort notation. At Bradford, no observations are taken on Sunday, except the rainfall, and in the monthly summary the letter designating a certain number of days missing, applies to all the data except rainfall.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army. At St. John's, N. F., the barometer appears read about .10 inch too high, which correction has been applied from August 1st, 1883.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Saint Francis Lighthouse, the original gives barometer reduced to freezing, but not to sea-level. The kind of clouds is given, but no distinction is made between upper and lower. Weather in general terms.

CHILIAN SERIES (by authority of the Secretary of Public Instruction, furnished by co-operation of Francisco Vidal Gormáz, President of the Central Meteorological Office at Santiago).—Observations are taken mostly at lighthouses on the coast; the originals give barometer as read off; temperature in Centigrade; humidity is not given but is computed at this office from the hygrometrical observations.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteoroiogical Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation.

DANISH SERIES (furnished by co-operation of Captain N. Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimeters reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted.

EGYPTIAN SERIES (Furnished by the co-operation of Albert Ismalun, Director of the Laboratoire Khédivial du Caire).—Original gives barometer reduced to zero, but not to sea-level, temperature in Centigrade. The velocity is the mean for past 24 hours. Rainfall in millimetres.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Mont Louis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Mont Louis and Perpignan. On September 1st the elevation of barometer at Commercy changes to 243 meters.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only, and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals, where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchini, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by the co-operation of the Geographical Bureau, Department of the Interior, through I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms. On September 16th, the elevation of barometer at Hamamatsu changes to 28 meters.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (furnished by co-operation of the respective observers).—The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys-Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred. At Batavia the elevation is stated to be "a few meters."

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiania).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, Director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in meters per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Astrakhan, Ashurada and Baku, the barometer-cistern is below sea-level. At Kasalinsk, the barometer appears to have a large error.

SPANISH SERIES (furnished by co-operation of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall

at San Juan is measured at 4 p. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of Professor E. Plantamour, Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of F. Nimr, B. A., Director of the Lee Observatory at Beirut).—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in meters per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms. At Samakov, the barometer is reduced to freezing, but not to sea-level; temperature in Fahrenheit. The kind of clouds is given, also the distinction between upper and ower.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Officer, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota the barometer is corrected for temperature only; at Puerto Berrio, is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind-direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas. At Rivas the humidity is obtained by readings from Saussure's hygrometer.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind-direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of the sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luis at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a slace of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

SWEDISH NAVAL SERIES (furnished by co-operation of E. Malmberg, Director of the Nautical Meteorological Bureau at Stockholm).—The originals give the barometer as read off. The movement of the air is indicated by force on a scale of 0 to 12, and the direction is corrected for magnetic variation at this office. The humidity is not given, but is computed from the hygrometrical observations. The rainfall is omitted. The height of the sea-swell is given on a scale of 0 to 9 and the weather by the Beaufort notation.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operations of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather maps.

ERRATA.

DAILY BULLETIN, September 1, page 8, H. M. S. "Euryalus," latitude S. 15° 55′, should read S. 17° 55′.

11th, page 2, French, Lescar, reduced barometer 777.7 mm., should read 767.7 mm.

27th. page 4, United States, Cheyenne, temperature, Fah. 31°.7, should read 32.8.

30th, page 4, Spanish sub-series, San Fernando, actual barometer, for 29.00 inches read 29.90.

NOTE.—The above observations, taken at 7 a. m., Washington time, were received too late for publication in the DAILY BULLETIN, and are given here in full; for continuation of the same, see DAILY BULLETIN.

REVIEW.

INTERNATIONAL METEOROLOGY FOR OCTOBER, 1883.

[*Pressure expressed in inches and millimetres; temperature in degrees. Fahrenheit and Centigrade; wind-force by scale of* 0–10.]

The following description refers to chart ii. for the month of October, 1883, issued with this SUMMARY. This chart continues the series of international charts begun in January, 1877, and exhibits the mean pressure, mean temperature, and prevailing wind-direction over the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich, mean time.

Only one area of low mean pressure appears on the chart for October, 1883; this area is indicated by the isobar for 29.4 (746.7), and is situated in Iceland, where the mean pressure, at Stykkisholm, is 29.37 (746.0). To the southward and eastward of the low area the barometric gradient increases gradually until the isobar for 30.0 (762.0), which runs from Newfoundland eastward along the forty-ninth parallel, is reached. In British India the means range from 29.81 (757.2) to 29.9 (759.4). In that part of Europe lying north of the sixtieth parallel the mean pressure ranges from 29.55 (750.6) in northern Scandinavia to 29.82 (757.4) at Saint Petersburg, Russia. In the British Isles and over the European continent, between N. 52° and 60°, the mean pressure ranges from 29.8 (756.9) to 30.0 (762.0); in all other parts of Europe it exceeds 30.0 (762.0). In the North American continent the lowest mean pressures are found in southwestern Arizona and the northern part of the Gulf of California, where they vary from 29.88 (758.9) to 29.9 (759.4). In British Columbia the pressure is less than 30.0 (762.0), but in all other parts of the continent it exceeds that amount.

Four areas of barometric maxima are exhibited on the chart; these are each enclosed by the isobar for 30.2 (767.1), and are distributed geographically as follows: the first is shown in the United States and covers the territory from N. 38° northeastward over the Atlantic seaboard states to N. 44° and between W. 70° and 78°. The second area occupies the Atlantic ocean from W. 20° westward to W. 40° and between N. 30° and 40°; at the centre of this area, near the Azores, the mean pressure is 30.26 (768.6); elsewhere over the Atlantic ocean, south of N. 50°, the pressure exceeds 30.0 (762.0). The third area stretches from the Caspian Sea eastward over Turkestan and southward to the borders of Afghanistan, the pressure over the this region being above 30.2 (767.1). The fourth area of high pressures is situated in that part of Asia bounded by the meridians of 80° and 112°, east longitude, and the parallels of 45° and 55°, north latitude. In other parts of Asia, excepting Hindostan and the region near the Sea of Okhotsk, the mean pressure exceeds 30.0 (762.0).

A comparison with the chart for the preceding month (September), shows the following changes to have occurred: over the eastern slope of the Rocky mountains and in the west Gulf states, the mean pressure is slightly below that of the preceding month. In all other sections of the United States it is above that for September, the increase being most marked in New England and in Canada. Over the Atlantic Ocean, south of 50° north latitude, there has been a general increase of pressure; between N. 50° and 60° there has been no material change, but to the northward of 60° and east of W. 30°, there has been a decrease of about .3 inch. In Europe there has been a general increase of pressure throughout the continent except in Scandinavia, where the mean pressure averages about .15 inch less than that for September. The increase is greatest in Austria, France, and the British Isles, and is least in Russia and in Denmark. Throughout Asia there has been a general and decided increase of pressure.

Compared with the corresponding month of previous years, the mean atmospheric pressure over the United States was slightly below the normal in the southern part of the country; on the Pacific coast, and in the Rocky mountain districts. In the northern districts east of the Mississippi river it was above the normal. In Canada the mean pressure was above the normal. In Europe the mean atmospheric pressure was slightly above normal in all districts, except in Russia and in the Danish and Scandinavian peninsulas; in the last-mentioned district the deficiency was about .14 inch. In British India it was .04 inch above the six years mean.

The following table gives the mean pressure and mean temperature, with corresponding departures for October, 1883, in the several countries of the eastern hemisphere, compared with the means as determined from observations taken during the last six years:

Countries.	Mean pressure.			Mean temperature.		
	Oct. mean of 6 (1877-'82) years.	Oct., 1883.	Departure.	Oct. mean of 6 (1877-'82) years.	Oct., 1883.	Departure.
				°	°	°
Algeria	30.07	30.10	+ 0.03	72.4	70.8	— 1.6
Austria	29.99	30.06	+ 0.07	56.7	56.2	— 0.5
British Isles	29.91	29.94	+ 0.03	52.6	53.1	+ 0.5
Denmark	29.90	29.86	— 0.04	49.1	50.6	+ 1.5
France	29.98	30.08	+ 0.10	61.8	57.0	— 4.8
Germany	29.97	30.01	+ 0.04	51.1	52.6	+ 1.5
India	29.82	29.86	+ 0.04	81.2	81.5	+ 0.3

* Means for five years only.

In the United States the mean temperature of the air was above the normal in the country lying south of the thirty-fifth parallel and east of the one hundred and fifth meridian; in this section the excess was from 1° to 5°. In all other districts of the United States the temperature was from 2° to 6° below the normal. In Canada it was also considerably below the normal. In Europe the mean temperature of the air was slightly below normal in the southern peninsulas, in France, and in Austria; in all other countries it was normal or slightly above the normal. In Hindostan it was 0°.3 above the six years' mean; the highest mean reported was 86°.2 Fahr. (30°.1

Cent.) at Kurrachee, and the lowest was 73°.9 Fahr. (23°.3 Cent.) at Belgaum.

The following are some of the extreme mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Freetown, Africa	83.6	28.7	Jacobshavn, Greenland	20.3	— 6.5
Cairo, Egypt	81.9	27.7	Godthaab, Greenland	27.1	— 2.7
Nassau, Bahamas	80.6	27.0	York Factory, B. A.	28.5	— 1.9
Beirut, Syria	79.9	26.6	Yeniseisk, Siberia	31.6	— 0.2

In the United States the prevailing winds were mostly northerly and northeasterly over the country east of the ninetieth meridian; in the other districts they were from south, east, northeast, and north, and on the Pacific coast they were variable. Over the Atlantic ocean the prevailing winds were northeasterly and easterly from the coast of the United States eastward to the sixty-fifth meridian and between N. 20° and 45°. Between N. 30° and N. 45° and from W. 65° to 30° they were mostly southerly; from W. 30° eastward to the European coasts and between N. 30° and 45° they were northeasterly and northerly. South of N. 30° they were easterly, and north of N. 45° they were northwesterly. In Europe the winds were mostly from south to southwest. In Japan the winds were mostly northerly.

The rainfall (including melted snow) during October, 1883, was less than the average in the lake districts of the United States, in the south Atlantic and east Gulf states, Rio Grande valley, in Idaho and Montana, and in the north Pacific coast region; in all other districts it was greater than the average, the excess being most marked in the Ohio valley, Tennessee, Florida, and New England. In Canada the rainfall was below the average. In Europe it was about the average.

STORM-TRACKS FOR OCTOBER, 1883, AND APRIL, 1882.

With this SUMMARY are issued the international storm-track charts for the months of October, 1883, and April, 1882. Hereafter, the storm-track chart for the month corresponding to that for which the SUMMARY is published, will be issued with that SUMMARY. The charts covering the intervening period (May, 1882, to September, 1883,) will be prepared as soon as practicable and will be published with the SUMMARY, from time to time, until the series is brought up to date.

These charts continue the international series begun in November, 1877. The data are charted for each day of the month, on the maps accompanying each issue of the "International Bulletin," and from these charts and additional miscellaneous data are traced the movements of the centres of barometric minima.

The following refers to the chart for October, 1883:

During October, 1883, the paths of thirty-six depressions that have appeared in the northern hemisphere have been determined; the geographical distribution of these disturbances was as follows: Nine depressions are traced in the North American continent; six of these moved with more or less rapidity from southwest to northeast; two passed eastward near the northern boundary of the United States, and one (number ii.) apparently originated in Mexico, and pursued a somewhat abnormal path, moving, first, north-northwestward over Arizona and southeastern California, to about latitude 42° north, and thence northward and eastward to British America.

Nine depressions are traced on the Atlantic ocean; of these, three are continuations of storms which developed in, and passed over the United States and Canada; while these disturbances advanced sufficiently near the European coasts to materially affect the weather conditions over western Europe, the centre of one only (number xiv.), appears to have actually entered the continent. One disturbance prevailed over the region between Bermuda and the coast of the United States, and one was first noted in the vicinity of the Bahamas, from which region it moved northeastward along the coast of the Carolinas. One depression developed in mid-ocean, and one near the coast of Labrador. Two depressions are shown in Greenland, these passed southeastward and entered the European continent. The general direction of movement of the storms which crossed the Atlantic was northeastward, with the exception of the two which developed in Greenland.

Of the storm-centres traced in Europe, five entered the continent north of the sixtieth parallel, and moved in an easterly or southeasterly direction; one appeared in Germany, and moved northeastward over the Baltic to the White Sea; and one developed over the North Sea, and passed southeastward to the Adriatic, where it recurved and moved off in an east-northeasterly direction. Two depressions are exhibited over the Mediterranean, and one in central Russia; one developed in northern Russia and moved eastward into Siberia.

Five depressions appeared in Japan, their general movement being from southwest to northeast. Number xxxiii. indicates the position of a disturbance which appeared in the Pacific ocean on the 9th and 10th, and numbers xxxiv., xxxv. and xxxvi. are depressions which occupied Alaska and Behring Sea.

The following are descriptions of the depressions charted:

I.—This disturbance appeared in Colorado on the 1st, the pressure near the centre being 29.68 (753.9); as the depression moved rapidly east-northeastward it caused rainy weather in the districts to the eastward, and by the morning of the 2d it occupied the Ohio valley, the barometric minimum being 29.43 (747.5) at Columbus, Ohio. During the day it passed into the Atlantic from the Massachusetts coast, followed by clearing weather in the districts to the westward of the coast line. This disturbance is hereafter referred to as low area xi.

II.—This disturbance was in northwestern Mexico and the Gulf of California on the 1st. The observer at Altata, state of Cinaloa, Mexico, reported: at 9 p. m. of the 1st, a strong wind sprang up from ne. and changed suddenly to all points of the compass, increasing in force until 5 a. m. of the 2d. The gale destroyed the town of Altata, leaving only four houses standing. The observer's anemometer was carried away, so that the velocity of the wind could not be ascertained. In some places the sea washed as far as one mile beyond high-water mark. The bark "Harmodius," at Mazatlan, had to cut away her three masts to avoid being driven ashore during a severe gale on the 2d and 3d. During the 2d the disturbance appears to have entered the United States, and, passing northwestward over Arizona, it was shown in southeastern California on the 3d, its centre being then enclosed by the isobar for 29.6 (751.8). By the 4th it had moved northward to British Columbia, causing moderate to strong northerly gales off the coast, and by the following day the depression occupied the Northwest Territories, where it finally dissipated.

III.—This depression developed in Arizona and New Mexico on the night of the 6th, and on the morning of the 7th its centre was enclosed by the isobar for 29.8 (756.9). The disturbance moved rapidly in a north-northeasterly direction to northern Minnesota and Manitoba, where it appeared on the 8th, with pressure near the centre 29.56 (750.8). Cloudy, rainy weather prevailed in the central valleys during its passage, and on the 8th the rains extended to the lake region. On the 9th the depression occupied Lake Superior, the pressure having increased to 29.65 (751.1); but unsettled and showery weather continued in the lake region and along the Saint Lawrence valley. On the 10th the disturbance was over the northern part of the province of Quebec, whence it passed northeastward over Labrador to the ocean; this is hereafter described as low area xiv.

IV.—This was an extensive but shallow depression which occupied the Ohio valley, Tennessee, and the Gulf states on the 13th, the barometric minimum, 29.9 (759.4), being in Louisiana. Rain fell in the upper lake region and in the Mississippi valley on the 13th, and extended on the 14th to the lower lakes and eastward to the coast line. On the 14th the area of low pressure occupied western New York and the New England states, where

the pressure ranged from 29.7 (754.4) to 29.8 (756.9); moderate southwesterly gales prevailed along the New England coast, with high northerly winds over the lake districts. During the 14th the disturbance passed over New England and the Canadian Maritime Provinces and entered the Atlantic, where it was shown on the 15th off the coast of Newfoundland; during that date it probably became merged in an extensive depression which occupied the ocean north of the fiftieth parallel.

V.—This depression appeared in the southwestern part of the United States on the 16th, the pressure at the centre of disturbance being about 29.75 (755.6). By the 17th the area of depression occupied Colorado, Nebraska, and Kansas, over which districts the pressure ranged from 29.5 (749.3) to 29.6 (751.8), with rainy weather accompanied by high winds over the country to the northward and northeastward of the centre. On the 18th the disturbance was shown in Manitoba, where it was joined by a depression which had advanced from the northwest; at the centre of disturbance the barometer read 29.25 (742.9), and the isobar for 29.4 (746.7) stretched from Manitoba eastward to Lake Superior. An area of high pressure occupied the Atlantic coast districts on the 18th, and as the disturbance moved eastward the barometric gradient became somewhat steep, and moderate southerly gales prevailed over the lakes. The depression moved eastward with increasing pressure and was attended by showery weather along the Saint Lawrence, and on the 19th it disappeared to the eastward of Hudson Bay.

VI.—This depression appeared in the Saskatchewan valley on the 17th, when low area v. was in Kansas; it moved eastward, attended by rainy weather, and on the 18th it coalesced with low area v. in Manitoba.

VII.—This disturbance probably developed over the western part of the Gulf of Mexico on the 23d, and by the following day its centre was on the Texas coast, where the pressure was 29.95 (760.7). By the 25th it had moved northeastward to Illinois and Ohio, where the barometric readings ranged from 29.8 (756.9) to 29.95 (760.7); moderate easterly winds with cloudy weather and occasional rain prevailed over the lake region. On the 26th the centre of disturbance was near Buffalo, where the barometer read 29.93 (760.2); during the day it passed eastward over New England into the Atlantic, and is hereafter described as low area xviii.

VIII.—This depression appeared off the coast of Oregon and Washington Territory on the 24th, the pressure at the land stations being less than 29.5 (749.3) on that date. During the 25th and 26th, the disturbance moved slowly eastward, causing cloudy, rainy weather in the northern plateau district, and in California southward to San Francisco. On the 27th the disturbance was in the Saskatchewan valley, where the pressure was 29.4 (746.7). On the 28th it occupied the same region, with no material change in pressure; on the 29th the region of least pressure was shown in Manitoba, where the barometer read 29.33 (745.0), the trough of low pressures extending northwestward over the Northwest Territories and causing rain or snow in the northwestern sections of the United States and in British America. An area of high pressures occupied the Hudson Bay region, and the disturbance was apparently forced in an east-southeasterly direction, combining, on the 30th, near the mouth of the Saint Lawrence river, with a depression which had moved from Kansas northeastward over the lake region.

IX.—This disturbance appeared in Colorado on the 28th, on which date the pressure in that state was below 29.6 (751.8), while over the region between the meridians of 90° and 110° it was below 29.8 (756.9), and a deep depression was in the Saskatchewan valley; cloudy or rainy weather prevailed over the country from the Mississippi river eastward to the lake region. The disturbance moved northeastward with slowly decreasing pressure, and on the 29th it was shown in northern Indiana and Michigan, where the barometer read 29.4 (746.7), and showery weather prevailed from Lake Michigan eastward to the Atlantic coast. As the depression moved northeastward over the provinces of Ontario and Quebec, it was joined by low area viii, the combined system forming a deep depression which exhibited great energy; on the 30th, the storm-centre, where the pressure was now below 28.9 (734.0) was near Quebec; an area of high pressures existed to the eastward of the Maritime Provinces, and as the depression approached the Atlantic, steep barometric gradients were formed, so that strong southerly and easterly gales prevailed over the Maritime Provinces, the Gulf of Saint Lawrence, and over the Atlantic as far as the fifty-fifth meridian. Another area of high pressures occupied the region north of Lake Superior, and as the winds shifted to westerly over the lakes, they attained the force of a strong gale; high westerly winds also occurred at stations on the New England coast. On the 31st the depression was over the Gulf of Saint Lawrence, the pressure at Anticosti Island being 29.11 (739.4) at the morning observation. The wind shifted to westerly over the Maritime Provinces, and moderated slightly, but violent westerly gales were reported on the Banks, with equally heavy southerly and southwesterly gales from W. 50° eastward to W. 35°.

The following are descriptions of the disturbances traced over the Atlantic and in Europe:

X.—This depression was shown off the coast of Labrador on the 2d, the lowest reported barometric reading being 29.33 (745.0) in N. 52°, W. 54°. It moved northward, and on the 3d the low area was shown in Greenland, the barometer at Godthaab reading 29.10 (739.1), a fall of about .6 inch during twenty-four hours. The depression apparently continued its northerly movement, and was probably closely connected with that charted as low area xii.

XI.—This was a continuation of the depression traced over the United States as low area i. It passed into the Atlantic on the 2d, and, moving northeastward along the coast of Nova Scotia, was central east of Cape Breton Island on the 3d; on the 4th it was near the Strait of Belle Isle, attended by moderate to strong southwesterly gales on the Banks of Newfoundland. During the 5th it probably merged in a depression which occupied Greenland.

XII.—On the 5th the barometer at Jacobshavn, Greenland, read 29.11 (739.4), the pressure at that station having been unsteady since the 3d. By the 6th the decrease had extended eastward to Iceland, where the barometer on the 6th showed a fall of about .4 inch. On the 7th the area of low barometer was shown off the Norwegian coast, and rainy weather had become general over the Scandinavian peninsula; during the day the depression passed over northern Scandinavia, and on the 8th the barometric minimum, 29.07 (738.4), was reported at Petrozavodsk, Russia; moderate to strong westerly winds prevailed over Scandinavia, the Baltic, and northeastern Europe, with cloudy or rainy weather, while an area of high pressure, giving clear weather and higher temperature, prevailed over central and southwestern Europe. By the 9th the depression had advanced to eastern Russia; moving thence eastward, it crossed the Ural mountains and disappeared in Siberia.

XIII.—This disturbance apparently originated in the neighborhood of Bermuda on the 8th; on that date the pressure over the ocean between Bermuda and W. 60° and N. 29° decreased about .25 inch. On the 9th the storm-centre was a little to the eastward of Bermuda, where the barometer now read 29.51 (749.5), wind n.; moderate to strong northerly gales prevailed over the ocean between the United States and Bermuda, with easterly gales to the northward of 35° N. and westerly and southwesterly breezes to the southward of 28° N. By the 10th the storm-centre had passed to the westward of Bermuda; the pressure over the region between W. 62° and 70° and N. 27° and 33° remained about 29.7 (754.4), and the wind at Bermuda shifted to southwest and increased to a gale, as did also the southwesterly winds encountered by vessels in the southeast quadrant of the disturbance. To the westward and northward the heavy gales continued, the wind gradually shifting to northeast between Bermuda and the coast line. On the 11th the reports showed the storm-centre to be near

N. 30°, W. 74°, the lowest reported pressure being 29.74 (755.4); strong northerly and northeasterly gales prevailed off the coast of Florida and the Carolinas, while the winds shifted to southeast over the region east of the seventieth meridian, and gradually moderated. During the 12th and 13th the storm-centre was off the coasts of Georgia and South Carolina, and, owing to the presence of a rather steep barometric gradient to the eastward and northeastward of the depression, moderate to strong southeasterly and easterly gales prevailed along the coast from North Carolina northward to the fortieth parallel and eastward to the seventieth meridian. During the 13th the disturbance appears to have entered South Carolina as a shallow depression and to have rapidly filled in. The schooner "Elise and Lucie" encountered this storm and reported on the 9th, when in the latitude of Bermuda and W. 74° 30′, that she had a hurricane from northeast, lasting four days, during which she lost and split sails; ocean steamers arriving in New York reported having met with a very heavy southeasterly sea-swell on the 11th in N. 41°, and from W. 66° to 72°.

XIV.—This was a continuation of the depression charted as low area iii.; it passed off the Labrador coast during the 10th, and on the following day it was central near N. 57°, W. 40°, where the lowest reported barometric reading was 29.52 (749.8); moderate westerly and southwesterly gales prevailed over the ocean between W. 50° and 30°, and N. 45° and 55°. By the 12th the region of least pressure was shown near N. 56°, W. 26°, the barometer having fallen to 29.14 (740.1); strong northwesterly breezes to moderate gales occurred over the region west of the thirtieth meridian; and to the eastward of the twenty-fifth meridian the winds were southerly and southwesterly, but they did not exceed the force of a moderate gale. On the 13th, the storm-centre was to the southward of Iceland, where the barometer had fallen to 28.89 (733.8); during the 14th and 15th, the disturbance moved slowly southward, the pressure at the centre remaining below 29.0 (736.6), and throwing off subsidiary depressions, which traveled over the British Isles, giving rainy weather and strong winds to gales over those Islands and the North sea. The passage of the disturbance was probably retarded by the area of high barometer which occupied northeastern and eastern Europe during the 13th, 14th and 15th, but on the 16th this high area began to withdraw to the southeastward, and at the same time, the depression advanced to northern Scotland. On the 16th, the lowest barometric readings were reported from the Orkney and Shetland Islands, where the pressure was 28.64 (727.4), and 28.8 (731.5), while the barometer stood below 29.0 (736.6) over the whole of Scotland, and the northern part of Ireland. During this date, strong southwesterly breezes to gales, with rainy weather prevailed over the British Isles and western Europe, while the wind moderated over the ocean west of the fiftieth meridian. On the 17th the storm-centre was near the Färöe Islands, barometer at Thorshavn reading 28.49 (723.6), and stormy weather continued over the greater part of western Europe and the Scandinavian peninsula. On the 18th the centre of disturbance was in Norway, the barometric minimum, 28.63 (727.2), being at Brono. Steep gradients formed over the British Isles and that part of Europe lying north of the fiftieth parallel, so that strong westerly gales prevailed generally from W. 20° eastward to E. 15°, with southerly and southwesterly gales over the Gulf of Bothnia and in the Russian Baltic Provinces. During the 19th and 20th the centre of disturbance remained in Scandinavia with no change of pressure, and during those dates small subsidiary disturbances formed to the southward of the central depression and passed eastward, giving heavy rains. During the 21st the pressure began to increase, and the chart for that day showed the low area to be over southern Sweden and the Baltic, where the pressure ranged from 29.26 (743.2) to 29.3 (744.2); as the barometric gradient declined rapidly, the wind in nearly all districts moderated to fresh or strong breezes. On the 22d the depression occupied the Gulf of Finland, the pressure having increased to 29.6 (751.8); showery weather prevailed in the Russian Baltic Provinces, followed by fair weather on the 23d, when the depression filled in.

XV.—This disturbance occupied northern Greenland on the 20th and 21st; it moved southeastward with decreasing pressure, and on the 22d it was shown near Iceland, pressure at Stykkisholm, 28.67 (728.2). Rather steep gradients were formed over the ocean south of Iceland, and moderate to strong westerly gales were reported by vessels on the fiftieth parallel. On the 23d the storm-centre was between Iceland and the Färöe Islands, and rain was falling in the British Isles and Scandinavia, with decreasing pressure in the northern districts. During the 24th and 25th the disturbance was between the Färöe Islands and the Norwegian coast, the pressure on the last-mentioned date having decreased to 28.8 (731.5); westerly and southwesterly winds, increasing to strong gales, occurred in the British Isles, North Sea, and northern Germany, with southerly and southeasterly breezes in the Baltic and Scandinavia, and showery weather in nearly all districts of western and northern Europe. On the 26th the region of least pressure occupied the southern part of the Gulf of Finland, accompanied by strong gales over the Baltic, where the winds had now shifted to west. During the day the depression moved eastward and passed into northeastern Russia, where it was central on the 27th. On the 28th and 29th it occupied the Ural region, causing fresh to strong westerly breezes over eastern Russia and southward to the Caspian Sea. By the 30th it had passed into Siberia, where it apparently dissipated.

XVI.—This depression appears to have developed in the sub-tropical region near the Bahamas on the 22d, but it did not attain any great depth or display unusual storm-energy during the earlier part of its path. On the 22d the pressure over the Bahamas and the West Indies was about 29.88 (758.9) and over the region north of the twenty-seventh parallel it was above 30.0 (762.0); moderate to strong northeasterly gales were reported during that day by vessels in the Gulf stream and near the coasts of the United States. On the 23d, the disturbance was near the Carolina coast but the barometer did not fall below 29.95 (760.7), but owing to a somewhat steep gradient that existed to the northward and northeastward, very strong easterly and northeasterly gales prevailed along the coast of the United States from Hatteras, North Carolina, to Cape Cod, Massachusetts. On the 24th the depression pushed steadily northeastward against the area of high pressures which persisted to the northward of the fortieth parallel, causing a steepening of the barometric gradient and an increase in the force of the easterly and northeasterly gales; the southerly and southeasterly winds to the eastward of the depression also increased in force. The chart for the 25th, showed the centre of disturbance for the first time, enclosed by the isobar for 29.8 (756.9), near N. 41°, W. 61°; an area of high barometer occupied the region from W. 52° eastward to W. 40° and from N. 25° northward to N. 48°, so that steep gradients were formed to the eastward of the depression, which produced violent southerly and southeasterly gales. On the 27th the disturbance moved to about N. 42°, W. 46°, the pressure remaining about 29.75 (755.6); as the gradients had declined in all quadrants of the depression, the winds during the 26th did not exceed the force of a moderate gale, but on the 27th, owing to a great decrease of pressure that occurred at the centre of disturbance, they again attained the force of 10. On the 27th, the lowest barometer reading was 29.02 (737.1), in N. 48° W. 32°, the depression extending as a trough of low pressure northward to Iceland. By the 28th, the disturbance had moved north-northeastward to about N. 60°, W. 21°, and during that and the three following days, it was apparently forced to the westward in the vicinity of Iceland, the pressure fluctuating between 29.0 (736.6) and 29.3 (744.2). An area of high pressures, which appeared in southeastern Europe on the 26th, began to move northwestward with increasing pressure and by the 29th and 30th, it had spread over the whole of northern and western Europe, the pressure at the centre, in western Russia, being 30.7 (779.8). The movement of this

area of high pressures probably accounts for the northerly and westerly movement of the low area.

XVII.—This disturbance appeared near N. 49°, W. 42° on the 23d, when the barometer suddenly fell to 29.27 (743.4) a decrease of about .7 inch. The depression moved northeastward, and during the 24th it apparently merged in low area xv., which then occupied the Färöe Islands. Strong breezes to moderate gales attended the passage of this disturbance.

XVIII.—This was a continuation of low area vii.; it entered the Atlantic during the 26th, the pressure gradually decreasing after the disturbance left the land, and on the 27th it was central near N. 43°, W. 60°. On the 28th it was near N. 43°, W. 48°, the pressure having decreased to 29.27 (743.4) near the centre; strong northerly and northeasterly winds prevailed over the Banks of Newfoundland, with moderate to strong easterly and southerly winds to the northward and eastward of the low area. On the 29th the disturbance was shown near N. 48°, W. 34°, with the barometer down to 29.12 (739.5), and very heavy southerly gales to the eastward of the thirtieth meridian; on the 30th it was near N. 53°, W. 28°, and during the day it probably became merged in low area xvi.; the combined depressions causing a continuance of heavy westerly gales over the region south of the fifty-fifth parallel at the close of the month.

XIX.—This disturbance occupied central and western Europe on the 1st, the barometric minimum, 29.48 (748.8), being in Germany. On the 2d the low area was in southern Sweden, the pressure at the centre remaining unchanged; during the 3d and 4th it moved northeastward to northern Russia and disappeared in the White Sea region. During its passage it caused showery weather in the British Isles and in the northern and western districts of Europe.

XX.—This was a depression which appeared in central Russia on the 2d; it moved northeastward, with steadily decreasing pressure, and on the 3d its centre was shown near Kasan, where the barometer read 29.33 (745.0). On the 4th it was central in the Ural region, barometer at Ekaterinburg 29.17 (740.9); during the day the disturbance passed into Siberia, and on the 5th it was shown near Yeniseisk, and by the following day it had passed beyond the stations of observation.

XXI.—This depression developed over the North Sea on the 3d; it moved southward with decreasing pressure at the centre, and attended by general rains in western Europe. On the 4th the centre was enclosed by the isobar for 29.4 (746.7), which covered the Netherlands and the northern part of the Channel; strong northerly breezes to moderate gales prevailed over the British Isles; westerly and northwesterly breezes in France, and southerly and southeasterly winds in Denmark and Germany, with cloudy or rainy weather in most districts. The disturbance moved southeastward over Germany, and by the 5th it occupied northern Italy; during the day it passed east-northeastward over Austro-Hungary, and disappeared in Russia on the 6th, its passage being attended by showery weather and brisk winds.

XXII.—This depression appeared in the region south of the White Sea on the 5th; on the 6th it was near Lake Onega, causing a strong northeasterly gale at Petrozavodsk. On the 7th the area of low barometer occupied northern Russia, and showery weather prevailed in the districts to the southward and westward of the disturbance. On the 8th this disturbance crossed the Ural mountains and disappeared in western Siberia, causing a moderate northerly gale at Ekaterinburg.

XXIII.—This was a depression which appeared near Akmolinski, Siberia, on the 6th, when the barometer at that station fell to 29.19 (741.5). By the following day the depression had apparently filled in, the barometer having risen to 30.19 (766.8).

XXIV.—This disturbance appeared in the extreme northern part of Scandinavia on the 8th, and remained in that region until the 9th, when it began to move southeastward. On the 10th the centre was to the southwestward of Archangel, with the pressure below 29.2 (741.7); it moved thence eastward, and on the 11th it occupied the Ural region, lowest barometer reported being 29.43 (747.5). On the 12th it moved into northeastern Siberia and disappeared.

XXV.—This appeared on the 11th, off the coast of Norway; on the 12th its centre was in Finland, where the pressure was 29.35 (745.5); strong northwesterly gales prevailed over the Gulf of Bothnia and at stations in Scandinavia. On the 13th the depression was central north of Archangel, where the barometer read 29.53 (750.0); during the day the disturbance disappeared in the Arctic region.

XXVI.—This depression appeared in the Mediterranean on the 12th, on which date the centre was north of Sicily where the pressure was 29.83 (757.7). On the 15th the centre was near the entrance to the Adriatic; by the following day the the depression had filled in. Moderate rains accompanied the passage of this disturbance.

XXVII.—This depression developed over the Mediterranean near the eastern coast of Spain on the 21st; it moved slowly northeastward and on the 22d it occupied the Gulf of Genoa, where the pressure was about 29.85 (758.2). Rainy weather prevailed in the French districts adjoining the Mediterranean, and over Italy; on the 23d the depression occupied the Adriatic, the lowest reported barometric reading being 29.85 (758.2). During the day the disturbance moved eastward over Austro-Hungary, and on the 24th its centre was enclosed by the isobar for 29.8 (756.9); on the 25th it was to the northward of the Black Sea, where it apparently dissipated. Its passage was attended by showery weather and fresh to brisk winds.

The following descriptions refer to the depressions charted in Japan:

XXVIII.—This depression appeared off the coast of southern Japan on the 4th, the pressure at the land stations being about 29.85 (758.2). As the disturbance moved northeastward along the coast, showery weather prevailed in Niphon, with fresh to brisk winds at coast stations. On the 5th the storm-centre was enclosed by the isobar for 29.8 (756.9), the U. S. S. "Pensacola," in N. 32° 40′, E. 140° 58′, reporting barometer 29.78 (756.4), wind sse., force 3. On the 6th the centre of disturbance was to the eastward of 141° east longitude, and was apparently increasing in energy. The "Pensacola," in N. 32° 39′, E. 140° 58′, reported barometer 29.41 (747.0), wind n., force 9. During the 6th the disturbance disappeared over the Pacific.

XXIX.—This disturbance appeared off the southern coast of Kiusiu on the 7th, the pressure at the centre of depression being less than 29.6 (751.8). On this day rainy weather and strong winds to gales prevailed over Niphon and the southern districts. During the day the depression moved northeastward over southern Niphon, with decreasing pressure and increasing storm-energy, and on the 8th its centre was shown in northern Niphon, where the barometer now stood at 29.30 (744.2), while moderate to strong gales prevailed in all districts except that in the extreme southwest. By the following day the disturbance had apparently passed into the Sea of Okhotsk, and clearing weather set in over Japan.

XXX.—This disturbance, like its predecessor, appeared off the southern coast of Japan, on the 12th. It moved northeastward along the eastern coast of Niphon, and on the 13th, it was central to the northeastward of Japan, passing thence beyond the limits of the observations. During its passage it caused strong winds to gales, and rainy weather.

The depressions numbered xxix. and xxx., were unusually severe in Japan. The following interesting article by Mr. E. Knipping, giving a detailed description of the paths of these storms, was published in the "Japan Mail," of October 22d, 1883, and is given in full herewith:

Notes on the storms of October 7th to 9th, and 12th to 13th, 1883.

The geographical position of Japan, between the continent of Asia on one side, and the Pacific ocean on the other, makes its climate dependent on these two great expanses of land and water, which, in their influence on the distribution of pressure in summer and winter, show the greatest contrasts.

In winter a wide area of high pressure, or anti-cyclone, lies over central Asia, while a deep depression occupies the northern Pacific near the Aleutian

Islands, causing a constant air current over Japan from north and west. In summer the positions of the highest and lowest pressure are nearly reversed, the lowest being then in Asia, the highest over the eastern part of the north Pacific. At this time of the year south to east winds are prevalent in Japan.

Whenever these two commanding areas of high and low pressure are well established in the middle of winter and summer the weather in Japan shows the greatest constancy, but as soon as they commence shifting in the spring and fall the weather becomes unsettled and changeable.

The autumn changes of this year began on September 1st, and brought a number of smaller and three large depressions. The first of the large ones passed September 11th to 14th (see "Japan Mail" of September 24th); the second, October 7th to 9th; the third, October 12th to 13th; the two last ones being similar in many respects.

The storm of October 7th to 9th traversed the whole country from southwest to northeast with great rapidity and fury. It passed probably through or near the Riukiu Islands, crossed 30° north latitude in about 130° east longitude or more, was off Kii Channel on the 8th at 6 a. m., passed east of Wakayama and Osaka (noon), Kioto (1 p. m.) to Kanazawa, in Echizen (2 p. m.), thence via Niigata (5 p. m.) to near Aomori (10 p. m.), and through Tsugaru strait into Hokkaido, passing Sapporo earlier than 6 a. m. on the 9th.

In these twenty-four hours the centre thus traveled more than twenty-five n. m. p. h. on an average, the distance, Wakayama–Sapporo, being six hundred n. m.; but from 5 p. m. on the 8th its rate of progress was fifty-five n. m. p. h.

The weather map for Sunday, October 7th, 2 p. m., shows the first approach of this depression. The barometer had fallen at Kagoshima 3 mm. since the morning, while pressure was banking up over the Inland Sea and in eastern Nippon by 2 mm. As these changes were not known at the time in Tokiyo, the first intimation of a storm approaching the southern coast was received by special telegram from Kagoshima and Nagasaki, heavy gales blowing at both stations at 9 and 10 p. m.. respectively, so that the warning issued immediately to the southwest coast was late for these two stations.

On Monday morning the 8th the depression had made rapid progress, advancing towards the northeast. The centre was then off Kii Channel, with very steep gradients* over central Japan from 5 upwards to 9; north to east gales from Kochi to Hamamatsu, little wind yet in northeastern Japan and also in the extreme west, heavy rain all over southern Nippon.

At noon the centre was abreast of Wakayama and Ozaka; at 2 p. m. near Kanazawa, the barometer having fallen there 17 mm. in eight hours, the heaviest fall recorded at any station since the publication of the weather maps in March. In eastern Nippon gradients ranged about 6, and the rain extended further northward to Hakodate.

From 2 to 10 p. m. the fluctuations in pressure were greatest, a fall of 17 mm. being recorded at Aomori, a rise of 20 mm. at Kanazawa. The former station had a calm at 10 p. m., the centre of the storm being near the station, while Hakodate had an easterly gale; all eastern Nippon, south to west gales.

On the 9th at 6 a. m. the centre was beyond Sapporo. In the whole south the wind had gone down and Sapporo, near the centre, had light wind, but in Tsugaru Strait and in northern Nippon strong southwesterly gales were blowing, changing afterwards to west, and at Sapporo with increasing force to northwest. At night the last gales were recorded in the north.

At both Hokkaido stations the wind reached force 6†; at thirteen others, force 5; at three more, force 4; leaving four out of the twenty-two stations, with force 3, or less.

The lowest pressure recorded was at Wakayama, 738 mm.; Ozaka and Kiyoto, 737 mm.; Kanazawa and Niigata, 738 mm.; Aomori and Sapporo, 743 mm.; the centre travelling with the greatest speed at the time when the pressure near the centre was lowest.

At two stations the change of wind near the centre lagged considerably behind the passage of the minimum of pressure, namely, at Ozaka, where the lowest barometer was noted at noon; north wind at 1 p. m.; west wind at 2 p. m.; and at Niigata with lowest reading at 5 p. m.; southeast wind at 6 p. m.; southwest wind at 7 p. m. In slowly moving cyclonic storms the greatest change of wind takes places usually about the time when the barometer is lowest.

The amount of rain for two successive days was:

	mm.		mm.
At Wakayama	139	At Kanazawa	62
Ozaka	96	Hiroshima	59
Sapporo	93	Gifu	56
Kiyoto	89	Numadzu	40
Sakai	82	Tokiyo	39
Miyasaki	66	Hakodate	34
Miyako	64	all others	18 or less.
Kochi	63		

* Greatest barometric slope in mm. for 60 naut. miles.

† At stations provided with anemometers for registering the velocity of the wind, the following table is used:

	Scale 0-6
Up to 1.5	metres per second force 0
Up to 3.5	metres per second force 1
Up to 6	metres per second force 2
Up to 10	metres per second force 3
Up to 15	metres per second force 4
Up to 29	metres per second force 5
Above 29	metres per second force 6

Not provided with anemometers are: Kagoshima, Miyasaki, Shimonoseki, Sakai, Hamamatsu, Numadzu, Akita; at these stations the force is guessed.

Not two days after the disappearance of this storm in the north, on the 11th, the aspect in the south grew threatening again, another depression advancing with the same symptoms and in the same quarter as the one which had just passed.

Saturday, the 13th October, at 6 a. m., its centre was near Wakayama with the pressure then at 746 mm., exactly the same as five days earlier and also with very steep gradients in central Japan, ranging from 4 to 11. After passing Wakayama, however, the centre did not cross to the sea of Japan, but went straight ahead, being about midway between Niigata and Tokiyo at 2 p. m., entering the Pacific near Nobiru at 4 p. m.

The rainfall in this storm was also heavy, the following amounts being recorded:

	mm.		mm.
Gifu	150 in 3 days.	Numadzu	50 in 3 days.
Wakayama	113 in 2 days.	Hamamatsu	44 in 3 days.
Osaka	? ?	Akita	40 in 1 day.
Tokiyo	74 in 3 days.	Miyasaki	37 in 1 day.
Miyako	69 in 1 day.	Niigata	28 in 1 day.
Kiyoto	68 in 3 days.	Aomori	24 in 1 day.
Kanazawa	68 in 2 days.	Hakodate	16 in 1 day.
Nobiru	65 in 3 days.	Sakai	12 in 1 day.
Kochi	50 in 1 day.		

None at Nagasaki, Kagoshima, Hiroshima, Shimonoseki, or Sapporo.

Both storms traveled in general about northeast, the first a little more northerly.

	1st storm.	2d storm.
The greatest velocity of the centre was	55	38 n. m. p. h.
The lowest barometer	737	746 m. m.
The greatest fall of barometer in 8 hours	17	15 m. m.
The greatest rise of barometer in 8 hours	20	8 m. m.
The steepest gradient	9	11
Number of stations with gales (out of 22)	18	8

In both storms due warnings were given to the coast, late at some western stations in the first one, owing to want of telegrams. In sixteen hours, the interval during which the coast may at present be considered as not properly guarded, a storm traveling at the rate of twenty-five n. m. p. h. may be, at 2 p. m. on one day south of Odinawa, at 6 a. m. the next morning at Kagoshima.

Twin depressions following each other in short intervals and similar in many respects do not seem to be quite rare, as two instances were noted in July, one pair crossing Nippon with an interval of two days, another pair going over southern Hokkaido within six days, In July, as well as in October, the first of the pair was always the principal one.

E. KNIPPING.

TOKIO, October 17, 1883.

XXXI.—This disturbance appears to have originated over the northern part of the Sea of Japan. It apparently moved southeastward over northern Niphon, and on the 23d it was central off the northeastern coast of that Island, the pressure at the land stations being about 29.85 (758.2). By the following day the depression had disappeared from the chart.

XXXII.—This was a disturbance which had apparently moved up from the China Sea, and on the 30th it was near the Strait of Corea. It moved with decreasing pressure northeastward over the Sea of Japan, attended by rainy weather and high winds to gales in Niphon. At the close of the month the area of low pressure occupied northern Niphon, where the barometer ranged from 29.45 (748.0) to 29.5 (749.3).

The following depressions appeared in Behring Sea and in the north Pacific ocean:

XXXIII.—This was a disturbance which appeared in the north Pacific ocean, apparently moving to the westward, on the 9th and 10th. On the first mentioned date the s. s. "Oceanic," in N. 39° 34′, W. 179° 45′, reported barometer 29.76 (755.9), a fall of about .2 inch, wind nw., force 4 to 6, weather fair; on the 10th, in N. 39° 38′, E. 175° 45′, the barometer read 29.88 (758.9), wind sw., force 4 to 6, and on the same day the s. s. "City of Tokio," in N. 40° 56′, E. 171° 56′, had nnw. wind of force 6, with squally weather. The ship "Cambrian Monarch," in latitude 42° 20′ north, and longitude 180°, reported on the 10th having encountered a strong gale, in which the wind backed from nw. to sw. and s., after which the weather became settled.

XXXIV.—This is charted to indicate the presence of an area of low barometer which occupied the Aleutian archipelago and Behring Sea from the 9th to the 17th. During this period the pressure ranged from 29.5 (749.3) to 29.8 (756.9).

XXXV.—On the 20th, the barometer at Fort Saint Michael's, Alaska, fell to 29.22 (742.2). By the 21st, it read 29.01 (736.8) and the wind had shifted from se. to n., with light rain; on the 22d the pressure had increased to 29.8 (756.9).

XXXVI.—This was a depression which appeared in Alaska

on the 26th, when the barometer fell to 29.09 (738.9); by the the morning of the 27th, the area of least pressure was shown near Sitka. On the 28th, it extended southeastward over British Columbia and the Northwest Territories, and probably joined the depression charted as low area viii.

STORM TRACKS FOR APRIL, 1882.

The paths of thirty-seven atmospheric depressions are shown on the chart for April, 1882; these are distributed, geographically, as follows: eight are traced in the United States and Canada; of this number, five are traced from the region west of the Rocky mountains, southeastward or eastward to the Atlantic; two moved eastward along the northern boundary of the United States and Canada, and one, number iii, moved from the southwestern part of the United States northeastward to the lake region and thence eastward to the Atlantic. The tracks of eleven disturbances are shown over the north Atlantic ocean; of these, four are continuations of the storms which passed over the North American continent; three developed over the ocean west of the sixtieth meridian; three developed in mid-ocean, and one near the British coasts. The general movement of these depressions was to the northeastward between the parallels of 45° and 55° north latitude, that traced as number xi. being remarkable for its erratic track and its long duration in mid-ocean.

Thirteen depressions are traced in Europe, of this number four entered the continent south of the fiftieth parallel and passed southeastward to the Mediterranean, three appeared in eastern Europe, and one in the Black Sea region, while the remainder traversed the British Isles and northern Europe. The storms which crossed the British Isles moved, in general, from sw. to ne., while those in Scandinavia passed to the eastward and southeastward. One disturbance is shown in Greenland and four in eastern Asia.

The general direction of movement of the storms traced in April, 1882, does not materially differ from that of the preceding month (March, 1882), but they have moved at a somewhat lower latitude; and while fewer storms are traced in northern Europe, they are more numerous in the British Isles than was the case in the previous month. As a result of this there was a decided increase in the mean pressure over Scandinavia and other parts of northern Europe, with a corresponding decrease in the British Isles and southern Europe.

The following descriptions refer to the depressions which appeared in the United States and Canada:

I.—This disturbance appeared in Manitoba on the morning of the 1st, its centre being enclosed by the isobar for 29.8 (756.9). As the disturbance traveled quickly eastward, it caused light rains in the lake region, and by the morning of the 2d, it had reached the province of Quebec, the pressure at the centre being now about 29.7 (754.4). During the day, it passed over northern New England and Nova Scotia into the Atlantic, still attended by rainy weather and brisk to high winds or moderate gales. On the 3d, the storm centre was in the Atlantic, and is hereafter described as low area xi.

II.—On the morning of the 3d this disturbance occupied Manitoba, Minnesota, and eastern Dakota, which districts were enclosed by the isobar for 29.8 (756.9), while, near the centre of disturbance, in Manitoba, the barometer read 29.64 (752.8). The disturbance moved rapidly eastward over Lake Superior, causing rainy weather and high winds on the lakes; on the 4th the region of low pressure was in northern Ontario and was closely followed by an area of high pressures which caused generally clear, freezing weather over the districts to the westward of the storm-centre. During the 4th the depression passed northeastward from the Saint Lawrence and reached the Atlantic from the coast of Labrador; this disturbance is hereafter referred to as low area xii.

III.—This disturbance developed in Arizona and New Mexico on the 4th; by the 5th its centre was enclosed by the isobar for 29.8 (756.9), which occupied Colorado and portions of Wyoming. During the day the depression moved northeastward and reached northern Iowa and Wisconsin, where it was central on the 6th; an area of high pressures occupied eastern Canada on the 6th, and as this disturbance moved over the lakes, steep barometric gradients were formed, so that high southerly winds to gales prevailed in the lake region. On the 7th the disturbance was in Ontario, whence it moved in a course slightly south of east over the Maritime Provinces, and passed into the Atlantic, being attended by rainy weather and strong winds. On the 8th the depression was shown to eastward of Nova Scotia, and is hereafter described as low area xiii. During the passage of this disturbance over Iowa and Wisconsin, severe tornadoes occurred in its southeast quadrant.

IV.—This depression appeared in the vicinity of Salt Lake City, Utah, on the 6th, and by the morning of the 7th it had moved into Colorado, where the barometer had fallen to 29.56 (750.8). During the 8th and 9th the disturbance moved slowly northeastward over Nebraska, southeastern Dakota, and Iowa, attended by rainy weather and brisk winds in the Mississippi and Missouri valleys, and by northerly winds and snow to the westward of the centre. During the 9th the course changed to the southeast and the disturbance passed rapidly over Tennessee and the Ohio valley toward the coast; on the 10th the disturbance was in North Carolina, whence it passed into the Atlantic and merged with low area ix., which was then central off the coast. Strong northerly winds with freezing temperatures and snow prevailed over the region north of the fortieth parallel as the disturbance passed to the coast, and disastrous tornadoes occurred in Kansas on the 6th.

V.—This disturbance appeared in California on the 9th; it moved southeastward during the 10th, crossed the Rocky mountains and appeared in northwestern Texas on the 11th; during this day it extended as a trough of low pressures from Montana southeastward to the Texas coast, while an area of high pressures occupied the country from Dakota southeastward to Mississippi and thence eastward to the Atlantic coast. On the 12th the barometric minima were reported from southern Texas, and during that day the disturbance passed off the Texas coast into the Gulf of Mexico; it moved eastward over the Gulf during the 13th and 14th, and apparently filled in during the last-mentioned date when near the western coast of Florida. During its passage across the Gulf the depression caused rainy weather and severe local storms in the Gulf states, and heavy "northers" on the Texas coast.

VI.—This disturbance appeared in Montana on the 15th, where a rapid decrease of pressure had taken place during the preceding twenty-four hours, the barometer having fallen from 30.20 (767.1) on the 14th to 29.8 (756.9) at the morning observation of the 15th. The depression moved south-southeastward during that date, and on the 16th it was shown in Utah, Colorado, and Arizona, with rain at Salt Lake City and heavy snow at Pioche, Nevada. During the 16th it moved eastward into Kansas, and thence northeastward over Nebraska to southwestern Iowa, where it was central on the 18th, its passage being marked by the occurrence of disastrous tornadoes in Missouri, Illinois, and Iowa, while generally rainy weather and brisk southerly winds prevailed over the central districts from the Gulf to the lake region. On the 19th the disturbance was central with increased energy in Wisconsin, the pressure near the centre having fallen to 29.2 (741.7). Heavy rains and high winds now prevailed over the lake districts and eastward to the Saint Lawrence river. By the morning of the 20th the isobar for 29.2 (741.7) extended from Georgian Bay eastward to northern New England and the province of Quebec. Moderate westerly gales and snow prevailed in the lower lake region, with unsettled, rainy weather in the districts to the eastward. During the 20th the depression moved eastward to the Bay of Fundy, where it was central on the 21st; it then passed northeastward over Nova Scotia, attended by strong gales on the Banks of Newfoundland and off the New England coast. On the 22d the centre was near Cape Breton Island, where the pressure was 29.25 (742.9); moving slowly eastward with no

material change of pressure at the centre it was shown off the southern coast of Newfoundland on the 23d. As the disturbance moved into the Atlantic an increase of pressure appears to have occurred, the barometric minima on the 24th being about 29.7 (754.4) on the eastern edge of the Banks, and by the following day the depression had disappeared from the chart.

VII.—On the morning of the 18th, the barometer at Sitka, Alaska, had fallen .7 inch, and by the following day, the decrease of pressure had extended to the northern boundary of the United States. On the 20th the circulation of the winds showed the presence of an area of low pressures in eastern Montana and Wyoming and in western Dakota, where the pressure was 29.6 (751.8); on the 28th the barometric minimum was in Kansas; northerly winds prevailed at stations on the eastern slope of the Rocky mountains, while southerly, southeasterly and easterly winds were reported at stations to the eastward and northward of the low area. During the 21st the depression moved slowly east-southeastward to southern Missouri where it was central on the 22d, causing rainy weather and strong easterly winds in the upper lake region and in the Mississippi valley; on the 23d the disturbance occupied the country east of the Mississippi river and south of the fortieth parallel, the lowest barometric readings being reported in Kentucky; during the day the depression passed off the Carolina coast with increasing pressure and finally dissipated during the 24th. This disturbance, like its predecessors, was accompanied by severe tornadoes in its eastern quadrants.

VIII.—This depression appeared on the north Pacific coast on the 24th, and moved rapidly southeastward to Colorado, where it was central on the 25th, the isobar for 29.8 (756.9) being elliptical in form, and extending from Montana southeastward to Kansas; on the following day, the depression, which had become contracted, occupied Illinois, and caused high easterly winds in the lake region. During the 26th, it moved eastward and passed into the Atlantic, the centre being shown near the coast of Delaware on the 27th; it then passed northeastward along the coast, and on the 28th, it was south of Nova Scotia, attended by moderate westerly gales near the fortieth parallel, and brisk to high northeasterly winds and occasional gales over Nova Scotia. During the 29th, it passed north-northeastward, and disappeared over the Gulf of Saint Lawrence.

The following descriptions refer to the depressions traced over the Atlantic ocean and in Europe:

IX.—This disturbance was indicated in about N. 37°, W. 68° on the morning of the 10th, by the report of the ship "Lake Erie"; that vessel in N. 38°, W. 69°, had barometer 29.47 (748.5), a fall of .43 inch, wind ene., force 6, heavy rain; and by the following day, in N. 38° 30′, W. 68° 30′, the barometer had risen to 29.56 (751.6), wind nw., force 3; vessels to the southward and westward of the "Lake Erie," had northerly and westerly winds of moderate force, while those on the fortieth parallel and to the eastward, had easterly and southeasterly winds of force 3 to 5. During the 10th, the disturbance moved northeastward, and on the 11th it was central in N. 41°, W. 63°, with the winds remaining moderate in force in all quadrants; during the 11th, its movement was northerly, and passing over the northern part of Nova Scotia, it entered the Gulf of Saint Lawrence, where it was central on the 12th, with the pressure about 29.5 (749.3) near the centre. After the 12th its movement was to the northwest and by the 13th, the centre of disturbance was over the mouth of the Saint Lawrence river, barometer at Father Point, Quebec, reading 29.21 (741.9), wind sw., 25 miles an hour, heavy snow; the disturbance then recurved and again crossed the Gulf, reaching Newfoundland on the 14th, causing moderate northwesterly gales over the Maritime Provinces and the Gulf of Saint Lawrence. This disturbance crossed the Atlantic and entered the continent of Europe, and is hereafter described as low area xiv.

X.—This was probably a continuation of the depression charted as low area x. on the chart for the preceding month, (March); it passed northeasward over Labrador at the close of that month, and was apparently to the westward of Godthaab, Greenland, on April 1st, the barometer at that station having fallen to 29.35 (745.2), wind s., force 6. By the following day the barometer had risen to 29.93 (760.2), and the depression had disappeared from the chart.

XI.—This was a continuation of the disturbance traced over Canada and northern New England as low area i. After reaching the Atlantic on the 2d the depression moved eastward, and on the 3d it was central near N. 43°, W. 53°, in which region the pressure was 29.56 (750.8), with moderate northerly gales to the westward of the sixtieth meridian and brisk southerly and southwesterly gales to the eastward of W. 50°. During the day the depression moved northeastward and was shown near N. 48°, W. 40° on the 4th, the lowest reported pressure being 29.31 (744.5); moderate to strong northwesterly gales prevailed during the day over the region west of 43° west longitude, with equally strong southerly gales to the eastward of 40° W. Continuing its northeasterly course, the disturbance reached N. 53°, W. 30°, on the 5th; at the same time another depression was to the northeastward of Newfoundland, and subsidiary disturbances existed over the ocean between N. 40° and 50° and W. 60° and W. 40°. Under the combined influence of these disturbances, strong variable winds to gales prevailed over the Atlantic ocean. On the morning of the 6th the depression had been forced to the southward and westward, while the area of high pressure which occupied northern Europe had spread over the ocean in a southwesterly direction. From the 7th to the 10th this depression remained, with slow and erratic movements and steadily decreasing pressure, over the region bounded by the parallels of 45° and 50° north latitude and the meridians of 30° and 42° west longitude, and during this time moderate to strong gales prevailed over the Atlantic. By the morning of the 10th the pressure at the centre of this disturbance had decreased to 29.1 (739.1) and very heavy gales were reported, especially in the southwest quadrant of the depression. During the 10th the storm-centre resumed its notheasterly movement, and by the 11th it was shown near N. 49°, W. 32°, the central pressure remaining unchanged and the winds increasing in force in all quadrants. On the 12th the centre was in N. 49°, W. 17°, and the disturbance had now extended its influence to the European coasts, while the gales to the westward of the thirtieth meridian had somewhat moderated in force. During the 12th it moved slowly northeastward with decreasing pressure, and by the 13th it was central off the west coast of Ireland, with the pressure at the centre about 28.75 (730.2). Strong south to southeast winds prevailed over France and the British Isles, with easterly gales on the fifty-fifth parallel and to the northward; and rainy, unsettled weather prevailed generally over western Europe. On the 14th the storm-centre was in Ireland, while a secondary disturbance was central in England, but the pressure had increased to 29.0 (736.6). Southwesterly gales prevailed over the Channel, but elsewhere the winds did not exceed the force of a strong breeze. During the 14th the disturbance moved over the North Sea, causing snow in the northern, and rainy, unsettled weather in nearly all districts. On the 15th the centre was shown over northern Denmark and the Skager Rack, the lowest reported pressure being 29.05 (737.9). It then moved northeastward over Sweden, and on the 16th was central, with slightly increased pressure, over the Gulf of Bothnia, causing moderate to strong gales in that region and over the Baltic, with rain or snow to the southwestward of the centre. On the 17th the disturbance occupied Finland, but the pressure had increased to 29.3 (744.2); high winds to gales and rain or snow accompanied the depression during that date, and by the 18th it had disappeared to the northeastward of the White Sea.

XII.—This was a continuation of the disturbance which passed off the coast of Labrador on the 4th, and before described as low area ii. On the 5th the depression was to the southward of Greenland, and by the following day it had passed into Greenland, causing the barometer at Godthaab to

fall to 29.41 (747.0), with the wind shifting from e. to n. On the 7th the disturbance disappeared from the chart.

XIII.—This was a continuation of the depression before described as low area iii. It passed into the Atlantic from the Maritime Provinces during the 7th, and on the following day the centre was indicated near N. 42°, W. 63°; it caused moderate to strong gales, especially in the southwest quadrants, and showery weather in the Maritime Provinces. During the 8th, it moved eastward, followed by northwesterly gales to the westward, and during the 9th it apparently become merged in low area xi., which occupied mid-ocean.

XIV.—This is a continuation of low area ix. After leaving Newfoundland it moved rapidly eastward, and on the 15th it was shown near N. 52°, W. 32°, the pressure at the centre being below 29.6 (751.8). Moderate gradients existed over the ocean, so that the winds during the 15th, did not exceed the force of 5–6; the disturbance moved east-northeastward during the 15th, and by the 16th, the pressure had decreased to 29.35 (745.5), in N. 53°, W. 15°. On the 17th, the depression occupied the British Isles, the minimum pressure, 29.27 (743.4), being in western Scotland, while unsettled weather, with rain or snow, was general in the western districts. On the 18th, the disturbance, having crossed the North Sea, was central off the coast of Germany, causing a continuance of showery and unsettled weather in western and central Europe. By the 19th, the depression had passed northeastward with increasing pressure, to southern Scandinavia, where it apparently dissipated.

XV.—This disturbance developed on the 16th near N. 36°, W. 60°, the lowest reported pressure in that region being 29.65 (753.1). The pressure decreased rapidly as the disturbance moved northeastward, and by the following day the storm-centre was in N. 44°, W. 44°, with the pressure at 28.6 (726.4). Captain E. Pilcher, commanding the ship "Lake Erie," in about N. 40° 40′, W. 52° 06′, reported on the 16th, at 10.30 p. m., Greenwich time: "Having experienced a moderate gale from ese. to s. all day with incessant rain; water tolerably smooth and barometer falling; the wind fell light towards sunset and veering into nw. suddenly blew a hurricane for about four hours, with tremendous sea from e. and n., lowest barometer 28.79 (731.3)." The following reports indicate the severity of the storm during the 17th: s. s. "Parthia," in N. 43° 40′, W. 43° 47′, barometer 28.54 (724.9), wind s., force 10, raining; s. s. "Rhynland," in N. 43° 44′, W. 42° 45′, barometer 28.58 (725.9), wind s., force 9, stormy; s. s. "Illinois," in N. 43° 06′, W. 43° 30′, barometer 28.69 (728.7), wind w., force 8, clear; s. s. "Celtic," in N. 45° 24′, W. 41° 11′, barometer 28.68 (728.5), wind s., force 6, misty; s. s. "Hermann," in N. 42° 23′, W. 44° 20′, barometer 28.77 (730.7), wind w., force 9, rainy. All vessels between W. 35° and 40° and N. 40° and 45°, had southerly gales of force 10, while those between W. 45° and 50° and the above-mentioned parallels of latitude, experienced northerly and northwesterly gales of force 8 to 9. During the 17th the disturbance moved northeastward, without change in the pressure at the centre, and accompanied by violent southerly and westerly gales. On the 18th the storm-centre was in N. 50°, W. 33°, the minimum barometric reading in that neighborhood being 28.7 (729.0). On the 19th the region of least pressure was shown near N. 56°, W. 27°, but the barometer had begun to rise and now read 29.1 (739.1), although the violent southerly to westerly gales continued without abatement. On the 20th the pressure had increased to 29.4 (756.7), and by the 21st this disturbance had moved northeastward and was central between Iceland and the Färöe Islands, while a subsidiary disturbance had formed near N. 50°, W. 30°; the latter moved eastward and developed great energy as it approached the British coasts, while the primary disturbance to the northward gradually decreased in intensity, and by the 22d it could not be traced as a separate depression.

XVI.—This was a slight depression which developed near the coast of the United States, south of Hatteras, during the 29th, and at the close of the month it was apparently central off the New England coast, with the pressure at the centre below 29.9 (759.4).

XVII.—This was a continuation of the disturbance traced as low area xxx. on the chart for March; it moved from the southern coast of Scandinavia southwestward over the North Sea at the close of that month, and on April 1 it was central to the southwestward of the British Isles. From that date until the 4th the depression lingered near the British coasts, with the pressure varying from 29.45 (748.0) on the 1st to 29.9 (759.4) on the 4th, and causing showery weather and fresh to strong winds over the British Isles.

XVIII.—This depression appeared in the Ural region on the 3d, the barometer at Ekaterinburg falling from 30.13 (765.3) on the 2d to 29.7 (754.4) on the 3d. By the 4th the pressure had decreased to 29.31 (744.4). On the 5th the depression occupied the province of Tomsk, Siberia; on the following day it was shown near Yeniseisk, whence it passed beyond the limits of the stations of observation.

XIX.—This disturbance appeared off the western coast of Spain on the 4th; it moved over the southern part of the Bay of Biscay during that day and entered southern France on the 5th. Passing eastward, attended by rainy weather in the Iberian peninsula and southern France, it reached the Mediterranean on the 6th, when it apparently dissipated.

XX.—An area of low pressures, within which the barometer ranged from 29.75 (755.6) to 29.95 (760.7), occupied the Italian peninsula and the eastern part of the Mediterranean from the 5th to the 10th, and during this period showery weather prevailed in those districts and in Algeria. During the 10th, the disturbance began to move eastward and on the 11th, it was shown over the Adriatic; by the following day it was in Austro-Hungary, attended by showery weather but increasing pressure and during the day it apparently filled in.

XXI.—This was a depression which appeared in northern Scandinavia on the 9th; it passed southeastward and on the 10th its centre was to the northeastward of Archangel, Russia, the barometer at that station reading 29.65 (753.1) wind nw. On the 11th the centre of disturbance was shown in the Ural region, the barometer at Ekaterinburg reading 29.76 (755.9), wind sw; during the 12th the depression apparently filled in. This disturbance did not cause any unusual weather conditions during its passage.

XXII.—On the 11th a disturbance developed over the western part of the Black Sea, causing fresh to strong winds in that region, with pressure about 29.55 (750.6). It passed east-northeastward, attended by strong northeasterly winds to gales along the northern shore of the Black Sea, and by the 12th it was central in Caucasia, where the barometer read 29.45 (748.0), with moderate northerly and northwesterly winds over the eastern part of the Black Sea. On the 13th the low area was to the southwestward of Akmolinsk, Siberia; by the following day it had passed to the northeastward and occupied the region between that station and Barnaul, with the pressure at the centre less than 29.35 (745.5). During the 14th the depression probably filled in.

XXIII.—This was a slight depression which developed in southern Scandinavia on the 11th, its centre being inclosed by the isobar for 29.8 (756.9); on the 12th it occupied the Baltic, causing moderate to strong northerly winds in Scandinavia, with rain or snow in the districts contiguous to the Baltic. On the 13th the storm-centre was over the Gulf of Finland, the barometer at Saint Petersburg reading 29.37 (746.0), wind ssw., light snow; during the day the disturbance appears to have moved in a south-southeasterly course, and on the 14th it was shown near Moscow, where the barometer read 29.41 (747.0); during that day the pressure increased and the depression disappeared from the chart.

XXIV.—This depression appeared in the extreme northern part of Scandinavia on the 12th, when the barometer read 29.58 (751.3) at stations in that region. It passed southeastward with decreasing pressure, and on the 13th it was to the

northeastward of the White Sea region; during the day it passed beyond the range of observations.

XXV.—This disturbance appeared in western France on the 15th, having approached the coasts from the Bay of Biscay; it was attended by rainy weather and strong northeasterly winds over the English channel. It passed in a southeasterly course over the central districts of France, and on the 16th, the centre of disturbance was over the Gulf of Genoa, where the pressure was about 29.65 (753.1); on the 17th the region of barometric minima was in northern Italy, but the pressure was increasing, and during the day the depression dissipated; moderate to heavy rains attended this disturbance throughout its course.

XXVI.—This depression appeared to the westward of the Ural mountains on the 19th, on which date the barometer at Ekaterinburg fell to 29.59 (751.6), wind ssw., rainy weather. On the following day the disturbance was in western Siberia, and by the 21st it had passed northeastward beyond the limits of the stations of observation.

XXVII.—This disturbance appeared off the Norwegian coast on the 20th, and was probably an off-shoot from low area xv; its centre on the 20th was enclosed by the isobar for 29.4 (746.7). On the 21st the area of low pressure occupied the head of the Gulf of Bothnia, being attended by moderate northwesterly gales along the coast of Sweden, and rain or snow in most places in Scandinavia and the Russian Baltic provinces. By the following day the disturbance had passed eastward over the White Sea districts and disappeared.

XXVIII.—This was a subsidiary disturbance which appeared near N. 50°, W. 30° when low area xv. was central near the Färöe Islands; the depression moved eastward with increasing energy and decreasing pressure during the 21st, and by the 22d it was central to the southwestward of Ireland, its centre being enclosed by the the isobar for 29.2 (741.7). Strong northerly gales were encountered by vessels between the meridians of 13° and 20° west longitude, and from N. 48° to 55°, with moderate to strong southerly winds to the eastward, and moderate westerly and southwesterly gales in the Bay of Biscay. On the 23d the centre of disturbance, having moved over the Irish Sea, occupied the northwestern part of England and was attended by moderate winds at English stations, but to the eastward and southward they attained the force of a moderate gale. During the 24th and 25th the low area remained over the northern part of the North Sea, with pressure near the centre about 29.0 (736.6), and causing rainy weather over the British Isles, western Europe, and Scandinavia, with strong winds to gales along the shores of the North Sea. During the last-mentioned day the disturbance appears to have moved southward, and was shown on the 26th, to the westward of the Danish peninsula, the pressure remaining about 29.0 (736.6); moderate to strong gales occurred in Denmark, Germany, and over the North Sea, and rainy weather continued in most districts. By the 27th, the course had changed to the northeastward, and the depression moved to Scandinavia, the barometer having risen to 29.35 (745.5); as the disturbance advanced with increasing pressure at the centre, the weather became fair in the districts to the westward of the centre, but rain continued to fall over the Gulf of Bothnia, while the wind moderated generally in all districts. During the 27th, the depression appears to have filled in.

XXIX.—This was a slight disturbance which appeared near Moscow on the 23d, its centre being enclosed by the isobar for 29.8 (756.9). By the following day the depression had filled in.

XXX.—This depression appeared near N. 53°, W. 30° on the 24th, with pressure at the centre about 29.65 (753.1), and attended by strong southwesterly gales in its southeastern quadrant. By the 25th the disturbance had reached the Irish coast. The winds over the region between W. 10° and 30° had now shifted to west and northwest, and blew with the force of a moderate or strong gale; in the absence of steep barometric gradients to the eastward the wind remained moderate in force. During the 25th the disturbance apparently passed over the British Isles and merged with low area xxviii, which occupied the North Sea on the 26th.

XXXI.—This disturbance appeared in northern Italy on the 27th, on which date the pressure in that district was 29.45 (748.0); rainy weather with strong northwesterly winds to gales prevailed over southeastern France with strong southerly and southeasterly winds in the Italian peninsula. On the 28th, the disturbance was over the Adriatic, with the pressure slightly above that of the preceding day; the winds in the southern part of Italy and over the Mediterranean had shifted to westerly and blew strongly, and the rain area extended over the Adriatic and to the western provinces of Austro-Hungary. On the 29th the disturbance was central in eastern Hungary, where the barometer read 29.55 (750.6); during the day the pressure began to increase and the depression filled in.

XXXII.—This disturbance appeared off the northwestern coast of Ireland on the 27th; it moved southeastward with decreasing pressure and by the following day it occupied the Irish Sea, and the greater part of England, the pressure near the centre of disturbance being about 29.1 (739.1). During the 29th the disturbance passed to the North Sea, and recurved to the northeastward, and was shown near the northeastern coast of Scotland; during the day it probably became merged in low area xxxiii., which had advanced over the British Isles from the Atlantic.

XXXIII.—This was a disturbance which appeared on the 28th near N. 47° W. 27°, in which region the barometer read 29.55 (750.6). During the day the depression moved eastward and on the 29th the area of low pressures occupied the British Isles with the minimum readings in Wales. Rainy weather and moderate to strong northerly and westerly gales prevailed over the region from the Saint George's Channel westward to the twelfth meridian, with strong westerly and southwesterly gales over the English Channel and along the French coast. On the 29th the disturbance moved over the North Sea, and at the close of the month it was central off the southern coast of Scandinavia, with the pressure below 29.15 (740.4). Moderate to strong southwesterly gales and showery weather prevailed over the North Sea and along the European coast from Belgium to Denmark.

The following are descriptions of depressions traced in eastern Asia:

XXXIV.—This disturbance apparently developed over the Sea of Japan on the 3d, the pressure having decreased about .3 inch over that region, and the adjacent land areas on that date. The centre of disturbance apparently moved north-northeastward along the western coast of Niphon, and on the 4th, the barometric minima were in the northern part of that island, and ranged from 29.4 (746.7), to 29.55 (750.6); during its passage northward, unsettled, showery weather prevailed in Japan. The disturbance moved northward to the Sea of Okhotsk, where it apparently remained until the 8th, when it gradually disappeared; during the period from the 5th to 8th, the barometer at Nikolaevsk, on the Amoor, varied from 29.39 (746.5), to 29.43 (747.5).

XXXV.—This was a well-defined depression which appeared in southern Japan on the 12th; it was preceded by rainy weather during the 11th, and on the 12th the barometer fell to 29.65 (753.1); rain continued throughout Japan, and high winds, ranging from twenty-five to forty-five miles an hour, occurred at numerous stations. By the 13th the region of least pressure was transferred to the northern districts, where the southwesterly winds increased in force while the westerly and northwesterly winds in the southern districts moderated. On the 14th the depression passed into the Pacific and beyond the field of observation.

XXXVI.—This was a depression which probably developed in northeastern China during the 20th and 21st. On the 22d it was shown over the northern part of the Sea of Japan, its centre being enclosed by the isobar for 29.8 (756.9); on the following day the pressure increased to 30.0 (762.0) and the depression disappeared.

XXXVII.—This depression appeared to the westward of Zi-Ka-Wei on the 26th, on which date the barometer at that station read 29.65, (753.1) wind s. raining; being a fall of .29 inch during the preceding twenty-four hours. On the 27th, the depression occupied the Yellow Sea and the peninsula of Corea, the pressure ranging from 29.55 (750.6) to 29.6 (751.8) with rainy weather in southern Japan. On the 28th, the disturbance, having moved northeastward, was shown near Vladivostock, where the barometer read 29.24 (742.7). On the following day the depression appears to have recurved and moved southwestward, as shown by the shift of the wind at Vladivostock; at the close of the month, it was shown as an extensive depression stretching from northeastern China to the Sea of Okhotsk.

GENERAL REMARKS.

DAILY BULLETIN.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in meters per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometers per hour, to meters per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations.

On February 1, 1883, the following change was made in publishing marine data in the "Daily International Bulletin":

All marine reports are classified as to districts, which are designated as follows: District No. 1, North Atlantic; District No. 2, South Atlantic, &c., under which headings the respective reports are printed.

BOUNDARIES OF DISTRICTS.

District No. 1 comprises the Atlantic ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° E., westward to 100° W., of Greenwich.

District No. 2 comprises the Atlantic ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 20° E., westward to 70° W., of Greenwich.

District No. 3 comprises the Pacific ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° W., westward to 100° E., of Greenwich.

District No. 4 comprises the Pacific ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 70° W., westward to 145° E., of Greenwich.

District No. 5 comprises the Indian ocean, its arms and tributaries, from the Asiatic continent southward to the pole, and in the Antarctic from 20° E., eastward to 145° E., of Greenwich.

The following remarks relate to the individual peculiarities in the *methods* of recording, and the *times* of taking, the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of Brig. General Béziat, Commandant Supérieur du Génie in Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour. Adelaide, furnished by co-operation of Charles Todd, C. M. G., F. R. A. S. The observations are taken at 9 p. m., local time.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemberg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind-direction is given to 32 points and weather by the Beaufort notation. At Bradford, no observations are taken on Sunday, except the rainfall, and in the monthly summary the letter designating a certain number of days missing, applies to all the data except rainfall.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army. At St. John's, N. F., the barometer appears read about .10 inch too high, which correction has been applied from August 1st, 1883. On October 1st elevation of barometer changes to 816 feet at London and to 200 feet at Ottawa.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Saint Francis Lighthouse, the original gives barometer reduced to freezing, but not to sea-level. The kind of clouds is given, but no distinction is made between upper and lower. Weather in general terms.

CHILIAN SERIES (by authority of the Secretary of Public Instruction, furnished by co-operation of Francisco Vidal Gormáz, President of the Central Meteorological Office at Santiago).—Observations are taken mostly at lighthouses on the coast; the originals give barometer as read off; temperature in Centigrade; humidity is not given but is computed at this office from the hygrometrical observations.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation.

DANISH SERIES (furnished by co-operation of Captain N. Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimeters reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted. At Jacobshavn observations are taken at 8 a. m., local time.

EGYPTIAN SERIES (Furnished by the co-operation of Albert Ismalun, Director of the Laboratoire Khédivial du Caire).—Original gives barometer reduced to zero, but not to sea-level, temperature in Centigrade. The velocity is the mean for past 24 hours. Rainfall in millimetres.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Montlouis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Montlouis and Perpignan.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only, and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of

—0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals, where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchini, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by the co-operation of the Geographical Bureau, Department of the Interior, through I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (furnished by co-operation of the respective observers).—The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys-Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred. At Batavia the elevation is stated to be "a few meters."

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiania).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, Director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in meters per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Astrakhan, Ashurada and Baku, the barometer-cistern is below sea-level. At Kasalinsk, the barometer appears to have a large error.

SPANISH SERIES (furnished by co-operation of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 4 p. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of the Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of F. Nimr, B. A., Director of the Lee Observatory at Beirut).—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in meters per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms. At Samakov, the barometer is reduced to freezing, but not to sea-level; temperature in Fahrenheit. The kind of clouds is given, also the distinction between upper and lower.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Officer, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota the barometer is corrected for temperature only; at Puerto Berrio, is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind-direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas. At Rivas the humidity is obtained by readings from Saussure's hygrometer.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind-direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of the sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

SWEDISH NAVAL SERIES (furnished by co-operation of E. Malmberg, Director of the Nautical Meteorological Bureau at Stockholm).—The originals give the barometer as read off. The movement of the air is indicated by force on a scale of 0 to 12, and the direction is corrected for magnetic variation at this office. The humidity is not given, but is computed from the hygrometrical observations. The rainfall is omitted. The height of the sea-swell is given on a scale of 0 to 9 and the weather by the Beaufort notation.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operations of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

INTERNATIONAL CHARTS ACCOMPANYING DAILY BULLETIN AND MONTHLY SUMMARY

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

International chart iii. shows tracks of centres of low barometer. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date.

In the above charts broken lines indicate that the lines so drawn are doubtful. Arrows show direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
	1, 2	0 to 9	0 to 4
	3, 4	9.1 to 22.5	4.1 to 10.1
	5, 6	22.6 to 40.5	10.1 to 18.1
	7, 8	40.6 to 67.5	18.1 to 30.2
	9, 10	67.6 up.	30.2 and over.

MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS.

The position of stations (latitude and longitude) are obtained from Keith Johnson's "Index Geographicus," except where more exact information is furnished. The elevation of stations is obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the original, is carefully computed at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather maps.

ERRATA.

DAILY BULLETIN, October 11, 1883, page 7, district No. 1, bk. "Ibis," for longitude W. 74° 40′, read 74° 00′.

15th, page 2, make observer at Cape Town, Cape Colony, Capt. R. Gardner Warton, and move I. Garfelt and names above up one line, so that I. Garfelt will be opposite Cape St. Francis Light-house and Miss Grace Pope opposite SW. Point, Anticosta; same correction on 16th, 18th, 19th, 20th, 21st.

Page 2, Chilian, Valparaiso, from October 1st to 12th, inclusive, reduced barometer reads 0.05 inches or 1.3 mm. too high.
