NOTE.—The above observations, taken at 7 a. m., Washington time, were received too late for publication in the DAILY BULLETIN, and are given here in full; for continuation of the same, see DAILY BULLETIN.

REVIEW.

INTERNATIONAL METEOROLOGY FOR JANUARY, 1884.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade; wind-force by scale of* 0–10.]

The following description refers to chart ii. for the month of January, 1884, issued with this SUMMARY. This chart continues the series of international charts begun in January, 1877, and exhibits the mean pressure, mean temperature, and prevailing wind-direction over the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich, mean time.

The area of least mean pressure is indicated by the isobar for 29.3 (744.2) and occupies the extreme northern part of Scandinavia, extending thence westward over the Arctic ocean to the longitude of Greenwich. To the westward of the area of barometric minima the mean pressure increases slowly, the isobar for 29.6 (751.8) enclosing Greenland and the ocean southward to the fifty-fifth parallel; this isobar runs eastward along the parallel just mentioned to southern Scandinavia, and thence northeastward over Finland and northwestern Russia to the mouth of the Petchora. The mean pressure increases rapidly over the regions south of 55° north, both over the Atlantic and the European continent. In the North American continent the mean pressure is least over Labrador and Newfoundland, where it ranges from 29.9 (759.4) to 30.0 (762.0); over the lake region, Canada, and the Gulf of Saint Lawrence it ranges from 30.0 (762.0) to 30.1 (764.5). In Asia the mean pressure is least over northwestern Siberia, southern Hindostan, and eastern Japan.

Six distinct areas of barometric maxima are shown on the chart; the first of these is the area of maximum pressure which occupies eastern Siberia, the highest mean being 30.57 (776.5) at Nertschinsk. In the Chinese empire the mean pressure varies from 30.5 (774.7) in the northern districts to 30.15 (765.8) at Amoy, Hong-Kong, and stations on the shores of the China Sea. The next in importance is the high area which occupies the European continent south of the fiftieth parallel and part of northern Africa; the centre of this area appears in the Iberian peninsula, where the mean pressure is 30.4 (772.1). The isobar for 30.3 (769.6) encloses the western part of the Mediterranean, Algeria, Morocco, and the Madeira islands, and thence northeastward over the Bay of Biscay to western and central France, while that for 30.2 (767.1) embraces the Italian peninsula, Austria, the northern districts of France and the Atlantic westward to the Azores. The third area of barometric maxima occupies the Atlantic ocean and is indicated by the isobar for 30.2 (767.1) and stretches from the West Indies eastward along the parallel of 24° north latitude, to about the thirty-fifth meridian west of Greenwich and northward to 35° N., the pressure gradually decreasing in a southwesterly direction from 35° to 30° N. The remaining areas of high pressure (three) are shown in the United States; each of these is enclosed by the isobar for 30.3 (769.6); one covers Louisiana, Arkansas, and the greater part of Texas; one the Missouri valley, and the other the territories of Wyoming, Montana, Idaho, and Utah. In all other parts of the United States the mean pressure ranges from 30.1 (764.5) to 30.29 (769.4).

Compared with the chart for the preceding month, (December, 1883) there has been a general increase of pressure over the United States, the increase being greatest over that part of the country from the Rio Grande valley northward to Dakota. At Cape Mendocino, California; Roseburg, Oregon; Deadwood, Dakota, and Fort Saint Michael's, Alaska, there has been a slight decrease of pressure. On the summit of Mount Washington, New Hampshire, the mean pressure was .05 less than in the preceding month. In Canada there has been an increase of pressure. In Europe, there has been an increase of pressure in France, Germany, Austria and the southern peninsulas, the greatest increase occurring over Italy and Spain. Over the northern peninsulas, the British Isles, and Russia, the pressure has decreased, the greatest departure being in Scandinavia, where it averaged .15 inch. In Algeria there was an increase of about .18 inch. In Asia there has been a general increase except in Hindostan where the pressure was about .03 less than in December. Over the Atlantic ocean south of 50° N., the pressure has increased; north of that parallel there has been a decrease.

Compared with the corresponding month of previous years, the mean atmospheric pressure in January, 1884, was slightly below normal in the north Pacific coast region, New England, and the middle Atlantic States; elsewhere it was above normal, the departures being greatest in the Rio Grande valley. In Canada the mean pressure was above the normal in eastern Quebec and the Maritime Provinces and normal or below in other parts of the Dominion. In Europe the mean pressure was above the normal in the western, (including the British Isles) and southern districts of the continent, and was much below the normal in Russia and in the Scandinavian and Danish peninsulas.

The following table gives the mean pressure and mean temperature, with corresponding departures for January, 1884, in the several countries of the northern hemisphere, compared with the means as determined from observations taken during the last seven years:

Countries.	Mean pressure.			Mean temperature.		
	Jan. mean of 7 (1877–'83) years.	Jan., 1884.	Departure.	Jan. mean of 7 (1877–'83) years.	Jan., 1884.	Departure.
				°	°	°
Algeria	30.18	30.32	+ 0.14	56.9	55.5	− 1.4
Austria	30.18	30.18	normal	33.0	37.4	+ 4.4
British Isles	30.01	30.03	+ 0.02	40.7	45.8	+ 5.1
Denmark	30.04	29.80	− 0.24	32.1	38.7	+ 6.6

* Means for six years only.

In the United States the mean temperature of the air was slightly above the normal in California, on the eastern slope of the Rocky mountains, except the southern district, and in Utah; in all other districts of the United States it was much below the normal, the greatest departures (6° to 8°) occurring in the lake region, the Gulf states and in the Ohio valley and Tennessee. In Canada the mean temperature was below the average, the departures being greatest in the province of Ontario. Throughout the continent of Europe the mean temperature of the air was considerably above the normal, the means for January, 1884, ranking amongst the highest on record in the British Isles, France and Germany. In British India the temperature was about 1°.8 below the six year mean. In Siberia it was above the normal.

The following are some of the extreme mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
			York Factory, B. A.	−30.6	−34.8
Freetown, Africa	86.7	30.4	Fort Chimo, B. A	−23.5	−30.8
Bridgetown, Barbadoes	80.7	27.1	Nertschinsk, Siberia	−15.5	−26.4
Colon, U. S. Colombia, S. A.	78.4	25.8	Upernavik, Greenland	−14.8	−26.0
Puerto Berrio, U.S.Colombia, S.A	78.3	25.7	Jacobshavn, Greenland	−14.8	−26.0
Paramaribo, Dutch Guiana, S. A.	76.9	24.9	Nikolaevsk on the Amoor, Asia	−11.0	−23.9

Over that part of the United States lying between W. 90° and the Atlantic and south of the thirty-fifth meridian, the prevailing winds were mostly from northwest and north. In Canada, and in the United States, north of 35° N. and east of 90° W., they were mostly southwesterly and westerly. In other parts of the country they were mostly northerly and northwesterly. Over the north Atlantic ocean, north of 30° and from the American, eastward to the European coasts, the winds were westerly and southwesterly; south of 30° N., they were easterly. In Europe the winds were from southwest to west and northwest; in Japan they were northerly and westerly.

The precipitation during January, 1884, was excessive in the Atlantic seaboard states, Tennessee, and the lake region; elsewhere it was less than the average, the deficiencies being greatest on the Pacific coast. In Canada it was less than the average. In the British Isles and France the precipitation was deficient; in other parts of western and central Europe it was above the average.

STORM-TRACK CHART FOR JANUARY, 1884.

Chart iii. for January, 1884, shows the paths of the depressions that have appeared in the northern hemisphere during that month. The data are charted for each day of the month on the maps accompanying each issue of the "International Bulletin," and from these charts, together with abstracts of ships' logs and other miscellaneous data received at this office, are traced the movements of the centres of barometric minima. Chart iii. continues the series of international charts begun in November, 1877.

The paths of forty-two depressions are shown on the chart for January, 1884, and are distributed geographically as follows: Thirteen are traced in the North American continent; of this number, four entered the United States from the Northwest Territories of British America, five originated in Texas or the Gulf states, one appeared off the California coast, one in Texas, one in the lake region, and one in the Hudson Bay district. The depressions which developed in the northwestern part of the continent moved first southeastward to the lake region and then eastward over northern Canada to the Gulf of Saint Lawrence, while those which originated in the southwest moved eastward over the Gulf of Mexico to the east Gulf states, and thence northeastward, passing into the Atlantic ocean from the Carolina and Virginia coasts. The disturbance charted as ii. moved from Utah southeastward to the Gulf of Mexico, and thence northeastward over the Atlantic seaboard states and Canada to Labrador.

Eleven depressions are traced over the Atlantic ocean; of this number, five are continuations of depressions which entered the Atlantic from the North American coast, one occupied the neighborhood of Bermuda, two appeared in mid-ocean, one of these, number xiv., being a continuation of a disturbance which occupied the ocean at the close of December, 1883, two depressions originated in the region north of the sixty-fifth parallel, and one appeared off the Irish coast at the close of the month. The general direction of movement of the above depressions was to the northeastward, those which entered the Atlantic from the United States having passed off the coast at unusually low latitudes, while only one well-defined depression passed into the Atlantic from the Gulf of Saint Lawrence or Maritime Provinces.

Of the ten depressions charted in Europe, five first appeared near the coasts of the British Isles and Scandinavia, three developed in the northern districts, near or north of the fifty-eighth parallel of latitude, while the remaining disturbances are shown over the Mediterranean districts. With one or two exceptions, noted below, the European storms have moved from the Scandinavian peninsula by a southeasterly course to central and southern Russia, two of them continuing their easterly movement into Asia. The exceptions referred to were numbers xxxi. and xxxii.; the former passed over northern Scotland and the North Sea, finally disappearing in the Baltic, while the latter disturbance, which exhibited great violence, moved from the Irish coast in a northeasterly direction, along the Norwegian coast.

Five depressions are charted in Japan, their general direction of movement being to the northeastward, and three are shown over the Pacific ocean; one of these appeared over the Aleutian archipelago; one near Kamtchatka, and one off the eastern coast of Japan. The course of this latter was somewhat unusual; it remained off the coast of Japan for several days, during which time it materially affected the weather in that country.

As interesting features of the storm-track chart for January, 1884, may be mentioned, 1st, the low latitude at which the storms from the American continent have entered the Atlantic, and the almost entire absence of well-defined disturbances from the Gulf of Saint Lawrence; 2d, the numerous depressions which have appeared in northern and eastern Europe, and their pronounced southeasterly direction of movement; 3d, the absence of well-defined or violent storms in the southern and western districts of Europe; 4th, the stormy period which occurred in northwestern Europe during the closing days of the month in connection with low area number xxxii.

Of the depressions which appeared in the North American continent, those traced as numbers ii. and vi. were the most violent, although high winds to gales accompanied nearly all of the depressions charted. Number ii. developed great energy during its passage over the Atlantic States on the 9th and 10th, the barometer falling to 29.0 (736.6). Number vi. was very severe over the lake region and New England, the barometer falling to 29.1 (739.1) on the 13th.

An area of high barometer occupied the Atlantic ocean south of 50° N., from the European to the American coasts during the first half of the month, and during this period deep depressions passed eastward over the regions north of the sixtieth parallel. On the 16th the pressure began to give way, especially over the ocean between W. 40° and the American coast, and continued fluctuating until the 21st, when an area of high pressures again formed and spread over the entire region between N. 20° and 50°; during this period several depressions passed northeastward, attended by more or less stormy weather. On the 25th and 26th, the pressure again gave way, and on the 27th the high area was pushed to the southward during the continuance of the storm traced as low area xxxii; at the close of the month, however, the pressure began to rise again. Some of the depressions which passed over the Atlantic were deep, notably so those that moved north of the sixtieth parallel.

Many of the storms which traversed northern Europe were very severe, the barometer falling below 29.0 (736.6) during the passage of low areas xiv., xv., xx., xxi., xxx., and below 28.5 (723.9) during the progress of number xxxi. But by far the most important and disastrous storm of the month was that which prevailed over the British Isles and northwestern Europe from the 26th to the 29th, charted as low area xxxii. In this storm the depression attained a depth of 27.3 (693.4), which is the lowest barometer reading, reduced to sea-level, ever recorded. In connection with this storm the following interesting article is taken from "SYMONS'S MONTHLY METEOROLOGICAL MAGAZINE," for March, 1884:

THE GREAT STORM OF JANUARY 26, 1884.

By William Marriott, F. R. M. S.

This storm was remarkable for its violence and large area, as well as for the unprecedently low barometer reading at its centre. * * * The centre of the depression appeared to have first reached the northwest coast of Ireland at noon, and passed in a northeasterly direction over the north of Ireland and across the middle of Scotland, reaching Aberdeen about midnight. Its rate of progress was therefore about 30 miles an hour. A violent gale was experienced all over the British Isles, the greatest hourly velocity of the wind being 68 miles at Valencia at 11 a. m.; 70 miles at Holyhead at 2 p. m.; 63 miles at Falmouth at 3 p. m.; 69 miles at Armagh, and 59 miles at Aberdeen at 5 p. m.; 58 miles at Greenwich from 5 to 7 p. m., and 76 miles at Alnwick at midnight. Thunder-storms occurred on the southeastern side of the depression, and travelled across the south of Ireland and England at the rate of about 30 miles an hour. The lowest readings of the barometer (reduced to sea level) yet reported were 27.26 inches (from an aneroid barometer, which is believed to be nearly correct), at Kilcreggan at 8.30 p. m., and 27.332 inches at Ochtertyre, near Crieff, at 9.45 p. m. In the southern part of England, directly after the minimum had occurred, there was a very sudden rise in the reading of the barometer, in some cases amounting to .08 inch in five minutes. From an examination of previous records it appears that there has never before been so low a barometer reading as 27.26 inches, so that this storm may be considered as one of the most remarkable that has occurred in the British Isles.

The lowest readings on record apparently are: December 25, 1821, 28.016 at Greenwich. January 7, 1839, 27.695 at Aberdeen. December 27, 1852, 27.984 at Culloden. December 31, 1865, 27.63 at the Hoy Lowlight, Orkney. On February 5, 1870, the reading of 27.33 inches was recorded on the Cunard steamer "Tarifa" in the Atlantic in lat. 51° N. and long. 24° W.

Of the depressions charted in Japan that numbered xxxvii. caused strong westerly to northerly gales during its passage, the barometer falling to 29.55 (750.6) in northern Niphon, while at the centre of disturbance in the Pacific, the pressure was less than 29.0 (736.6).

STORM-TRACKS FOR JUNE, 1882.

The chart for June, 1882, shows the tracks of thirty-two depressions that have appeared in the northern hemisphere. They are distributed geographically as follows: Ten are traced in the United States and Canada; of these three developed in the central valleys of the United States and passed eastward over the lake region and Canada to the Gulf of Saint Lawrence, two appeared in northern Canada, and one in the Saint Lawrence valley, the latter being a continuation of a storm shown on the chart for the preceding month; that charted as number ix. followed an irregular course, moving slowly over the Gulf of Saint Lawrence and then southward and westward to the coast of Nova Scotia, when it apparently recurved and moved off to the eastward. One depression developed in the northwest and passed eastward to the lakes and thence northeastward along the Saint Lawrence valley. Three depressions are shown over the region west of the Rocky mountains; these disturbances had some progressive movement within the stationary area of low pressure which occupied this region throughout the month. No disturbances were sufficiently well-defined after leaving the American continent to admit of their being traced as continuous storms over the Atlantic, although several depressions appeared over the region east of the twentieth meridian. Thirteen disturbances are traced in Europe; these moved slowly and in erratic paths, principally over the northwestern districts of the continent. Five moved eastward and northeastward from the ocean between W. 20° and 10°, where they first appeared, to the British Isles and southern Scandinavia; number xxi. developed near Iceland and remained for several days off the western coasts of the British Isles, causing unsettled weather in those districts. Three are charted over the Italian peninsula, whence they passed eastward and northeastward into Russia; one is shown in central Russia, two in the Black Sea region, and one is charted in Germany and the Netherlands.

Seven depressions are traced in Asia; two of these occupied eastern Siberia and the remaining five are shown on the eastern coast of China and over Japan. Two disturbances are traced in the north Pacific ocean.

The noteworthy features of the chart are: the absence of disturbances over the north Atlantic, and the irregular paths of the depressions traced in Europe and also those in America; and the comparatively few depressions that appeared in Scandinavia. None of the disturbances exhibited marked energy, although some were unusually deep for summer depressions, especially those in Europe. In the depression charted as number i. over the United States, the barometer fell to 29.3 (744.2) on the 1st; in the case of number ii. it read 29.5 (749.3) on the 3d and 4th; and in numbers vii. and ix. the minima were 29.25 (742.9) and 29.28 (743.7) on the 18th and 27th, respectively. In the depressions traced in Europe the lowest barometer readings were as follows: number xi., 29.4 (746.7) on the 3d; xiii., 29.11 (739.4) on the 7th; xiv., 29.17 (740.9) on the 5th and 6th; xvii., 29.17 (740.9) on the 11th; xix., 29.28 (743.7) on the 14th. In the storms which occurred in eastern China and Japan, the barometer fell to 29.5 (749.3) during the passage of low areas xxiv., xxviii., and xxx.; in numbers xxvi. and xxix., which moved over the Pacific ocean, the lowest pressures recorded were, 29.15 (740.4) on the 12th, in the former; and 29.0 (736.6) on the 20th, in the latter.

GENERAL REMARKS.

DAILY BULLETIN.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz: ‡, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in meters per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometers per hour, to meters per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations.

On February 1, 1883, the following change was made in publishing marine data in the "Daily International Bulletin":

All marine data are classified as to districts, which are designated as follows: District No. 1, North Atlantic; District No. 2, South Atlantic, &c., under which headings the respective reports are printed.

BOUNDARIES OF DISTRICTS.

District No. 1 comprises the Atlantic ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° E., westward to 100° W., of Greenwich.

District No. 2 comprises the Atlantic ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 20° E., westward to 70° W., of Greenwich.

District No. 3 comprises the Pacific ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° W., westward to 100° E., of Greenwich.

District No. 4 comprises the Pacific ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 70° W., westward to 145° E., of Greenwich.

District No. 5 comprises the Indian ocean, its arms and tributaries, from the Asiatic continent southward to the pole, and in the Antarctic from 20° E., eastward to 145° E., of Greenwich.

The following remarks relate to the individual peculiarities in the *methods*

of recording, and the *times* of taking, the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of M. Thévenet, Director of the Meteorological service at the College of Science of Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour. Adelaide, furnished by co-operation of Charles Todd, C. M. G., F. R. A. S. The observations are taken at 9 p. m., local time. Hobart Town, furnished by Commander J. Shortt, R. N. Observations are taken at 9 p. m., local time.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemberg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BELGIAN SERIES (furnished by the co-operation of J. C. Houzeau, Director of the Royal Observatory at Brussels).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade; weather by the Vienna symbols, and occasionally in general terms. At Arlon the observations are taken at 1 p. m., local time.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind-direction is given to 32 points and weather by the Beaufort notation. At Bradford no observations are taken on Sunday except rainfall.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army. At St. John's, N. F., the barometer appears read about .10 inch too high, which correction has been applied from August 1st, 1883.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Saint Francis Lighthouse, the original gives barometer reduced to freezing, but not to sea-level. The kind of clouds is given, but no distinction is made between upper and lower. Weather in general terms.

CHILIAN SERIES (by authority of the Secretary of Public Instruction, furnished by co-operation of Francisco Vidal Gormáz, President of the Central Meteorological Office at Santiago).—Observations are taken mostly at lighthouses on the coast; the originals give barometer as read off; temperature in Centigrade; humidity is not given but is computed at this office from the hygrometrical observations.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation.

DANISH SERIES (furnished by co-operation of Adam Paulsen, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimeters reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted. At Jacobshavn the observations are taken at 8 a. m., local time.

EGYPTIAN SERIES (Furnished by the co-operation of Albert Ismalun, Director of the Laboratoire Khédivial du Caire).—Original gives barometer reduced to zero, but not to sea-level, temperature in Centigrade. The velocity is the mean for past 24 hours. Rainfall in millimetres.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Montlouis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Montlouis and Perpignan.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only, and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals, where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchini, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by the co-operation of the Geographical Bureau, Department of the Interior, through I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (furnished by co-operation of the respective observers).—The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys-Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred. At Batavia the elevation is stated to be "a few meters."

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiania).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, Director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in meters per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Astrakhan, Ashurada and Baku, the barometer-cistern is below sea-level. On December 7th, 1883, the barometer at Archangel was "deranged," and the corrections to the aneroid used in its place are not exact.

SPANISH SERIES (furnished by co-operation of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 10 a. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of the Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of F. Nimr, B. A., Director of the Lee Observatory at Beirut).—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in meters per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms. At Samakov, the barometer is reduced to freezing, but not to sea-level; temperature in Fahrenheit. The kind of clouds is given, also the distinction between upper and lower.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Officer, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota the barometer is corrected for temperature only; at Puerto Berrio, is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind-direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas. At Rivas the humidity is obtained by readings from Saussure's hygrometer.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind-direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of the sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operations of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

INTERNATIONAL CHARTS ACCOMPANYING DAILY BULLETIN AND MONTHLY SUMMARY.

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

International chart iii. shows tracks of centres of low barometer. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date.

In the above charts broken lines indicate that the lines so drawn are doubtful.

Arrows show direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
→	1, 2	0 to 9	0 to 4
→	3, 4	9.1 to 22.5	4.1 to 10.1
→	5, 6	22.6 to 40.5	10.1 to 18.1
→	7, 8	40.6 to 67.5	18.1 to 30.2
→	9, 10	67.6 up.	30.2 and over.

MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS.

The position of stations (latitude and longitude) are obtained from Keith Johnson's "Index Geographicus," except where more exact information is furnished. The elevation of stations is obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the original, is carefully computed at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

BRITISH SERIES, Bradford: a letter placed opposite the name of station, refers to all the data except rainfall.

On January 1st, 1884, the following changes occur in the elevation of stations: Chilian Series, Valpariso, from 25 to 40 meters; Japanese, Nemuro, from 18 to 13 meters; Austrian, Eperies, from 250 to 258 meters; Szegedin, from 78 to 86 meters; United States, Helena, Montana, from 4,100 to 4,044 feet.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather maps.

ERRATA.

MONTHLY SUMMARY, November, 1883, page 25, Fort Conger, Grinnell Land (Lady Franklin Bay), in place of latitude and longitude as published, read latitude N. 81° 44′, longitude W. 64° 45′.

DAILY BULLETIN, January 4th, 1884, page 1, Canadian, London, Ontario, reduced barometer 29.14, 740.1, should read 30.14, 765.5.

5th, page 1, Canadian, London, Ontario, actual barometer 30.36, 771.1, should read 29.36, 745.7.

20th, page 1, Canadian, Medicine Hat, N. W. T., actual barometer 29.92, 760.0, should read 27.92, 709.2.

24th, page 1, Australian, Adelaide, reduced barometer 29.07, 738.4, should read 30.07, 763.8.

25th, page 1, Australian, Adelaide, reduced barometer 29.06, 738.1, should read 30.06, 763.5.

26th, page 1, Australian, Adelajde, reduced barometer 29.16, 740.7, should read 30.16, 766.1.

NOTE.—The above observations, taken at 7 a. m., Washington time, were received too late for publication in the DAILY BULLETIN, and are given here in full; for continuation of the same, see DAILY BULLETIN.

REVIEW.

INTERNATIONAL METEOROLOGY FOR FEBRUARY, 1884.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade; wind-force by scale of* 0–10.]

The following description refers to chart ii. for the month of February, 1884, issued with this SUMMARY. This chart continues the series of international charts begun in February, 1877, and exhibits the mean pressure, mean temperature, and prevailing wind-direction over the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich, mean time.

Two areas of barometric minima appear on the chart; the first of these is indicated by the isobar for 29.3 (744.2) and occupies that part of the ocean lying between Greenland and Iceland, including the last-mentioned within its limits. The lowest mean pressure reported is 29.26 (743.2) at Stykkisholm, Iceland. The barometric gradient increases uniformly on the western, southern, and eastern sides of the low area, until the isobar for 30.0 (762.0) is reached. That line extends from Labrador southeastward to, and including Newfoundland, thence southeastward to the fortieth parallel to about 10° west of Greenwich; thence it trends northeastward along the western shores of Europe to the Gulf of Bothnia. The second area of low mean pressure is situated over Behring Sea, and is indicated by the isobar for 29.6 (751.8); the mean pressure at Behring Island being 29.56 (750.8). In the United States and Canada, the mean pressure is everywhere above 30.0 (762.0).

The areas of barometric maxima are four in number; one, 30.4 (772.1), occupies southern Siberia and northern China. To the southward and westward of this area the mean pressure decreases slowly, but towards the east the decrease is more rapid, the isobar for 30.0 (762.0) running north and south over Japan. The second area of high pressure is that of the Atlantic; it occupies the ocean between N. 25° and 37°, and from W. 58° eastward to W. 35°; within those limits the mean pressure ranges from 30.2 (767.1) to 30.26 (768.6 . In that part of the Atlantic south of N. 40°, and from the American coast eastward to the tenth meridian west of Greenwich, the mean pressure is above 30.1 (764.5), except over a small area from W. 20° to the Portuguese coast. The third area, which is indicated by the isobar for 30.2 (767.1), occupies the Northwest Territories of British America, and extends southeastward over Montana and Dakota and eastward to northern Minnesota. In the lake region, New England, and the western provinces of Canada the mean pressure ranges from 30.05 (763.3) to 30.1 (764.5). Within a narrow strip of territory extending from the Texas coast northward to Indian Territory and Arkansas, the pressure is also below 30.1 (764.5), but in other parts of the country it is above that amount. The fourth and last area of high pressure is enclosed by the isobar for 30.1 (764.5) and covers the Canadian Maritime Provinces; within this area the means vary from 30.10 (764.5) to 30.15 (765.8).

Compared with the chart for the preceding month (January, 1884), there has been a general decrease of pressure over the United States, except in northern Minnesota, Dakota, and Montana; the decrease being most marked in Texas, Louisiana, Mississippi, and Arkansas. In the Canadian Maritime Provinces there has been a slight increase of pressure. Over the north Atlantic ocean south of 40° N., and between the American coast and W. 30°, there has been no material change, but from W. 30° eastward to the coast line there has been a considerable decrease. Over the region north of the fortieth parallel the mean pressure was slightly lower than in the preceding month. In Europe the following changes have occurred, viz: a considerable increase of pressure is shown over Russia, Denmark, and Scandinavia, the increase amounting, in the last-mentioned district, to nearly .4 inch. In the British Isles, France, and the Iberian peninsula, there has been a decrease ranging from .15 to .30 inch; in Austria and Italy the decrease is only about .05 inch, while no change has occurred in Germany. In Hindostan there has been a decrease of about .10 inch; but in other parts of Asia there has been no change, the distribution of pressure remaining substantially the same as in the preceding month.

Compared with the corresponding month of previous years, the mean atmospheric pressure during February, 1884, was slightly above normal in the extreme northern sections of the United States; in all other parts of the country it was below the normal. In Canada it was slightly below normal in Ontario, and was above the normal in the Maritime Provinces and Quebec. In Europe the mean atmospheric pressure was above the normal, expect in Spain, France, and the British Isles, where there was a slight deficiency. The excess was greatest in the northern peninsulas.

The following table gives the mean pressure and mean temperature, with corresponding departures for February, 1884, in the several countries of the northern hemisphere, compared with the means as determined from observations taken during the last seven years:

Countries.	Mean pressure.			Mean temperature.		
	Feb'y mean of 7 (1877–'83) years.	Feb'y 1884.	Departure.	Feb'y mean of 7 (1877–'83) years.	Feb'y 1884.	Departure.
				°	°	°
Algeria	30.17	30.16	− 0.01	58.6	62.4	+ 3.8
Austria	30.07	30.15	+ 0.08	37.7	40.7	+ 3.0
British Isles	29.88	29.85	− 0.03	43.4	44.6	+ 1.2

* Means for six years only. † Mean for five years only.

In the United States the mean temperature of the air was above the normal over the country from the lower lake region southwestward to Texas; in all other districts, excepting Arizona and New Mexico, it was below the normal, the greatest

departure occurring in the northern portions of Minnesota and Dakota, and in Wyoming, Montana and Nebraska. In Canada the temperature was generally above the normal. In Europe the mean temperature was everywhere above the normal, except in Spain, where there was a slight deficiency. In British India it was slightly above the seven years' mean; the highest mean temperature reported was 87°.9 Fahr. (31°.1 Cent.), at Bellary, and the lowest was 60°.6 Fahr. (15°.9 Cent.), at Sibsagar.

The following are some of the extreme mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Bridgetown, Barbadoes, W. I.	79.4	26.3	York Factory, B. A.	—31.1	—35.1
Puerto Berrio, U.S. Colombia, S.A	78.8	26.0	Fort Chimo, B. A	—19.3	—28.5
Paramaribo, Dutch Guiana, S. A.	76.7	24.8	Upernavik, Greenland	—13.4	—25.2
Manila, Philippine Islands	76.3	24.6	Jacobshavn, Greenland	—11.9	—24.4
Bluefields, Nicaragua, C. A.	75.3	24.1	Nikolaevsk on the Amoor, Asia	— 3.5	—19.7

In the United States south of 37° N. and east of 100° W. the winds were mostly southerly; along the New England and middle Atlantic coasts they were northeasterly; in all other parts of the country they were mostly from north to west. Over the north Atlantic the winds were as follows: near the coasts of the United States and south of 40° N., they were southerly; from W. 60° eastward to the European coasts and from 40° to 60° N. latitude, they were mostly west and northwest; south of 30° N. they were easterly and northeasterly. In Europe the prevailing winds were from east to southeast, south, and southwest. In Japan they were westerly and northerly.

The precipitation during February, 1884, in the United States was less than the average in Florida, the western part of the Gulf states, all of Texas and part of New Mexico, and in the north Pacific coast region; in the last-mentioned district the deficiency was unusually large. In all other parts of the United States the precipitation was above the average, the excess being greatest in southern California and in Tennessee. In Canada the rainfall was above the average. In Europe it was normal or slightly below normal.

STORM-TRACK CHART FOR FEBRUARY, 1884.

On chart iii. are shown the paths of the atmospheric depressions that have appeared in the northern hemisphere during the month of February, 1884. The data are charted for each day of the month on the maps accompanying each issue of the "International Bulletin," and from these charts, together with abstracts of ships' logs and other miscellaneous data received at this office, are traced the movements of the centres of barometric minima. This chart continues the series of international charts begun in November, 1877.

The paths of forty-one depressions are traced on the chart; they are distributed as follows: Fifteen appeared in the North American continent; of this number, three (numbers iv., vi., and viii.) were first noticed on the Pacific coast; the two first-mentioned disappeared in Utah and Nevada, while number viii. moved eastward over the Rocky mountains to the lake region and thence to the Gulf of Saint Lawrence. Five developed in the region south of the fortieth parallel and west of the Mississippi river; these, with one exception (number vii.), moved northeastward into the Atlantic from the coast line between N. 37° and 40°, and thence to the Banks of Newfoundland. Five depressions appeared in the northwest; four of these moved east-southeastward to the lake region and thence northeastward or eastward to the Gulf of Saint Lawrence and the New England coast, while one, number xii., passed southeastward from Montana to South Carolina and from there into the Atlantic. Of the remaining depressions, numbers i. and v., the former appeared in New England and moved northeastward over the Gulf of Saint Lawrence, and the latter originated in the lake region and passed eastward over Nova Scotia to the Atlantic.

Eleven depressions are traced over the Atlantic ocean; of these, six, (numbers xix., xxiii., xxiv., xxviii., xxxi., and xxxii.), are continuations of depressions which passed off the American coast and from the Gulf of Saint Lawrence into the ocean. Three depressions developed in Greenland, one passing northeastward to northern Scandinavia, one southeastward to the northwestern coasts of the British Isles, while the other dissipated in southern Greenland. Number xxx. developed in mid-ocean, and merged with number xxxi. on the 25th; number xxiv. *a* was subsidiary to number xxiv., and appeared off the southwestern coast of Ireland on the 19th.

Of the twelve depressions that are traced in Europe, three are continuations of storms (xvi., xxiv., xxxi.), which entered the continent from the Atlantic; xxiv. *b* was subsidiary to xxiv., and of the remainder, two appeared in the southern districts of Europe, one in the British Isles and the Netherlands; one in southern Scandinavia, the Baltic, and western Russia, two in northern Europe and two in eastern Russia.

Four depressions are shown in Japan; two of these moved northeastward along the southeastern coast of Niphon, and two passed eastward from the Sea of Japan over northern Niphon and Yesso. Three disturbances appeared in Behring Sea and over the Aleutian archipelago, and one over the eastern part of the Pacific ocean.

The general direction of movement of the low areas during February, 1884, was somewhat similar to that followed by the depressions charted in the preceding month (January, 1884), although these latter appear to have moved at slightly lower latitudes than the former. In point of numbers there was also but little difference, except in Scandinavia, where fewer disturbances are traced during the present than in the preceding month.

Several of the depressions exhibited great energy, especially during their progress over the ocean and when near the British and Scandinavian coasts, and were marked by extremely low barometric readings. The most important low area, on account of its violence, low pressures, and erratic track, was that traced as number xxiv. This disturbance remained for several days (from the 12th to the 19th) over the ocean between W. 30° and the British coasts, giving out during this period numerous subsidiary disturbances which caused unsettled weather and moderate gales over the British Isles.

On the 12th the barometric pressure at the centre of low area xxiv. was less than 28.0 (711.2), rising to 28.4 (721.3) by the 14th; it remained below 29.0 (736.6) until the 18th, when a slight rise set in and continued until the 21st, when the pressure again fell below 29.0 (736.6). During these dates the area affected by the disturbance extended over nearly the whole of the Atlantic north of the fortieth parallel. The easterly movement of this depression was retarded by an extensive and important area of high pressures which occupied northern and central Europe during the period from the 12th to the 20th. This area enclosed, at times, the British Isles, and its eastern limit reached the Ural region; from the 14th to the 16th the maximum pressure, near the centre of the high area, ranged from 30.6 (777.2) to 30.8 (782.3).

In low areas xvi. and xxii., the barometer fell below 28.9 (734.0) in the former, and to 28.2 (716.3) in the latter. The storms which were most violent near the American coasts were numbers xiv. and xxxi.; in the first the barometer fell to 28.6 (726.4) in the Maritime Provinces on the 29th, and in the case of the last-mentioned to 29.1 (739.1) on the 24th. In number viii., when on the Pacific coast, the barometer fell from 29.4 (746.7) on the 15th to 29.3 (744.2) on the 17th.

(For special barometric observations in connection with the depressions traced over the Atlantic, see chapter under NORTH ATLANTIC STORMS in the MONTHLY WEATHER REVIEW for February, 1884.)

The depressions which appeared in Japan were unimportant and presented no special features; in those over the Aleutian archipelago the barometer fell below 29.2 (741.7).

GENERAL REMARKS.

DAILY BULLETIN.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in meters per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometers per hour, to meters per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations.

On February 1, 1883, the following change was made in publishing marine data in the "Daily International Bulletin":

All marine data are classified as to districts, which are designated as follows: District No. 1, North Atlantic; District No. 2, South Atlantic, &c., under which headings the respective reports are printed.

BOUNDARIES OF DISTRICTS.

District No. 1 comprises the Atlantic ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° E., westward to 100° W., of Greenwich.

District No. 2 comprises the Atlantic ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 20° E., westward to 70° W., of Greenwich.

District No. 3 comprises the Pacific ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° W., westward to 100° E., of Greenwich.

District No. 4 comprises the Pacific ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 70° W., westward to 145° E., of Greenwich.

District No. 5 comprises the Indian ocean, its arms and tributaries, from the Asiatic continent southward to the pole, and in the Antarctic from 20° E., eastward to 145° E., of Greenwich.

The following remarks relate to the individual peculiarities in the *methods* of recording, and the *times* of taking, the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of M. Thévenet, Director of the Meteorological service at the College of Science of Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour. Adelaide, furnished by co-operation of Charles Todd, C. M. G., F. R. A. S. The observations are taken at 9 p. m., local time. Hobart Town, furnished by Commander J. Shortt, R. N. Observations are taken at 9 p. m., local time.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemberg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BELGIAN SERIES (furnished by the co-operation of J. C. Houzeau, Director of the Royal Observatory at Brussels).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade; weather by the Vienna symbols, and occasionally in general terms. At Arlon the observations are taken at 1 p. m., local time.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind-direction is given to 32 points and weather by the Beaufort notation. At Bradford no observations are taken on Sunday except rainfall.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Saint Francis Lighthouse, the original gives barometer reduced to freezing, but not to sea-level. The kind of clouds is given, but no distinction is made between upper and lower. Weather in general terms.

CHILIAN SERIES (by authority of the Secretary of Public Instruction, furnished by co-operation of Francisco Vidal Gormáz, President of the Central Meteorological Office at Santiago).—Observations are taken mostly at lighthouses on the coast; the originals give barometer as read off; temperature in Centigrade; humidity is not given but is computed at this office from the hygrometrical observations.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation.

DANISH SERIES (furnished by co-operation of Adam Paulsen, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimeters reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted. At all Greenland stations the observations are taken at 8 a. m., local time.

EGYPTIAN SERIES (Furnished by the co-operation of Albert Ismalun, Director of the Laboratoire Khédivial du Caire).—Original gives barometer reduced to zero, but not to sea-level, temperature in Centigrade. The velocity is the mean for past 24 hours. Rainfall in millimetres.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Montlouis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Montlouis and Perpignan.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms.

GREEK SERIES (furnished by co-operation of Prof. D. K. Kokkides, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only, and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals, where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchini, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by the co-operation of the Geographical

Bureau, Department of the Interior, through I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (furnished by co-operation of the respective observers).—The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys-Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred. At Batavia the elevation is stated to be "a few meters."

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiania).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, Director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in meters per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Astrakhan, Ashurada and Baku, the barometer-cistern is below sea-level. On December 7th, 1883, the barometer at Archangel was "deranged," and the corrections to the aneroid used in its place are not exact.

SPANISH SERIES (furnished by co-operation of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 10 a. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of the Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of F. Nimr, B. A., Director of the Lee Observatory at Beirut).—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in meters per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms. At Samakov, the barometer is reduced to freezing, but not to sea-level; temperature in Fahrenheit. The kind of clouds is given, also the distinction between upper and lower.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Officer, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota the barometer is corrected for temperature only; at Puerto Berrio, is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind-direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas. At Rivas the humidity is obtained by readings from Saussure's hygrometer.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind-direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of the sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operations of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

INTERNATIONAL CHARTS ACCOMPANYING DAILY BULLETIN AND MONTHLY SUMMARY.

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

International chart iii. shows tracks of centres of low barometer. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date.

In the above charts broken lines indicate that the lines so drawn are doubtful. Arrows show direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
→	1, 2	0 to 9	0 to 4
→	3, 4	9.1 to 22.5	4.1 to 10.1
→	5, 6	22.6 to 40.5	10.1 to 18.1
→	7, 8	40.6 to 67.5	18.1 to 30.2
→	9, 10	67.6 up.	30.2 and over.

MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS.

The position of stations (latitude and longitude) are obtained from Keith Johnson's "Index Geographicus," except where more exact information is furnished. The elevation of stations is obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the original, is carefully computed at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

BRITISH SERIES, Bradford: a letter placed opposite the name of station, refers to all the data except rainfall.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather maps.

ERRATA.

The following corrections should be applied to barometer readings from stations of the United States series, as follows:

Shreveport, Louisiana, from May 1st to August 31st, 1882, both inclusive, actual barometer .015 of an inch, or 0.38 mm., too low; from September 1st, 1882, to July 31st, 1883, both inclusive, actual barometer .020 of an inch, or 0.51 mm., too low; from August 1st to 31st, 1883, both inclusive, actual barometer .025 of an inch, or 0.64 mm., too low; from September 1st to 30th, 1883, both inclusive, actual barometer .062 of an inch, or 1.57 mm., too low; from October 1st to December 31st, 1883, both inclusive, actual barometer .065 of an inch, or 1.65 mm., too low; from January 1st to 31st, 1884, both inclusive, actual barometer .070 of an inch, or 1.78 mm., too low.

Saint Vincent, Minnesota, from September 4th, 1880, to December 1st, 1880, all barometric readings are too low by .034 of an inch, or 0.86 mm.; and from December 1st, 1880, to February 1st, 1884, are too low by .021 of an inch, or 0.53 mm.

Fort Canby, Washington Territory, from September 1st, 1883 to February 1st, 1884, all barometer readings are too low by .024 of an inch, or 0.61 mm.

Fort Concho, Texas, from December 1st, 1881, to December 31st, 1884, both inclusive, all barometer readings are too low by .030 of an inch, or 0.76 mm.

Key West, Florida, from May 4th, 1882, to January 31st, 1884, both inclusive, all barometer readings are too low by .021 of an inch, or 0.53 mm.

Yuma, Arizona, from November 1st, 1882, to June 30th, 1883, both inclusive, barometric readings are too low by .011 of an inch, or 0.28 mm.; from July 1st, 1883, to September 30th, 1883, both inclusive, barometric readings are too low by .015 of an inch, or 0.38 mm.; from October 1st, 1883, to December 31st, 1884, both inclusive, barometer readings are too low by .024 of an inch, or 0.61 mm.

Port Huron, Michigan, from March 1st to 31st, 1883, both inclusive, barometric readings are too low by .010 of an inch, or 0.25 mm.; from April 1st to May 31st, 1883, both inclusive, barometric readings are too low by .015 of an inch, or 0.38 mm.; from June 1st to October 31st, 1883, both inclusive, barometric readings are too low by .020 of an inch, or 0.51 mm.; from November 1st to December 31st, 1883, both inclusive, barometric readings are too low by .025 of an inch, or 0.64 mm.

DAILY BULLETIN, February 7th, 1884, page 7, District No. 1. Bark "Fred W. Carlon," Progresso roads, C. A., should read Progresso roads, Yucatan, Mexico; same correction on 10th, 13th, 16th, 19th, 22d, 25th, 28th; and for s. s. "City of Alexandria," on 28th and 29th.
