Vorwort.

Das Jahrbuch für 1883 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 38 Stationen.

Aus der Stationsliste ausgegangen sind die Stationen: Birid, in Folge der Unvollständigkeit der Beobachtungen; Dommesten, in Folge des Aufhörens der Beobachtungen, und Karasjok, in Folge der Abwesenheit des Beobachters.

Hinzugekommen sind die beiden neuen Stationen Hamar und Röldal.

Die Station Hamar befindet sich auf dem Gehöfte Börstad bei der Stadt Hamar an der Ostseite des Landsees Mjösen. Die Lage ist sehr frei.

Die Station Röldal liegt in einem Gebirgskessel gleichen Namens an der Westseite der „Langfjelde" südlich von Hardanger (Ullensvang).

In Bezug auf die Lage der Stationen, die Instrumente u. s. w. ist im Uebrigen auf die Jahrbücher 1875 — 1882 zu verweisen. Bei den einzelnen Stationen ist folgendes zu bemerken:

Alten. Bei der Inspection d. 27. u. 28. Juli 1883 fand ich die constante Correction des Stationsbarometers = $-0.^{mm}28$ (MF = $\pm$ $0.^{mm}033$, 4 Beobachtungen). Im Jahre 1875 fand man dieselbe am Institute —0.31, 1878 bei der Inspection —0.33, 1881 —0.26. Das Barometer hat also die angewendete Correction $-0.^{mm}3$ ausgezeichnet gut bewahrt.

Brönö. Die Beobachtungen des Minimumthermometer für Februar und März waren unbrauchbar. Das Monatsmittel für diese Monate ist aus den Beobachtungen 8 a. und 8 p. berechnet mit einer aus den Prestöer Beobachtungen abgeleiteten Correction.

Flesje. Es fehlen die Beobachtungen für den Zeitraum vom 26 März bis 13 April. Das Monatsmittel für diese beiden Monate ist reconstruirt durch Vergleichung mit Florö.

Südvaranger. Bei der Inspection am 2. August 1883 fand ich die constante Correction des Stationsbarometers = $-0.^{mm}05$ (MF = $\pm$ $0.^{mm}032$, 6 Beobachtungen). 1875 wurde dieselbe bei der Aufstellung des Barometers gefunden = $+0.^{mm}05$. Vom 1 Januar 1883 sind die Beobachtungen mit $-0.^{mm}05$ reducirt worden.

Tromsö. Bei der Inspection d. 21. Juli 1883 fand ich die constante Correction des Stationsbarometers = $-0.^{mm}22$ (MF = $\pm$ $0.^{mm}044$, 5 Beobachtungen). 1875 wurde gefunden $-0.^{mm}32$, 1881 $-0.^{mm}12$. Vom 1 Juli 1883 sind die Beobachtungen corrigirt mit $-0.^{mm}22$. Am 30 Juni wurde nämlich das Barometer von einem neuen Beobachter in ein neues Zimmer übergebracht.

Vardö. Bei der Inspection am 1, 7, 8. und 9. August 1883 ergab sich die constante Correction des Stationsbarometers = $-0.^{mm}265$ (MF = $\pm$ 0.044, 10 Beobachtungen). 1875

war gefunden —0.^{mm}44, 1878 —0.^{mm}49. Irgend welchen Grund für diese Aenderung oder ein Datum für ihren Eintritt liess sich nicht ermitteln. Vom 1 Januar 1883 an sind die Beobachtungen mit —0.^{mm}27 reducirt.

Villa. Die Angaben des Minimumthermometers erschienen zweifelhaft, weshalb die Monatsmittel für die Lufttemperatur nach der Formel $\frac{1}{2}$ (8 + 8) + Corr. berechnet sind, wobei die Correction durch Vergleich mit Prestö bestimmt wurde.

Bei der Inspection im Jahre 1883 benutzte ich als Controllbarometer Adie No. 1506, dessen constante Correction 1878 = —0.^{mm}40 gefunden war.

Durch Vergleich mit 2 Barometern auf der Polarstation in Bossekop fand ich:

d. 23—26 Juli 1883 die constante Correction = —0.^{mm}415 (MF = ± 0.^{mm}035, 6 Beobach.)
und d. 13—18 August — — —0.^{mm}375 (MF = ± 0.^{mm}025, 6 Beobach.),
also im Mittel . . . . . —0.^{mm}395

Im September 1883 fand man am meteorologischen Institut durch Vergleich mit dem Normalbarometer die constante Correction = —0.^{mm}395 (MF = ± 0.^{mm}030, 30 Beobach.).

Das Controllbarometer hat also unter der ganzen Inspectionsreise seine Correction unverändert bewahrt.

In Bezug auf die Schwerecorrection ist auf das Jahrbuch für 1882, Vorwort, Seite III und IV zu verweisen.

Die folgende Tabelle giebt eine Uebersicht über die Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchtthürmen werden die Beobachtungen vom betreffenden Leuchtfeuerverwalter ausgeführt.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, inclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

Die Windstärke nach Schätzung, Scala 0 = Still bis 6 = Orkan[2]).

---

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1874.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II.

[1]) Mandal . Okt. 16 — Dec. 31. Höhe des Regenmessers: 1.^{mm}5.

[2]) Tromsö . Juli 1 — Dec. 31. Const. Corr. d. Bar.: -0.^{mm}2.

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. Die Bezeichnungen sind:

● Regen.	*n* Nacht	Als Exponent
∗ Schnee.	*a* Vormittag	Als Exponent
△ Graupeln.	*p* Nachmittag	Als Exponent
≡ Nebel.	*o* Schwach	Als Exponent
⌴ Reif.	*2* Stark	Als Exponent
∞ Höhenrauch.	1 Erste Beobachtungsstunde.	
⁄ Starker Wind.	2 Zweite —	
⊼ Gewitter.	3 Dritte —	
< Blitz ohne Donner.		
⋔ Nordlicht.		
⊕ Sonnenring.		
⦶ Sonnenhof.		
⦷ Mondring.		
⦷ Mondhof.		

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ● 1, Regen 8^h Morgens; ∗ 3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolirte Werthe sind mit Cursiv gedruckt.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und das Normalbarometer, aber nicht auf die Meeresfläche und nicht auf die Normalschwere reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind als Mittel der drei täglichen festen Beobachtungen und der Minimum-Temperatur bestimmt.

✓ Für Christiania sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt wurden.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction berechnet. Für Dovre, Röros und Tönset ist Correction wegen des Luftdrucks an den Mitteln angebracht worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die an Wilds

Windstärkeplatte beobachtete Geschwindigkeit des Windes 15 Meter überstieg, oder (an den Stationen, die keine Windmesser haben,) die Windstärke über 4 notirt ist.

Nach den speciellen Beobachtungsschematen für Gewitter geben wir hier folgende berichtigte Tabelle über die Anzahl der Tage mit Gewitter.

Zahl der Tage mit Gewitter:

	Bergen.	Florö.	Prestö.	Villa.
Januar . . .	1	0	0	0
Februar . . .	2	0	2	2
März	1	0	0	2
April	1	0	0	1
Mai	1	0	0	0
Juni	3	1	2	2
Juli	6	3	1	2
August . . .	0	1	0	0
September . .	1	0	0	0
October . . .	2	2	0	0
November . .	1	1	0	0
December . .	2	0	0	1
Jahr	21	8	5	10

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die richtige Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Als Anhang I sind dynamische Windrosen für 24 Stationen beigegeben. Wenn eine Windrichtung während eines Monats nicht notirt worden ist, so wird dies durch einen Strich bezeichnet. Bei der Berechnung des Jahresmittels sind die für jeden Monat und für jede Windrichtung gefundenen Summen der Windstärke zusammenaddirt, und als Divisor die Anzahl der sämtlichen für das Jahr notirten respectiven Windrichtungen benutzt, welche letztere aus dem 2. Theil des Jahrbuches „Windvertheilung: Jahr“ entnommen ist.

Als Anhang II folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen, K. Hesselberg, N. Oftedal, A. Bendixen, J. Schroeter* und *H. Chr. Löcken* ausgeführt.

Christiania, September 1884.

H. Mohn.
