Vorwort.

Das Jahrbuch für 1888 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 78 Stationen; von letzteren sind 32 Stationen solche, die mit Quecksilberbarometer versehen sind, 7 Leuchtfeuerstationen, und 32 Regenmesserstationen.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen:

Im Sommer 1889 unternahm ich eine Inspectionsreise nach den Stationen II Ordnung Færder, Krappeto, Tønset und Eidsvold, III Ordnung Løveid, den Regenmesserstation Vestfjorddalen, Frederikshald, Strømfos, Ørje, Rena und Rasten. Auf derselben Reise wurden die neuen Stationen II Ordnung (Dalen und Hamar) und III Ordnung Hogga eingerichtet. Als Controlbarometer wurden zwei Barometer mitgeführt: Sécrétan No. 349 (Fortin) und Adie No. 674 (Kew-Station-Barometer). Auf der Reise zeigten die Correctionen dieser Barometer sich leider nicht constant. Dieser Uebelstand wurde aber dadurch glücklich abgeholfen, dass ich in der Mitte der Inspectionsfahrt nach Christiania reiste und am meteorologischen Institute die Reisebarometer mit den Normalbarometern Fuess und Negretti & Zambra daselbst verglich. Nach den am Anfang, in der Mitte und nach Schluss der Reise gefundenen Correctionen wurden die für die respectiven Inspectionsepochen an den Stationen geltenden Correctionen durch Interpolation nach der Zeit berechnet. Die mit diesen auf den Stationen, von beiden Reisebarometern, erhaltenen Luftdruckwerthe stimmen sehr gut mit einander.

Eidsvold. Bei der Inspection am 23. August 1889 fand ich aus 4 Vergleichungen die Correction des Stationsbarometers Adie No. 1476 $= + 0^{mm}.34$; M. F. $= \pm 0.015$. Am Institute wurde gefunden im Mai 1875 $+ 0.18$, und vom Herrn Steen bei Inspection im September 1875 $+ 0.18$ und im September 1879 $+ 0.20$. Die Correction scheint somit in den letzten 10 Jahren um $0^{mm}.14$ gestiegen zu sein. Eine Vergleichung der Barometerhöhen von Eidsvold und Christiania in den Jahren 1880 bis 1888 gab indessen kein Zeichen einer derartigen Aenderung. Es ist wahrscheinlich, dass der Beobachter, der jetzt ein alter Mann ist, früher den Nonius genauer einstellte als er thatsächlich jetzt thut, und dass dadurch die Aenderung der Correction compensirt worden ist.

Die Thermometer hatten keine Correction.

Færder. Signalstelle und Leuchtthurm auf einer kleinen Insel an der Mündung des Christianiafjords. Die Instrumente waren früher in Sandøsund.

Die Station befindet sich im Telegraphengebäude, wo die Instrumente eine sehr gute Aufstellung erhalten haben.

Bei der Inspection am 21. und 22. Juli 1889 fand ich aus 7 Vergleichungen die Correction des Stationsbarometers Adie No. 1512 $= + 0^{mm}.08$; M. F. $= \pm 0.02$. Für dasselbe Barometer sind früher die folgenden Correctionen gefunden worden: am Institute 1876 im März: $+ 0^{mm}.11$, und in Sandøsund 1879 im September: $+ 0^{mm}.03$, 1884 im August: $+ 0^{mm}.12$. Die

Correction hat sich also gut erhalten. Die Höhe des Barometers über Mittelwasser fand ich zu 13.0 Meter.

Die Thermometer stehen am Nordwand, und sind durch gute Schirme gegen die Sonne beschützt. Corr. beider Thermometer bei $18^0 = -0^0.1$.

Die Wind-Beobachtungen sind vorzüglich.

Der Regenmesser steht auf der Klippe im NNW von der Station, fest und frei.

Krappeto. Bei der Inspection am 1. 2. und 3. August 1889 fand ich aus 9 Vergleichungen die Correction des Stationsbarometers Adie No. 637 $= + 0^{mm}.18$; M. F. $= \pm 0.02$. Am Institute wurde im August 1884 $+ 0.02$ gefunden, aber bei der Inspection im September desselben Jahres fand Herrn Steen $+ 0.21$. Die Beobachtungen von 1884 bis Ende 1888 sind ohne Correction berechnet worden, sie müssen also mit $+ 0.2$ verbessert werden.

Die beiden Thermometer hatten eine Correction von $+ 0^0.1$.

Krappeto liegt am oberen Ende einer Reihe von Schleussen. Wenn der Wasserfall stäubt, wird die Feuchtigkeit der Luft hier im ingen Thalschluchte anomal gross gegen die der Umgebung.

Windfahne oben über dem Walde und Regenmesser am See standen gut.

Løveid. Kanal-Schleussen-Station wie Krappeto. Gute Aufstellung der Instrumente. Station inspiciert von mir am 19. Juli 1889. Die Messung der Niederschläge fand früher nicht nach jedem Niederschlagstag statt; daher können nicht Max. u. Tag angegeben werden.

Tønset. Am 31. October/1. November 1888 wurde die Station nach ein neues Local verlegt, wo die Instrumente eine sehr gute Aufstellung bekamen. Bei die Inspection am 20. August 1889 fand ich aus 5 Vergleichungen mit dem Reisebarometer Sécrétan die Correction des Stationsbarometers Adie No. 1475 $= + 1^{mm}.22$; M. F. $= \pm 0.04$. Früher ist gefunden vom Herrn Steen 1879 September $+ 0.81$, und von mir 1886 August $+ 0.99$ und 1888 Juni $+ 0.95$. Das Barometer hat also, wahrscheinlich durch die neue Aufstellung, eine um etwa $0^{mm}.2$ grössere Correction erhalten. Mit der neuen Correction sind die Beobachtungen im neuen Local reduciert worden. Die neue Höhe der Barometers ist 499.0 Meter. Die Barometerhöhen vom November und December 1888 sind auf die frühere Höhe von 492.7 Metern reduciert worden. Die Thermometer standen 3.5 Meter und die Regenmesser 1.2 Meter über dem Erdboden. Leider müssten die Beobachtungen in Tønset vom 1. Juli 1889 ab sistiert werden wegen Mangel von Mitteln um den Beobachter zu honorieren.

Katnosa und Hakloa haben die Art des Niederschlags nicht notiert. Die Tage mit Schnee sind daher nach den Nachbarstationen beurtheilt und mit cursiv angeführt worden.

Anstatt Rasten, woher nur Beobachtungen vom Januar und Februar vorliegen, ist Rena aufgenommen worden.

Sogndal und Balestrand sind zu lückenhaft gewesen, um mitgenommen werden zu können.

Aus der neuen Station Bjelland liegen einige Beobachtungen der Bewegung der Cirruswolken vor.

In Bezug auf die Schwerecorrection ist auf das Jahrbuch für 1882, Vorwort, Seite III und IV zu verweisen.

Die Tabelle auf Seite VII giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchtthürmen werden die Beobachtungen vom betreffenden Leuchtfeuerverwalter ausgeführt.

In der ersten Rubrik „Ordnung“ bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —
R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens, kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, inclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[2]).

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

● Regen.	$_n$ Nacht	Als Exponent

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II., so wie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ● 1, Regen 8^h Morgens; ✱ 3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolirte Werthe sind mit Cursiv gedruckt.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und das Normalbarometer (wahre Barometerhöhe), aber nicht auf die Meeresfläche und nicht auf die Normalschwere reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind für alle Stationen des südlichen Norwegens bis an die Breite von Trondhjem ($63^1/_2$ Grad) als Mittel der drei täglichen festen Beobachtungen und der Minimumtemperatur bestimmt. Für die Stationen, welche eine nördlichere Lage haben, ist die im Jahrbuch für 1884 Vorwort S. XII—XIII angegebene Berechnungsweise angewendet worden.

Für Christiania, Aas und Trondhjem sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt wurden.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet. Für Dovre, Röros und Tönset ist Correction wegen des Luftdrucks an den Mitteln angebracht worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *J. Schroeter*, *C. Krafft*, *N. Nielsen* und *H. Chr. Löcken* ausgeführt.

Der Druck dieses Jahrbuches ist durch den Typographenstreik in Christiania in der ersten Hälfte der Jahres 1889 um ein halbes Jahr verspätet worden.

Christiania, Mai 1890.

H. Mohn.
