Vorwort.

Das Jahrbuch für 1890 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 89 Stationen; von letzteren sind 37 solche, die mit Quecksilberbarometern versehen sind, 4 Stationen mit Psychrometern, 8 Leuchtfeuerstationen, und 40 Regenmesserstationen.

Im Sommer 1891 unternahm ich eine Reise nach dem Gudbrandsdal um drei neue Stationen zu errichten, und die Station Dovre zu inspizieren. Als Reise-Control-Barometer diente das Barometer Fuess No. 270. Eine Reihe Vergleichungen mit den Normalbarometern des Instituts gaben vor der Reise

1890. Juni 7—15, 10 Vergleichungen, im Mittel

Normal Fuess No. 214	$+ 0^{mm}.12 = 754^{mm}.596$		
„ Negretti & Zambra No. 640	$+ 0^{mm}.60 = 754^{mm}.616$		
	Mittel	$= 754^{mm}.606$;	Diff. $= - 0^{mm}.020$
Reisebarometer Fuess No. 270	„	$= 754^{mm}.444$	
„ „ „	Corr.	$= + 0^{mm}.162$;	M. F. $= \pm 0^{mm}.022$

Nach der Reise wurde gefunden:

1890. Juli 1—6, 10 Vergleichungen, im Mittel

Normal Fuess No. 214	$+ 0.12 = 751.990$		
„ Negretti & Zambra No. 640	$+ 0.60 = 751.957$		
	Mittel	$= 751.973$;	Diff. $= + 0^{mm}.033$
Reisebarometer Fuess No. 270	„	$= 751.808$	
„ „ „ „	Corr.	$= + 0.165^{mm}$;	M. F. $= \pm 0^{mm}.031$

Die Correction des Reisebarometers ist also dieselbe vor und nach der Reise gewesen, und auch dieselbe wie im vorigen Jahre. Die beiden Normalbarometer haben ihren gegenseitigen Stand seit 1884 nicht geändert.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen.

Tönset. Am 17. Juni 1890 wurden die Instrumente vom Herrn Steen aufgestellt, auf denselben Plätzen, wo sie früher standen. Siehe Jahrbuch für 1888. Die Station ist eine Eisenbahnstation, und liegt unweit des Glommen-Flusses. Das Thal ist hier sehr weit. Das Stationsbarometer, Adie C. 732, war gleich vor der Reise des Herrn Steen mit den Normalbarometern am Institute verglichen worden, und die Correction $= - 0^{mm}.05$ gefunden (M. F. $= \pm 0^{mm}.025$). Am 17. Juni 1890 fand Hrr. Steen durch 6 Vergleichungen mit den Reise-Control-Barometer Fuess No. 270 (siehe Jahrbuch für 1889 Vorwort) in Tönset die Correction des Stationsbarometers $= - 0^{mm}.077$ (M. F. $= \pm 0.013$). Die Beobachtungen sind mit der Correction $- 0^{mm}.05$ bei 710^{mm} berechnet worden.

Die Höhe des Barometers ist durch Eisenbahnnivellement gleich 497.9 Meter über dem Meere gefunden.

Tönset hat 2 Psychrometer mit den gewöhnlichen Beschirmungen, ausserhalb Fenstern. Das eine wendet gen NNW, das andre gen SSE. Ihre Höhe über dem Erdboden ist resp. 3.6 und 3.9 Meter.

Der Wild'sche Windstärkemesser steht am Giebel eines Hausdaches.

Der Regen- und Schnee-Messer steht im Garten. Die Oberfläche beider ist 1.2 Meter über dem Boden.

Die neue Beobachtungsreihe fing am 1. Juli 1890 an. Der Beobachter ist derselbe wie früher.

Dovre. Durch 12 Vergleichungen am 22. Juni 1891 und eine am 25. Juni mit dem Controlbarometer Fuess fand ich die Correction des Stationsbarometers Adie No. 1500 gleich $+ 0^{mm}.35$ bei 714^{mm} (M. F. $= \pm 0^{mm}.084$). Bei der Inspection im August 1886 fand ich durch 2 Reisebarometer die Correction $+ 0.50$ und $+ 0^{mm}.51$ bei 705^{mm}. Das Stationsbarometer hat also in 5 Jahren (58 Monaten) seine Correction um $0^{mm}.15$ vermindert, und diese hat sich der früher gefundenen ($+ 0^{mm}.12$ in 1877) genähert. Die gedruckten Beobachtungen vom September 1886 bis Ende 1890 sind mit $\frac{0.15}{58}$ oder 0.00259 per Monat zu vermindern oder

vom September 1886 bis Juni 1887: $0^{mm}.0$ abzuziehen
„ Juli 1887 „ Ende 1890: $0^{mm}.1$ „

In diesem Jahrbuche für 1890 sind also alle Barometerhöhen Dovres um $0^{mm}.1$ zu vermindern.

Die Thermometer wurden im August 1890 verificiert.

Rena. Diese frühere Regenmesserstation wurde im Juni 1890 zu eine Station 2. Ordnung erweitert. Die neuen Instrumente wurden vom Herrn Steen aufgestellt.

Für das Stationsbarometer Adie C. 733 wurde kurz vorher am Institut die Correction $- 0^{mm}.08$ (M. F. $= \pm 0^{mm}.026$) bei 757^{mm} gefunden. Aus 7 Vergleichungen mit dem Controlbarometer Fuess an der Station am 18. und 19. Juni fand Hrr. Steen die Correction bei 733^{mm} gleich $- 0^{mm}.141$. Nach der Kew-Correctionstabelle steigt die negative Correction aufs Normalbarometer um $0^{mm}.00225$ für eine Steigerung von einem Millimeter des Barometerstandes, ändert sich also um $- 0.053$ von 757 bis 733^{mm}. Bei dem letzten Stande sollte also die Correction $- 0.08 - 0.053$ oder $- 0.133$ sein, was mit der von Herrn Steen gefundenen Correction $- 0^{mm}.141$ sehr gut stimmt.

Nach dem Eisenbahnnivellement und der Messung des Herrn Steen ist die Meereshöhe des Barometers $229^{m}.8$.

Das Häuschen mit dem Psychrometer steht ausserhalb eines Fensters gegen NNE mit einem Schirm für die Morgensonne. Höhe der Thermometer über dem Boden $1^{m}.68$. Als Vindfahne dient ein Wimpel an einer Stange am Giebel des Hauses angebracht.

Der Regen- und Schneemesser stehen wie früher, mit ihren Oberflächen $1^{m}.3$ über dem Boden.

Rena ist eine Eisenbahnstation. Thallage am Fluss Glommen. Der Beobachter ist der Stationsvorstand. Die Beobachtungen, besonders die des feuchten Thermometers sind leider allzu oft mislungen.

Aabogen. Neue Station 2. Ordnung. Eisenbahnstation. Thallage. Die Instrumente wurden am 27. Juni 1890 vom Herrn Steen aufgestellt.

Für das Stationsbarometer Adie C. 734 war am Institut Juni 4—26 die Correction $- 0^{mm}.123$ gefunden. Aus 13 Vergleichungen am 27., 28. und 29. Juni mit dem Controlbarometer Fuess fand Hrr. Steen die Correction $- 0^{mm}.135$ (M. F. $= \pm 0^{mm}.023$). Die Beobachtungen sind mit $- 0^{mm}.14$ reduciertworden. Die nivellierte Höhe des Barometers über dem Meere ist $146^{m}.7$.

Das Thermometerhäuschen mit dem Psychrometer und Minimumthermometer steht sehr gut ausserhalb einer gen NNW wendenden Hauswand. Die Höhe der Thermometerkugeln über dem Boden ist $1^m.4$.

Auf dem südlichen Giebel des Stationsgebäudes steht die Stange mit dem Wimpel und Orientierungskreuz. Der Regen- und Schneemesser stehen auf Pfählen in einem Abstand von 40^m vom Stationsgebäude, mit ihren Oeffnungsflächen $1^m.33$ über dem Boden.

Der Stationsvorstand ist ein sehr tüchtiger Beobachter.

Röldal. Die Beobachtungen sind im Jahre 1890 leider sehr lückenhaft.

Voss. Einige Monaten haben unzuverlässliche Beobachtungen gezeigt. Diese sind nicht gedruckt worden.

Christiansund. In diesem Jahrbuch für 1890 sind alle Barometerbeobachtungen mit den in demselben Jahre (siehe Jahrbuch für 1889 S. VIII) gefundenen Correctionen reduciert worden.

Skomvær. Leuchtfeuerstation auf einem flachen Inselchen, dem allerwestlichsten der Lofotgruppe. Die Station liegt wie ein Schiff im offenen Meere. Die Instrumente wurden im Juni 1890 von der früheren Station Röst übergeführt, und haben auf Skomvær eine gute Aufstellung in einer guten Lage und einen sehr guten Beobachter gefunden.

Das Stationsbarometer Adie No. 1482 wurde das letzte Mal von mir auf Röst im Jahre 1877 inspiciert, und die Correction $-0^{mm}.10$ gefunden. Nach dem Bericht des Beobachters auf Skomvær ist dasselbe in guter Ordnung nach dieser Station angelangt. Die Höhe des Barometers ist $19^m.8$ über Mittelwasser.

Die Thermometer stehen, vor der Sonne gut geschützt, in ihrem Häuschen gen Norden und $2^m.37$ über dem Erdboden.

Der Wind wird auf dem Leuchtthurme sehr gut beobachtet.

Der Regen- und Schneemesser steht frei mit ihren Oeffningsflächen $1^m.8$ über den Boden. Das heftige Wehen des Windes scheint die Genauigkeit der Niederschlagsmessung zu beeinträchtigen. Die Beobachtungen auf Skomvær fingen im Juli 1890 an.

Prestö. Die Beobachtungen der Wassertemperatur schliessen mit dem Monat Mai.

Villa. Die Beobachtungen hörten mit dem Monat Juni auf, da die Leuchtfeuerstation nach Nordöerne übergeführt wurde und mit dieser die Instrumente.

Nordöerne. Leuchtfeuerstation an der Inselgruppe Vigten. Die Instrumente haben eine sehr gute Aufstellung und einen sehr guten Beobachter (früher Assistent auf Oxö) gefunden. Sehr freie Lage.

Vestfjorddalen. Die Beobachtungen vom Mai fehlen wegen des Todes des Beobachters. Mit dem neuen Beobachter ist der Regenmesser an einen anderen naheliegenden Ort übergeführt worden.

Varhoug. Februar und December unvollständig. Für März fehlt die Zahl der Tage mit Niederschlag.

Soggendal. Februar unvollständig. Das Fehlende interpoliert.

Vang. August fehlt wegen des Wechsels des Beobachters und des Beobachtungsortes.

Die Lage der Stationen Eidfjord, Sveingaard und Egeland ist in den früheren Jahrgängen und für die zwei letzten in den Uebersichtstabellen dieses Jahrbuchs nicht richtig angegeben. Die richtige Lage findet man in der folgenden Tabelle. Sie ist:

	Breite.	Länge E. Gr.
Eidfjord	60° 25′	7° 17′
Sveingaard	60 43	7 44
Egeland	58 48	9 6

In Bezug auf die Schwerecorrection ist auf das Jahrbuch für 1882, Vorwort, Seite III und IV zu verweisen.

Die Tabelle auf Seite VIII und IX giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchtthürmen werden die Beobachtungen vom betreffenden Leuchtfeuerverwalter ausgeführt.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —
R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens, kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, inclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[1]).

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

● Regen.	^{n} Nacht	Als Exponent
✱ Schnee.	^{a} Vormittag	
△ Graupeln.	^{p} Nachmittag	
≡ Nebel	^{o} Schwach	
⌴ Reif.	^{2} Stark	
∞ Höhenrauch.	1 Erste Beobachtungsstunde.	
⚡ Starker Wind.	2 Zweite —	
⊼ Gewitter.	3 Dritte —	
< Blitz ohne Donner.		
⋔ Nordlicht.		
⊕ Sonnenring.		
⦶ Sonnenhof.		
⦷ Mondring.		
⦸ Mondhof.		

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ●1, Regen 8^{h} Morgens; ✱3, Schnee 8^{h} Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes ^{n}, ^{a} oder ^{p}.

Interpolirte Werthe sind mit Cursiv gedruckt.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und das Normalbarometer (wahre Barometerhöhe), aber nicht auf die Meeresfläche und nicht auf die Normalschwere reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind für alle Stationen des südlichen Norwegens bis an die Breite von Trondhjem ($63^1/_2$ Grad) als Mittel der drei täglichen festen Beobachtungen und der Minimumtemperatur bestimmt. Für die Stationen, welche eine nördlichere Lage haben, ist die im Jahrbuch für 1884 Vorwort S. XII—XIII angegebene Berechnungsweise angewendet worden.

Für Christiania, Aas und Trondhjem sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt wurden.

---

[1]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II., sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet. Für Dovre, Röros und Tönset ist Correction wegen des Luftdrucks an den Mitteln angebracht worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen, J. Schroeter, C. Krafft, N. J. Nielsen, A. Graarud* und *H. Chr. Löcken* ausgeführt.

Christiania, Februar 1892.

H. Mohn.
