Inhalt.

Vorwort.

Meteorologische Litteratur, im Jahre 1897 in Norwegen erschienen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Christiania 1897.

II. Meteorologische Beobachtungen an zwölf Stationen in Norwegen 1897.

III. Monats und Jahres-Resumé für das Jahr 1897.

IV. Anhang. Beobachtungen der Bewegung der Cirruswolken 1897.

Druckfehler und Verbesserungen.

Vorwort.

Das Jahrbuch für 1897 enthält die stündlichen Luftdruck- und Temperatur-Registrierungen in Christiania, die vollständigen Terminbeobachtungen für dieselben 12 Stationen wie die vorhergehenden Jahrgänge, die Uebersichtstabellen für 57 Stationen und einen Anhang mit Cirrusbeobachtungen. Von den 57 Stationen haben 40 Quecksilberbarometer, 42 Psychrometer, 15 nur trocknes Thermometer, unter welchen 6 Leuchtfeuerstationen sind. Die in den früheren Jahrgängen mitgenommenen Regenmesserstationen sind im Jahrbuch für 1897 nicht eingenommen, da seit Juli 1895 eine erweiterte Niederschlagsmessung in Norwegen eingeführt worden ist, mit 350 Stationen ausserhalb der in diesem Jahrbuch enthaltenen, und deren Beobachtungen bald in einer besonderen Publikation mitgetheilt werden können.

Im Sommer 1897 machte ich eine Inspektionsreise nach Stationen im südlichen Norwegen. Als Reise-Kontroll-Barometer benutzte ich Wild-Fuess No. 270. Die Korrektion dieses Barometers hielt sich den ganzen Sommer hindurch nicht vollkommen konstant, wie die folgende Tabelle 1 zeigt. Ich beobachtete mit der unteren Hülfsskala auf Null gestellt. In der Tabelle bedeutet Korr. a das einfache Mittel der für Fuess 270 durch Vergleichungen mit dem Normalbarometer (Fuess No. 214 + 0.12 mm.) gefundenen Korrektionen und M. F. die mittlere Abweichung einer einzelnen Korrektionsbestimmung vom resp. Mittel derselben. Die Beobachtungen auf den Stationen sind mit einer Korrektion für Fuess No. 270 berechnet worden, gleich + 0.04 mm. für Aas, + 0.08 für Eidsvold und gleich + 0.01 für die übrigen Stationen.

Tab. 1.

1897 Tage.	Anzahl d. Beob.	Korr. a. mm.	M. F. mm.	Bemerkungen.
Mai 22—29.	14	+0.045	±0.028	
Juni 1—4.	6	+0.040	.020	
Juni 11—19.	17	+0.119	.046	
Juni 20—30.	16	+0.091	.030	beide Bar. gereinigt.
Sept. 1—10.	26	+0.115	.019	

Das Resultat der Barometervergleichungen auf der Inspektionsreise ist aus der Tabelle 2 zu ersehen. Korr. 1897 zeigt die für die Stationsbarometer gefundene Korrektion auf die wahre Barometerhöhe. Frühere Korr. zeigt den Werth der Korrektion, mit welcher früher gerechnet worden war, und △ den Unterschied zwischen der neuen und der früheren Korrektion. Die Bemerkungen, zu welchen dieser letzte Anleitung giebt, finden sich unten mitgetheilt. Wenn der genannte Unterschied nicht 0.05 mm übersteigt, wird die Korrektion des Barometers als unverändert angesehen.

An sämmtlichen Stationen, die ich besuchte, wurden die Quecksilberthermometer mit einem Normalthermometer verglichen, dessen Korrektion auf das Luftthermometer bekannt war.

In Bezug auf die einzelnen Stationen verweise ich auf die früheren Jahrgänge und folgende Bemerkungen.

Aabogen. Von November 1897 ab ein neuer Beobachter. Die Psychrometerbeobachtungen sind in den letzten Wintern von dem früheren Beobachter weniger genau gemacht worden. Dasselbe ist der Fall mit dem neuen Beobachter in den ersten Monaten seiner Funktionszeit.

Aas. Bei der Inspektion den 30. und 31. Mai 1897 wurde die konstante Korrektion des Stationsbarometers Adie No. 638 gleich +0.10 mm gefunden. Das Barometer ist ein Bischen träg. Bis am 1. Juni 1897 wurde mit der Kew-Korrektion 0.00 mm gerechnet. Indessen geben die Vergleichungen mit dem Normalbarometer am Institut in 1884 eine konstante Korrektion von +0.11 mm, und wie angeführt, die Vergleichungen am 30. und 31. Mai 1897 eine Korrektion von +0.10 mm. Vom 1. Juni ab sind die Beobachtungen mit der Korrektion +0.10 mm berechnet worden. In den Uebersichtstabellen in diesem Jahrbuch sind also die Monatsmittel für den Luftdruck für die Monate Januar bis Mai mit 0.1 mm zu vergrössern. Durch ein neues Nivellement ist die Seehöhe des Barometers gleich 89.90 Meter gefunden, anstatt der früher angenommenen 92.0 m.

Die Thermometeraufstellung est eine vorzügliche in einer Wild'schen Hütte.

Fagernes. Die Beobachtungen des Minimumthermometers und des feuchten Thermometers sind wegen des hohen Alters des Beobachters nicht zu benutzen.

Færder. Am 25. November 1897 wurden die Instrumente nach einem anderen Hause überführt. Die frühere Seehöhe des Barometers war von 13.0 m, die neue ist 8.9 m. Die frühere Höhe des Thermometers über dem Boden war 7.0 m, die neue ist 6.4. Die Luftdrucksbeobachtungen im neuen Lokal sind bis Ende des Jahres 1897 auf das Niveau 13.0 m zurückgeführt worden.

Kongens Grube hat seit Juni 1897 ein Minimumthermometer erhalten.

Listad. Am 2. November 1897 um 1 Uhr Nachm. wurde die Station nach einem dem früheren ganz nahe liegenden Haus überführt, wo die Seehöhe des Barometers 288.9 m ist. Bis am Ende des Jahres sind die Luftdrucksbeobachtungen aut die frühere Seehöhe 276.8 m reduciert worden. Die Höhe des Thermometers über dem Boden war früher 4.5 m, und ist jetzt 1.7 m.

Sydvaranger. Die Psychrometerbeobachtungen sind für die Wintermonate unbrauchbar gefunden worden.

Tonsaasen. Durch geometrisches Nivellement ist die Seehöhe des Stationsbarometers gleich 629.4 m gefunden worden. Die frühere Bestimmung (halb geom. Niv., halb barom.) derselben ergab 628.0 m.

Tönset. Die Beobachtungen für März 1897 fehlen wegen der Unzuverlässlichkeit des

früheren Beobachters. Seit April hat die Station ein neues Lokal und einen neuen Beobachter erhalten. Die neue Seehöhe ist 496.4 m und das Thermometer steht 1.7 m über dem Boden.

Ullensvang. Seit dem 1. Juni 1897 ist mit der konstanten Korrektion des Stationsbarometers +0.08 mm gerechnet.

Vang. Die Beobachtungen für Februar 1897 fehlen wegen der Abwesenheit des Beobachters.

Die folgende Tabelle giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die konstante Korrektion der Barometer, die Schwerekorrektion, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphen-, Eisenbahn- und Leuchtfeuer-Stationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —

Am 1. Januar 1895 wurde die mitteleuropäische Zeit, eine Stunde früher als Greenwich, durch Gesetz in Norwegen eingeführt. An den meisten meteorologischen Stationen wurden die früheren Beobachtungstermine beibehalten, indem die respektiven Uhrzeiten nach Normalzeit den Beobachtern mitgetheilt wurden. Nur an einigen Telegraphenstationen musste die Aenderung gemacht werden, dass die Beobachtungen auf 8 a, 2 p und 8 p Normalzeit verlegt wurden. Als aber eben diese Stationen früher nach Christiania Zeit beobachteten, und diese Zeit nur 17 Minuten später ist als die Normalzeit, hat die Aenderung nur wenig Bedeutung.

Wegen der Kontrolle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die erste Abtheilung, welche im vorigen Jahrgang neu war, enthält die stündlichen Beobachtungen für Christiania, die mit Richards Barograph und Thermograph registriert worden sind.

Der Barograph ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reducierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph steht in der Wild'sche Hütte im Park des astronomischen Observatoriums. Seine Bügel steht im Kupferhäuschen, wo das Psychrometer aufgestellt ist und ganz nahe an der Kugel des trocknen Thermometers. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf die auf das Luftthermometer reducierten Ablesungen des Normal-(Luft) Thermometers [1]).

Die Tabellen der zweiten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf **die Normalschwere** reduciert [2]). Die Reduktion auf die Normalschwere nach der Formel

$$\text{Schwerekorrektion} = b\,(-0.00259 \cos 2\varphi - 0.000000196\, H)$$

wo b die auf 0° und das Normalbarometer reducierte Barometerhöhe, φ die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerekorrektion angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerekorrektion stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerekorrektion, im Sinne unreducierte minus redu-

---

[1]) Am Institut haben wir die folgenden mit Barograph und Thermograph registrierten Beobachtungen berechnet und eingeführt in Manuskript-Tabellen wie die in diesem Jahrbuch für Christiania gedruckten.

	Luftdruck	Lufttemperatur.
Christiania.	Barogr. Richard von Juli 1892 bis jetzt.	Thermogr. Rung von Juli 1883 bis Januar 1896. Thermogr. Richard von Juni 1893 bis jetzt.
Bergen.	Barogr. Hottinger von Januar 1891 bis Oktober 1894. Barogr. Richard von August 1896 bis jetzt.	Thermogr. Richard von Sept. 1895 bis jetzt.
Trondhjem.	Barogr. Richard von Januar 1896 bis jetzt.	Thermogr. Richard von Januar 1896 bis jetzt.
Dovre.	Barogr. Richard von Januar 1896 bis jetzt.	
Aasnes.		Thermogr. Richard von Januar 1896 bis jetzt.

[2]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252 sammt Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math.-naturv. Klasse, 1896 No. 1. Side 1—15.

cierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Korrektionen der Thermometer auf das Luftthermometer reduciert worden[1]). Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m., mit dem trocknen Thermometer, korrigiert worden. Vom 1sten Januar 1894 an wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Psychrometerbeobachtungen sind seit 1895 nach Jelineks Tafeln berechnet worden, mit der Aenderung, dass, nach Ekholms Anweisung, wenn das feuchte Thermometer Kältegrade zeigt, eine Korrektion an die (für Theilungsfehler berichtigten) Ablesungen dieses Thermometers angebracht worden ist, wie diese Tabelle zeigt

Von	$-0^0.1$	bis	$-1^0.1$	Korr. =	$-0^0.1$
„	$-1\ .3$	„	$-2\ .2$	„	$-0\ .2$
„	$-2\ .4$	„	$-3\ .3$	„	$-0\ .3$
„	$-3\ .5$	„	$-4\ .4$	„	$-0\ .4$
unter	$-4\ .4$			„	$-0\ .5$.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 6 = Orkan[2]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Ueberzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden, sind nach der Bewölkungszahl angeführt worden. ● Regen; ∗ Schnee; ⁘ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. (Normalzeit).

Die Bezeichnungen sind:

●	Regen.	n	in der (vorhergehenden) Nacht
∗	Schnee.	a	vormittags
△	Graupeln.	p	nachmittags

[1]) Dies ist durch den glücklichen Umstand erreicht, dass die Korrektionen des Normalthermometers auf das Luftthermometer weniger als $0^0.05$ betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Angaben der Tagestunden beziehen sich auf mitteleuropäiche Zeit. Die Zeitangabe „früh" bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr Morgens, „spätabd" zwischen 8 Uhr Abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. „abd" ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. „mtg" umfasst die Stunden 12 bis 2.

Interpolierte Werthe sind mit Kursiv gedruckt.

Die Uebersichtstabellen der dritten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen plus eine Korrektion. Diese Korrektionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christiansand, Bergen und Bossekop abgeleitet worden.[1]) Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Korrektionsgrössen, welche für 1897 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel[2])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt.[3])

Für Christiania, Aas, Aasnes, Eg[4]) und Trondhjem sind die mittelst Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometers gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.
[2]) Siehe Met. Zeitschr. 1891, S. 253 ffg.
[3]) Siehe Jahrbuch für 1894. S. IX.
[4]) Seit 1886.

der drei Terminbeobachtungen plus eine Korrektion. Die Werthe dieser Korrektionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Jerkin, Dovre und Tonsaasen ist Korrektion wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\ q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Faktors c. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel er Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den zweiten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Cirrusbeobachtungen der Stationen Aasnes, Christiania, Trondhjem und Lödingen sind in diesem Jahrbuch nicht mitgenommen, da die Wolkenbeobachtungen dieser Stationen in einem besonderen Werke erscheinen werden.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen, N. J. Føyn. Aa. Grårud, K. Irgens, H. Chr. Löcken, N. A. J. Larsen* und *K. Maalstad* ausgeführt.
