Inhalt.

Vorwort.

Verzeichnis der Stationen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Kristiania, die der relativen Feuchtigkeit, der Windrichtung und der Windgeschwindigkeit, des Niederschlags und des luftelektrischen Potentialgefälles in Aas 1921.

II. Termin-Beobachtungen an zwölf Stationen in Norwegen 1921.

III. Mònats- und Jahres-Resumé für das Jahr 1921.

IV. Anhang I. Abweichungen der Monatsmittel 1921 vom Normalwert.

V. Anhang II. Beobachtungen der Bewegung der Cirruswolken 1921.

VI. Anhang III. Beobachtungen auf Spitzbergen in Green Harbour, Eisfjord, Juli 1920—Juni 1921, Monats- und Jahres-Resumé 1920.

Druckfehler und Verbesserungen.

Vorwort.

Das Jahrbuch für 1921 enthält stündliche Werte des Luftdrucks und der Tempeatur in Kristiania, diejenigen der relativen Feuchtigkeit, der Windrichtung und der Windgeschwindigkeit, des Niederschlags und des luftelektrischen Potentialgefälles in Aas, die vollständigen Terminbeobachtungen für 12 Stationen, die Uebersichtstabellen für 69 Stationen und drei Anhänge. Der dritte von diesen enthält die stündlichen Werte des Luftdrucks und der Temperatur, die vollständigen Terminbeobachtungen und die Uebersichtstabelle für Green Harbour in Spitzbergen.

Von den 69 Stationen haben 40 Quecksilberbarometer, 43 Psykrometer oder Haarhygrometer und 26 nur trockenes Thermometer, unter welchen 5 Leuchtfeuerstationen sind. Sämtliche Stationen haben Minimumsthermometer, während nur Kristiania, Bergen, Trondhjem und Haldde mit Maximumsthermometer versehen sind. Die Thermometer sind in kleinen Gehäusen am Fenster aufgestellt. Hütten sind nur an Stationen mit Termographen im Gebrauch.

Die Quecksilberbarometer sind beinahe ausschliesslich Adie-Stationsbarometer. Die Thermometer sind Küchlerthermometer mit Papierskala und 1/5° C, für Minimumthermometer 1/1° C Einteilung. Bei den Psykrometerbeobachtungen wird Aspirator nicht verwendet. Die Haarhygrometer, welche bei uns verwendet werden, sind ausschliesslich die Russeltvedt'schen Torsionshygrometer [1]). Folgende 20 Stationen haben diese: Røros, Tønset, Dovre, Ulstad, Vinstra, Granheim, Lillehammer, Rena, Hamar, Kutjern, Aabogen, Kristiania, Modum, Nes, Dalen, Mykland, Austad, Bergen, Søfteland, Stenkjær, Hatfjelddalen, Alten, Sydvaranger, Spitzbergen. Kristiania und Bergen beobachten ausserdem Psykrometer in allen Monaten, während Alten das Psykrometer in den Sommermonaten benutzt, weil zu der Zeit die Sonne das Hygrometer antrifft. Vergleich zwischen den Beobachtungen ist in 7 Jahren ausgeführt worden, und er hat gezeigt, dass das Russeltvedt'sche Torsionshygrometer sehr gut ist, und selbst in der warmen Jahreszeit zuverlässigere Feuchtigkeitswerte gibt, als das Psykrometer geben kann, wenn Aspirator nicht verwendet wird.

An den Stationen Kristiania, Aas, Bergen, Trondhjem, Dovre und Spitzbergen sind Richard'sche Barographen und in Kristiania, Aas, Bergen, Trondhjem, Rena und Spitzbergen Richard'sche Thermographen aufgestellt. Die Registrierungen dieser Barographen und Thermographen sind alle ausgewertet und in Manuskripttabellen eingeführt wie die in diesem Jahrbuch gedruckten Tabellen für Kristiania und Spitzbergen.

In diesem Jahrbuch sind die Stationen dieselben wie im vorhergehenden mit der Ausnahme, dass Modum, Vangsnes und Runde als neu aufgenommen sind während Kongsberg, Balestrand und Kristiansund herausgegangen sind.

---

[1]) Met. Zeitschrift 1908 S. 396—400.

In bezug auf die einzelnen Stationen wird auf die früheren Jahrgänge und auf folgende Bemerkungen verwiesen.

Aabogen. Die Beobachtungen sind vom 1. Juli 1921 an der Eisenbahnstation wieder aufgenommen.

Balestrand. Die Beobachtungen waren in mehreren Jahren weniger gut und da eine Station auf der anderen Seite des Sognefjords—Vangsnes — errichtet war, wurde beschlossen, Balestrand Station aufhören zu lassen.

Florø. Es zeigte sich, dass das Barometer einen Fehler bekommen hatte. Das Barometer wurde umgetauscht. Durch die Vernachlässigkeit der Beamten wurden doch die Barometerablesungen zum teil nicht ausgeführt. Die Luftdruckswerte fehlen daher in den meisten Monaten.

Kongsberg. Der alte Beobachter wünschte nicht die Beobachtungsarbeit zu fortsetzen und der Versuch einen anderen Beobachter zu erhalten ist missgelungen.

Modum. Neue Station vom Juni 1920 unweit von dem See Tyrifjord ca. 40 km. im W. von Kristiania.

Runde. Neue Station vom Juni 1918 an dem Leuchtfeuer Runde ca. 30 km. im SW. von Aalesund.

Vangsnes. Neue Station vom December 1920 auf der südlichen Seite des Sognefjords.

Vardø. Die Psykrometerbeobachtungen nicht zu verwenden.

Auf Seite XII sind die wichtigsten Erläuterungen über die Stationen tabellarisch gegeben. In der letzten Kolonne sind die Beobachtungsstunden angegeben, aus welchen zu sehen ist, dass die gewöhnlichen Beobachtungstermine 8 a, 2 p und 7 p nach Mitteleuropäischer Zeit sind Nur an ganz wenigen Stationen ist der Mittagstermin aus verschiedenen Gründen auf 1 p statt 2 p verlegt.

Das Jahrbuch ist in drei Abteilungen geteilt.

Die erste Abteilung enthält die stündlichen Werte des Luftdrucks und der Temperatur in Kristiania, diejenigen der relativen Feuchtigkeit, der Windrichtung und der Windgeschwindigkeit, des Niederschlags und des luftelektrischen Potentialgefälles in Aas.

Der Barograph in Kristiania ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde sind reduziert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reduzierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph in Kristiania steht in der Wild'schen Hütte im Park des astronomischen Observatoriums. Seine Angaben sind reduziert auf die auf das Luftthermometer reduzierten Ablesungen des Normalthermometers.

Der Hygrograph in Aas steht unterhalb eines auf 2 Meter hohen Phählen erbauten kleinen Hauses in 1.8 Meter Höhe über dem Erdboden. Die Angaben sind mit Hilfe eines Aspirationspsykrometers reduziert worden.

Die Windgeschwindigkeit in Aas wird jetzt mit Hilfe eines in 5.1 m. Höhe (über dem früher benutzten Windtafel) aufgestellten Robinsonschen Anemometers ermittelt. Die Werte der Windgeschwindigkeit werden elektrisch nach dem Hauptgebäude des Observatoriums überführt. Die da aufgestellte Registrieranordnung gibt ausser Detailwerten die hier aufgeführten Stundenmittel der Windgeschwindigkeit direkt.

Die Windrichtung in Aas wird mit Hilfe einer Windfahne in 4.7 m. Höhe über

dem Erdboden ermittelt. Die Fahne ist unter starker Dämpfung mit einer Registrieranordnung verbunden.

Der Niederschlag in Aas wird mit einem registrierenden Schneemesser, Süstem Hellmann, gemessen.

Die in diesem Jahrbuch angeführten Potentialregistrierungen sind durch die im Oktober 1918 aufgestellte neue Potential-Registrieranordnung erhalten.

Ausser den Stundenwerten des Luftelektrischen Potentials sind angegeben sowohl »Monatsmittel des luftelektrischen Potentialgefälles für jede Stunde« und »Täglicher Gang des luftelektrischen Potentialgefälles nach Abweichungen vom Monatsmittel« als »Monatsmittel der luftelektrischen Leitfähigkeit (für positive Elektricität) für jede Stunde» und »Täglicher Gang der luftelektrischen Leitfähigkeit nach Abweichungen vom Monatsmittel», während die Kurven der früheren Jahrgänge weggelassen sind.

Für die Mittelberechnung sind (es gilt die beiden elektrischen Elemente) nur Normaltage verwendet, für welche die Zahlen fett gedruckt sind.

Die zweite Abteilung enthält die vollständigen Terminbeobachtungen an den 12 Stationen Dovre, Kristiania, Færder, Mandal, Skudenes, Bergen, Florø, Trondhjem, Brønnø, Bodø, Alten und Vardø. Interpolierte Werte sind mit Kursiv gedruckt. Die Tabellen haben folgende Daten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0^0 C, auf das Normalbarometer und auf die Normalschwere, aber nicht auf das Meeresniveau, reduziert[1]). Die Reduktion auf die Normalschwere geschiet nach der Formel.

$$C = \frac{g - g_{45}}{g_{45}} b \text{ (für Pendelstationen) oder } C = \frac{C_0}{b_0} b,$$

wo g die Schwerebeschleunigung an der Station, g_{45} die Normalschwere (9.80616 m.), b die Barometerhöhe, reduziert auf 0^0 und das Normalbarometer, C die Schwerekorrektion bei b, C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite sind zwei zusammengehörige Werte von C und b angegeben. C wird dort C_g genannt um anzugeben, dass es sich um die Schwerekorrektion handelt. Die angegebene Barometerhöhe ist so gewählt, das die Schwerekorrektion für diese Höhe eben von einem Zehntel bis nächsten überspringt. Man sieht dann unmittelbar mit welcher Schwerekorrektion man zu rechnen hat und es ist auch ganz leicht die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumsthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m. mit dem trocknen Thermometer korrigiert worden. Vom 1. Januar 1894 an wird das Minimumsthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psykrometerbeobachtungen nach Jelineks und für Kältegrade nach Birkelands Tabellen berechnet. Für die Haarhygrometer Stationen

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252 sowie Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math. naturv. Klasse, 1896 No. 1. S. 1—15.

Dovre, Alten und Spitzbergen aus der relativen Feuchtigkeit und der Luft-Temperatur. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet oder direkt nach den korrigierten Haarhygrometerbeobachtungen genommen. 00 = 100 %.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 12 = Orkan[1]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Überzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden sind, sind nach der Bewölkungszahl angeführt worden. • Regen; * Schnee; ⁘ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern am 8 Uhr mg. gemessen, angeführt für den Tag, an welchem er gemessen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tagezeit M. E. Z.

Die Bezeichnungen sind:

● Regen.	sch.	Schauer.		n	in der (vorhergehenden) Nacht
* Schnee.	tr.	Tropfen,		a	vormittags.
△ Graupeln.	fl.	Flocken.		p	nachmittags.
≡ Nebel.	körn.	körnig.		mg.	morgens.
⌒ Tau.	o	Schwach	Als Exponent	mtg.	mittags.
⌣ Reif.	2	Stark.		abd.	abends.
⁄ Starker Vind.				I	Erste Beobachtungsstunde.
⊼ Gewitter.				II	Zweite —
< Blitz ohne Donner.				III	Dritte —
⋔ Nordlicht.				u.	und.
⊕ Sonnenring.				st.	stark.
⦶ Sonnenhof.				sp.	später.
⦷ Mondring.				-	zeitw. zeitweise.
⦷ Mondhof.					

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Zeitangabe »früh« bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr morgens, »spätabd«. zwischen 8 Uhr abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. »abd.« ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. »mtg.« umfasst die Stunden 12 bis 2.

Die dritte Abteilung enthält die Übersichtstabellen des Monats- und Jahresresumé in Mitteln und Summen. Die Tabellen haben dieselben Daten wie die der 2. Abteilung.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, aber nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen.

---

[1]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Lufttemperatur. Von den Minimumstemperaturen gilt dasselbe wie oben von denen in der zweiten Abteilung gesagt. Die Monatsmittel sind berechnet nach der Formel [1])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt [2]).

Für Kristiania, Bergen (Met. Obs.), Trondhjem und Haldde sind die mittels Maximumsthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, welche angegeben worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion [3]). Diese die aus den stündlichen Beobachtungen in Kristiania, Bergen und Bossekop (Alten) berechnet worden sind, können mit dem Abendtermin um 7 p ungeändert gebraucht werden.

Die Terminmittel für Haarhygrometerstationen sind aus den Mitteln der relativen Feuchtigkeit und der Lufttemperatur berechnet mit einer empirisch bestimmten Korrektion, die nur von der Temperatur abhängt:

Temp.	Korr.
$> 20^0$	— 0.2
15-20	— 0.1
10-15	0.0
0-10	+ 0.1
— 6-0	+ 0.2
— 10- —6	+ 0.3
< -10	+ 0.4

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden [4]).

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tage mit merkbarem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Als Schneetage sind in diesem Jahrbuche nur diejenigen gerechnet, an welchen eine messbare Menge gefallen ist. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Als Tage mit Nebel sind auch diejenigen gerechnet, wo schwache Nebel vorhanden war, aber Tage mit Bodennebel sind nicht mitgezählt. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Als Gewittertage sind diejenigen gerechnet, an welchen Donner gehört wurde. Übrigens sind die Angaben der Gewitter bei den meisten Stationen ganz unvollständig. Sturmtage sind solche, an

[1]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg.
[2]) Siehe Jahrbuch für 1920. S. IX.
[3]) Die Werte dieser Korrektion sind angegeben im Jahrbuch für 1891, S. XV.
[4]) Die Werte des Faktors c sind angegeben im Jahrbuch für 1920, S. XI.

welchen die Windstärke über 8 notiert ist. Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergibt. Die Angaben von Trondhjem sind doch ziemlich vollständig.

Die Windverteilung ist direkt aus den notierten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtturmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr morgens.

Sonst gelten für die Übersichtstabellen dieselben Bemerkungen wie für den zweiten Teil.

Anhang I enthält die Abweichungen der Monatsmittel des Luftdrucks und der Temperatur vom Normalwert für beziehungsweise 10 und 19 Stationen. Die verwendeten Normalperioden sind für Luftdruck (1866—95) und für Temperatur (1841—90).

Anhang II gibt Beobachtungen über die Bewegung der Cirruswolken über Kristiania Kongsberg und Trondhjem. Die Beobachtungen sind ohne Hilfsapparäte gemacht und deshalb ist nur die Zugrichtung angegeben.

Anhang III enthält die Beobachtungen an der norwegischen Radiostation in Green Harbour auf Spitzbergen vom Juli 1920 bis Juni 1921 nebst einem Monats- und Jahresresumé für das Jahr 1920.

Die stündlichen, aus den Registrierungen eines Richards Barographen herausgenommenen Luftdruckswerte sind auf die Angaben des Stationsbarometers reduziert. Die Seehöhe des Stationsbarometers ist 11,4 Meter.

Der Thermograph steht in einer norwegischen Thermometerhütte und die stündlichen Temperaturwerte sind auf die Angaben eines dortigen Quecksilberthermometers reduziert.

Kristiania, Juli 1922.
