LETTER OF TRANSMITTAL

UNITED STATES DEPARTMENT OF AGRICULTURE,
WEATHER BUREAU,
Washington, October 12, 1926.

SIR: I have the honor to submit herewith a report of the operations of the Weather Bureau during the fiscal year ended June 30, 1926.

Respectfully,

C. F. MARVIN,
Chief of Bureau.

Hon. W. M. JARDINE,
Secretary of Agriculture.

REPORT

OF THE

CHIEF OF THE WEATHER BUREAU

Conforming to the plan inaugurated a year ago in the interest of economy in printing, the annual report of the Chief of the Weather Bureau for the fiscal year ending June 30, 1926, is submitted in greatly abridged form.

This is the fifty-sixth year of the operation of the meteorological service of the United States, and for a score of years or more the field of effort has covered practically every feature of meteorology in a service for the benefit of agriculture, commerce, and navigation. The details of these activities have been covered in previous annual reports, and it need be said now only that the work has been maintained at even a higher stage of efficiency and economy, based on experience, than heretofore.

The beneficial effects of the operation of the provisions of reclassification and of retirement of civil employees have expressed themselves in numerous ways, and the personnel of the organization are perhaps in a more satisfied and contented state than at any time since the beginning of the war. Further improvements are gradually being worked out in these respects, and the entire organization of the Weather Bureau is in a good condition.

LEGISLATION IN SUPPORT OF AIR NAVIGATION

Many of the public will recall the great agitation that prevailed during a considerable portion of the calendar years 1925 and 1926 in connection with the governmental policy concerning aeronautics. The final outcome of this has been a very satisfactory and definite program of support of both civil and commercial aviation on the part of the Government, in the form of more definite programs for the military branches of the Government, and the enactment of the so-called air commerce act, which had been before Congress in various forms for several years and which charges the Secretary of Commerce with important responsibilities in regard to civil aeronautics. Certain sections of this legislation conclusively define and describe certain duties of the Chief of the Weather Bureau in respect to the conduct of meteorological observations and advices for the benefit of aviation.

During the last days of Congress appropriations were made for carrying into effect the provisions of the air commerce act, and include items for the extension of Weather Bureau work in this field. As these appropriations were not available until the beginning of the new fiscal year, the discussion of work and activities in this field is appropriately deferred until the next annual report.

FIRE-WEATHER WARNINGS

The enormous economic losses suffered by the public and private forest interests as the result of forest fires have impressed upon the bureau the importance of furnishing meteorological advices and information to Federal, State and private forest interests regarding weather conditions adverse to or favorable for the inception and spread of fires. The need of funds with which to organize work of this character was stressed in previous years without success until emphatically urged by representatives of the great lumber and forestry interests in the western section of the country. As a result certain special appropriations were made available to the Weather Bureau for the development and extension of the fire-weather warning work which had been inaugurated several years before in a tentative way on a part-time basis, with the cooperation of private forestry interests who bore part of the expenses.

As the result of the definite appropriations made for the purpose, a conference was held at Portland, Oreg., in the spring, between representatives of the Weather Bureau, including the chief of the bureau, and Federal, State, and private agencies of the Northwest interested in the forest-fire fighting problem. The whole program of meteorological service in aid of forest-fire fighting is necessarily a cooperative one, requiring the closest coordination of effort of the forest-fire fighting agencies with the forecasters and meteorologists who supply the weather information.

The conference in question is believed to have been productive of a highly satisfactory understanding, and as a result of the conference an outline of the program of work for the fiscal year beginning July 1, 1926, was formulated. It is hoped that the details of this work may be more fully presented and reported upon in the next annual report.

PRECIPITATION AND THE LEVEL OF THE GREAT LAKES

It seems appropriate at this point to comment on one of the more notable contributions to the work of the bureau during the past year, namely, the publication of a carefully prepared digest of all of the observations available from 1875 to 1924 concerning the precipitation in the drainage area of the Great Lakes, by P. C. Day, in charge of the Climatological Division. The problem of the decreasing levels of the Great Lakes has become one of critical importance to the States and municipalities adjacent to the lakes, and especially to the shipping traversing those waters. It is believed that the publication of these definite facts concerning the water supply of the Great Lakes serves a very definite and valuable purpose in stabilizing thought regarding the causes of changes in lake levels.

Those interested in the question must of course consult the original publication, but it seems proper briefly to state that for a score of years or so the records show a general deficiency of precipitation as compared to averages of annual precipitation prevailing over an equal period of years preceding the opening of the twentieth century. The Weather Bureau is disposed to believe such differences in precipitation represent changes over relatively short intervals of time, and that recurrences of wet periods, so called, may reasonably be expected, in which case it is the bureau's opinion that there will be a corresponding increase in the lake levels, with the accompanying benefits to shipping and other interests.

REVIEW OF WEATHER CONDITIONS DURING THE YEAR 1925

By P. C. Day, Meteorologist and Chief of Division

Among the important weather events of the year the following appear as of particular note:

The persistence of unusual warmth during the months of February, March, and April over practically all parts of the United States and Canada, constituting a period of excess in temperature that for extent of territory covered and amount of excess has not been experienced previously in the history of meteorological observations in the territory covered. In addition to the unusual warmth experienced during the three months mentioned there was nearly everywhere a marked deficiency in the precipitation as well.

The severe tornado that occurred in the early afternoon of March 18, starting in southeastern Missouri and moving east-northeast over southern Illinois into southern Indiana, was attended by the loss of nearly 700 lives and damage to property of approximately $16,000,000.

The marked variations in temperature over much of the interior valleys and eastern districts from May 22 to 24, when both the highest and lowest temperatures ever observed in May, were reported from many points.

The severe drought in the southern Appalachian Mountain region and near-by areas that began in the spring and continued with increasing severity during the summer months, not terminating until September over much of the area, and in some localities most affected continuing well into October.

In September unusual heat prevailed to a more or less extent over much of the country from the Rocky Mountains eastward. This was particularly the case during the first three weeks. In portions of the Ohio and lower Mississippi Valleys and thence eastward the average temperatures for the month were the highest of record, and previous individual high temperatures were exceeded by several degrees in numerous instances.

Notably cold weather occurred in October, in marked contrast with the unusual heat of the preceding month, this being particularly the case from the Dakotas and Nebraska eastward to the upper Lake region and Illinois.

JANUARY

The first month of 1925 was marked by comparatively steady winter weather, though Florida and adjacent districts experienced prolonged warmth, and the far Northwest had almost unbroken mild weather, but the middle Rocky Mountain and eastern middle Plateau areas had steady cold, so that the month was one of the coldest ever experienced there. After the 20th warm weather prevailed in the Pacific and northern Plateau States and over practically all of the Missouri Valley, save that in the latter a cold wave was felt about the 27th; but in the Northeast, especially in Vermont and the interior of New York, this 11-day period was decidedly cold.

The month averaged colder than normal in most parts of Utah, Colorado, and Nebraska, and the districts to southward, likewise in lower Michigan, central Ohio, and most of West Virginia and the Carolinas, and in nearly all portions to eastward of these. In the rest of the country, which was just about one-half, the month averaged warmer than normal, decidedly so in western Montana and considerably so from northwestern Minnesota to the north Pacific coast, also in Florida and southern Georgia.

There was more than the normal precipitation in the far Northwest, where the falls were rather well distributed through the month. From California to central Texas and to the northeastward as far as or beyond the middle part of the Canadian boundary and the Great Lakes there was a marked deficiency, especially in Arizona and the southern portions of Utah, Nevada, and California. Over the southern drainage of the Ohio River and in New England there was usually somewhat less precipitation than normal. In the Atlantic States otherwise, and in the Gulf States (except in Texas only the eastern part), there was more than the normal precipitation, notably from Louisiana to southeastern Virginia; the climax was in Georgia where the average rainfall of the State was close to 11 inches. Most of the rain in the Southeast came between the 9th and the 21st, and severe floods resulted.

Snowfall was unusually heavy in Pennsylvania, interior New York, and northern and western New England, owing chiefly to a heavy fall during the closing week. In the central valleys and the upper Lake region there was less than the January average. The middle and southern portions of the far West had less snow in elevated districts than normal, but Oregon, Washington, Idaho, and northwestern Montana generally had more than the normal.

FEBRUARY

Marked warmth for winter and scarcity of rain and snow characterized the month. During the first few days there was some cold weather in the eastern half, chiefly near the northern border from Minnesota eastward, but the remainder of the first decade was unseasonably mild practically throughout the country, except close to the Pacific and Gulf coasts. Many portions had colder weather part of the time between the 10th and 15th, the Southeast particularly, but it usually did not last long. The period from the 15th to the 25th was mainly mild, but the final days brought an emphatic change to colder in nearly all parts east of the Rocky Mountains.

In New York, Virginia, Texas, Oklahoma, and Wyoming this month had a higher average temperature than any other February since state-wide records started, and in nearly all States it was among the very warmest Februarys. The excess of temperature was greatest in Idaho, Wyoming, eastern Colorado, northwestern Texas, and to eastward very nearly to the Mississippi River, and again in the upper Ohio Valley and to eastward and northeastward. Every regular station and almost every cooperative station in the country showed a monthly mean temperature above normal, but the departures were least in the southern parts of California and Florida and near Lake Superior.

In the Pacific coast districts the precipitation was well distributed through the month, but in the lower Missouri Valley it came largely about the 22d, and in the central valleys and thence southeastward to the southern Appalachians about the 15th and the 22d. In the Northeast the most important precipitation was about the 11th. The districts just named include almost all in which the monthly amounts were either above or fairly close to the normals.

The deficiencies in February precipitation, which were found in most of the States, were very marked in Arizona, New Mexico, and southern California; also in the southern half of the Plains and from Texas along the Gulf and Atlantic coasts as far as New York.

The month's snowfall was decidedly light, particularly in southern New England and Pennsylvania and to southwestward and westward over the States bordering the Ohio River and as far west as the central Plains. The western mountains received little save at considerable elevations.

MARCH

The month, like February, was notable for unseasonable warmth and dryness. There were however, two cold spells; the first, during the opening days, being felt chiefly from the Plains States eastward, especially in the Southeastern States on the 3d, and the other about the middle of the month over nearly all the country, although the Atlantic and east Gulf areas were not much affected. The last few days were mainly cool over eastern and southeastern districts and in large portions of the Pacific States.

The average temperature of the month was above normal everywhere, save along parts of the Pacific coast. The most marked departures were in New Jersey and Pennsylvania and to northeastward and between the Mississippi River and the Rocky Mountains, the States of Nebraska and South Dakota averaging more than 6° warmer than normal.

Along the immediate north Pacific coast there was considerable precipitation, though practically at no point as much as normal. Many parts of California had liberal rains coming chiefly during the second half of the first decade and within the last five days of the month. In Montana and some adjacent areas there was considerable precipitation, the bulk of it occurring between the 5th and 15th. To eastward of the 100th meridian the middle decade included the greater part of the precipitation, save that New York and New England had much during the final week. Only in Montana, New York, and New England were the section averages of precipitation more than the respective normals, but much of California reported amounts near normal, likewise much of the lower Missouri Valley and a strip from northern Louisiana eastward and northeastward across the southern end of the Appalachian region to the coast of North Carolina.

The month was dry over the greater part of the cotton region; in Texas only the most southern and eastern portions had worth-while rains, and western Oklahoma, southeastern Georgia, and other areas had unusually little. To northward of the cotton region large shortages were reported from South Dakota and nearly all parts of Minnesota and Iowa, and from most of Virginia and southern Maryland.

The snowfall of the month was generally light, though from Montana to Minnesota considerable occurred, likewise in the northern parts of New York and New England. In the high portions of the Western States there was snowfall of importance in but few areas, the western slope of the Sierra Nevada being one of them. Upon the whole the prospects for water supply were poor, though hardly anywhere as poor as in the worst of recent years.

A notable feature of the weather during March, 1925, was the great tornado that occurred in the early afternoon of the 18th, extending from a point in southeastern Missouri east-

northeast for a distance of over 200 miles across southern Illinois and into southern Indiana. The loss of life, nearly 700, and damage to property, about $16,000,000, were the greatest ever experienced in the United States from a single storm of this character.

APRIL

This was the third month in succession to show, for the country as a whole, abnormal dryness and warmth. During the first week rather cool weather prevailed in portions of the East, and likewise in the far Southwest; then, for a fortnight, marked warmth prevailed, save that it was cool about the 18th to 22d in the Lake region and the Northeast. From the 22d onward the weather was decidedly warm over most of the eastern half, particularly in the central valleys and the southern Lake region, but cool weather dominated the West and it advanced eastward steadily. As the month ended the low temperatures had reached the East, but warmer weather had set in over much of the far West.

The month everywhere averaged warmer than normal, save in southern Florida, and there was a marked excess from the vicinity of the Mississippi River and northern Minnesota westward almost to the Rocky Mountains.

Early in the month there was considerable rain in California; also in a strip extending southeastward from Wyoming to Georgia and adjacent States there were irregular amounts, but usually enough to be of great benefit. The central districts had imporant rainfall locally during each week, but the distribution was uneven. From the upper Mississippi Valley eastward to New York and New England the most important precipitation of the month came about the 17th to 21st, some of the northernmost portions reporting an unusually heavy snowfall for April; also about this time there was considerable precipitation in the Pacific States. During the latter part of the month there was much precipitation for the region over a strip from Arizona northward to Montana, and heavy rains fell over most of Oklahoma and parts of adjoining States; also during the very last days considerable rain fell in portions of central and southeastern Texas and from central North Carolina northward.

There was more than the normal precipitation in most districts west of the Continental Divide, notably in central and northwestern California; however, the eastern parts of Utah and Arizona mainly had but little. Near the Canadian border from western Montana to north-central Minnesota there was a moderate excess and likewise in most of Oklahoma and Kansas, with northern Texas and western Missouri.

Much of the greater part of the country had less than the normal April rainfall, and the shortage was marked in New Mexico and Colorado, southwestern and central Texas, practically everywhere along the Gulf coast and inland from it at least 200 miles, and in northern Michigan, northern and eastern Ohio, and central Maine.

MAY

The tendency to scanty precipitation over most of the country continued in May, but the temperature conditions for the eastern half showed a marked change from the months just before, May being decidedly cool. From the Rocky Mountains eastward cool weather for the time of year was practically continuous during the first half, but meantime it was warm in the far West, especially in the middle and southern parts of the Plateau. The latter part of the second decade was warm in the Gulf States, and a brief period of marked warmth prevailed in the eastern half of the country about the 20th to 23d; then an abrupt change to unseasonable cold came, particularly from the middle and northern Plains eastward, but the last few days of the month were mainly warm there.

In the Rocky Mountain States and to westward, though not in California, it was very nearly the warmest May of record, while at practically every station in the eastern half of the country the month averaged cooler than normal, much of the upper Ohio Valley and the interior of the Middle Atlantic States being about as cool as in any May before within the last 30 or 40 years.

In the southern half of Florida there were important rains during at least part of each week. Washington had its chief rains about the 7th, but Oregon and California during the middle decade, and most parts of the South Atlantic States had moderate to ample rains during this decade, while West Virginia and near-by districts had considerable about the 10th. Much of the lower Missouri Valley had moderate falls about the 12th to 16th, the middle and west Gulf regions about the 6th to 12th, and, finally, the lower Rio Grande Valley received heavy falls, not well distributed, during the last few days of the month.

In the upper Mississippi Valley, the upper Lake region, and the northern drainage of the Ohio River the monthly amounts of some States appear as the least of record for May, while large shortages are found locally from the lower Ohio Valley southeastward to southern Georgia and southwestward over Arkansas to eastern and east-central Texas, also along the coast from

southern New Jersey to southeastern North Carolina. Other regions of marked deficiencies were the middle Missouri Valley, southern Kansas, northern Oklahoma, and central and southern Wyoming, with most of Colorado and southern Utah. There was more rain than normal in central and northern California and south-central Oregon, in a strip from eastern Washington southeastward to the Black Hills, in most of eastern New Mexico, and southwestern, west-central, and northern Texas, in nearly all of the Florida Peninsula, and in a few other scattered areas.

JUNE

The first decade was marked by a prolonged heated period, about as intense as has ever been experienced in June, over the eastern half, with the greatest abnormality east of the Mississippi River and north of the Ohio and the State of Virginia. Meantime it was cool for June in most of the western half, notably in the middle Plateau region and most of Idaho, Wyoming, and Montana. From the 10th to the middle of the month the temperature tendencies continued nearly as before, though less intense in degree. During the latter half warmth prevailed without important break in the western half and almost throughout the cotton States, with very hot weather in the interior portions of the Pacific States and the western Plateau area; but the north-central and northeastern parts of the country, while mainly warm until the 22d, were usually cooler than normal afterward.

From Texas, Oklahoma, and Kansas eastward and northeastward the month averaged usually 4° or more above normal, and in many instances it was the warmest June or among the warmest in many years. In each of the Pacific States, also in Idaho and Montana, June completed a half year with every month averaging warmer than normal.

The rainfall distribution was decidedly irregular. During the first half there were frequent showers in many parts of the far West, and especially in most northern districts lying to westward of the upper Lakes and in the middle and lower Missouri Valley. Furthermore, after the 7th there were moderate to excessive amounts in most districts within a hundred miles or two of the coast from Virginia to Texas. After the middle of June few districts, save in the north-central portion, had important rains till the 22d; but during the latter part of the month most States in the upper or middle Mississippi Valley and to eastward had moderate to heavy rainfall, and the relief of droughty conditions was very timely in Kentucky, Pennsylvania, and elsewhere; also much of the Plateau region had rains of great benefit.

June, as a whole, had deficient rainfall in almost every State east of the Mississippi River; the shortage was particularly marked in the northern parts of Mississippi, Alabama, and Georgia. Northern Missouri and adjacent districts had very large monthly totals, and to northward there was a considerable excess as far as the Canadian boundary. In the States of the western half, Oklahoma, Texas, and New Mexico had much less than normal, and large parts of the latter two were in dire need of rain; also the North Pacific States had less than normal; otherwise the Western States had more than normal, and some of the Plateau States, where the usual amounts are small, had over three times the normal.

JULY

The first two weeks were hot in nearly all the States, especially in the middle and southern Plains, but in the vicinity of Lake Superior and to eastward and southeastward there was cool weather for the season part of this time. From about the 15th to the end, temperatures varied more than previously, but they were mainly above normal in the western half, though not in the Dakotas and adjacent districts after the 20th, and they continued mostly very high in Arkansas and Louisiana and thence eastward to the south Atlantic coast; but this period was almost wholly cooler than normal in Missouri, Kentucky, and Virginia, and all the States to northward.

The month was mainly warmer than normal over the southern half, also nearly everywhere west of the 105th meridian. In Idaho and adjoining districts, in the southern half of the Plains, and in the southern Appalachian region it was much hotter than the July average, in a few areas the hottest July of record. It averaged cooler than normal in most of the Dakotas and Minnesota and in practically all the States east of the Mississippi and north of the Ohio and Potomac, and was especially cool in the northern portions of New York and New England.

The precipitation averaged mostly more than normal west of the 100th meridian, except it was scanty near the northern border from North Dakota to Washington. Most of the rains in these western areas came during the first week or the final decade. Over the eastern half the distribution was mainly good, but the totals were below normal, on the whole, and were unfavorably small in central, southern, and eastern Texas, in most of the Missouri, middle Mississippi, and lower Ohio Valleys, and from the latter southeast to the Carolinas. There was a marked excess, however, over New Jersey, eastern Pennsylvania, and large parts of New York and New England. Arkansas, western Tennessee, and most parts of Mississippi and Alabama had been suffering for several months from unusually dry weather, and July

brought more than normal rain to the first two and not much less than normal to Mississippi and Alabama. In Wisconsin, as a whole, and in southern Michigan the rainfall was above normal and mainly beneficial.

AUGUST

The first decade was mostly warmer than normal along the northern border and in the Pacific States, while it inclined to be cooler than normal in the Appalachian region and the middle and southern Plains. From the beginning of the middle decade to the end of the month hot weather was fairly constant between the Appalachians and the Rockies, while the region to westward was usually cooler than normal; also the Atlantic States had considerable cool weather after the 20th.

The month averaged warmer than normal practically everywhere between the Rocky and the Appalachian Mountains, also in nearly all districts near the Canadian border, and in most of the South Atlantic States; yet the excesses were mainly small. In most districts west of the Rocky Mountains, except the northernmost, it was moderately cooler than normal, likewise eastward to include the western third of Kansas and the western half of Texas, and in the Middle Atlantic States. In California and most of the far Northwest August was the first month during 1925 to average cooler than normal.

The first decade brought considerable rains in central and southern Florida, and from about the 10th to the 20th there were important rains from eastern Nebraska and northeastern Kansas eastward to the middle Ohio Valley; the northwestern and some other parts of Florida had much rain during the final three weeks, and the last week brought considerable amounts in several areas scattered from central Texas to eastern Nevada and southern Idaho and also in parts of Washington, Kansas, and the upper Lakes.

In the western third the majority of the States had somewhat more than their normal August amounts; but from the Plains eastward only four States—Kansas, Nebraska, Iowa, and Florida—had more than their normal amounts, and practically all the Southeastern States, except Florida, less than half, South Carolina receiving but about one-quarter. Most of this southeastern portion, particularly the southern Appalachians, had been suffering from drought before August came, so the situation there grew very serious. In several other States, as Oklahoma, North Dakota, New Jersey, and Maine, the rainfall was decidedly scanty. Usually in the Northeastern States and the Lake region conditions were not dry when August began, so the August shortage of rainfall was not serious.

SEPTEMBER

September was mainly a month of abnormal weather, averaging very hot over a large portion, being decidedly wet in some States, and in others, where severe drought had previously set in, bringing no important relief.

Hot weather was the rule for the first three weeks in the Plains States and to eastward, the opening week being especially hot in the Missouri and Mississippi Valleys and from the Ohio River and Pennsylvania southward. The heat persisted most notably in the southeastern portion of the country, though there the second week was less hot than the first, but just after the middle of the month it was about as hot as before in the lower Mississippi Valley and thence westward over the southern Plains. Meantime moderately cool weather reached some districts, particularly the interior of California and the middle and southern Plateau region, and about the middle of the month Montana, North Dakota, and some near-by areas had rather cool weather for a time. The last few days of the month were marked by continuation of the heat in the lower Mississippi Valley and to eastward, also it was warm in the extreme Northwest; but there was considerable cool weather in the Lake region, the Northeast, and the southern half of the Plains.

September averaged warmer than normal almost everywhere east of the Continental Divide, also in most of Washington; but it was somewhat cooler than normal in northern New England and over most districts west of the Divide, especially in Nevada and California. From Arkansas, Missouri, and Illinois southeastward to Florida, Georgia, and South Carolina there has been no hotter September in the last 30 years or more, and at some stations with 50-year records no previous September is found within 3° or more of the average temperature of the present one. When the highest temperatures are studied, it appears that in Tennessee, the East Gulf States, and the interior parts of Georgia and the Carolinas all previous records were passed at numerous stations; while the previous September high marks were exceeded, sometimes by 6° or more, from southern Illinois and western Arkansas and Louisiana eastward, but not often in Florida or the Virginias.

There were rains of great importance during the second week in the Lake region and the upper Mississippi Valley and to southward and southwestward; and near the end irregular rainfall, usually ample and locally excessive, came to the middle and lower Mississippi Valley,

Oklahoma, and Texas. About the 16th to 20th liberal rains fell over much of Arizona, Utah, and Nevada. Other rains were mainly of moderate to light amount or else reached only comparatively small areas.

The rainfall was below normal in much of the northern Plains, and especially in the Atlantic States from New Jersey southward, the East Gulf States, and Tennessee. There was more than normal in nearly all northern-border States and almost throughout the far West; also in Ohio, Indiana, Illinois, and Kentucky, in the States next west of the Mississippi River, and especially in Kansas, Oklahoma, and Texas. In Oklahoma the amounts averaged more than twice the normal, while in Texas each division showed an excess and the month broke a string of 11 successive months with less precipitation than normal.

In the eastern half of Tennessee, the western parts of the Carolinas, and most of Georgia the rainfall was more or less scanty, and, with intense heat and the long-continued dryness of preceding months, great loss, inconvenience, and suffering resulted.

OCTOBER

There is seldom as great a contrast in the temperature features of two successive months as with September and October of 1925. Instead of the marked heat of September from the central valleys eastward and southeastward, October had unseasonable cold, substantially all the Missouri and upper Mississippi Valleys suffering from weather more fitting for November.

For the first two decades nearly all the country was cold, the north-central portion particularly, but several Atlantic and Gulf districts were warmer than normal during parts or all of this period. From the 20th to the end temperatures were mainly above normal west of the Rocky Mountains, but continued low to the east save in portions of Florida. The temperatures during the last four days lowered the previous October records by several degrees at numerous stations in the central portion, especially in the lower Missouri Valley. During the period of nearly 40 years that the State of Missouri has been well covered by reporting stations, there had hitherto been no lower October mark than 11° above, but on the 30th two points recorded 3° below zero.

The month averaged colder than normal in almost every State and about 10° to 12° colder from the Dakotas and Nebraska eastward to Wisconsin and Illinois. During half a century in Nebraska no other October was within 4° of being as cold as this. However, a small area in the southeastern part of the country averaged a little warmer than normal; also an area along the Pacific coast from central California to Canada.

The precipitation was, on the whole, more plentiful and better distributed through the month and over the country than in most fall months. Early in the month part of southern California and southwestern Arizona, much of Utah, and some other far western areas received large amounts for the time of the year; also the upper Mississippi and central valleys had heavy rains. From a little before the middle of the month onward to the close there were periods of much rain from the eastern parts of Texas, Oklahoma, and southern Missouri to the Appalachians and about as far north as the Ohio River; also most Eastern States had some important rains, especially about the 25th.

In the far Northwest and over northern and central California the month was notably dry, but otherwise the western half of the country had mainly more precipitation than normal, notably a strip from southern California northeastward to the western portions of Nebraska and South Dakota. The rest of Nebraska and the Dakotas, also Minnesota and Wisconsin, had less than normal, and likewise some districts along the south Atlantic coast. The bulk of the eastern half of the country had a considerable excess, some portions of eastern Texas having fully three times the normal, and the amounts were notably large over a strip extending thence northeastward to West Virginia.

Most northern and central districts from the Rocky Mountains eastward received unusual amounts of snow for October, the falls being chiefly during the final few days.

NOVEMBER

On the whole, November was not very different from the average, thus being in decided contrast with October and September. However, the first decade was mainly quite cold, especially in the north-central portion. During the middle decade and the first part of the last rather warm weather prevailed, especially near the northern border, but there was much cool weather in the southern portions from Arizona to Alabama. The final few days were warmer than normal nearly throughout the western half and the lower Mississippi Valley, but cooler than normal to eastward.

The average temperature for the month did not depart materially from the normal, no important section having averages more than 4° on either side of the normal.

The precipitation was not well distributed over the country, but was hardly anywhere seriously deficient. On the opening days there was much rain in the Southeast, and about the 3d to 8th there were large falls over most of an area extending from eastern Texas to the middle Ohio Valley. The North Pacific States and the northern half of California had important precipitation about the 8th to 17th. Much of the country east of the Mississippi River, particularly the Gulf coast, had liberal rains about the middle of the month; then for over a week scarcely any State had important rainfall or snowfall. The far Northwest and a small part of California received considerable precipitation during the final week, and moderate amounts occurred in the Ohio Valley and northeastward about the 27th. As the month was ending southeastern Florida was visited by a remarkably heavy downpour.

The precipitation of the month was near normal in most of the Atlantic States and the Lake region and was inclined to exceed the normal in the Gulf and central valley regions. A strip from eastern Texas to northern Mississippi had decidedly excessive amounts. From northern Kansas north and northeast, also almost throughout the Mountain and Plateau regions and western Texas, the precipitation was less than normal; and in the Pacific region the falls were mainly below, though the northern third of California and the western halves of Oregon and Washington had rather large amounts.

The snowfall of November was hardly anywhere notably heavy for the season, though considerable in eastern Iowa and near-by parts of Illinois and Wisconsin, and also in eastern Colorado and adjacent parts of other States. In the mountain portions of the far West the amounts of snow were usually less than normal.

DECEMBER

Except for a rather severe cold spell late in the month, decidedly wintry features were hardly to be found in the weather of December. Comparatively mild weather prevailed almost constantly during the first half. After the 15th somewhat colder weather was the rule, save that mildness continued over large areas west of the Continental Divide to the end of the month, and in most parts of the Atlantic States temperatures were near or above normal till the 24th or 25th. In the lower Mississippi Valley and thence westward to the Rio Grande quite cool weather prevailed nearly all the time after the 16th. The notable cold wave of the month entered the northern Plains on the 26th and spread rapidly southward and eastward till substantially all the eastern two-thirds of the country was under its influence; yet temperatures mainly had an upward trend before the month closed.

The month averaged a little warmer than normal in most of the Northeast, but about all the rest of the eastern half averaged colder, notably the upper and middle Mississippi and lower Ohio Valleys. In nearly all of Texas and New Mexico, also eastern Oklahoma, the temperature averaged below normal. The western half of the country, save as just noted, had a warm December, especially Montana and adjacent districts.

As a whole, the precipitation was scanty. During the first few days the Atlantic States had much rain, chiefly from a storm which struck Florida before November ended. Large portions of California had considerable rain about this time, and about the 4th there was fairly heavy snow in most of Iowa and Wisconsin and in some adjacent districts. About the 14th considerable snow and rain occurred from southeastern Wyoming to northwestern Missouri, and much rain from eastern Texas to the South Atlantic States. In the extreme Northwest precipitation was frequent until about the 24th, and for the last week of this period the wet area extended eastward into the upper Missouri Valley; also about the 18th there was again considerable precipitation in California. About the 21st the Atlantic States received much, but the final week brought most portions of the country but very little; in the vicinity of the south Texas coast, however, there was rain with much more sleet and snow than are often seen in that region; and eastward to the mouth of the Mississippi the coast districts had considerable precipitation, and also the vicinity of the Mexican border westward to southeastern California.

In Florida and portions of the south Atlantic coast region the rainfall of the month was much above normal, and in the remaining Atlantic States and near the Gulf coast, and from Wisconsin to Wyoming and from eastern Montana to the north Pacific coast the monthly precipitation was about normal. Marked deficiencies were the rule from central Texas, Arkansas, and Missouri westward to the California coast; also in the Ohio Valley, the State of Kentucky averaging less than 1 inch, while its December normal is over 4 inches.

The December snowfall, though widely distributed, was mainly scanty, notably in most mountain areas of the far West. However, from southeastern Wyoming to southern Wisconsin amounts exceeded the normals for the month.

15029—27——2

TORNADOES, 1925

The tornadoes of 1925 are individually described in the paragraphs following, the sections of the Climatological Service, almost always equivalent to States, being taken up alphabetically, then the tornadoes within their limits in chronological sequence. The Monthly Weather Review and the section reports have printed accounts of the more important ones, and almost all were mentioned in the Review's table, "Severe local storms," which lists many kinds of storms besides tornadoes; but in a few cases the information came too late for such mention, while in other cases additional information has led to a change in the classification of the storm which the table indicated.

During 1925 there were more tornadoes than usual, 119 being counted, not so many as in 1924 when 130 were noted, or in 1917 when 121 came to attention, but more than in any other recent year.

It is seldom that one tornado stands out so conspicuously in the year's list as in 1925. The great tornado of March 18 caused more than six-sevenths of the deaths (689 out of 794) and more than two-thirds of the reported property losses due to the tornadoes of the entire year. The seven less important tornadoes of that day took together 51 lives, and the 111 tornadoes of the other days of the year 54 lives.

The loss of life from the tornadoes of the year was 794, a score not equaled by any year since 1884, and perhaps not by that year, though 1896 scored 520, almost two-thirds the number for 1925. March, with 740 deaths, was far ahead of any other month, October, with 26, coming next. January, September, and November were without tornado fatalities, and the other seven months recorded deaths as follows: February, 1; April, 7; May, 3; June, 10; July, 1; August, 2; December, 4. The State of Illinois had 606 tornado deaths, Indiana coming next with 74; in all, tornado fatalities occurred in 16 States, and occurred as the results of 26 among the 119 tornadoes.

As in 1924, no month of 1925 was without tornadoes, indeed the smallest count for any month was 4, reached in January, August, September, and November. June led, with 38 tornadoes, April standing next with just half as many, 19. The other six months had these counts: February, 6; March, 10; May, 5; July, 12; October, 8; December, 5.

On June 2 there were 9 distinct tornadoes, that day leading all the other days of the year in this respect. There were, however, but six deaths resulting. Next among days for number of tornadoes was the memorable 18th of March, with 8 tornadoes and 740 deaths. In all, 65 days recorded tornadoes, just 40 of these days being within the four-month period, April to July, inclusive.

Geographically the distribution of the tornadoes was somewhat more even than in an average year. Of the 48 States, storms considered tornadoes occurred in 31. There were in 1925 no storms classified as tornadoes in Washington, Idaho, Montana, Utah, Nevada, Arizona, or New Mexico, among Western States. The other 10 States without tornadoes were all along the Atlantic coast, namely: Georgia, North Carolina, Virginia, Maryland, Delaware, New Jersey, Connecticut, Rhode Island, New Hampshire, and Maine. The occurrence of three tornadoes west of the Continental Divide within one year is unusual, but, on the other hand, the occurrence of only five tornadoes east of the Appalachian crest (none of the Alabama or Florida tornadoes being counted) is abnormal.

Iowa, with 18 tornadoes, counted more than any other one State in 1925, Kansas coming next with 12, and no other State having more than eight. Neither the distribution by months nor the distribution by States for a single year should be taken as the average situation, as experience shows there is decided variation in occurrence from year to year.

The property losses that were reported from the tornadoes (crop losses being included) were probably considerably less than the true losses, for it is seldom feasible to secure estimates for all parts of a long track, and in many cases no estimate or none that is trustworthy can be obtained. The sum of the amounts reported is $24,023,900, which is almost 10 per cent less than the corresponding sum for the tornadoes of 1924, but exceeds the sum for every other year for which computations are available. Very nearly three-quarters of the year's total occurred during March, somewhat more than half ($13,193,000) occurring within Illinois from the great tornado of March 18. For the year Illinois reached $13,303,000, Indiana standing next with $3,003,300, while Iowa and Kentucky also each exceeded a million.

The chief tornado of March 18 traversed parts of three States, causing damage totaling $16,532,000, a figure somewhat exceeding those of the Lorain, Ohio, tornado, of June 28, 1924, and the St. Louis tornado of May 27, 1896. The path was 219 miles long, a length only a few times exceeded in tornado records, and traversed in almost exactly the same number of minutes.

A detailed account of this great tornado and the havoc it caused was printed in the Illinois "Climatological Data," for March, 1925. However, a subsequent statement of deaths and injuries, prepared by the American Red Cross, has been followed in the present compiling; the number of deaths being now indicated as about fifty less than the earlier statement.

Chart 5, as in preceding years, shows the tracks of those storms counted as tornadoes, the direction of advance being indicated by the arrowhead. When the reports secured did not indicate the direction, that which seemed most probable under the weather conditions prevailing at the time has been marked. In every case the arrow is necessarily far broader than the actual width of the path of damage, drawn to scale; also in most cases it has to be made too long for the true length of path, in order that it may be distinguishable.

Alabama.—There were apparently five tornadoes during 1925, all but the storm of March 18 being in the southeastern portion. Three of the five occurred on January 10, and these seem to have been the first tornadoes of 1925 anywhere in the country; not one of the three was of much importance, and probably each had a short and narrow path. The earliest was at 8 a. m., in the southeastern part of Coffee County, 3 miles south of Enterprise. Then about noon there was a tornado at West Elba, in the same county, 20 miles to northwestward of the place of the first tornado, and about noon the other tornado was noted at Shellhorn, Pike County, more than 30 miles north of West Elba. No deaths resulted from these tornadoes, but some persons were hurt by those in Coffee County. The damage, chiefly or wholly to buildings, was about $10,000 for each of the three.

On that disastrous afternoon, March 18, one of the seven tornadoes occurred in northwestern Alabama. This was the most southern, apparently the shortest and least destructive, and the second to form, of the seven storms. The hour was about 4:45 p. m., and the advance was to the northeast; the track was approximately 12 miles long and 60 yards wide, and passed through Littleville, in the southeastern part of Colbert County. One person was killed and the property loss was $15,000.

Early in the forenoon of June 12 two waterspouts were observed over part of Mobile Bay, several minutes intervening between the disappearance of the earlier and the appearance of the later. As only the later approached the shore and that dissipated on reaching it, they are not counted as tornadoes.

As a rule October brings no severe tornadoes and few, if any, of even slight importance; but the last and much the worst Alabama tornado of the year was during the early morning hours of October 25, about 2 to 4 a. m. For loss of life this surpassed every other tornado of 1925 in the country, save only the two most terrible ones of the seven occurring March 18. The path on October 25 was from eastern Butler across Crenshaw, Pike, and the southern part of Bullock Counties, into northern Barbour, near Comer, in all about 75 miles, in direction east-northeast, the width of the track being 400 yards where widest. The deaths resulting were 18 and the property loss was $250,000.

Alaska.—No tornadoes reported.

Arizona.—No tornadoes reported.

Arkansas.—Five tornadoes were reported during 1925, all happening during the colder months, and none involving loss of life. All three February tornadoes moved to northeastward, and their paths, as far as indicated by information obtained, were quite short. On the 8th, about 9 a. m., the first tornado was at Mulberry, Crawford County, in the northwestern portion of the State; the track was 150 yards wide and the resulting damage was $20,000. The second and third tornadoes were on the 22d, Bearden, in the northeastern part of Ouachita County, in the south-central portion of Arkansas, being visited by the earlier about 10 a. m., the property loss being estimated at $15,000; then, an hour and a half later, Stuttgart, Arkansas County, being traversed by the later tornado, with path only 100 feet wide and damage of only $500. As Stuttgart is about 80 miles to northeastward of Bearden, it is not certain the Stuttgart storm should be counted as distinct from the Bearden storm.

On November 26, about 2:30 p. m., a tornado with path but 100 feet wide advanced 10 miles eastward in Mississippi County, passing Blytheville and causing property losses of $4,000. This county is one of the northeasternmost of the State. A week later, December 3, at 11 p. m., the north-central portion of the State was visited by the fifth tornado of the year, which moved over 5 miles to northeastward near Marshall, Searcy County, with track 50 yards wide, causing damage to the amount of $3,500. Other tornadoes occurred a few hours afterwards in Mississippi and Kentucky.

California.—Rockwood, near the center of Imperial County, in the extreme southeastern part of the State, was visited by an intense storm late on August 9, with damage of $50,000, but no deaths, though five persons were hurt. It is hinted that there were perhaps two tornadoes, which united into one before reaching the town. The length of track of each, or surely of one, before the junction is reported as 4 miles. However, but one tornado is counted. On the 25th of the same month, Calipatria, in the same county, experienced a violent storm, with damage of $100,000, and one fatality, but this seems not to have been a tornado, and the damage and death are therefore counted in the table of windstorms not tornadoes, on a later page.

Colorado.—About 1:30 on the afternoon of June 6 there was a tornado in Yuma County, in the northeastern portion of the State, the path being 22 miles long and a mile wide and ending

near Wray. The direction of advance was to the northeast. There were serious injuries to six people and the property loss was estimated at $100,000. The violent wind which visited part of Pueblo eight days later, though it showed whirling motion and one death resulted, seems to have lacked the size and intensity needed to justify designating it a tornado.

Florida.—On April 5 there was a tornado in Dade County, near the southern end of the mainland. It started about 1 p. m., near Hialeah, 8 miles northwest of the heart of Miami, and moved northeastward to the shore of Biscayne Bay, covering the 12 miles in just about an hour, indicating a rate of advance among the slowest on record for a tornado; indeed, eyewitnesses state that once it made practically no advance for the period of about five minutes. The width of track averaged less than 100 yards, five deaths resulted, and the property loss was estimated as $250,000.

On July 24, at 5:45 p. m., a violent storm, probably a small tornado, occurred in the outskirts of Tampa, Hillsborough County, 4 miles west of the center of the city, leaving a track 300 yards long and 20 yards wide. Eyewitnesses reported that the storm came from the northeast or north. Nobody was materially hurt, though damage to houses and garages was about $20,000. On August 4 Sarasota Beach, 50 miles south of Tampa, suffered losses from a violent local windstorm, possibly a tornado, but not counted as one in the absence of trustworthy information.

Georgia.—No tornadoes reported.

Hawaii.—No tornadoes reported.

Idaho.—About noon on July 4 a very few miles south of Pocatello, the formation, development, contraction, and disappearance of a small but typical tornado cloud were well observed. It lasted 15 or 20 minutes, moving slowly northward. However, the testimony is so conclusive that it never even nearly reached the ground, that it is not counted as a tornado for the State or the month or the year.

Illinois.—In the east-central portion, a small tornado struck McKeen, Clark County, about or shortly before 3 p. m., March 10, then moved to the east-northeast across the extreme southeast part of Edgar County, till it crossed the State line into Indiana 6 or 7 miles from McKeen. The track averaged one-eighth to one-fourth mile wide, and the damage in Illinois was $50,000.

Eight days later, at about the same hour, the most disastrous tornado ever reported crossed the southern part of Illinois, moving toward east-northeast, at about 59 miles per hour. It entered Jackson County from Missouri just before 2:30 p. m., traversed Williamson, Franklin, Hamilton, and White Counties, leaving the last named to enter Indiana about 4 p. m. The track in Illinois was 92 miles long and half a mile to a mile wide. Within Illinois this one tornado caused losses of life, 606, and of property, $13,193,000, greater than ever before known from all the tornadoes of any one year within any single State. The city of Murphysboro suffered more than any other one community, 242 deaths and close to $10,000,000 damage.

Portions of west-central Illinois suffered from violent winds on the afternoon of June 14, and in Hancock County there was apparently a small tornado, about 2 miles north of Carthage. This covered a path 100 yards wide and over 3 miles long, causing damage of $10,000 and injuries to three persons.

About 1 a. m., September 11, Du Page County, in northern Illinois, was visited by a violent storm, probably a tornado. There was $50,000 of damage in Wheaton, which is about 20 miles west of Chicago, but the storm caused other damage, though of much less amount, to southwestward and northeastward of Wheaton, starting about 4 miles southwestward of the town and advancing 7 miles in direction northeast by east, with path 800 feet wide. Other places in northern Illinois recorded notable storms at early hours that day, but no others seem to have been tornadoes. In the afternoon, however, South Bend, Ind., approximately 95 miles east of Wheaton, reported occurrence of a tornado not far from the city.

Indiana.—There were apparently seven tornadoes during 1925. The tracks of the three occurring in March were in no case wholly within the State limits. About 3 p. m., March 10, a tornado entering from Illinois advanced east-northeastward 5 miles in the northwestern part of Vigo County, reaching and ending at the college grounds of St. Mary-of-the-Woods. The width of path was one-eighth to one-fourth of a mile. No persons were badly hurt, but the damage was about $50,000 in Indiana, or in the total path of about 10 miles it was twice as much.

On the 18th of March, about 4 p. m., the most disastrous tornado ever known entered Posey County, near the southwest corner of the State, wiped out the village of Griffin, proceeded northeastward across Gibson County into northwestern Pike, and about or shortly after 4:30 left the ground, after covering 41 miles in Indiana, or 218 miles in all. The speed of advance in Indiana was about 68 miles per hour, or faster than in either Missouri or Illinois, and about as rapid as any previous well-authenticated case of tornado advance. The path in Indiana was mainly from a half to three-fourths of a mile wide, but much narrower toward the end. The loss of life was 70 in Indiana, making with 13 in Missouri and 606 in Illinois a total of 689, more than

twice any previous record of a single tornado; persons injured were 354 in Indiana, forming with Missouri's 63 and Illinois's 1,563 a total of 1,980; property losses were computed as $2,775,000 in Indiana, which combines with $564,000 in Missouri and $13,193,000 in Illinois to indicate $16,532,000 as the total for this one tornado.

Approximately 75 miles to the east-southeast of the end of the track of the chief tornado in Pike County a much shorter and far less important, yet rather violent, tornado formed about 5:15 p. m., or 45 minutes after the chief tornado lifted from the ground. This tornado was wholly in the southern part of Harrison County in the 10-mile Indiana portion of its track, advancing to the east-northeast and passing slightly south of Elizabeth, then crossing the Ohio River, which here flows nearly due south, into Kentucky. Over the higher ground in Indiana the path was about half a mile wide, but in the steep descent to the Ohio River it narrowed decidedly. Damage of $150,000 and four deaths were results in Indiana from this storm.

Late in the afternoon of April 13 several places in the State suffered from brief destructive winds, but only one tronado occurrence is decidedly indicated; this was in the southwest portion, where Sullivan, in the county of the same name, was visited at 5:30 p. m., the tornado track being apparently very short and rather narrow, compared with the average of such tracks. According to press reports, the advance of the tornado was toward the southeast and the property loss was fully $300.

In the west-central part of the State there was a violent windstorm near Byron, Parke County, on May 16, possibly a tornado, but more probably not one. The next day, about 3:30 p. m., near the northern border of the State, in the vicinity of Laporte, in the county of the same name, many farm buildings were wrecked and others moved by what was probably a tornado. Four days afterwards, May 21, Crawfordsville, Montgomery County, not many miles from Byron, reported a tornado in the country districts to westward of the city. This was about 2 p. m., and the track left was 4 miles long and probably of smaller width than the average tornado track; the advance was probably to eastward. Buildings were wrecked, crops suffered some injury, and telephone poles and trees were laid low, the total damage being about $5,000.

During the afternoon of September 11 near South Bend, St. Joseph County, there was one tornado, or possibly two; reports suggest that perhaps two distinct tornadoes united southwest of the city, advanced about 4 miles as a single tornado, then became two, one heading east and one northeast. Damage of $23,000 occurred. This is reckoned but one tornado in the counts for the month and the State.

Iowa.—For 1925, 18 tornadoes are counted, several more than occurred that year in any other one State. On April 21, the day after a tornado occurred in southeastern Nebraska, there was a tornado in northeastern Iowa, about 9:30 a. m., in the vicinity of Cresco, Howard County, advancing 8 miles northeastward. One person was killed, but no estimate of the amount of damage was secured.

No less than 15 tornadoes were noted during June, and a careful, detailed report has been printed in the monthly "Climatological Data" of Iowa section, so only a brief synopsis is given here. Late in the afternoon of the 1st, Milford, Dickinson County, in the northwestern portion of the State, reported a short-path tornado as occurring northwest of the town, heading northeastward; the damage was very little and no person was even hurt.

During the late afternoon and the evening of the 2d there were five tornadoes, all but the last being in the western portion and all heading to northeastward. About 4 to 5 p. m. the northernmost of the five moved from west of Onawa, in Monona County, about 40 miles to Cushing, Woodbury County, with path 200 feet to half a mile wide. The property loss was $480,000 or more and a few persons were hurt. At the same time, about 90 miles to southward, a tornado from Nebraska covered 13 miles in Mills County, making 53 miles in all, with the path in Iowa from 200 yards to nearly half a mile wide. No deaths resulted in either State, but there was damage of $50,000 in Iowa, or $250,000 altogether.

A little after 6 p. m., in Montgomery, the next county east of Mills, another tornado advanced 11 miles, causing damage of $100,000. Practically on the continuation of its path, fully 30 miles northeastward and about two hours later, what is reckoned a distinct storm covered 20 miles in Cass and Guthrie Counties, with path about 40 rods wide. Three persons were killed and the property loss was estimated at $100,000. Far removed from these four tracks just mentioned, in the eastern part of the State, the northwest part of Iowa County was visited about 10:15 p. m. by a short-path tornado, of width 20 rods, doing only slight damage.

On the next day, June 3, Harrison and Pottawattamie, the two Missouri River counties between Monona and Mills, were visited by two tornadoes, about 5:30 and 6 p. m. The earlier, passing very near Neola, covered but about 5 miles, wholly or mostly in Pottawattamie County, moving northeastward. The second advanced nearly north, about 10 miles in all, the path ending in Harrison County. The second tornado resulted in one death, while the property loss from the two combined was $750,000. There was one more tornado that day, at about

9 p. m., starting, separating into two, and each part ending within Greene County. The path began about 70 miles to the northeast of the end of the next earlier tornado in Harrison County; the main path and each branch path was between 5 and 10 miles long, the former lying to northeast and the branches respectively northward and eastward; the damage was only about $10,000. This is counted as but one tornado.

After an interval exceeding a week, the afternoon and early evening of June 11 brought several more tornadoes, affecting the counties of Franklin, Butler, Floyd, and Chickasaw, in the north-central and northeastern portions of the State. All the storms headed toward the northeast or the east-northeast. A well-marked path was left through Alexander 50 to 70 yards wide, the path in all being 15 miles long, about 4 to 4:45 p. m., resulting in one death and $350,000 damage. Tornado visits were reported without any other fatality but with an aggregate property loss of $150,000 by Popejoy, Hampton, Dumont (at 4:30 p. m.), Greene, Carrville (6:30), and Nashua (also 6:30). It is thought that Popejoy and Hampton visits were by one storm, Dumont and Greene by another, Carrville by another, and Nashua by still another, making five tornadoes during the day.

In the northern part of Fremont, the most southwestern county of Iowa, a small tornado occurred about 2 a. m., June 28, near Tabor. This advanced southeastward about 6 miles and caused damage of $10,000.

Blue Grass Township, Scott County, in the easternmost part of Iowa, had a short-path tornado, advancing southeastward, about 2:30 p. m., July 24, causing property loss of about $100,000.

In the southeastern portion of Iowa, about 2 a. m., October 3, near Givin, Mahaska County, a strip half a mile wide and three times as long, was swept by what was probably a tornado, moving southward, the damage amounting to $50,000.

Kansas.—There were apparently 12 tornadoes in the State during 1925, a number which exceeds the count in all other States save Iowa. In the southeastern portion of Kansas, the southern part of Montgomery County was visited by a severe storm about 5 a. m., March 18, the track being about 30 miles long and 3 miles wide, the movement of the storm being probably to eastward or east-northeastward. This was probably wholly or partly a tornado, and the damage of $50,000 is counted in the tornado losses of the year. It was eight hours after this occurrence and 250 miles away, in southeastern Missouri, in direction very slightly north of due east, that the most tragic tornado ever known started.

In Johnson County, Kans., Goodman, a suburb of Kansas City, was struck by a violent windstorm, probably not a tornado, late in the afternoon of March 20; one man was killed, but no estimate of the amount of damage or facts of the path were secured.

On April 23, between 2 and 3 p. m., Chase and Morris Counties, in the east-central part of the State, were visited by a tornado, which traveled 36 miles north-northeastward from west of Matfield Green to near Dunlap, with path 300 to 400 yards wide. The damage, chiefly in Morris County, was $12,000. About 4 p. m. that day a tornado passed through part of Atchison, and it seems to have started near Lancaster, Atchison County, about 90 miles northeast of Dunlap, and to have covered 12 miles in Kansas, advancing eastward, before it crossed the Missouri River into Missouri. The path was of irregular width, mainly less than tornado tracks average, and the damage seems to have been rather small.

On June 1, between 3 and 4 p. m., there was a tornado in the central part of McPherson County, a moderate distance to the eastward of the center of the State; this traveled 15 miles northeastward, sweeping a strip from 50 to 100 yards wide and causing damage of $65,000. About 160 miles from McPherson County, in direction to east-southeast, there was a tornado the same day, about 4:30 or 5 p. m., moving northeastward 12 miles in northern Cherokee and southern Crawford Counties, causing injuries to four people and damage of $100,000. The next day, June 2, about 5 p. m., in the northeastern part of Kansas, a tornado started a little northeast of Riley and advanced 10 miles northeastward to near Garrison, these places being in Riley and Pottawatomie Counties, respectively. The track was only 50 to 100 feet wide, and the property losses were $35,000. There were numerous tornadoes during the afternoon and early evening of this day in eastern Nebraska and western Iowa, the nearest to Garrison, Kans., being the one which started about 90 miles to northward, near Douglas, Nebr., and moved northeastward into Iowa.

On June 15 three places in Kansas reported tornadoes, there being apparently three distinct storms. Persons in Manning, Scott County, in the far western portion, saw one storm passing over open country during the afternoon; the path was not well defined, damage was presumably insignificant, and nobody was hurt. This was the only tornado reported from the western half of Kansas during the first half of 1925. In Clay County, almost 200 miles to east-northeastward of Manning, the time of the tornado was reported as between 7:30 and 8 p. m., the path was a mile and a half long and 200 yards wide, and the damage was $10,000. Over 30 miles to westward, in northern Ottawa County, the tornado moved 18 miles eastward, the time

being given as about 8:30 p. m. The path was a mile wide and there were losses of property and crops amounting to $90,000.

On June 17, residents of Powhattan, Brown County, near the northeast corner of Kansas, saw a tornado close to the town at 4 p. m. The path was narrow and short and the damage was unimportant.

During July violent winds, with suggestions of tornadic formation, were reported from several portions of Kansas, the dates being the 6th, 18th, 25th, and 29th. In each case the information seems inconclusive, so the property losses and the one death are placed in the table of losses by windstorms other than tornadoes, on a later page.

There was probably a small tornado at Seguin, Sheridan County, during the evening of August 14. Neither definite information as to the track nor an estimate of the damage could be had, though the damage is thought to have been comparatively small. This was the only tornado of the latter half of 1925 in the western half of Kansas.

Near Bethel, Wyandotte County, which is close to the Missouri River, between Leavenworth and Kansas City, there was a small, violent storm, probably a tornado, about 4 p. m., September 10. The track started two miles and a half southwest of Bethel and was less than two miles long and apparently decidedly narrow, the advance being to northeast or east. The property loss aggregated $5,000.

There was no loss of life in the 12 tornadoes of 1925 in Kansas, and only three fatalities resulted from the 46 tornadoes in that State during the three successive years ending with 1925.

Kentucky.—Three of the tornadoes of March 18 affected the State. Each advanced in a direction between northeast and east-northeast. The most northern, coming from Harrison County, Ind., crossed Jefferson County about 5 miles south of the heart of Louisville and ended near Pewee Valley, Oldham County, the time at Pewee Valley being about 6:10 p. m. In part of Jefferson County the track was one-fourth of a mile wide, but in Oldham it narrowed to 50 feet, while the length was 27 miles in Kentucky, but 37 in the two States. The tornado caused three deaths in Kentucky and damage of $100,000, or altogether seven deaths and damage of $250,000. Probably a few minutes before this northern tornado ended and almost 60 miles to southward, the middle Kentucky tornado started in Marion County and traversed Washington, Mercer, Jessamine, and Fayette Counties to end in Bourbon at 7:30 p. m. From start to end the path was fully 60 miles long, but many gaps with no damage occurred, while the width was mainly from 200 to 400 yards. The loss of property was $850,000, but of life fortunately only two. The southern Kentucky tornado entered Allen County from Tennessee probably about 5:25 or 5:30, and crossed northwestern Monroe and southeastern Metcalfe and most of the width of southern Adair County, ending, presumably many minutes after 6 p. m., about 40 miles south-southeast of where the middle Kentucky tornado began. The track was 500 feet to a half mile wide, and in Kentucky about 55 miles long or altogether about 70. The deaths were 12 in Kentucky but 38 in all, and the damage was $100,000 in Kentucky or twice as much in all. In the matter of loss of life this tornado was the most disastrous, save one, not only for March 18, but for the entire year 1925.

On October 16, late in the afternoon, a tornado covered about 160 miles, advancing toward the east-northeast. There were many gaps with no damage or very little, while the greatest damage was in Warren, Hart, and Marion Counties. The storm began in the western part of Warren and ended in Estill County, so the middle point of its path was near the center of the State. The width of path was from 150 yards to one-fourth of a mile. One death resulted and 44 persons were injured, 11 of them seriously. The property loss is estimated as $250,000. There was a second tornado that day, about 60 miles southeast of the eastern end of the path just mentioned, occurring at an hour not reported. The mining community of Alloway, in the southern part of Perry County, was damaged to the extent of $5,000 and one person was killed. Details of the track and the direction of advance were not secured, but presumably the path was quite short.

Between 9 and 10 a. m., December 4, or about four hours after a tornado occurred at Yazoo City, Miss., approximately 280 miles away to the south-southwest, violent winds visited many localities in western Kentucky. Apparently there were not less than three tornadoes, advancing in direction very slightly north of east. The most northern of the three struck Gilbertsville, in northern Marshall County, Kuttawa and Eddyville, Lyon County, and Princeton, Caldwell County, causing damage of $20,000. This indicates a path 23 miles long. Next to southward is a path which probably ended west of Gilbertsville, but if extended would have lain about 10 miles south of that place. Mayfield, Graves County, reported $5,000 damage, while to eastward, in Marshall County, there was loss of property not estimated, and of two lives. A track fully 16 miles long is indicated. Farther to southward by 16 miles, Murray, Calloway County, suffered damage of $30,000 in a tornado which probably was of short path, the width being 300 yards and the time 9:15 a. m. Damage at Hazel, south of Murray, and at Sturgis, Union County, far north of Princeton, seems probably the work of winds not tornadoes.

Louisiana.—There was probably a tornado in Union, one of the northernmost parishes of the State, on March 13. The locality was 3 miles northeast of Bernice where houses, other buildings, and fences were wrecked with intense energy. No estimate was obtained of the property loss, nor of the dimensions of the track, which was very likely short.

On July 30, about 6 p. m., there was a small tornado at Dodson, Winn Parish, which is to northward of the center of the State. The path is reported as 1,000 yards long and 100 yards wide and the damage was about $4,000.

A small tornado struck near Comite, in East Baton Rouge Parish, at 8:37 a. m., October 14, moving eastward. The path was seemingly short and narrow; but one house was wrecked with great violence, five members of the family occupying it being killed or fatally hurt. The property loss was about $1,200.

Maryland and Delaware.—No tornadoes were definitely reported. On March 27 a funnel-shaped cloud was observed in a northerly direction at College Park, Prince Georges County, Md., but no damage from it was ever heard of. The possible tornado of August 8, in southern Pennsylvania, is considered by some to have come from near Hagerstown, Md., but it seems almost certain there was no tornado that day in Maryland.

Michigan.—On the evening of April 24, in the east-central portion, a tornado advanced from near Alma or St. Louis, Gratiot County, through Midland County to the northern part of Bay City, Bay County, almost 40 miles in all, the direction being toward east-northeast. A stopped clock at Bay City indicated 8:26 p. m. as the time. No lives were lost but there was property damage amounting to $225,000.

On June 1 a violent storm occurred near Marlette, Sanilac County, in the southeastern portion. The path is reported to have been a mile and a half long and the damage several thousand dollars. This was probably a tornado and the storm of the afternoon of the next day, near Ionia, Ionia County, a hundred miles to westward of Marlette, is likewise thought to have been a tornado, for its path was narrow and well defined and its violence wrecked many buildings and seriously hurt one woman.

In Upper Peninsula, on July 15, soon after 7 p. m., a small violent storm, probably a tornado, advanced southeastward about 20 miles from near Whitney, Menominee County, across Delta County to the shore of Green Bay. The path was a quarter to a half mile in width and the damage was $50,000.

In and near Chelsea, Washtenaw County, in the southeastern portion of the Lower Peninsula, there was a violent storm September 11, but it probably was not a tornado.

Minnesota.—About 10:30 p. m., June 5, Moorhead, Clay County, was struck by a violent storm affecting only a comparatively small area, but probably not a tornado.

On June 13, about 3:30 to 4 p. m., a tornado occurred in southeastern Minnesota, striking the ground at intervals from Hayfield, Dodge County, to near Grand Meadow, Mower County, thus advancing about 20 miles southeastward, with path near Grand Meadow 100 yards wide. There was damage of fully $100,000 at Hayfield and $7,500 elsewhere.

Near Maple Plain, in the western part of Hennepin County, a tornado moved eastward on July 8, at 2:30 p. m., causing property loss of $25,000. The path was probably a quarter of a mile wide but not many miles long. The outskirts of Minneapolis, in the eastern part of the same county, suffered from violent winds later in the day, but these seemed to lack tornadic formation.

A comparatively feeble tornado occurred at Detroit, Becker County, in the west-central portion of Minnesota. The time was 5:30 p. m., August 16. The funnel cloud seldom reached the ground but advanced northeastward, doing damage of $5,000.

Mississippi.—About 5:10 a. m., December 4, a windstorm, probably a tornado, advancing probably to northeastward through Yazoo City, caused two deaths and damage estimated at $250,000. The length of the path was probably 18 miles and the width is stated to have been one-fourth of a mile. Yazoo City is in the west-central part of the State, about 250 miles southeast of the spot in Arkansas visited six hours earlier by a tornado and 280 miles to south-southwest of extreme western Kentucky, where tornadoes struck four hours later than the Yazoo City tragedy.

Missouri.—The report secured of earliest sight of the great tornado of March 18 locates it north of Ellington, Reynolds County, just before 1 p. m. It moved rapidly to the east-northeastward across Iron, Madison, Bollinger, and Perry Counties and crossed the Mississippi River into Illinois before 2:30 p. m. The length of the Missouri portion was 85 miles, so the speed of advance here was about 55 miles per hour. The width of path averaged one-fourth of a mile, but for 3 miles in the south-central part of Perry County there were apparently two storms with parallel paths. In Missouri 13 were killed and 63 hurt and the property loss was $564,000.

On April 23, about 4 p. m., a tornado moving eastward traversed Atchison, Kans., and reports from that city indicate that it continued 3 miles into Missouri, making a path 15 miles long in all. The Missouri portion was probably in Buchanan County. The damage altogether

was unimportant. The following night, at an hour not reported, the vicinity of Laredo, Grundy County, 90 miles northeastward from Atchison, was visited by a small tornado, advancing in an easterly direction, but covering apparently only a short distance and causing not very great damage.

About 4 p. m., June 7, Rockport, in Atchison County, which is the most northwestern county of Missouri, was visited by a small storm, probably a tornado; this moved northeastward and caused property loss of $7,000.

About 12:10 p. m., September 6, North Kansas City, Clay County, had a violent wind, affecting a very limited area. While some statements indicate this may have been a small tornado, the information seems inconclusive, and it seems wiser to classify it as a wind not tornadic. The same is the case with the storm that occurred two days afterwards, at 3 p. m., at Mexico, Audrain County.

Montana.—No tornadoes reported.

Nebraska.—On April 20, about 4 p. m., there was a small tornado in the southeastern portion of the State, in the southern part of Pawnee County. The storm advanced northeastward, but only a short distance, and the damage was presumably small.

During June there were six tornadoes, all, like the April 20 tornado, occurring well east of the central longitude of Nebraska, and four of them south of the Platte River, while one of the remaining two was close to that river. Each of the two tornadoes of June 2 was considerably worse than any Nebraska tornado of any other day of 1925. It was about 3 p. m., June 2 when the earlier tornado of the afternoon occurred, the locality being southern Madison County, in northeastern Nebraska; the storm moved 4 miles northeastward, with path 200 yards wide, resulting in three deaths and property loss of $250,000. To southeastward by 100 miles, the second tornado started its long course near Douglas, Otoe County, about 3:30 p. m. Douglas is about 90 miles north of the end of path of a Kansas tornado, near Garrison, Kans., about 5 p. m. the same day. The Nebraska tornado advanced northeastward from Douglas across Otoe and Cass Counties about 40 miles, till it came to the Missouri River and crossed into Iowa. The width of the track was at one place half a mile, and the damage was $200,000 in Nebraska, but there were no fatalities.

During the afternoon of June 3 the western part of the city of Omaha had local winds of violence, causing considerable havoc; some reports suggest the storm was a tornado, but it is not so counted, since the evidence is insufficient.

The southern part of Merrick County, at 5:30 p. m., June 11, had a small tornado, moving northeastward. The path was 200 to 300 feet wide, and short, but the loss was estimated at several thousand dollars.

The three other tornadoes occurred June 16, all being small, of short path, and not particularly violent. The earliest was about 5 p. m., in northern Webster County, near Blue Hill. The second was about 7 p. m., in Polk County, approximately 70 miles to northeastward of the region visited by the first tornado of the day. The width of path was 50 yards, and the value of the property destroyed $1,000. The last tornado of the day was about 7:30 p. m., in Saunders County, south of Prague, or about 40 miles east of the region hit by the second tornado. The track was a quarter of a mile wide. No lives were lost and probably no persons were materially hurt by any of these three tornadoes, and the damage of the third and first, though no estimate was secured, probably did not greatly exceed at the worst the $1,000 amount reported for the second.

Nevada.—No tornadoes reported.

New England.—Late in the afternoon of April 15, a small, violent storm struck part of Chicopee, Hampden County, Mass. There was damage of $50,000, according to reports, but no person seems to have been much hurt. While this may have been a tornado, the information secured is not definite enough to so classify it, and the damage is therefore placed in the table of "Losses from windstorms, other than tornadoes," on a later page. Like classification is made of the violent windstorms, possibly some or all of them tornadoes, occurring in widely separated localities in Connecticut on June 15.

On July 7, at an unreported hour, there was apparently a tornado near the center of Vermont, in Rochester, Windsor County. The dimensions of the path are not stated, but the storm moved in an easterly direction; no mention is made that anyone was even injured, but the property loss was probably about $5,000.

An intense storm, probably a tornado, passed through the center of the city of Woburn, Middlesex County, Mass., about 10 miles from Boston, at 3:13 p. m., October 25. The advance was in an easterly direction, and the path, reported as one-fourth of a mile wide, covered 3 miles to westward of Woburn, and probably 3 more miles to eastward, to a point in the town of Stoneham. One man was killed and the total damage was about $200,000.

New Jersey.—On July 16, about 10 p. m., there was a violent windstorm on the New Jersey side of the Delaware River, in Burlington County, between Camden and Trenton, the towns of Riverside and Cambridge suffering most. Considerably to southward, near Hammonton,

Atlantic County, on September 16, a violent wind of probably even smaller size caused considerable damage. Near the southernmost tip of the State, on October 25, several localities reported intense winds and much damage. In each case whirling winds were described or the word "tornado" used, but it is thought none was a tornado, and the property losses are noted in the table, "Losses from windstorms other than tornadoes."

New Mexico.—In the east-central portion, near Floyd, Roosevelt County, there was possibly a small tornado on September 10, but the evidence is deemed inconclusive.

New York.—On September 13, about 5 p. m., a violent storm, probably a tornado, swept a strip in northwestern Wyoming County, in the western portion of the State. It is stated that the storm struck first near Bennington Center, moved eastward and swept a path to Attica, 7 miles long and one-fourth to one-half of a mile wide. There were no injuries to persons reported, but the damage was $400,000.

North Carolina.—No tornadoes reported.

North Dakota.—On June 5, about 10:30 p. m., a portion of Fargo was swept by a violent storm, also part of Moorhead, Minn., just across the Red River. Consideration of all the information obtainable leads to the belief that this was probably not a tornado.

On the night of June 18, a farm in the eastern part of Barnes County, which is in the southeastern portion of the State, was struck by an intense storm, which seems to have been a tornado. The property loss was $10,000.

Ohio.—On May 16, probably about 7 or 8 p. m., a tornado occurred in the north-central portion, starting near Attica, in the southeastern part of Seneca County, and thence traveling to the east-northeastward about 40 miles, across Huron County to near Pittsfield, in Lorain County. The width of the track varied from 25 yards up to one-fourth of a mile (440 yards). No deaths resulted, but some persons were seriously hurt, and the damage was more than $100,000.

On July 9 there was probably a small tornado in the eastern part of Auglaize County, which is in the west-central portion of the State. A loss of several thousand dollars is reported, owing to destruction or damage to buildngs, wire lines, and trees. Apparently no person suffered much injury, but the hour, dimensions of path, and direction taken were not reported.

Oklahoma.—Three tornadoes seem to have occurred on February 21, the two earlier in the south-central portion and the last in the east-central. The time at Pooleville, Carter County, was stated as 9 a. m., the path was 100 yards wide, and there was damage of $60,000. Only 17 miles southwest of Pooleville, Loco, Stephens County, was struck by the second tornado at 7:30 p. m., one death resulting and much property loss. The last tornado, at 11:15 p. m., was at Henryetta, Okmulgee County, about 100 miles northeast of Pooleville; the path was only 200 feet wide, two persons were injured, and there was damage of $15,000.

Four places in Oklahoma report tornadoes seen during the afternoon of April 8, there being probably three distinct tornadoes. In the central portion the visits noted at two points fully 30 miles apart were probably by a single tornado advancing toward the east-northeast and doing little harm, if any, between the points. The western point is near Tryon, Lincoln County, where the time was about 2:30 p. m., and the width of track 75 yards, while the eastern point is in the west-central part of Creek County, about 10 miles northwest of Bristow; apparently no person was hurt, and the aggregate property loss was quite small. About 140 miles to southward of Tryon, near Thackerville, Love County, and close to the Red River, there was probably a tornado that day about 3:30 p. m., sweeping a path less than one-fourth of a mile wide and causing damage of $10,000. Apparently distinct from either of the above-mentioned tornadoes, a tornado passed just west of Weleetka, Okfuskee County, almost 60 miles southeast of Tryon, at 5:30 p. m., doing only slight damage.

At Madill, Marshall County, in the south-central portion, there was a tornado on the 26th of April, at 5:30 p. m. The path was about 75 yards wide, one person was killed, and there was property loss of $5,000. At Aylesworth, in the same county, 10 miles southeast of Madill, there was much greater damage that day, but the wind at Aylesworth was judged not to be tornadic, the width of the area of havoc was one-fourth of a mile, and especially the time was stated as 8:30 p. m., so this is reckoned another storm and not a tornado.

Driftwood, Alfalfa County, in the northwestern portion of Oklahoma, was laid waste by a violent storm, probably a tornado, at 5 p. m., July 13. The damage was considerable, but as far as reports state no lives were lost.

Oregon.—There was a severe storm, probably a tornado, in the north-central portion of the State, at Condon, Gilliam County, on April 15, probably about 10:30 a. m. This advanced to the northeastward, sweeping a belt half a mile wide and causing a property loss of approximately $10,000.

The first tornado reported for many years west of the Cascade Mountains occurred about 11 a. m., November 11, a few miles southwest of Salem, starting in Polk County, and traveling 5 miles in direction slightly north of east, most of the path being in Marion County. There was damage of a few thousand dollars, though well-built structures close to those wrecked were not much damaged.

Pennsylvania.—Numerous localities in the western and central portions suffered from intense winds during the early afternoon of April 19. It is thought there were three distinct tornadoes, the earliest moving a few miles eastward or northeastward near California, Washington County, and Newell, Fayette County, places about 30 miles south of Pittsburgh; the time was 1 to 1:25 p. m., the width of path 300 yards, and the property loss $10,000. About 110 miles to northeastward, Philipsburg, on the western edge of Center County, was struck by the second tornado at 2:15 p. m., the width of the track being reported as 500 yards and the damage $3,500. Then at 2:30 p. m., Belleville, Mifflin County, about 35 miles southeast of Philipsburg, was hit by the third tornado, the width of track being but 200 yards, and, as at the places named before, there being no fatalities, nor even serious injuries. The property loss at Belleville, including the results of the fire which probably started because buildings were wrecked, was $150,000. The aggregate wind losses at other points, where the tornadic character of the wind was not indicated by reports, greatly exceeded the amounts just named.

About 6:30 p. m., August 8, a violent storm from Maryland swept over part of Franklin County, to near Altenwald; while this was possibly a tornado, it is thought it was not.

Porto Rico.—No tornadoes reported.

South Carolina.—In the southwestern portion of the State, Barnwell, in the county of the same name, was visited by a violent storm at 1:30 p. m., January 16, damage of $3,000 resulting. This was probably a tornado, though details of the path were not secured.

On May 12, soon after 1 p. m., a funnel-shaped cloud was seen for a few minutes from Due West, Abbeville County, in the western portion of the State. This was judged to be 12 or 15 miles distant, in a southerly direction, but no damage was ever heard of, so it is likely the cloud never reached the ground and no count is made of it.

During the severe winds in the northwestern portion of the State, between 5 and 8 a. m., October 25, there was possibly a tornado at Owings, in the northern part of Laurens County, but the evidence is inconclusive, and it is not counted.

South Dakota.—The southeastern portion apparently had two tornadoes in April, one late in the afternoon of the 12th and the other about 8 p. m., of the 23d. The earlier seems to have advanced 30 miles to east-northeastward, in Sanborn and Miner Counties, but the later, in Lincoln County, but a short distance to northeastward. In each case there was damage of more than $10,000.

On June 5 there was destruction near the center of the State, about 5 p. m. at Presho, Lyman County, then, beyond a gap of 15 miles, along a path to northeastward in Hughes, Hyde, and Hand Counties, to a point about 70 miles northeast of Presho, the time in Hyde County being about 7 p. m. This is regarded as one tornado. The width of path was 1,000 feet at Presho; the damage there was $10,000, and was considerable in Hughes, Hyde, and Hand Counties, although no estimate of it was secured.

Tennessee.—Three of the tornadoes of March 18 started in Tennessee, all traveling in a northeasterly direction. The earliest and most northern of the three was first noted near the center of Sumner, one of the counties of the northern border, about 5 p. m.; very near the northeast corner of the county it crossed the line into Kentucky, having advanced 15 miles within Tennessee, the path being 200 to 400 yards wide, the fatalities 26, and the property loss $100,000 before the State boundary was crossed. About 5:45 p. m. the middle tornado started in Williamson County, approximately 50 miles south-southwest of the starting point of the northern one; this middle tornado moved only about 20 miles, ending in Rutherford County, requiring 30 to 40 minutes for this progress. The track was 100 to 400 yards wide, one death resulted, and the damage was $30,000. The southern tornado of the Tennessee trio formed in the northwestern part of Bedford County, 12 miles to south-southeast of the point where the middle tornado began; the time was probably not many minutes after 6 p. m. This southern tornado traveled only 12 miles, ending in Rutherford County about 6:45 p. m.; the track was 100 to 200 yards in width, two persons were killed, and the property loss was $20,000. In the matter of property losses from the tornadoes of the afternoon and evening of March 18, Tennessee, with $150,000, was far outranked by Illinois, Indiana, Kentucky, and Missouri, but in deaths, with 29, by only the two first named.

About 2 a. m., October 24, there was a violent windstorm in Tipton County, near Covington, in the westernmost portion of the State. It is believed that this was a small tornado, though it affected but a very small area, as far as could be learned. There was damage of $2,000.

On November 7, about 6:30 p. m., there was a tornado not far from the center of the State, in the central part of Wilson County; this moved northeastward about 10 miles, the width of the track being 200 yards. No person was even hurt, as far as known, but the property loss was $10,500.

About 5 p. m., November 26, a small tornado occurred a considerable distance to northwestward of the center of Tennessee, in Dickson County, advancing 6 miles northward, and causing injuries to three persons and damage to the amount of $5,400.

Texas.—There were apparently six tornadoes in the State during 1925, every one during the second half of the year, an unusual happening, since ordinarily the first half of the year records a decided majority of the tornadoes. However, there is a slight possibility that the violent wind and hailstorm near Kyle, Hays County, about 6 p. m., April 28, included a tornado within the broad area that was storm-swept.

About 4 p. m., July 7, a tornado passed near Paducah, Cottle County, in the northwestern portion of the State, the information stating that it took the unusual direction of southwestward advance. The path was 8 miles long and 50 yards wide and there was property loss amounting to $12,000.

The dimensions of the track were not reported for the tornado a week later, 5:30 p. m., July 14, which occurred near Farmersville, Collin County, in the northeastern portion of Texas. The storm traveled southeastward, causing the death of one boy and damage of $10,000. Just four days later, at the same hour, a violent storm occurred 60 miles to southwestward of Farmersville, in a sparsely settled section of Ellis County, near Waxahachie. This storm was probably a tornado, its advance was to eastward for 3 miles, affecting a width of three-fourths of a mile, and five persons were hurt, while the property loss was $5,000. At 8 p. m., July 30, Richland, Navarro County, 40 miles southeast of Waxahachie, was hit by a tornado, moving southeastward and sweeping a strip about half a mile wide, causing damage amounting to $100,000.

Windstorms in Waco, August 13, in Thrall, August 21, and even a very destructive one at Seabrook, Harris County, August 22, which resulted in the death of 2 persons and injury of 10, are all thought not to have been tornadoes. However, about 4 p. m., August 29, Electra, in Wichita County, which borders on the Red River in the north-central portion of Texas, was visited by what was probably a tornado, though the path is reported as a mile wide and only twice as long, the advance of the storm being to the southeast. There were two fatalities, but no estimate of the damage was secured.

On October 9, about noon, four waterspouts, but only one of them important, were observed over the bays near Corpus Christi, Nueces County; the chief spout moved rapidly southwestward, but as it broke up immediately on reaching land, no tornado is counted.

About 11 p. m., October 14, part of one of the northeastern counties, Fannin, was visited by a destructive windstorm, probably a tornado. Details of the path were not secured, but the storm probably did not travel far, and the property loss was only moderate. The neighborhood is 7 miles southwest of Bonham.

Utah.—No tornadoes reported.

Virginia.—On June 21 a violent storm of hail and wind passed from the central portion to the southeastern. In Richmond the débris sometimes suggested tornadic action, but the evidence was very far from conclusive. Two very much shorter strips were swept in July by similar storms, with probably even greater wind force—one around Mount Jackson, Shenandoah County, in the northwestern portion of Virginia, on the 2d, and the other near Suffolk, Nansemond County, in the southeastern portion, on the 26th. In each case some information hinted at tornadic action, but the weight of the information as a whole, as in June, was against such classification.

Virgin Islands.—No tornadoes reported.

Washington.—No tornadoes reported.

West Virginia.—On the afternoon of May 24 a tornado occurred in very rugged country in the northeastern portion, striking southern Barbour County and the western and north-central parts of Tucker County. The time was about 2 p. m. Some information indicates the starting point was in northern Upshur County, making a course to Pierce, in Tucker County, about 40 miles; the tornado surely passed a few miles south of Philippi, in Barbour County, thus indicating a path over 30 miles long. The width of path was from one-fourth to one-half mile, and the advance was toward the east-northeast, though varying somewhat in different places. The deaths were three, due to upsetting of a coal tipple at Pierce, and the property loss was at least $20,000.

Wisconsin.—There was a violent storm near the center of Calumet County, in the east-central portion of the State, early on April 11, very soon after midnight. This covered but a short path, with gaps between places of damage, the width of path where greatest being half a mile. Those living nearby think the storm advanced toward the southwest, a very unusual direction. The property loss was $4,000. It seems probable that this storm was a tornado.

Late on June 2, a day when several tornadoes had occurred in Kansas, Nebraska, Iowa, and Michigan, a small tornado formed about 10:30 p. m. near the southwestern corner of Clark County, which is in the west-central portion of Wisconsin. The tornado advanced northeastward about 20 miles, with path 100 yards wide or somewhat less, causing damage of about $30,000. In the direction that this tornado headed, about 145 miles from its end, a violent storm struck the same night, about 1 a. m., June 3, resulting in two deaths and damage of

$2,500. The locality is Brule, in the northern part of Florence County, close to the Michigan boundary; and though details of the track and the direction taken are lacking, it is thought this was a tornado.

In the southwestern part of Juneau County, which is to southward and slightly to westward of the center of the State, there was a small tornado about 5:45 p. m., June 13; the path was 4 rods wide, but short, and the property loss was $30,000.

The fatal windstorms occurring July 11 in Door County and September 9 in Walworth, Racine, and Kenosha Counties were thought by some to have tornadic features, but the information about them, as a whole, points to their being not tornadoes, and the same is the case with the storm of August 29 in Clark County, which one person thought a "small twister."

Wyoming.—There was probably a small tornado in the southeastern portion of the State on May 26, about 3:30 p. m. The place was Two Rivers, Albany County, very near Laramie. There was really no damage, as the storm passed over open prairie throughout its course.

HAIL, 1925

Charts 6 and 7 indicate the localities in which injurious hail occurred during the period from April to September, inclusive. The information was obtained mainly from the records and special reports of regular and cooperative stations of the bureau. Two grades are indicated, Chart 6 showing the places where there was moderately heavy hail, causing only slight damage, while Chart 7 shows where heavy or especially destructive hail occurred. Falls of hail too light to cause damage were noted at hundreds, if not thousands of stations, and no effort has been made to chart such falls. Hailstorms are often decidedly local, and in their occurrence from year to year show much irregularity; therefore the distribution that appears on the charts should not be construed as the usual condition.

During 1925 there seem to have been fewer severe hailstorms than usual in many of the Rocky Mountain and Plains States. The facilities for securing hail information are greater in certain States than in others, and the zeal and care of the observers and reporters show marked differences. The greater the facilities and the more accurate the observers are the more numerous are likely to be the dots representing hailstorms; so in certain States, as Iowa, a larger number of dots is likely to represent many reports as compared with neighboring States, instead of many hailstorms.

In one case a very destructive hailstorm was reported for such a distance that it is best indicated on Chart 7 by a line rather than by several dots. This storm occurred during the forenoon of August 18 in Iowa and Illinois, affecting an area approximately 100 miles long, but being more severe in the western half of the track. The loss to crops and property is estimated as about $3,000,000, Keokuk and Henry Counties, Iowa, having each damage of approximately half a million. Fields of corn as large as 75 acres were so utterly devastated that not one stalk was left standing. Of hailstorms in the vicinity of large cities that of May 23 in New York City and its northeastern suburbs, and that of the next day in Baltimore and its environs, were probably the most serious.

Hail during the first three and the last three months of the year is not included on the charts, as crop injury is seldom important during those months. During 1925 some unusually severe falls of hail did occur in those months, particularly in October; on the 5th of that month a severe hailstorm struck near Fresno, Calif., where there was crop damage of about $50,000. On the 14th severe hail occurred in two of the southeastern counties of the Texas Panhandle, Hall and Childress, doing $1,000,000 damage, then eastward in a belt through southwestern and south-central Oklahoma for approximately 200 miles, the hail damage in Oklahoma again amounting to about $1,000,000. A detached Texas area, in Fisher and Jones Counties, about 120 miles south of Childress, had great hail damage the same day.

As in each of the three next preceding years, no hail of consequence occurred anywhere in Alaska, Porto Rico, or the Virgin Islands, as far as could be ascertained. In Hawaii two falls of moderately heavy hail occurred during March, with damage resulting; one near the north coast of Kauai, in Hanalei District, and one near the east coast of the island of Hawaii, in Puna District.

In Iowa the careful canvass by assessors indicated the total hail losses suffered during 1925 as $7,975,691, or somewhat more than in 1924, and more than three times the aggregate hail losses of 1923.

LOSSES FROM WINDSTORMS, 1925

For the tenth successive year statistics have been collected, chiefly through the field-service officials of the bureau, as to property damage and loss of life due to windstorms that are considered not to have been tornadoes. The results appear in the table following, the amounts stated being merely estimates of the damage; and often it was not feasible to secure even rough estimates, so symbols appear instead, yet in most cases these symbols stand for comparatively

small losses. Deaths and fire losses resulting from lightning are not shown in the table, even though high winds occurred at the time; and when rain or hail or both come with the severe wind and aid it in causing damage, an effort is made to estimate the share of the damage due to wind. As with tornadoes and severe hailstorms, most of the individual windstorms whose results are indicated in the table were duly mentioned in the chronological lists presented in the Monthly Weather Review.

The deaths enumerated are slightly fewer than the average yearly number shown by the tables for preceding years, though slightly more numerous than in either 1924 or 1923. The count is 88, which occurred in 20 different States, Alaska, Hawaii, Porto Rico, and the District of Columbia. Ohio reported 16, of which 14 resulted from the wrecking of the U. S. Navy airship *Shenandoah*, while Florida and New York reported 10 each.

The manner in which the deaths occurred is unknown in one instance; 14 lives were lost because wind wrecked the *Shenandoah*, 10 because it wrecked various large vessels, and 9 because it wrecked or upset small craft; 5 deaths resulted from contact with live wires brought down by wind or with metal charged by fallen live wires; 28 lost their lives through complete or partial wrecking of buildings, and 5 in the wrecking of structures other than buildings; falling trees, broken off or uprooted by wind, killed 3 and branches torn from trees 4; 3 lives were lost by persons being blown off exposed spots, 1 of them a high roof, 1 a towering crane, and the other a narrow footbridge over water beyond a man's depth; 5 lives were lost in the upsetting of 3 automobiles and a hayrack wholly or chiefly by wind, and the remaining death was when wind dashed a boy violently against a pole.

Among the months, September, when the *Shenandoah* was wrecked, scored most deaths, 19; August and December came next, with 11 each; January alone among the months had no such death; while the other months recorded the following numbers: February, 1; March, 4; April, 6; May, 4; June and July, 9 each; October, 8, and November, 6.

Losses from windstorms, other than tornadoes, by months and sections, 1925

[Figures, except in last column, indicate dollars]

[1] Loss not estimated occurred. [2] Loss not readily estimated in addition to amount of loss stated.

But one hurricane from the region of the West Indies affected appreciably United States territory. This came to notice just before the close of November, and it affected both Gulf

and Atlantic coasts of Florida, and the Atlantic coast to northward as far as New Jersey and Long Island. In Florida and immediately on its coast 10 lives were lost, and it is probable that fully 40 more, not counted in the table, were lost on the open ocean.

Among the other notable windstorms the earliest of the year was on April 19, affecting a belt from Illinois to Pennsylvania. The vicinity of Minneapolis suffered great wind damage on June 2, central Indiana on July 12, and two separate counties in Ohio on July 25. On September 3 occurred the line squall over southeastern Ohio which wrecked the *Shenandoah* but did scarcely any harm on the earth's surface.

The sum of the estimated damage is somewhat less than the corresponding sum for 1924 and not far from the average over the nine years preceding 1925.

Annual summary, climatological data, Canadian stations, 1925

[Data furnished by the Canadian Meteorological Service]

Station	Pressure in inches			Temperature						Precipitation

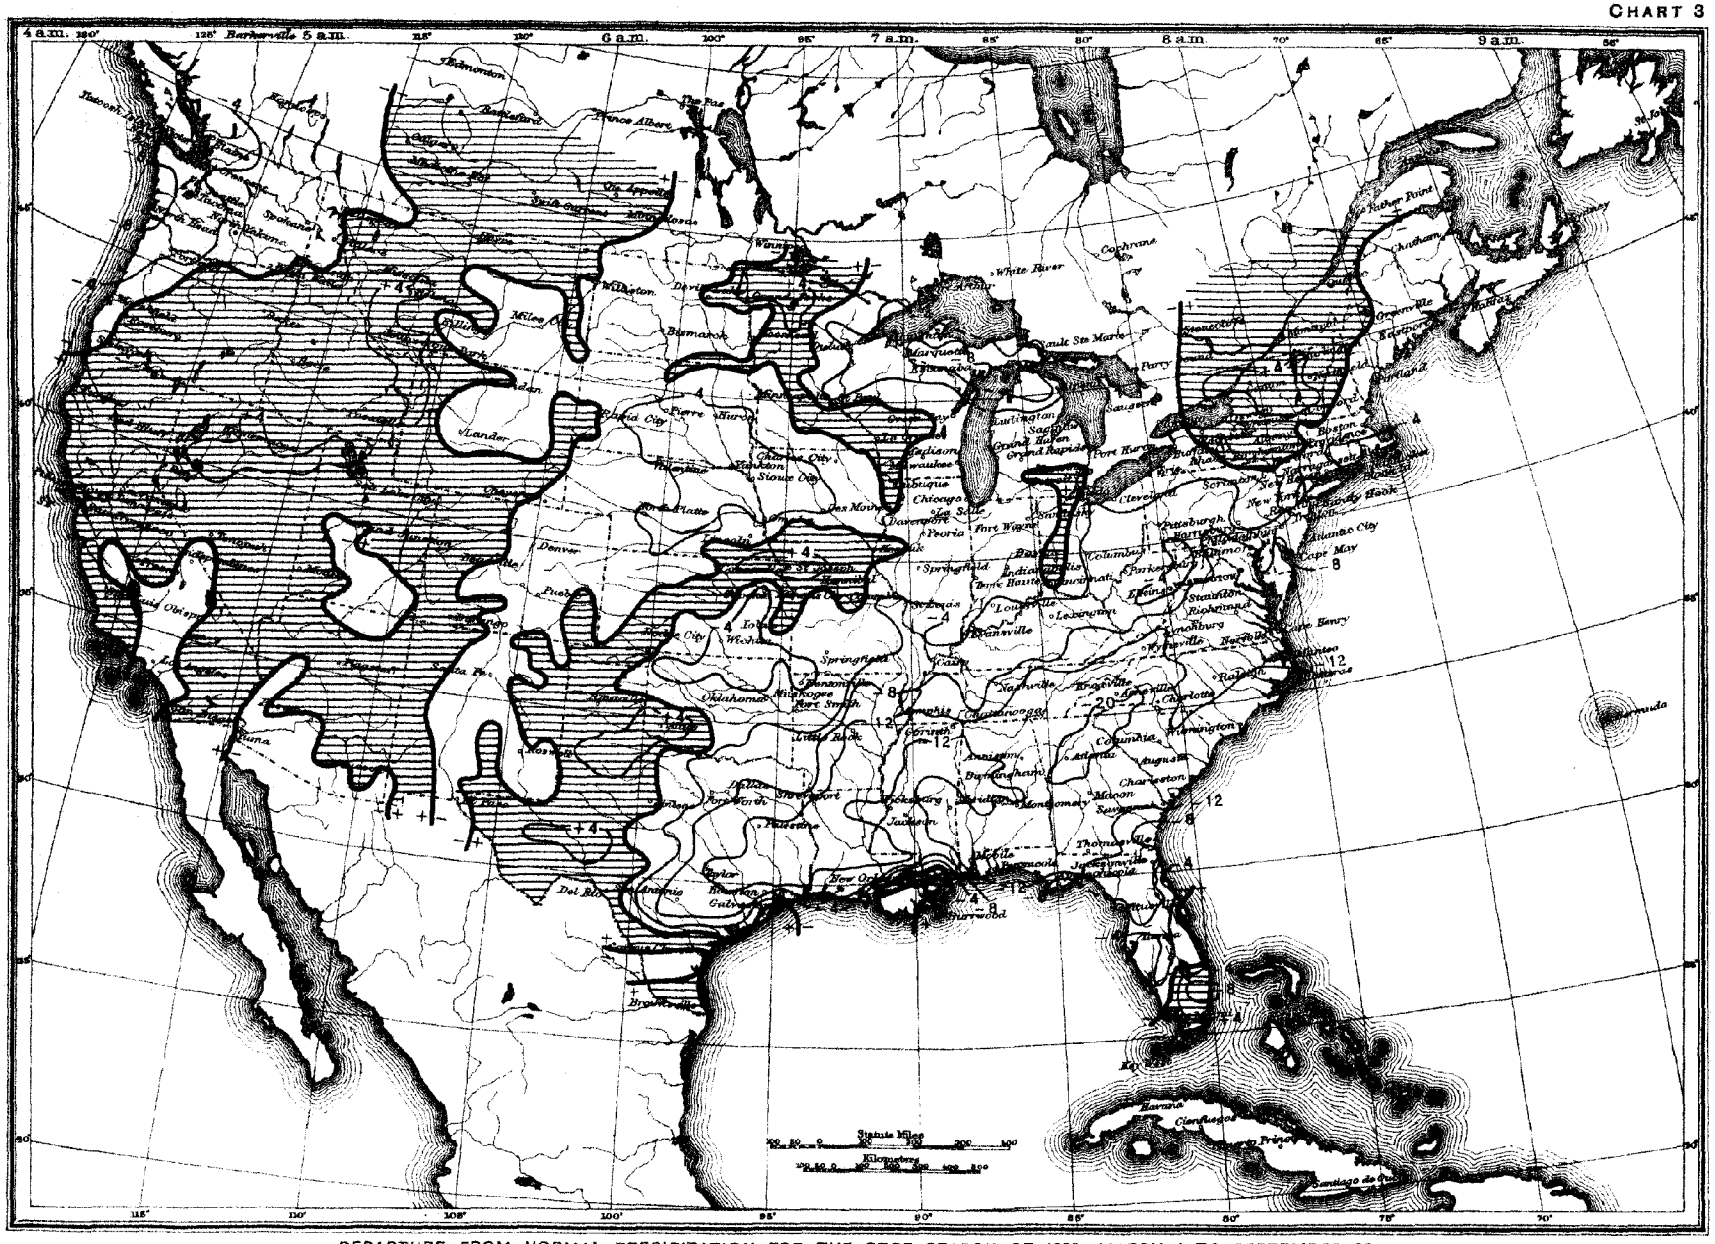
DEPARTURE FROM NORMAL TEMPERATURE, IN DEGREES FAHRENHEIT, FOR THE CROP SEASON OF 1925, MARCH 1 TO SEPTEMBER 30

Shaded portions show excess (+) and unshaded portions deficiency (−) of temperature

Figures show mean daily excess (+) or deficiency (−) of temperature over areas bounded by light lines

CHART 2

TOTAL PRECIPITATION, INCHES, FOR THE CROP SEASON OF 1925, MARCH 1 TO SEPTEMBER 30



DEPARTURE FROM NORMAL PRECIPITATION FOR THE CROP SEASON OF 1925, MARCH 1 TO SEPTEMBER 30

Shaded portions show excess (+) and unshaded portions deficiency (−) in precipitation

Figures show, in inches, amount of excess or deficiency of precipitation over areas bounded by light lines

TOTAL PRECIPITATION, INCHES, FOR THE YEAR 1925

OCCURRENCE OF TORNADOES DURING THE YEAR 1925

The arrows show the location of tornado paths, and point in the direction of storm motion

OCCURRENCE OF MODERATELY HEAVY HAIL, DOING SLIGHT DAMAGE ONLY, FOR THE WARM SEASON OF 1925, APRIL 1 TO SEPTEMBER 30

The dots show the localities where moderately heavy hail fell, as reported by observers of the Weather Bureau and others

OCCURRENCE OF HEAVY HAIL, DOING MATERIAL DAMAGE TO CROPS AND OTHER PROPERTY, FOR THE WARM SEASON OF 1925, APRIL 1 TO SEPTEMBER 30

The dots and lines show the localities where heavy hail fell, as reported by observers of the Weather Bureau and others

LIST OF OBSERVING STATIONS

The following table contains the geographic coordinates of the several stations whose summaries are published in Part III, the adopted height of the barometer cistern above mean sea level and of other instruments above ground, the difference between local mean and seventy-fifth meridian time, and the date on which observations began. The standard of time used by the Weather Bureau in all of its synchronous work is that of the seventy-fifth meridian (eastern time), which standard is always understood unless otherwise expressed.

The elevations of the barometers are those adopted January 1, 1900, except at stations established since that date. They are the results of precise levels, and are known as the "station elevations."

Changes in the elevations of other instruments during 1925 are shown by the figures immediately below, and the dates of such changes are given under appropriate heading.

The significance of the bold-face letter or letters following the name of station is as follows:

P = continuous records of pressure (on December 31, 1925);
T = continuous records of temperature (on December 31, 1925);
W = continuous records of wind (direction and velocity) (on December 31, 1925);
V = continuous records of wind (velocity only) (on December 31, 1925);
R = continuous records of rainfall (on December 31, 1925);
S = continuous records of sunshine (on December 31, 1925).

Summary of stations in operation during the year

Taking two observations daily (all elements)	170
Taking one observation daily (all elements)	33
Taking two observations daily (temperature, rain, wind, and weather)	41
Taking one observation daily (temperature, rain, wind, and weather)	37
Taking one observation daily (climatological and cotton)	1
Taking one observation daily (meteorological and river)	1
Taking one observation daily (meteorological and storm warning)	4
Taking one observation daily (cotton)	84
Taking one observation daily (cotton and cattle)	12
Taking one observation daily (sugar and rice)	5
Taking one observation daily (cotton and river)	30
Taking one observation daily (cotton and rainfall)	41
Taking one observation daily (river)	558
Taking one observation daily (rainfall)	286
Taking one observation daily (river, rice, and fruit)	1
Taking one observation daily (sugar and rice and river)	3
Taking one observation daily (river and rice)	1
Taking one observation daily (corn and wheat)	137
Taking one observation daily (corn and wheat and river)	8
Taking one observation daily (corn and wheat and rainfall)	35
Taking one observation daily (corn and wheat and fruit)	1
Taking one observation daily (cranberry)	10
Taking one observation daily (fruit)	17
Taking one observation daily (fruit and river)	1
Taking one observation daily (fruit and rainfall)	1
Taking one observation daily (fruit and cotton)	2
Taking one observation daily (cattle)	37
Taking one observation daily (cattle and rainfall)	11
Taking one observation daily (tobacco)	5
Taking one observation daily (alfalfa and cattle)	1
Snowfall	116
Snowfall and evaporation	2
Vessel	178
Storm warning	145
Total paid stations	2,015
Cooperative stations (about)	[1] 4,500
Grand total	6,515

[1] Exclusive of the observers of the cattle, cotton, sugar and rice, and corn and wheat regions, who generally act as cooperative observers during the period when not employed as special observers.

TABLE I.—*Latitude, longitude, elevation, etc., of Weather Bureau stations*

SUNSHINE, 1925

The following tables give for 164 stations the monthly amounts of sunshine and percentage of the possible, as derived from the automatic records made by an instrument designated the "thermometric recorder," illustrated in preceding volumes of this series.

This instrument does not record satisfactorily the duration of sunshine for about one hour after sunrise and for about one hour before sunset, and on this account it has been considered necessary to apply to the record for these hours what has been designated a "twilight correction." The amount of this correction is found by noting the comparative clearness of the sky during the time that elapses between the hour of sunrise and the moment the instrument begins to record and between the time the instrument ceases to act and the hour of sunset.

The average cloudiness of the whole sky is determined by numerous personal observations at all stations during the daytime, and is given in the column "daylight" under "cloudiness" in the tables of Part III.

EXCESSIVE RAINFALL, 1925

The following table contains statistics of excessive rainfall during the calendar year 1925. Similar data for the years 1896 to 1924, inclusive, have been presented in the appropriate annual reports of the Chief of the Weather Bureau. The published data prior to 1896 consist of a record of maximum amounts of rainfall in 5 and 10 minute periods, also in 1 and 24 hours. The annual report for 1895–96 contains a summary of the records which up to that time had been made at the principal stations supplied with automatic gauges.

The following table shows, for most stations of the Weather Bureau furnished with self-registering gauges, the accumulated amounts of precipitation for each 5 minutes during all storms of 1925 in which the rate of fall equaled or exceeded 0.25 inch in any 5-minute period, or 0.30 inch in any 10-minute period, or 0.35 inch in any 15-minute period, etc. If the period be 1 hour, the minimum fall would need to be 0.80 inch; if 2 hours, 1.40 inches. In the comparatively few cases when the excessive rate of fall continued for more than 2 hours, the record has been spread over three or more lines, as necessary, each line showing amounts through 50 minutes; the four left-hand columns have each but a single entry for the storm, while the amounts shown in the column headed "5 min." are, in reality, the 55-minute amount on the second line, the 105-minute amount on the third line, etc.

The excepted stations, for which the statistics only of the more intense storms appear here, are those in the South Atlantic and the Gulf States, including Arkansas and Tennessee, but not including the western portion of Texas. In these States very heavy falls are so frequent that much space would be needed to print detailed statistics of each rainfall that attained to one of the limits mentioned above, so only the more intense rainfalls are shown. At most stations the only falls included are those in which 1 inch or more fell within an hour, as footnote 6 indicates; but a few stations within these States had no such fall during 1925; so for such stations those falls in which 0.50 inch or more fell within 30 minutes have been presented (footnote 5).

Normal standard time at the place of occurrence is employed in this table.

Accumulated amounts of precipitation for each 5 minutes for the principal storms in which the rate of fall equaled or exceeded 0.25 inch in any 5 minutes or 0.80 in 1 hour during 1925 at all stations furnished with self-registering gauges

PART III

MONTHLY AND ANNUAL METEOROLOGICAL SUMMARIES FOR TWO HUNDRED AND SEVEN STATIONS DURING 1925

EXPLANATION OF THE TABLES

For a detailed account of the method of reducing the observed barometric pressures the reader is referred to the "Report on the barometry of the United States, Canada, and the West Indies," to be found in the Annual Report of the Chief of the Weather Bureau, 1900–1901, Volume II.

Pressure.—Two mercurial barometers of the well-known Fortin cistern pattern, or a modified form thereof, are furnished each station. One of these, the "station barometer," is used in making all regular observations; the other, the "extra," is held in reserve for use in case of emergency, except that once each month five comparative readings are made on the two instruments for purpose of check upon the deterioration of either instrument.

Each barometer, before issue to station, is compared with the substandard at Washington, and a certificate of correction card furnished showing the several constant corrections that must be applied to the readings of the instrument in order to derive therefrom the actual pressure of the air in standard units at a specified elevation. Each observation as made, therefore, is corrected by the application of the following:

(1) Correction for scale errors, capillarity, etc.

(2) Correction to standard gravity, comprising both latitude and altitude terms.

(3) Correction for removal—a correction applied if any change has been made in the elevation of the barometer, to reduce the readings to the elevation adopted in 1900.

Corrections 1, 2, and 3 are constant for any one station and are combined in a single sum.

(4) Correction for the temperature of the scale and mercurial column.

The monthly mean pressures given in the summary are deduced from the corrected observations of pressure at 8 a. m. and 8 p. m., seventy-fifth meridian time, by taking the mean thereof and applying thereto a correction to reduce to the mean of 24-hourly observations. At several Alaska stations the mean is printed uncorrected.

The extremes are determined from the barograph trace.

Temperature.—The temperature of the air at 8 a. m. and 8 p. m., seventy-fifth meridian time, and at noon, local time, is obtained by the use of the whirled dry-bulb thermometer. The latter is a part of the whirled psychrometer and is mounted in the thermometer shelter adopted in 1885. The means of these observations are given in the columns headed 8 a. m., noon, and 8 p. m., respectively.

The maximum temperature is obtained by the use of the Negretti and Zambra mercurial thermometer, having a constriction in the bore of the tube below the scale. The minimum temperature is obtained by the use of the ordinary Rutherford alcohol minimum thermometer. Both instruments are read and the values recorded twice daily, at 8 a. m. and 8 p. m., seventy-fifth meridian time, and are set twice daily at 8 a. m. and 8 p. m. The extremes given in the summaries are for the civil day, midnight to midnight, normal standard time. The monthly means have been obtained by dividing the sum of the mean maximum and mean minimum temperature by 2.

Moisture.—The monthly means of the dew point, relative humidity, and vapor pressure are given as computed directly from the original daily observations.

The rain gauges used at the regular Weather Bureau stations have a circular catchment area of about 8 inches diameter, and the snow, hail, or sleet caught within them is melted and measured as water. The rain gauge proper is set within an inclosing cylinder 8 inches in diameter and 2 feet high, which serves as an overflow attachment in the case of heavy rains and as a snow gauge in the winter season.

The sum total of the depth of rain and melted snow is measured to within 0.01 inch at 8 a. m. and 8 p. m., seventy-fifth meridian time, daily. The total precipitation is determined from the amounts recorded daily, midnight to midnight, standard of time in local use.

The snow caught and retained in the gauge is melted and measured as water. No correction is applied for the snow that is lost out of the gauge by the eddying action of the wind; consequently in some cases the record is less than would be given if the observer had measured cylinders of snow cut from the spots representing the average snowfall on the ground. When it is known that the catch of the snow gauge is markedly deficient, an independent ground measurement is made and used as the official record. The loss of both rain and snow, caused by high winds, from gauges located on the roofs of tall buildings in which some of the regular stations of the Weather Bureau are located is undoubtedly larger than is the case at the cooperative stations, where the gauges are located in the open country and near the ground, but this loss does not appear to be sufficient to make the monthly and annual sums derived from these two classes of stations wholly inconsistent with each other.

By the maximum precipitation in 24 hours is meant the greatest measurement for any 24 consecutive hours; it does not refer to the rate of rainfall for 24 hours, as deduced from short, heavy showers.

The number of days with precipitation amounting to 0.01 and 0.04 inch, respectively, relates to the rainfall from midnight to midnight, standard of time in local use.

The cloudiness recorded in the summaries is derived from personal observations. The proportion of sky covered with clouds is estimated by the observer at 8 a. m. and 8 p. m., seventy-fifth meridian time, and at noon, local time, on a scale of 0–10. These observations can not be combined into a daily mean in the present state of our knowledge of the diurnal variations in cloudiness, and are therefore given separately. In order however, to obtain a general record of the sunshine as affecting the growth of plants, the observer keeps some memoranda of the cloudiness, sufficient to enable him at the end of the day to determine the average cloudiness on the scale given above, from sunrise to sunset; the resulting average for each month is given in the column of "daylight" cloudiness.

The number of days that were clear, as given under "Number of days, etc.," includes those on which the daylight cloudiness was 0, 1, 2, or 3 tenths; the days partly cloudy were those on which the daylight cloudiness was 4, 5, 6, or 7 tenths; the cloudy days were those having 8, 9, or 10 tenths of cloudiness during daylight.

Wind.—The direction and velocity of the wind are recorded at nearly all the stations on what is known as the "triple register." On these instruments the direction of the wind is recorded every minute.

The maximum velocities given are for five-minute periods.

Number of days.—The number of days with hail includes all of those on which at least a trace of hail fell.

No record is made of deposits of dew.

The number of days with fog includes all of those on which fog prevailed for at least an hour and was dense enough to obscure objects 1,000 feet distant.

References and abbreviations.—H_b=height of barometer cistern above mean sea level on January 1, 1900, or when the station was established, if it was established since January 1, 1900, that being the elevation to which all previous readings have been reduced. It is designated as the "station, or adopted, elevation." At stations where a change has been made in the elevation of the barometer since January 1, 1900, a corresponding correction has been applied to the observed reading, thereby reducing all values to the "station, or adopted, elevation." The actual elevation and the station, or adopted, elevation are identical, except at stations where the barometer has been moved since January 1, 1900. h_t=height of thermometer above ground; h_r=height of rain gauge above ground; h_a=height of anemometer above ground.

15029—27——5

Annual meteorological summary for the year ending December 31, 1925

PART IV

MONTHLY AND ANNUAL PRECIPITATION, 1925 (ALL STATIONS)—MONTHLY AND SEASONAL SNOWFALL, SEASON 1925–26 (SELECTED STATIONS)—MONTHLY AND ANNUAL EVAPORATION, 1925

The precipitation values given in the following tables have been taken largely from the records of unpaid cooperating observers. Most of these observers have standard rain gauges, the remainder having gauges similar in pattern to the standard.

Occasionally the record for a station may be incomplete from various causes, either for a single storm or for a longer period. Where conditions were favorable, the missing data have been supplied by interpolation from the records of near-by stations. The monthly amounts in such cases are inclosed in brackets to show that the whole amount or some portion has been estimated.

The discrepancies between the amounts recorded by separate observers when two reports are received from the same place are often considerable; in general, they are due to differences in exposure, although at times one observer may make the last measurement of the month as early as 6 o'clock a. m., whereas the other may defer it to 9 p. m. or later, thus sometimes causing a difference in the amounts recorded on the first and last days of the month.

The monthly and seasonal amounts of snowfall for the winter of 1925–26 are given for selected stations in the United States and Canada.

The monthly and annual amounts of evaporation during the year 1925 follow the snowfall, this being the seventh year that this series of reports has included them. The number of these reports at the present time is small, records appearing from only about half of the States.

The evaporation measurements are all made from cylindrical pans, 4 feet in diameter, 10 inches deep, placed on framework laid on the ground, and exposed as far as possible to full sunshine. A description of equipment and methods of observation appears in the Monthly Weather Review of December, 1916, pages 674 to 677.

Monthly and annual precipitation (in inches and hundredths) for 1925

[1] The large differences in the amounts of evaporation at these places is due mainly to differences in exposures. The evaporation pan at "Yuma" is exposed in an irrigated alfalfa field where the wind action is greatly modified by the growing vegetation. At "Yuma Citrus" the exposure is on the open unirrigated mesa, at a considerably higher elevation, and fully exposed to the wind, which averages several hundred per cent higher than at the "Yuma" station.
