SUMMARY OF TROPICAL STORMS - 1944

(Number of storm in table corresponds with number of track on accompanying chart.)

STORM	DATE	MAXIMUM REPORTED WIND	LOWEST REPORTED BAROMETRIC PRESSURE	INTENSITY
I	Jul. 17-19	38 Knots (mph) reported at Bermuda	No data	Probable Hurricane
II	Jul. 24-27	58 Knots (mph) Port de France	No data	--------
III	Jul. 30 to Aug. 4	Estimated 70-80 mph at the Oak Island Coast Guard Sta., N.C.	959.3 mb (28.32 in.) at Oak Island Coast Guard Station.	Hurricane
IV	Aug. 16-23	Estimated 100-120 mile gust at Boston Bay Jamaica, 93 mph Guard Cayman (measured)	993.3 mb (28.74 in.) a ship at 15° 10'N 86° 40'W	Hurricane
V	Aug. 20-22	34 Knots (mph) Port Isabel Texas	No data near center	Slight
VI	Sep. 5-16	134 Knots (mph) Extreme gusts Estimated 150 mph Cape Henry Va.	947.2 mb (1[illegible].97 in.) Hatteras, N.C.	Hurricane
VII	Sep. 8-10	47 Knots (mph) Pensacola Naval Air Station	1003.4 mb (29.63 in.) at Mobile, Alabama	--------
VIII	Sep. 19-21	75 Knots (mph) Campeche	1001 mb (29.56 in.) at Campeche	Hurricane
IX	Sep. 29 to Oct. 2	33-38 Knots (mph) Ship report	1004 mb (29.65 in.) 29.65 Ship report	Slight
X	Oct. 13-21	Reported 158 Knots (mph) at Boyeros	948.9 mb (28.02 in.)	Hurricane

HURRICANES - 1944

During the year 1944, there were ten tropical disturbances in the Western Atlantic, Caribbean Sea, and Gulf of Mexico, of which five, and possibly six, reached full hurricane intensity.

I - Tropical Disturbance July 12-19, 1944

A tropical storm of probable hurricane intensity was first indicated by a circular isobaric pattern on the 0030 GCT chart of July 13. It developed in association with a trough which was first noted on the 11th at 0030 GCT just west of Port of Spain, moving westward at approximately 12 knots. By 0030 GCT July 12th, the upper winds and 5,000 and 10,000 feet pressure charts indicated the probable presence of a tropical disturbance, but too far north to be definitely located, due to the lack of stations in that area. By 0030 GCT July 13th, the storm was central in the vicinity of Latitude 25°N, Longitude 73°W, moving north-northwestward with winds of gale force near the center. The disturbance increased in intensity with a northwesterly ~~movement~~, eventually recurving to the northeast near Latitude 28°N, Longitude 76°W, during the night of July 15th, thence continuing its northwestward movement over the Atlantic.

This storm was probably of hurricane force from the time it recurved to the northeast, although no station or ship reports were available near the center. The highest winds reported were from Bermuda which reached 38 knots as the storm passed about 250 miles northwest of the station.

The path of the storm was rather definitely established by the general pressure pattern as indicated at 5,000 feet and particularly at 10,000 feet, which was reflected somewhat on the surface synoptic chart. The pattern aloft indicated the breaking-off into a separate cell of the western extension of the Atlantic High in the Gulf. The trough thus formed was the path followed by the disturbance. The anticyclone in the Gulf was further intensified by a cell which moved down and spread out from the northwestern United States. A close study of the upper air charts and the deepening tendencies of the Gulf cell indicated a fairly definite movement of the disturbance.

II - Tropical Disturbance July 24-27, 1944

A disturbance still in the formative stage moved south of Martinique on the 24th. The storm moved generally west-northwestward at approximately 20 knots, its path being rather erratic for the first 18 hours perhaps for two reasons: first, because of its being still in its infancy, second, because of the difficulty in locating the storm accurately since as yet there was no definite center. By 1200 GCT July 26th, it was centered in the vicinity of Latitude 16° 20'N, Longitude 71° 30'W, with estimated winds of 45 to 50 knots, which was apparently the maximum intensity reached, gradually dissipating thereafter. The westerly movement continued across the Caribbean giving squally weather to all of Puerto Rico, the south coast of Hispaniola and Cuba, and all of Jamaica. On July 27th it was approximately 120 miles south-southwest of Kingston, apparently having diminished to the extent of being nothing more than a squally area. The last reports of a squall

are indicated a position about 140 miles southwest of Cozumel on August 1st.

This tropical storm of slight intensity was apparently associated with a trough indicated by southeasterly winds at Cayenne, Paramaribo, and Georgetown.

The future path of the storm was again evident from the pressure patterns aloft and at the surface. The Atlantic High showed no sign of breaking down into two cells, thus forcing the storm to move along its periphery across the Caribbean. The circulation at no time reached altitudes above 12,000 feet.

III - Tropical Disturbance July 30 to August 4, 1944

A trough oriented west-southwest east-northeast associated with a deep wave on the Intertropical Front became evident July 27th between Fort de France and Bridgetown, moving westward at 18 knots. By 0030 GCT on July 31st, a disturbance of slight intensity was developing east of the Bahamas, moving west-northwest at 18 knots. This movement continued until approximately 250 miles of West Palm Beach whence a gradual recurving to the north-northwest and an increase in speed took place, carrying the storm out of the area where no further checks were made. No advisories were issued by Pan American on the disturbance since it did not reach dangerous proportions until after the northward track was well established. The storm attained hurricane intensity about the time it was abeam Jacksonville.

Early indications of the separation of the Atlantic High into two cells was evident on the 10,000 and 15,000 foot wind chart, giving a good indication as to the future movement of the storm along the trough line northward between these two cells. The situation was quite similar to that associated with the first July tropical disturbance.

IV - Tropical Disturbance August 16-23, 1944

First evidence of the presence of an incipient tropical disturbance appeared on the 5 and 10,000 foot levels of the 0900 GCT wind charts of August 16th. Strong flow from the southern hemisphere pushing northward apparently produced a wave on the Intertropical Front, which provided the instability and initial cyclonic flow.

The circulation increased until at 0030 GCT, on August 17th, a closed isobaric pattern appeared with its center in the vicinity of Latitude 12°N, Longitude 59°W. This disturbance of slight to moderate intensity moved west-northwest across the Caribbean with the center passing 10-20 miles north of Kingston near noon of August 20th.

Kingston reported highest wind of 50 knots with gusts to 60 at 1815 GCT on August 20th. Due to terrain of Jamaica the surface winds at Kingston did not exhibit evidence of the close proximity of the disturbance until it was almost directly north of the station. Then the wind increased from west 10 knots at 1500 GCT, to west-northwest 40-45 knots at 1825 GCT, and reached a maximum of 50-60 knots at 1815 GCT.

The path of the disturbance was influenced by the strong flow around the Atlantic High and the movement eastward of a deep anticyclone which was centered over the eastern United States as the storm moved near Jamaica. The strong easterly flow from the Atlantic High continuing around the continental anticyclone

prevented the storm from assuming a northward track and forcing it to remain in its general westward movement. The storm continued in a west-northwest direction passing about 30 miles south of Grand Cayman. This station reported the highest gust at 93 mph from the east northeast at 1215 GCT on August 21st. The disturbance entered the Yucatan peninsula approximately 50 miles south of Cozumel near 1200 GCT on August 22nd, decreasing in intensity while passing over the land area, and continued across the Gulf of Campeche. It apparently entered the coast of Mexico early on the morning of August 24th with greatly decreased circulation.

V - Tropical Disturbance August 20-22, 1944

A small storm of slight intensity became evident in the vicinity of Latitude 23°N, Longitude 88°W. This small disturbance gradually moved west-northwest and entered the Mexican coast approximately 150 miles south of Brownsville late in the afternoon of the 22nd with winds of 40-45 knots near center. The storm rapidly dissipated after entering the coast and was dropped from the charts by the end of the following day.

VI - Tropical Disturbance September 8-15, 1944

This hurricane was subsequently referred to as the Great Atlantic hurricane or the New England hurricane.

Although previous weather charts showed indications of the presence of a disturbance, no accurate location was arrived at until September 9th. At 2300 GCT, on that date, reconnaissance flights definitely located the hurricane center at Latitude 22.5°N, Longitude 62.5°W. The disturbance moved nearly northwestward at 10-12 knots which brought it to the position of Latitude 25.2°N, Longitude 69.7°W by 1200 GCT on September 11th.

By the morning of September 12th the disturbance had attained full hurricane proportions, and analysis indicated a more westerly movement. This centered the storm at Latitude 25.7°N, Longitude 72.5°W by 1200 GCT of this date. The evening analysis and reports indicated that the hurricane was recurving to the northwestward. The disturbance passed 150 miles east of Nassau and was estimated to reach a position of Latitude 26.5°N, Longitude 75.0°W by 0400 GCT of September 13th.

The storm continued a slow curve toward the north, moving now north-northwestward at 14 knots. By 1700 GCT on September 13th it had reached a position of Latitude 29.0°N, Longitude 78.0°W.

The storm reached a position approximately 100 miles southeast of Norfolk, Virginia by 1600 GCT of the 14th, with average wind speed of 52 knots with gusts to 75-80 knots. During the evening of the 14th New York experienced winds up to approximately 90 knots.

By 0630 GCT of the 15th the storm was just east of Boston with wind speeds of 35-40 knots. The storm continued northeastward and moved approximately 60 miles southeast of Bangor, Maine by 1200 GCT on the 15th. By 0030 GCT on September 16th the storm centered over Newfoundland accompanied by winds of 25-35 knots. It continued in a northeasterly direction and gradually dissipated.

VII - Tropical Disturbance September 8-10, 1944

On the 1930 GCT map of September 7th it became apparent that a small low pressure

area was developing in the vicinity of Vera Cruz, Mexico. By 1200 GCT on the 8th, isobars began to take on a cyclonic curvature, which became a closed system centered at Latitude 23°N, Longitude 94°W by 1830 GCT.

At this time a stationary front was lying west-southwest to east-northeast along the southern edge of the Gulf coast states, over Savannah, Georgia and out into a low situated in the north Atlantic. Squally conditions existed along this front with scattered thunderstorm and shower activity extending southward through Florida.

By 1830 GCT on September 9th the low pressure area apparently attached itself to the frontal trough and was carried as a wave at the southwest end of the front. This wave was centered at Latitude 26.5°N, Longitude 94.5°W with ships in the vicinity of the center reporting wind speeds of 16-20 knots. The wave moved slightly northward, and then by 0630 GCT of September 10th it curved east-northeastward along the stationary frontal line. At 1230 GCT the wave was approximately 160 miles west of Burrwood in the extreme of south Louisiana with a wind of 20-25 knots reported at that station. The rain area accompanying the wave and frontal line extended from southern Louisiana, Mississippi, Alabama to northern Florida. The wave moved just to the east of Pensacola on September 11th with stations in the vicinity of the wave reporting winds of 10-15 knots except Pensacola which reported a wind as high as 47 knots (according to USWB), from the south.

The wave then moved into the center of Alabama with the accompanying rain area covering most of Alabama, and with average wind speeds over the state of 10-15 knots. The low remained stationary over Alabama during the 13th, then moved with the frontal line to the east coast and gradually dissipated.

Most damage caused by this disturbance was due to the almost continuous rain area which existed along the front and around the low and brough flooded conditions in several sections.

VIII - Tropical Disturbance September 19-21, 1944

On the 0630 GCT chart of September 19th it became apparent that a small low pressure area was forming in the western Caribbean, centered approximately Latitude 20°N, Longitude 85°W. The 1230 GCT chart showed that the weak cyclonic circulation was spreading out, and that it now extended east almost to Cienfuegos, west to Merida and south to Puerto Cabezas, Nicaragua. By 1830 GCT a well defined cyclonic circulation existed with its center at Latitude 20.5°N, Longitude 85°W.

The storm deepened and moved to Latitude 22°N, Longitude 86.5°W, with winds of 35-40 knots near the center, by 0630 GCT of September 20th. This position brought continuous moderate rain to Cozumel. By 1230 GCT the storm began to move west-southwestward over the Yucatan peninsula, and by 1830 GCT it was centered at Latitude 20.5°N, Longitude 88.5°W with winds near the center of 45-55 knots. By 0030 GCT on September 21st the storm was centered just to the southeast of Merida and continuous moderate rain at Campeche. The storm moved out into the Gulf of Mexico by 1230 GCT, centered at Latitude 19.5°N, Longitude 92.5°W attended by a widespread area of light rain extending from Campeche across the western gulf of Tampico.

By 1830 GCT of the 21st. The storm had re-entered the coast and was centered

Latitude 18.5°N, Longitude 90°W. The storm passed inland to the east of Villahermosa causing a light rain and drizzle condition over most of the Yucatan peninsula. By the following day the storm had dissipated.

IX - Tropical Disturbance September 29 October 2, 1944

On the 1830 GCT chart of September 29th a trough was lying northeast-southwest across the southern Caribbean from La Guaire across St. Lucia in the Leeward Islands. By 1830 GCT the isobars across this trough had taken on a cyclonic curve and the surface winds through the Leeward Islands, while light, showed the beginning of the circulation. By 0830 GCT on September 30th a small low pressure area had developed centered approximately Latitude 16.5°N, Longitude 58.5°W. No weather seemed to be connected with this position except for few showers and broken cumulus. By October 1st the low moved to the east-northeast of Roseau, with light cyclonic circulation remaining but still no weather through the islands. Judging from the shifting of the wind through the Leeward Islands the low moved gradually northwestward. By October 3rd, 0830 GCT, the winds at St. Kitts and St. Johns showed them to be on the south side of the circulation. Still no weather seemed to be associated with this circulation as far as the island stations were concerned. The disturbance then moved northward into a strong trough moving southeast to the east of Bermuda. This disturbance was not heard from after this and caused no damage.

X - Tropical Disturbance October 13-21, 1944

On October 8th a front was lying NNE-SSW over western Cuba and extending south into the Caribbean. Prior to this time the front had moved northwestward through the Lesser Antilles, producing unsettled conditions which also prevailed on the 8th in conjunction with a well developed wind stream from the Pacific, as indicated by winds aloft at the Canal Zone.

From aircraft reports of the 12th there was an indicated weak closed cyclonic circulation in the vicinity of Longitude 80°W and Latitude 14°N at 1200GCT. The disturbance then began to increase in intensity and moved to the north-northeast being central in the vicinity of Latitude 17.5°N and Longitude 81.5°W at 1600 GCT on the 13th. From here it moved north and north-northeast to approximately Latitude 18.5°N then followed the track of a right hand loop within an area of one degree latitude and Longitude during the 14th and 16th. It now began a west-northwest to northwest movement passing Grand Cayman to the near south between 2000 GCT on the 15th and 0100 GCT on the 16th. During this time Grand Cayman reported rain and heavy squall with lowest pressure at 966.0 millibars, an average east surface wind of force nine with gusts to 92 knots at 2200 GCT on the 15th and 118 knots at 2200 GCT on the 16th. From then on the barometer followed a rapid rise with surface wind veering to southeast as the disturbance, of now hurricane force, assumed a northerly track approximately the vicinity of Longitude 82.5°W.

Continuing on its northerly track the hurricane passed along the eastern side of the Isle of Pines on the night of October 17th, and passed just west of Havana with the center near Boyeros Airport about 1300 GCT on the 18th. Boyeros at that time reporting maximum surface wind 158 mph with lowest pressure reading by aneroid barometer at 957.0 millibars. After passing over Cuba the hurricane continued its northerly movement, with a slightly decreasing intensity, and passed approximately 40 miles to the west of Key West about 2100 GCT on the 18th, continuing on to enter the west coast of Florida on the morning of the 19th between Ft. Myers and Tampa.

The track then became north-northeast with the hurricane passing across Florida to enter the Atlantic Ocean near Jacksonville. It then recurved toward the north and north-northwest to enter the coast just north of Savannah moving inland till it again moved into the Atlantic along the New Jersey coast following a northeast track with no accelerated speed. On past Cape Cod [illegible] eventually merge with an Icelandic low east of Greenland.

The movement of the disturbance was originally under the influence of an anticyclonic circulation to the east to bring about its first northward movement. Then with a second high pressure cell to the north there was evidence that the disturbance would assume a westward movement under its influence, as indicated as the time of the loop and its movement past Grand Cayman. However, the disturbance remained in the northward moving air stream to continue its track as described with slight variation toward northeast and northwest.
