PRZEDMOWA

Układ „Rocznika meteorologicznego 1967" wydawanego w zeszytach miesięcznych, jest taki sam jak rocznika 1966.

W celu zmniejszenia objętości poszczególnych zeszytów miesięcznych, część opisowa obejmująca objaśnienia do poszczególnych tablic, wraz ze spisem oraz mapą sieci stacji i posterunków meteorologicznych, została wydana jako oddzielny zeszyt.

Rocznik został opracowany w Ośrodku Gromadzenia i Rozpowszechniania Danych PIHM pod kierownictwem i redakcją mgr Zofii Jackowskiej.

ПРЕДИСЛОВИЕ

Расстановка „Метеорологического ежегодника 1967" выпускаемого ежемесячно, такая же как и ежегодника 1966.

Для уменьшения объема отдельных месячных выпусков, описательная часть, охватывающая пояснения к отдельным таблицам вместе со списком и картой сети метеорологических станций и постов, издается как отдельный выпуск.

Ежегодник подготовлен Центром сбора и распространения данных ГГМИ под руководством и редакцией Зофии Янковской.

PREFACE

The pattern of the „Meteorological Yearbook 1967", published in monthly fascicles, does not differ from that of 1966.

To abridge the volume of individual monthly fascicles, the descriptive part, comprising explanatory remarks to individual tables, together with the list and the map of the network of stations and posts, was issued in a separate fascicle.

The yearbook was prepared in the Center of Data Collection and Dissemination in the National Institute for Hydrology and Meteorology. Editorial works were directed and supervised by Mrs Zofia Jackowska, M. Sc.

OBJAŚNIENIA

Materiał zawarty w "Roczniku Meteorologicznym" został podzielony na dwie części. W pierwszej (tabl. tabl. I-III) umieszczono wyniki pomiarów ze stacji meteorologicznych, natomiast w części drugiej (tabl. IV) umieszczono wyniki z posterunków meteorologicznych.

METODA OPRACOWANIA WYNIKÓW ORAZ TREŚĆ TABLIC

Tabl. tabl. I-III. Stacje meteorologiczne

Począwszy od 1 stycznia 1966 roku, opracowanie wyników oparto na pomiarach i obserwacjach dokonywanych przez stacje meteorologiczne w ciągu całej doby. W tablicy I zawarte są wyniki obserwacji dokonywanych co sześć godzin w terminach: 1, 7, 13 i 19 CSE (00, 06, 12, i 18 GMT), dla wybranych stacji. W tablicy II zawarte są wyniki dobowe oraz średnie wartości dobowe, wyliczone z ośmiu obserwacji wykonywanych co trzy godziny w terminach: 1, 4, 7, 10, 13, 16, 19 i 22 CSE (00, 03, 06, 09, 12, 15, 18 i 21 GMT) dla wszystkich stacji. Natomiast tablica III zawiera sumy miesięczne oraz wartości średnie, wyliczone z sumy miesięcznej ośmiu terminów obserwacyjnych.

Prace obliczeniowe zostały wykonane według programu ułożonego przez mgr inż. Witolda Duszyńskiego w Zakładzie Obliczeniowym ZOWAR przy pomocy maszyny matematycznej IBM-1440.

Temperatura powietrza. Temperaturę powietrza wyznaczono za pomocą termometrów umieszczonych w klatce meteorologicznej typu angielskiego na wysokości 2 m nad powierzchnią gruntu. Skrajne dobowe wartości temperatury odnoszą się dla stacji meteorologicznych do okresu od godziny 19 CSE (18 GMT) dnia poprzedniego do godziny 19 CSE danego dnia.

Temperaturę minimalną powietrza przy powierzchni gruntu, wyznaczono za pomocą termometru minimalnego umieszczonego na wysokości 5 cm nad powierzchnią gruntu, na poletku pozbawionym roślinności.

Wilgotność powietrza. Temperaturę punktu rosy, prężność pary wodnej i wilgotność względną wyznaczono za pomocą psychrometru Augusta.

Ciśnienie atmosferyczne. Ciśnienie atmosferyczne mierzono za pomocą barometrów rtęciowych naczyniowych.

Usłonecznienie. Usłonecznienie mierzono za pomocą heliografów Campbell-Stokes'a.

Wiatr. Pomiary wiatru są dokonywane w przeważającej części przy użyciu anemometrów typu M-47, a tylko w nielicznych przypadkach przy użyciu wiatromierzy Wilda.

Opad. Wysokość opadu, począwszy od 1 stycznia 1966 roku mierzy się na stacjach co sześć godzin w terminach: 1, 7, 13 i 19 CSE (00, 06, 12 i 18 GMT). W tablicy I podano wysokość opadu za okres ubiegłych sześciu godzin, natomiast w tablicy II i III podano wysokość opadu odnoszącą się do doby liczonej od godziny 7 CSE (06 GMT) dnia danego do godziny 7 CSE dnia następnego. Pomiary te wykonywano za pomocą deszczomierzy Hellmanna o powierzchni otworu 200 cm^2, umieszczonych na wysokości 1 m nad powierzchnią gruntu, z wyjątkiem części stacji górskich, położonych powyżej 500 m nad poziomem morza, gdzie używane są deszczomierze typu górskiego, mające powierzchnię otworu 500 cm^2 i umieszczone na wysokości 1,5 m nad powierzchnią gruntu.

Kolumny tablic, od lewej do prawej, zawierają następujące informacje:

Tablica I - Spostrzeżenia codzienne stacji meteorologicznych (wartości terminowe)

1. Kolejne dni miesiąca
2. Temperatura powietrza T, w °C

Tabl. VII - Kalendarz typów cyrkulacji i typów pogody

Za typ cyrkulacji lub typ pogody uważa się okres co najmniej dwudniowy zaklasyfikowany do tego samego typu. Pojedyncze dni, znacznie odbiegające charakterem pogody lub cyrkulacji od typu poprzedzającego lub następującego, oznaczono symbolem x.

Klasyfikacja typów cyrkulacji opiera się na trzech czynnikach: wskaźniku cyrkulacji strefowej dla Europy (Ws), wskaźniku cyrkulacji południkowej dla Europy (Wp) oraz wskaźniku ciśnienia dla Polski (Cp). Wskaźnik Ws przyjmuje wartość dodatnią dla cyrkulacji o składowej zachodniej, a ujemną dla składowej wschodniej. Wskaźnik Wp ma znak dodatni dla składowej południowej, a ujemny dla składowej północnej. Powyższe wskaźniki obliczane są z codziennych dolnych map synoptycznych. Wszystkie wyżej wymienione czynniki klasyfikowane są według systemu trójklasowego równoprawdopodobnego, w wyniku czego otrzymuje się 27 typów cyrkulacji.

Dla oznaczenia poszczególnych klas użyto następujących symboli:

Wskaźnik południkowy (Wp)
- N - klasa poniżej normy (ujemna)
- O - " w pobliżu normy
- S - " powyżej normy (dodatnia)

Wskaźnik strefowy (Ws)
- E - klasa poniżej normy (ujemna)
- O - " w pobliżu normy
- W - " powyżej normy (dodatnia)

Wskaźnik ciśnienia (Cp)
- C - klasa poniżej normy
- O - " w pobliżu normy
- A - " powyżej normy

Symbol typu cyrkulacji otrzymuje się przez zestawienie symboli klas dla wszystkich trzech czynników (Wp, Ws, Cp). Jeżeli wartości jednego z czynników Wp lub Ws są zaliczane do klasy O, wówczas w symbolu typu cyrkulacji zera tego się nie wpisuje, jeżeli natomiast wartości obu tych czynników są zaliczane do klasy O, wówczas pisze się tylko jedno zero. Klasę wskaźnika Cp wypisuje się w formie indeksu na dole po prawej stronie.

Przykłady:

Typ określony przez: klasę O dla Wp, klasę E dla Ws, klasę A dla Cp, będzie miał symbol E_A;

Typ określony przez: klasę N dla Wp, klasę W dla Ws, klasę O dla Cp, będzie miał symbol NW_O;

Typ określony przez: klasę O dla Wp, klasę O dla Ws, klasę C dla Cp, będzie miał symbol O_C

Typy pogody dla Polski Centralnej są klasyfikowane w oparciu o dwa elementy: temperaturę i opady. Przez zastosowanie klasyfikacji trójklasowej równoprawdopodobnej dla każdego z tych elementów otrzymujemy 9 typów pogody. Symbole użyte dla oznaczenia poszczególnych klas są jednakowe dla obu elementów:

- 1 - klasa poniżej normy
- 2 - " w pobliżu normy
- 3 - " powyżej normy

W wyniku przyjęcia takich oznaczeń symbol typu pogody jest liczbą dwucyfrową, w której pierwsza cyfra oznacza klasę temperatury, a druga klasę opadów.

Przykład:

Typ pogody określony przez: klasę 1 dla temperatury, klasę 2 dla opadów, będzie miał symbol 12

Dla bardziej szczegółowych opracowań wprowadza się dodatkowo podział każdej klasy na trzy równoprawdopodobne podklasy. Symbole używane dla oznaczenia poszczególnych podklas podaje poniższe zestawienie:

klasa	podklasy		
1	1_0	1	1_2
2	2_1	2	2_3
3	3_2	3	3_4

W kalendarzu typów pogody, typ pogody według klasyfikacji trójklasowej jest oznaczony dużymi cyframi. Umieszczony poniżej głównego symbolu, symbol napisany małymi cyframi w nawiasie odnosi się do kla-

syfikacji z podziałem na podklasy. Brak tego symbolu oznacza, że jest on identyczny z symbolem głównym.

Dla ilustracji każdego przypadku, dołączono mapki średniego rozkładu ciśnienia atmosferycznego na poziomie morza.

Szczegółowe omówienie zasad powyższego systemu klasyfikacyjnego podano w pracy J. Lityńskiego "Liczbowa klasyfikacja typów cyrkulacji i typów pogody".

ПОЯСНЕНИЯ

Материалы содержащиеся в "Метеорологическом ежегоднике" распределены на две части. В первой части (таб.таб. I-III) помещены результаты измерений из метеорологических станций, во второй (таб. IV)- из метеорологических постов.

МЕТОД ОБРАБОТКИ РЕЗУЛЬТАТОВ И СОДЕРЖАНИЕ ТАБЛИЦ

Таб.таб. I-III. Метеорологические станции

Начиная с I января 1966 г. обработка результатов основывается на измерениях и наблюдениях проводимых метеорологическими станциями на протяжении целых суток. В таблице I содержатся результаты наблюдений проводимых каждые шесть часов в сроки: I, 7, I3 и I9 СЕВ (00, 06, I2 и I8 GMT), для избранных станций. В таблице II даны суточные результаты и средние суточные значения, вычисленные из 8 наблюдений, проводимых каждые три часа в сроки: I, 4, 7, I0, I3, I6, I9 и 22 СЕВ (00, 03, 06, 09, I2, I5, I8 и 2I GMT) для всех станций. Таблица III содержит месячные суммы и средние значения, вычисленные из месячной суммы сроков наблюдений.

Расчеты выполнены по программе составленной дипл. инж. Витольдом Дуниньским в Вычислительном отделе ZOWAR с помощью математической машины IBM-I440.

Температура воздуха. Температура воздуха определяется с помощью термометров, помещеных в метеорологической будке английского типа на высоте 2 м над поверхностью почвы. Предельные суточные значения температуры относятся для метеорологических станций к периоду с I9 СЕВ (I8 GMT) предыдущего дня до I9 СЕВ данного дня.

Минимальная температура воздуха у поверхности почвы определена с помощью минимального термометра, установленного на высоте 5 см над поверхностью почвы, на площадке лишенной растительности.

Влажность воздуха. Температура точки росы, упругость водяного пара и относительная влажность определены с помощью психрометра Августа.

Атмосферное давление. Атмосферное давление измеряется с помощью ртутных чашечных барометров.

Продолжительность солнечного сияния. Продолжительность солнечного сияния измеряется с помощью гелиографов Кемпбела-Стокса.

Ветер. Измерения ветра производятся главным образом анемометрами типа М-47, а только в исключительных случаях флюгером Вильда.

Осадки. Количество осадков с I января 1966 г. измеряется на станциях каждые шесть часов в сроки: I, 7, I3 и I9 СЕВ (00, 06, I2, и I8 GMT). В таблице I указано количество осадков за период минувших шести часов, а в таблицах II и III - количество осадков, которое относится к суткам длившимся с 7 СЕВ (06 GMT) данного дня до 7 СЕВ следующего дня. Эти измерения выполнены с помощью дождемеров Геллъманна, с приемной площадью 200 $мс^2$, установленных на высоте I м над поверхностью почвы, за исключением горных станций, расположенных выше 500 м н.у.м., где применяются дождемеры горного типа с приемной площадью 500 $см^2$, на высоте I,5 м над поверхностью почвы.

Таблица VII - Календарь типов циркуляции и типов погоды

Типом циркуляции или типом погоды считается период не менее двух дней, зачисленный к одному типу. Отдельные дни, которые характером погоды или циркуляции отклоняются от предыдущего или следующего типов обозначены символом x.

Классификация типов циркуляции проведена для трех факторов: для показателя зональной циркуляции для Европы (Ws), для показателя меридиональной циркуляции для Европы (Wp) и для показателя давления в Польше (Cp). Показатель Ws принимает положительное значение для циркуляции с западной составляющей, а отрицательное с восточной. Показатель Wp положительный для южной составляющей, а отрицательный для северной составляющей. Вышеназванные показатели вычисляются на основании ежедневных приземных синоптических карт. Классификация всех этих факторов проведена по трехклассовой равновероятной системе, вследствие чего получается 27 типов циркуляции.

Для обозначения отдельных классов используются следующие символы:

Меридиональный показатель (Wp)
- N - класс ниже нормы (отрицательный)
- O - класс поблизости нормы
- S - класс выше нормы (положительный)

Зональный показатель (Ws)
- E - класс ниже нормы (отрицательный)
- O - поблизости нормы
- W - выше нормы (положительный)

Показатель давления (Cp)
- C - класс ниже нормы
- O - " поблизости нормы
- A - " выше нормы

Символ типа циркуляции получается путем сопоставления символов классов всех трех факторов (Wp, Ws, Cp). Если значение одного из факторов Wp или Ws причисляется в класс O, тогда в символе типа циркуляции этого нуля не следует вписывать, а если значения обеих факторов зачислены в класс O, тогда следует вписать только один нуль. Класс показателя Cp пишется в форме индекса внизу по правой стороне.

Примеры:

Тип определенный: классом O для Wp, классом E для Ws, классом A для Cp, обозначается символом E_A;

Тип определенный: классом N для Wp, классом W для Ws, классом O для Cp, обозначается символом NW_O;

Тип определенный: классом O для Wp, классом O для Ws, классом C для Cp, обозначается символом O_C

Классификация типов погоды для Центральной Польши проведена на основании двух элементов: температуры и осадков. Применяя трехклассовую равновероятную систему классификации для каждого из этих элементов, получаем 9 типов погоды. Символы принятые для обозначения отдельных классов одинаковы для обеих элементов:

1 - класс ниже нормы
2 - " поблизости нормы
3 - " выше нормы

В результате применения таких обозначений символ типа погоды является двухцифровым числом, в котором первая цифра обозначает класс температуры, а вторая класс осадков.

Пример:

Тип погоды определенный: 1 классом для температуры, 2 классом для осадков, будет обозначен символом 12

Для более детальных обработок каждый класс дополнительно разделен на три равновероятные подклассы. Символы принятые для обозначения отдельных подклассов даются в нижеизложенном сопоставлении:

класс	подкласс		
1	1_0	1	1_2
2	2_1	2	2_3
3	3_2	3	3_4

В календаре типов погоды тип погоды по трехклассовой классификации обозначен большими цифрами. Символ написанный малыми цифрами в скобках ниже основного символа относится к классификации с разделением на подклассы. Отсутствие этого символа обозначает, что он идентичен основному символу.

Для иллюстрации каждого случая приложены карты среднего распределения атмосферного давления на уровне моря.

Детальные выводы относительно принципов описанной системы классификации даны в работе Ю. Литыньского "Численная классификация типов циркуляции и типов погоды".

EXPLANATORY REMARKS

The material contained in the "Meteorological Yearbook" has been divided into two parts. The first part (tab. tab. I-III) comprises the results of measurements taken at meteorological stations, while the second one (tab. IV) includes the observation records from meteorological posts.

METHOD OF DATA PROCESSING AND CONTENT OF TABLES

Tab. tab. I-III. Meteorological stations

Since January 1st, 1966, data processing was based on daily measurements and observations performed by meteorological stations. Table I comprises the results of observations taken every six hours at 1, 7, 13 and 19 MET (00, 06, 12 and 18 GMT) for selected stations. In table II, daily records and means computed from eight observations taken every three hours at: 1, 4, 7, 10, 13, 16, 19 and 22 MET (00, 03, 06, 09, 12, 15, 18 and 21 GMT) for all stations are contained. Table III containes monthly totals and means computed from the monthly total of eight observation times.

Computations were performed following the programming by Mr. Witold Duszyński, M. Sc., Eng. with a IBM-1440 computer in the Computer Division of ZOWAR.

Air temperature. Air temperature was measured with thermometers installed in a louvered thermometer screen at 2 m above ground level. The extreme temperatures refer to meteorological stations and the period from 19 MET (18 GMT) of the preceding day to 19 MET of the respective day.

Minimum air temperature at ground surface was measured with minimum thermometer exposed 5 cm above ground level, over bare soil plot.

Air humidity; dew point temperature, water vapour pressure and relative humidity were measured with August psychrometer.

Atmospheric pressure; the atmospheric pressure was measured with cistern mercury barometers.

Sunshine duration; sunshine duration was recorded with Campbell-Stokes' heliographs.

Wind; wind measurements are mostly carried out with cup anemometres of M-47 type, and in some cases only with Wild's anemometers.

Precipitation. The amount of precipitation beginning 1 January 1966 is measured at the stations every six hours at: 1, 7, 13 and 19 MET (00, 06, 12 and 18 GMT). In Table I the precipitation amount for the past six hours was shown, while in Tables II and III the precipitation amount referring to twenty four hours counted from 7 MET (06 GMT) of the respective day up to 7 MET of the next day. Measurements were taken with Hellmann's gauges with a receiving area of 200 cm^2, exposed 1 m above ground, excluding a number of mountain stations situated over 500 m above sea level, where are used the gauges of the mountain type with a receiver of 500 cm^2. The last are exposed 1,5 m above ground.

Tab. VII - The calendar of circulation and weather types

A circulation or weather type is a period of at least two days duration, classified under the same type. Particular days, much differing in weather or circulation characteristics from the foregoing or subsequent type, are designed by x.

The classification of circulation types is based on three factors: the index of zonal circulation for Europe (Ws), the index of meridional circulation for Europe (Wp) and the index of pressure for Poland (Cp).

The index Ws is positive for circulation with western component, and negative for circulation with eastern component. The index Wp is positive for southern component, and negative for northern component. These indices are computed from daily synoptic sea-level charts. All above named factors are classified according to a three - class system of equal probability what results in the 27 circulation types.

The following symbols are used to specify the particular classes:

Meridional index (Wp)
- N - class below the standard (negative)
- O - " near the standard
- S - " above the standard (positive)

Zonal index (Ws)
- E - class below the standard (negative)
- O - " near the standard
- W - " above the standard (positive)

Pressure index (Cp)
- C - class below the standard
- O - " near the standard
- A - " above the standard

The symbol of the circulation type is formed by combining the class symbols for all the three factors (Wp, Ws, Cp). If the values of one of the factors Wp or Ws are entered under class O, then in the symbol of the circulation type this O isn't written; but if the values of both these factors belong to class O, then only one zero is written. The class of the index Cp is written as a subscript down to the right side.

Examples:

The type indicated by: class O for Wp, class E for Ws, class A for Cp, will have the symbols E_A;

The type indicated by: class N for Wp, class W for Ws, class O for Cp, will have the symbol NW_O;

The type indicated by: class O for Wp, class O for Ws, class C for Cp, will have the symbol O_C

The weather types for Central Poland are classified basing on two elements: temperature and precipitation. The application of the three-class classification of equal probability for each of these elements yields 9 weather types. The symbols used to designate particular classes are the same for both elements:

- 1 - class below the standard
- 2 - " near the standard
- 3 - " above the standard

As a consequence, the symbol of the weather type is a two-figure number, in which the first figure relates to the temperature class, the second to the precipitation class.

Example:

The weather type indicated by: class 1 for temperature, class 2 for precipitation, will have the symbol 12

Additionally, for more detailed elaborations, a subdivision of each class into three subclasses of equal probability is introduced. The symbols used to designate particular subclasses are listed below:

class	subclasses		
1	1_0	1	1_2
2	2_1	2	2_3
3	3_2	3	3_4

In the calendar of the weather types, the weather type resulting from the three-class classification is represented by capital figures. The bracketed symbol, written with small figures and placed below the main symbol, refers to the classification with the subdivision into the subclasses. The lack of this symbol means that it is identical with the main symbol.

To illustrate each case, maps of the mean distribution of atmospheric pressure at sea level are given.

A detailed description of the principles of the above applied classification system is given in the paper by J.Lityński "Numerical classification of circulation and weather types".
