I N L E I D I N G.

Hierdie boekdeel is die negentiende van 'n reeks Jaarverslae en bevat opsommings van waarnemings wat by al die *meteorologiese stasies* in die *Unie van Suid-Afrika, Basoetoland, Swaziland en Betsjoenaland* gedurende die jaar 1944 gedoen is. Die opsommings is beperk tot maandelikse en jaarlikse waardes van die verskillende weerselemente.

Vir hierdie verslag word die meteorologiese stasies in drie hoofindelings gerangskik, naamlik:-

(1) Eerste en tweede orde stasies, waar tenminste tweekeer per dag, d.w.s. om 8.30 vm. (0830) en om 3 nm. (1500) S.A. Standaard Tyd, waarnemings gedoen word.

(2) Derde orde stasies, waar waarnemings net eenkeer per dag, om 8.30 vm., uitgevoer word.

(3) Reënvalstasies, waar die meting van die reënval eenkeer per dag (8.30 vm.) onderneem word.

Die tabelle is gerangskik net soos in die 1943 verslag en verskyn in die volgende orde:-

(i) Klimatologiese opsommings van 96 eerste en tweede orde stasies.

(ii) Klimatologiese opsommings van 149 derde orde stasies.

(iii) Maandelikse gemiddeldes en uiterste waardes van 'grasminimum' temperature by 28 stasies.

(iv) Maandelikse gemiddeldes van grondtemperature by verskillende dieptes by 17 stasies.

(v) Maandelikse gemiddeldes en persentasies van daaglikse sonskynduur by 14 stasies.

(vi) Uurlikse gemiddeldes van lugtemperatuur vir elke maand by 18 stasies.

(vii) Uurlikse gemiddeldes van relatiewe vogtigheid vir elke maand by 18 stasies.

(viii) Maandelikse en jaarlikse hoeveelheid neerslag en aantal reëndae by 3416 stasies.

Soos in die 1943 verslag word die gekorrigeerde lugdruk in hierdie verslag herlei tot die naaste 100 geodinamiese meter-vlak of tot die gemiddelde seespieël (0 gdm.) indien die stasie laer as 500 gdm. gelee is. Die bepaalde niveau (vlak) vir elke stasie word bo-aan die betrokke tabel vermeld, soos volgt:- *Fm by____gdm.*

By al die klimatologiese stasies word die temperatuur in 'n Stevenson skerm gemeet. Die skerm huisves 'n maksimum- en minimum- termometer en 'n droog en natbol psychrometer. Die droëbol-termometer is so aangebring dat sy bol 4 vt. bo die grondvlak is. Gemiddelde lesings van die natbol-termometer word slegs vir eerste en tweede orde stasies gepubliseer.

'Grasminimum' temperature word verkry deur 'n gewone minimum-termometer wat binne 'n glasbuis gemonteer en horisontaal opgestel is sodat sy bol nie meer as een duim bokant kortgeknipte gras lê nie.

Grond-termometers is die gewone Symons tipe en word in staal buise by verskillende dieptes blootgestel.

Uurlikse waardes van temperatuur en relatiewe vogtigheid, wat op bladsye 83 tot 94 verskyn, is verkry uit die kurwes van Friez termohigrograwe wat in Stevenson skerms by 'n hoogte van omtrent 4 vt. blootgestel is.

Die sonskynduur is deur middel van Campbell Stokes sonskynmeters verkry. Die sonskynkaarte is volgens die voorskrifte in die Weernemershandboek (M.O.London) bepaal.

Die standaard-reënmeter wat in die Unie in gebruik is, het 'n deursnee van 5 duim en is op 'n voetstuk gemonteer sodat die rant daarvan 4 voet bo die grond is. Verdamping van reënwater vanuit die meter word tot 'n minimum beperk deur die nou opening van die opvangemmertjie en deur die feit dat laasgenoemde heeltemaal binne die voetstuk van die meter ingesluit is.

Die windfrekwensies wat in die klimatologiese tabelle vir eerste en tweede orde stasies voorkom, verteenwoordig die totale frekwensie van windrigtings wat om 8.30 vm. en 3 nm. waargeneem is. Vir eerste orde stasies, wat met 'n Dines Drukbuisanemometer voorsien is, word die frekwensies egter uurliks vanaf die *anemogramme afgeleses.*

Die volgende is 'n lys van simbole waarvan die betekenis nie alreeds in die hoofde van die tabelle verduidelik is nie:-

	-	Breedtegraad.
	-	Langtegraad.
H	-	Hoogte van stasie bo seespieël.
h_t	-	Hoogte van droëbol-termometer bo die grondvlak.
h_r	-	Hoogte van reënmeterrand bo die grondvlak.
h_a	-	Hoogte van windmeterkop bo die grondvlak.
	-	Som (totale hoeveelheid neerslag).
_	-	Geen waarnemings, of geen betroubare waarnemings.
( )	-	Syfers in hakies is berekon uit 'n ontoereikende aantal daaglikse waarnemings.

I N T R O D U C T I O N.

The present volume is the nineteenth of a series of Annual Reports and contains summaries of observations made at all meteorological stations in the Union of South Afric, Basutoland, Swaziland and Bechuanaland during the year 1944. The summaries are confined only to monthly and annual values of the different meteorological elements.

For the purpose of this report the meteorological stations are classified in three main groups, namely:-

(1) First and second order stations where observations are made at least twice daily, i.e. at the main observation hours 8.30 a.m. (0830) and at 3 p.m. (1500) S.A. Standard Time.

(2) Third order stations where observations are carried out at 8.30 a.m. only.

(3) Rainfall stations where rainfall measurements are undertaken once daily (8.30 a.m.)

The tabular matter is arranged, as in the report for the year 1943, in the following order:-

(i) Climatological summaries for 96 first and second order stations.

(ii) Climatological summaries for 149 third order stations.

(iii) Monthly means and extremes of "grass-minimum" temperatures at 25 stations.

(iv) Monthly means of earth temperatures at various depths at 17 stations.

(v) Monthly means and percentages of daily sunshine duration for 14 stations.

(vi) Hourly means of air temperature for each month at 18 stations.

(vii) Hourly means of relative humidity for each month at 18 stations.

(viii) Monthly and annual amounts of precipitation and number of rainfall-days at 3416 stations.

As in the report for 1943, the corrected pressure values are reduced to the nearest 100 geodynamic metre level or to mean sea level (0 gdm.) if the station lies below 500 gdm. The appropriate level for each station is given in the heading of the respective table, thus:- Pm at _____ gdm.

At all climatological stations, temperatures are measured in a Stevenson screen housing a maximum and minimum thermometer and a dry and wet bulb psychrometer. The height of the bulb of the dry-bulb thermometer is 4 ft. above the ground level. Means of wet-bulb thermometer readings are only published for 1st and 2nd order stations.

'Grass-minimum' temperatures are obtained by an ordinary sheathed minimum thermometer exposed horizontally so that its bulb is not more than one inch above the surface of short cut grass.

Earth thermometers are of the usual Symons pattern, exposed in steel tubes at various depths.

Hourly values of temperature and relative humidity, given on pages 83 to 94, are obtained from the traces of Fries thermohygrographs which are exposed in Stevenson screens at a height of about 4 ft. above the ground.

The duration of bright sunshine is measured by means of Campbell-Stokes sunshine recorders. The traces are evaluated according to the instructions appearing in the Observers' Handbook (M.O.London).

The standard raingauge used in the Union is 5 inches in diameter and is mounted on a stand so that its rim is 4 ft. above the ground. Evaporation of rainwater from the gauge is reduced to a minimum by having a small orifice to the collecting bucket and by enclosing it completely inside the outer stand of the gauge.

The wind frequencies given in the climatological tables for 1st and 2nd order stations represent the total frequency of wind directions observed at 8.30 a.m. and 3 p.m. For first order stations equipped with a Dines Pressure Tube Anemometer, however, the frequencies are derived from the anemograms read off hourly.

The following is a list of symbols used, whose meanings are not already indicated in the headings to the tables:-

	-	Latitude.
	-	Longitude.
H	-	Height of station above M.S.L.
h_t	-	Height of dry-bulb thermometer above ground.
h_r	-	Height of raingauge above ground.
h_a	-	Height of anemometer head above ground.
	-	Sum (total amount of precipitation).
-	-	No observations, or no reliable observations available.
( )	-	Figures in brackets are computed from an insufficient number of daily readings.
