THERE are no French letters come to me ſince my laſt, nor any others from abroad. We diſcourſe of ſetting out a fleet in the ſpring; I hope it will be in conjunction with the Dutch, to repreſs the conquering neighbour; which will ſoon appear, when the Swediſh embaſſador ſhall be arrived here. Sir, I cannot conclude this, without acquainting you of the deſign of the Society's council, whereof you are a member, of building a college, as one of the moſt probable means of their eſtabliſhment. They did, on Saturday laſt, conſider of it in a full council, where *H. Howard* of *Norfolk* was alſo preſent (who intends to continue his nobleneſs, either by contributing to this work a good ſum of money, or by giving us ground about *Arundel* houſe to build upon) and proceeded ſo far as to view a draught, and to ſelect out of the Society's liſt ſuch perſons, as they thought both willing and able for ſuch contributions: and to carry it on the more effectually, they appointed a committee of beggars (as they were pleaſed to term it merrily) or ſolicitors, to ſpeak to ſuch as were called out for that purpoſe, and to recommend this work to their liberality. Our preſident biſhop of *Saliſbury*, Mr. *Howard*, Dr. *Wilkins*, and myſelf, are the principal beggars; we want Sir *R. Moray* exceedingly in this employment. Thoſe, that came to my ſhare, are ſet down in the encloſed liſt; and I was particularly deſired to acquaint you with this intention, and alſo Sir *R. Moray*, to engage him to beg in *Scotland* among the noblemen there, that are of the Society, on our behalf. I believe, Sir, you will not be diſpleaſed, if I am open and particular to you in this buſineſs; which I think myſelf obliged to be, as tending to your better direction and information. They gueſs there will be four claſſes of contributions: ſome of an 100 *l.* ſome of 60 or 50, ſome of 40, ſome of 20. Our preſident hath already declared for 100; and I think, the biſhop of *Saliſbury* for the like ſum. Dr. *Wilkins* for 50, Mr. *Hayes* for 40, Sir *Phil. Carteret* for 50, and if there be occaſion, for more. We begin with the council, and proceed to the Society; that, when we go on to beg of others not of our body, they may not object, we would load others, and draw our own necks out of the yoke. The council, when they ran over the liſt of the Society, thought you, Sir, the fitteſt perſon to beſpeak my lord *Clifford*'s generoſity in this matter, thinking it ſuperfluous to invite yourſelf otherwiſe, than by a bare intimation. I am confident, you take in good part both the council's and my freedom in this diſcourſe, which ſtops my pen of ſaying more by way of excuſe of it. I muſt now paſs to make a tranſcript of Mr. *Hook*'s paper, which was promiſed you in the beginning of this letter, by,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

London, Jan. 18, 1667.

SIR,

I AM almoſt altogether perſuaded, that upon a mature conſideration of the importance of building a college to eſtabliſh the Society, you will not at all heſitate in giving your approbation and concurrence thereto. We had, on Saturday laſt, at the meeting of the council, a draught of the ſtructure before us, which was ſcanned ſufficiently, Mr. *Howard* being there alſo, and giving no ſmall proof of his underſtanding and ſkill in that art, as well as of his frankneſs and generoſity in giving the foundation, and forwarding the execution of the work. I think, we ſhall at our next council, which is ſummoned to meet on Thurſday next in the evening, begin to make ſubſcriptions in ſuch a form, as may be obligatory in law, and yet not ſevere in the expreſſion. My lord *Angleſey*, having the thing occaſionally mentioned to him by me, ſhewed ſo much inclination to it, that he is like to be received into the Society, and to be both a contributor and ſollicitor for this noble work. Sir, my opinion is, ſince you are pleaſed to demand it, that in caſe you think not yet fit to come to *London*, you may declare in a note to me the ſum, you intend to caſt in, directing me to ſignify it to the council, and giving order, where the Society's treaſurer ſhall receive it.

CONCERNING the proviſion made by the council to ſecure men's philoſophical proprieties, they have ordered, that if any thing of that nature be brought in and deſired to be lodged with the Society, in caſe the authors be not of their body, they ſhould be obliged to ſhew it firſt to the preſident (for fear of lodging unknownly ballads and buffooneries, in theſe ſcoffing times) and that then it ſhould be ſealed up, both by the ſmaller ſeal of the Society, and the ſeal of the propoſer; but if the authors were of the Society, that then they ſhould

ſhould not be obliged to ſhew it firſt to the preſident, but only to declare the general head of the matter to be laid up, and that then it ſhould be ſealed up, as mentioned before.

I DOUBT not, when that other critick ſhall have found any thing conſiderable about the *Greeks* faith in the doctrine of the ſacrament, you will take care, to ſee it ſpeedily communicated to me. As I was writing this, there came to viſit me the rabbi *Abendana*, whoſe brother is now at *Oxford*. He mentioned, what had been done in his buſineſs of vending ſome Hebrew manuſcripts, and that it was likely, ſome would be bought at *Oxford*, and particularly, that you had expreſſed an intention to buy ſome of them for yourſelf. I told him, that I was perſuaded, you would aſſiſt Dr. *Barlow* in furthering this matter, as much as you could; and he deſiring me, that I would recommend it to your particular care, I promiſed him, to do in it, what you ſee here, I do; intreating you withal, to preſent, upon occaſion, my humble ſervice to Dr. *Barlow*, and to give him many thanks from me, for conſidering my note, I ſent to him by theſe Hebrews, when he was at *London*, for recommending their deſires to him, I being then ſo unfortunate, that I always miſſed of Dr. *Barlow*, when I was to wait on him at his lodgings in *Holborn*.

I AM ſorry, I find nothing in your letter declared concerning Mr. *Hook*'s way of examining the preſſure of the air at ſea. It is a thing, that ſhould be well and ſpeedily conſidered, that now the ſeaſon is come of ſhips going into all parts, it might be recommended to ſeveral careful maſters of ſhips, for their obſervation. There are twelve great ſhips going for the *Eaſt-Indies*, whereof ſeven or eight are ready to ſet ſail by the firſt fair wind, the reſt to follow ſoon after. Here is a good opportunity for this particular, as well as for other inquiries, we have lodged with ſome of them, and intend to do, God willing, with the reſt.

I AM very ſorry, we muſt be ſo long deprived of your company, and I ſtretch my patience ſo far in ſtaying for the particular deſcription of the way of making experiments with ſealed receivers, and for the ſight of the performance of the trials themſelves.

ON Thurſday laſt Dr. *Lower* produced, by order, ſome horſes eyes, and ſhewed the company the cauſe of their frequent blindneſs, which is ſuch, that they can ſee nothing in the day time, but ſee very well in the dark, ſo as that they ſtumble and fall, when they travel by day, but go well by night. He ſaid, there was a ſpongy excreſcence growing in horſes out of the uvea, which did cover the whole pupil, when contracted by the daylight; which was removed by the opening and enlarging of the pupil in the dark.

WE had alſo the view of four or five dozen particular ſorts of mineral, ſent to me for the Society's repoſitory by Mr. *Colepreſſe*, which pleaſed very well; among which there was a kind of earth, pretended to be a *terra ſigillata*, and an iron oar mixed with another matter, which, though ſo mixed, was yet ſenſible enough of the loadſtone. Sir *William Strode*'s ſon is here, and, I believe, another ſuch collection for you, if you could but come to receive it.

THE commiſſioners for accounts have ſent about their letters to the treaſurers and receivers, to bring in an account of monies received, *&c.* The parliament-men begin to flock hither again for February 6. and to talk already of what may be the fitteſt way of raiſing more money, for the next ſummer's fleet, which, it is thought, will be rather done by a general exciſe upon commodities of conſumption, limited to two or three years, than to a new land-tax.

THE French ſhew, by their laſt letters, that they are ſurpriſed at our league with the Dutch, uſing this expreſſion: *Peu de gens avoient crû, que les choſes en duſſent venir là.* Their king is certainly gone, with a good army, to the *Franche Compté*, and, ſome ſay, already ſat down before *Dole*, to take in thoſe poſts before the imperial forces can paſs into *Burgundy*, and to prevent his being attacked in thoſe parts.

I HEAR, the phrenetick man, that received the calves blood into him, is now very well, and that the experiment of it is printed by M. *Denys*, from whom I expect a copy of it every day.

WHEN they opened at *Vienna* the little archduke, that was born and died lately, there was found in his lungs three ſtones, and much ſerum in his brain.

AT *Paris* they have found four breaſts on a woman, that died in one of their hoſpitals.

I AM certainly promiſed a copy of the Florentine experiments, now abroad; and I expect every hour *Steno de motu muſculorum geometrico*, as alſo *Borelli de vi percuſſionis*, and *Leotand de geometria practica*.

London February 4, 1667-8.

SIR,

I AM ſorry, I found nothing yet in your laſt, about the way propoſed here of eſtimating the preſſure of the ſea air: but I humbly thank you and the critick for the titles of the books, which concern the Greeks. What you were prevented in to ſay to ſome particulars of my laſt, I hope to hear from you about by your next, if it be worth while. If I can find out Mr. *Strode*'s lodging, I ſhall not fail, God willing, to acquaint him with your reſpects to him, nor to take of what he ſhall leave with me for you.

THE council of the Society having given order to print a hundred or two of the forms for ſubſcriptions, I preſume to ſend you one of them, ſince you have declared your willingneſs to contribute. If I had thought, there were any others at *Oxford*, that would caſt in their benevolence, I would have ſent more copies. We hope, we ſhall very ſhortly lay our foundation; and therefore the ſooner the contributors take care of paying in their re-

ſpective

ſpective ſums, the more they will oblige the Society, in haſtening the execution of their deſign.

ON Thurſday laſt the Society met not, becauſe it was the 30th of January. At our next meeting we are like to have an experiment, to determine, whether there may be made a body more ponderous than gold, by trying, whether any quickſilver will penetrate into the pores of gold. And another, to ſhew the paſſage from the ear to the mouth, by cutting away the tympanum, and blowing tobacco fume through that organ into the mouth.

I HAVE now received *Stenonis Muſculi Deſcriptio Geometrica*, and *Alphonſus Borrelli De Vi Percuſſionis*; of both which, and ſome two or three books more, I intend, God willing, to take notice in this month's Tranſaction.

SINCE I wrote this, I was viſited by *R. Abendana*, who ſhewed me a letter from his brother now at *Oxford*, mentioning, that you had expreſſed to him your wondering at my not taking notice of the catalogue of Hebrew books, brought over by the ſaid *Abendana* to be ſold here. I was ſurpriſed to hear this, who, if I am not extremely miſtaken, mentioned in my very laſt that buſineſs to you, expreſſing, how I had endeavoured to recommend it to Dr. *Barlow* here in *London*, and making it my requeſt to you to aſſiſt in it, as much as your conveniency would permit. It is true, before I was ſpoken to by the Rabbi, I was ſilent of it in my letters to you; but that was upon the conſideration of your manifold other engagements, which I thought would not ſuffer you to meddle with books of that nature, as for your own uſe; and as far as it might concern the publick uſe of the univerſity, I judged, Dr. *Barlow* was more in the way of doing good in this matter, than any body, I know, of the univerſity. This day the ſaid *Abendana* entreats you, that, if you choose any books out of this catalogue, you would ſend, as ſoon as you can, your order for it, to leave them either with me, or ſome other perſon, you ſhall think fit; becauſe he is neceſſitated within a fortnight to return to *Amſterdam*. Sir, if you pleaſe, to look only into my laſt letter, you will there find, I did really recommend to you this affair.

THE French begin to declare their deſire for an accommodation with *Spain*; and certainly, if *Sweden* do enter into our league with the Dutch, there will be a peace in all appearance. And that the rather, becauſe one of the articles of that league imports, that if *France* do not comply with the conditions of peace, to be agreed on as reaſonable by the allies, they ſhall combine their forces, both by ſea and land, to compel the French to it, even to the reducing of them into that ſtate, they were in at the time of the Pyrenean treaty. And if *France* ſhould be ſo obſtinate, as to ſuffer things to run ſo far, they will run the hazard of loſing all they have gained in *Flanders*; whereas, if now they make peace, they are to keep what they have conquered in that country, or elſe to receive that, which ſhall be judged equivalent by the umpires.

THE French king, when he reſolved upon the expedition into *Franche Comté*, deviſed this ſleight to bring together his nobility to follow him. He gave out, he would keep an extraordinary carnival at *Paris*; which tempted the French gentry to flock thither in extraordinary numbers. Being thus come together in vaſt troops, the king declares to them one night, that the next day he muſt take the field, and that whoſoever loved him, would follow him. *Qui m'aime, me ſuive.* This made quickly up an army of 10000 horſe, who marched with their maſter without any heſitation they durſt give any ſign of.

THIS night is to be acted at court, by ſome of the fineſt gentlemen and faireſt ladies, the play of the Horatii; which has raiſed mighty expectations for great bravery, but finds not at leiſure, to be a ſpectator,

SIR,

your very humble,

and faithful ſervant,

OLDENBURG.

London, Feb. 11, 1667-8.

SIR,

I RECEIVED your laſt rich packet, full of philoſophical experiments and money. I ſhall hide the former till further order, and declare the latter at the firſt meeting of the next council, and acquaint you with the time of the firſt actual payment made by any of the contributors. I humbly thank you for all, as alſo for the communications of what concerns the Greek belief of the ſacrament, which I ſent away yeſternight.

WHATEVER you ſhall ſend to our noble preſident, I am ſure, he will take as much care of, as of any thing of his own.

HERE are arrived two of the Florentine virtuoſi; whereof the one is ſignior *Magolotti*, the other's name I have not yet heard. I met them yeſterday accidentally in *Weſtminſter-hall*, accompanied with Sir *Bern. Gaſcoyn*, who brought us together, and who intends to conduct them to the meeting of the Society on Thurſday next. They expect every day a packet from *Paris*, containing an exemplar of the Florentine experiments, to be by them preſented from cardinal *Leopold* to the Society. I intend this very night yet to give them a viſit, and as ſolemn a welcome as I can. When they return home, I may by their favour purchaſe a correſpondence with all the ingenious men in *Italy*, if I pleaſe, and am able to entertain it. I find, by Mr. *Colepreſſe*'s laſt letter, that he intends ſtill to travel; being deſirous, I would procure for him, ſome recommendatory letter, under the ſeal of the Society, to penetrate with the more eaſe and credit into the company and acquaintance of the

the curious abroad. I may alſo accompany him with a particular letter of my own, and, if you pleaſe, Sir, to have any thing ſaid concerning him, as from yourſelf (which you ſeemed to give a hint of, in one of your laſt) I ſhall ſerve you in it very readily, upon the receipt of your inſtructions, as to the particulars you would have mentioned about it.

THERE came lately to hand a letter written from *Balſera*, which you know lyes near the Perſian gulf, relating, that thereabout had, not long ſince, been an extraordinary earthquake, which laſted thirty-two days and nights, and ſwallowed up three hundred houſes, and all the men: and that, where the earth thus ſunk with ſo many houſes, there appeared inſtead of it a large lake, ſome fathoms deep: and then, that at ſome diſtance from that place, another great lake, full of fiſh, did in thoſe thirty-two days of the earthquake, caſt up all its fiſh on the dry land, where might have been gathered many; and that, when the new great lake appeared, the old one dried up, and became firm land.

HERE was yeſterday made publick a ſmall book, licenſed by my lord *Arlington*, entituled, *A free conference touching the intereſt of* England, *in reference to the preſent French deſigns*. The ſhort of it is, that neutrality in this conjuncture of affairs is diſhonourable and dangerous for *England*; and that, in taking part, the intereſt and honour of *England* directs to join with *Spain*, rather than with *France*. It ſeems to be well done, but it will vex the latter of thoſe two crowns, not only by reaſon of the matter itſelf, but alſo of ſome ſmart expreſſions and reflections on the French.

HIS majeſty in his ſpeech yeſterday to the parliament acquainted them with the league made with *Holland*, with the neceſſity of a ſupply to make it good; and with his deſires of conſidering of an effectual way, to make all his proteſtant ſubjects worſhip God cheerfully and unanimouſly. But the houſe of Commons the ſame morning, before the king came, had voted, that his majeſty ſhould be deſired to iſſue a proclamation, reinforcing the execution of the act of uniformity, and other ſtatutes; which is a riddle to,

SIR,

your very humble,

and faithful ſervant,

OLDENBURG.

No news yet of the French king's ſucceſs in the *Franche Comité*.

London, Feb. 18, 1667-8.

SIR,

I HAVE not only received your ſealed paper, but alſo produced it before the Society, together with your intimation of giving the firſt example in making the Society a depoſitary of inventions. They were well pleaſed with it, and ordered, that it ſhould be delivered by me to our preſident, who was not there, but who received it from my hands two or three days after, and put it up in my preſence, in a box by itſelf, after he had written on it the day and year of his receiving it, as I had done the ſame minute it came to my hands. One of the company, though in another place, objected, that the matter not being named of ſuch notions or inventions, it might happen, that another might light on the ſame thing, and not only have it in his conception, but alſo bring it to perfection; and that in ſuch a caſe he ran the hazard of loſing the honour of what he had done and perfected upon the account, that another before him had given a hint of the ſame thing.

To this I thought I could juſtly reply, that ſuch notions and diſcoveries being ſealed up, and thereby kept from coming to the knowledge of others, if another ſhould light upon and perfect the like, it would then be manifeſt to all the world, the latter had it not from the former, and therefore the Society would be ſo juſt as to teſtify ſo much, and withal to add upon occaſion, that the latter had not only conceived ſuch and ſuch a thing, without being beholding to others for it, but alſo rendred it compleat or uſeful (according as the matter may be.)

I DID not mention any thing in my laſt about the ſucceſs of the experiment about filling the pores of gold, becauſe nothing was done in it, that brought the thing to any certainty; though I believe it will be proſecuted with more care than hitherto. It is aimed at, to try, whether the pores of that metal, for all its compactneſs, will admit ☿ into them; and whether there may be made a ſubſtance compounded of two, that ſhall be heavier when mixed, than both of them aſunder.

I HOPE, when Dr. *Wren* comes to *London*, he will bring your leave with him of letting the Society know your way of determining experimentally, to what height water can be raiſed by pumping. I ſhall not ſo much as name it, becauſe I find not your permiſſion to do ſo. Some of the Florentine virtuoſi are come, but not yet their book of experiments. They were pleaſed the other day to give me a viſit, wherein they told me, upon my enquiry, that the chief ſubject of their experiments was the air and the preſſure thereof; which things, if they had been publiſhed three or four years ago, might perhaps appear new, but would hardly do ſo now. You will eaſily think I underſtand them, and why they prefaced ſuch a thing here, where they know, that argument hath been ſo plentifully and accurately proſecuted. They did enquire for you, and expreſſed their trouble for not finding you in town. Though they intend not to make a long ſtay, yet I am apt to think, they may find cauſe to ſtay ſo long as to ſee you here.

I THE

THE French king hath maſtered all *Franche Compté*, and is not like to ſtop there: ſome fear either *Antwerp* or *Luxemburg* will be next. The preparations of thoſe, whoſe intereſt it is to ſtop his progreſs, are both ſlow and ſlight, as far as I ſee, and others with me.

——ſerò medicina paratur
Cùm mala per longas invaluêre moras.

I will not ſay any thing of the late votes in parliament concerning the many miſcarriages in the late war: you will have that matter from better and ſafer hands. To morrow, I hear, they will fall upon the conſideration of the king's ſpeech, and chiefly upon money and toleration.

SIGNIOR *Borrhi* is at *Copenhagen*, if I am not miſinformed; which is all that can at preſent be ſaid of him, by,

SIR,

your very humble,

and faithful ſervant,

H. OLDENBURG.

WE do hear ſomewhat of a very odd diſeaſe of a youth about *Oxford*, of his bones being corrupted, ſo as that he takes them out of his jaw-bones and elſewhere by fragments of whole ounces weight, and that without any conſiderable pain. We ſhould be very glad to know the truth and circumſtances hereof from a good hand. If he be born of healthy parents, it were worth enquiry, whether his nurſe was alſo healthy, and free from the lues venerea.

London, Feb. 25, 1667-8.

SIR,

I HAVE received both the favour of your letter, which gives notice of your preſent, and the preſent itſelf. As I was ſurpriſed at it, ſo I checked myſelf for having left open my note about that book, and thereby occaſioned you that trouble. I have nothing to return, but my humble thanks, and this annexed print, which, I am perſuaded, you will eſteem upon the account both of your devotion to the inventor, (his majeſty) and the expeditious uſefulneſs of the contrivance itſelf. I muſt alſo add my thankfulneſs for the ſecond part of thoſe experiments you formerly were pleaſed to entruſt with me, who ſhall be very punctual in concealing them, till you allow me the liberty of making them known.

THE Italian philoſophers are gone, I preſume, this very morning for *Oxford*. They told me on Sunday laſt, when I reviſited them, that they would do ſo. I am confident, their converſation with Mr. *Boyle* alone will make them to be abundantly ſatisfied with their journey; though, I think, they will alſo make themſelves known to Dr. *Wallis* and Dr. *Wren*. They were on Thurſday laſt at our publick meeting in *Arundel* houſe, but came pretty late, and at a time when our preſident was not in the chair, whoſe ſingular dexterity of managing whatſoever is propoſed there you well know. There was only made before them the experiment of weighing tin and copper aſunder, and mixed both in the air and in water, and the mixed found heavier than the parts ſeparated. Mr. *Hook* has not proſecuted that experiment of making a body heavier than gold.

THERE occurring in *Steno*'s *Muſculi Deſcriptio Geometrica* an experiment of binding up the deſcending artery from the head, and thereby depriving immediately the animal of all ſenſe and motion, theſe Florentines were aſked, whether they ſaw the experiment made, it having been performed at *Florence*: they anſwered, that they had not, but heard M. *Steno* ſay, that he had done it, but ſometimes failed therein. Perhaps it will be experienced by Dr. *Lower* here.

THERE was read before the Society part of a letter written to me by Monſieur *Carcavy*, the famous French mathematician, and the preſent bibliothecarius of the royal library at *Paris*, and one of the chief of the new French experimental academy: the main thing was in theſe words:

Lors qu'il plait à Dieu donner des roys, comme nous les avons, l'on ne doit pas, ce me ſemble, leur rendre ſimplement l'obeiſſance, l'amour, et la fidelité qu'on eſt obligé, mais il faut, que ceux, qui ont le bien de les approcher, menagent autant qu'ils peuvent tous les momens d'un regne ſi heureux, pour ne ſe pas rendre coupables envers la poſterité de ne luy auoir pas procuré les avantages d'une rencontre ſi favorable, C'eſt à quoy vous et les autres meſſieurs de voſtre Societé vous employez ſi dignement: c'eſt à quoy nous travaillons auſſi dans noſtre academie, et taſchons de contribuer par nos ſoins et par noſtre diligence à ce que demande de nous la generoſité et la munificence du plus grand, et du meilleur roy, que nous ayons eu. Ee comme vos travaux et les noſtres ne tendent qu' à l'utilité publique, et que le ſecours mutuel, que nous pourrions nous rendre, ſerviroit beaucoup à l'augmenter, nous eſtablirons toute la correſpondence, que vous jugerez à propos: et en voſtre particulier, s'il vous plait, que je vous donne part de ce que nous ferons, ce me ſera une joye ſinguliere de pouvoir vous aſſurer, que &c.

OUR Society hereupon ordered only, becauſe this letter was not formally written from that Society to this, that no farther notice ſhould be taken of it, but that I might give him thanks in a private letter, and in general terms embrace his offer. This I was not very well ſatisfied with. I ſee punctilio's retard and obſtruct much good, both publick and private. But I muſt ſubmit.

SIR, if you come to determine any thing of the burning of bodies in vacuo, I ſhould eſteem it a great favour, to be inſtructed in the point, who ſhall declare no more of it, than you ſhall order me.

THE French army marches into the province of *Luxemburg*, and ſtrikes terror into the princes ſeated on the *Rhine*, particularly

Treves and *Mayence*. The king himſelf is returned to St. *Germain*, extolling his conqueſts, and making himſelf merry with our late league, ſaying; *Les foux et les gueux ſe ſont accordés*. But ſince *Spain* and *Portugal* are agreed on one hand, and *England* and *Holland* on the other, it would be a very ſtrange providence, if *France* ſhould ſtill go on to prevail.

WE ſay, the parliament will raiſe money neither by a land tax, nor by exciſe, but by an impoſition upon exceſs and luxury, as ſilks, ſpices, wines, coaches, ſedans, pictures, perfumes, perriwigs, comedians, mountebanks, ſhews, *&c.*

How far this will go, or whether indeed it will be fixed upon, is not yet known, but doubtleſs will be very ſhortly, conſidering the nearneſs of the ſpring, and the neceſſity of arming, to ſtop the French inundation.

THERE are at this time twelve ſhips deſigned for the *Eaſt Indies*, whereof eight are already gone for the coaſt, and four are to follow in March for *Suratte*. You will eaſily gueſs, we let not them go without our philoſophical commiſſions. If you pleaſe to ſend any new directions or enquiries thither, they ſhall be faithfully recommended by,

SIR,

your faithful humble ſervant,

H. O.

P. S. I ſent this morning by carrier a great packet of two *Petrus Bleſenſis*, printed at *Paris*, to *Oxford*, addreſſed to Dr. *Wallis*, accompanied with my letter to him, which I would deſire him to ſend for. I know, Sir, you will give him part of the news I have mentioned, and in particular of that of M. *Carcavy*. I forgot, I think, to deſire him to procure and ſend me one of his *Grammatica Linguæ Anglicanæ* for the uſe of a Pariſian virtuoſi; the ſooner the more welcome.

WHEN I wrote this, I had hopes to have got a print of the king's new way of fortifying; but he that promiſed it, hath failed me this time.

London, March 3, 1667.

SIR,

THE Florentine gentlemen met, it ſeems, with ſome impediments, which ſtoped them in their journey to *Oxford* on that day, they had appointed for it. They were again with us at *Arundel* houſe on Thurſday laſt, when we had no ill entertainment for them. There were produced by Mr. *Smethwick* ſome of his new-figured glaſſes, for which he hath obtained a patent from the king. He maintains, they are of a figure not ſpherical; whether elliptical or hyperbolical, he declares not. He brought in of three ſorts: Firſt, a teleſcope of four foot, furniſhed with three eye-glaſſes of the new figure, and a common object-glaſs, he not having as yet been able to make ſuch for any conſiderable length. This teleſcope being compared with a common, yet a very good one, ſomewhat larger than it, it was found, that it excelled it conſiderably; by magnifying the objects more, and repreſenting them more exactly in their due proportions, without colours, if the eye were held juſt in the center of the glaſs. Then there was a reading or microſcopical glaſs, which ſhewed the letters, and magnified them up to the very edges, from one brim to the other thorough the center perfectly. Laſtly, two burning concaves of that figure, (both of ſix inches diameter, but of ſuch different cavities, that the focus of the one was but three inches diſtant from the center of the glaſs, the focus of the other, ten inches) did, when held to a lighted candle, warm the faces of thoſe, that were preſent, at four or five foot diſtance, and when approached to the fire, burn gloves and clothes at the diſtance of a yard and more. The inventor added (appealling for it to the teſtimony of the biſhop of *Saliſbury*, as an eye witneſs) that the former of theſe concaves had by the ſun turned wood into a flame in the ſpace of ten ſeconds; and the latter, in the ſpace of five ſeconds, and that in autumn about nine in the morning, the weather gloomy.

OUR preſident, before he will declare any thing poſitively of the figure of theſe glaſſes, will by a gage meaſure them; and if the invention bear his teſt, it will paſs for current, and be no diſcredit to the Society, that a member of theirs is the author thereof.

THEN, there was made *Steno*'s experiment, of tying up the deſcending artery of a dog, to ſee whether, thereupon, all motion would ceaſe in the animal, as *Steno* affirms it does. But it ſucceeded not with us, who made only a compreſſure of the veſſel, with a finger, and not a ligature. This experiment is to be repeated with more exactneſs, before we decry *Steno*.

FURTHER, there was tried your experiment of compreſſing the air upon ſhining fiſh, which ſucceeded very well, the air compreſſed upon the fiſh rendering the light of it conſiderably more vivid, than before; the Florentines being very well pleaſed with the ſight thereof, and made acquainted, we were obliged to Mr. *Boyle* for it.

NEXT, there was conſidered a letter, written to me by doctor *John Palmer*, that mathematical divine, who is now arch-deacon of *Northampton*; in which letter, the author acquaints us of an attempt of his, to reſolve all algebraical queſtions by the common *regula falſi*; and that he had made ſome progreſs in it, declaring his purpoſe to communicate to us his further ſucceſs therein, and referring us to a place in *Pitiſcus*, confirming his opinion, in theſe words: (Trigonom. l. 5. in append.) *Regula falſi in trigonometria tam magnum uſum habet, ut diſcipulum ejus artis à tricis algebraicis prorſus liberare poſſit.*

WE had alſo a full relation of the waterman, whoſe temporal muſcle was broken by a violent

a violent ſtroke, whereupon two ſpoonfuls of his brain came out, and yet this man recovered, without any conſiderable prejudice to his intellectuals.

THERE was alſo an account given of a ſtone, taken out of the bladder of Sir *Thomas Adams*, lately deceaſed, which weighed 25½ ounc. and 2 drams; and yet the breeder of it ſaid not to have complained of any conſiderable trouble, till a few days before his death, when, it ſeems, the ſtone, that before was faſtned to the bladder, fell down and ſtopped up the paſſage. We are on Thurſday next to ſee the ſtone itſelf.

THERE were alſo produced ſeveral curioſities, to be lodged in our repoſitory, as a great bone petrified; a whole egg in an egg; a ſtone bottle, which ſeven years ago was filled full with Malaga ſack, and well ſtopped, but is now empty, though ſaid never to have been opened, and the outſide of it is all covered over with a thick mucous coat, having ſtood in a corner of a wine-cellar all that time.

No great news from abroad; only that *Munſter* is arming again, and ſuſpected to be hired by the French, to infeſt the Dutch again. *Spain* is ſaid to be willing to the alternative, but I doubt, whether France be ſo too. I fear, they will, upon their late ſucceſſes in the *Franche Comté*, carry it high, and recede from their engagement, and take the field too early for their adverſaries.

SIR, the particulars abovementioned I would beg Dr. *Wallis* may have a ſight of; to whom I cannot now in a letter apart acknowledge the receipt of his. Mean time, I am his very humble ſervant, and ſhall, God willing, obſerve, what he intimates about another copy of P. *Bleſenſis* for *Baliol* college.

MR. *Colepreſſe* is ſhortly going over, as I underſtand by his laſt to me. I have obtained for him a letter recommendatory upon parchment, from the Society, with their common ſeal to it; and I have preſumed to ſecond it by a private letter of my own to Dr. *Sylvius* at *Leyden*, wherein I have not forgot the expreſſions of your eſteem for this friend of ours. The ſaid doctor, as I have ordered the matter, will recommend him all over the Low-countries, and in *Denmark* and *Germany*, into all which parts he declares his intention to go: and if he travel alſo into *France*, upon the firſt notice ſent me I can give him there as good philoſophical acquaintance, as he can deſire.

HE intimates, at the cloſe of his laſt letter (which was dated February 22.) that that week had produced extraordinary high tides, raiſed by the ſtorm, as they ſuppoſed; but yet that himſelf obſerved one, on February 21, in the morning, very high, yet the weather calm. This alſo Dr. *Wallis* ſhould know from,

SIR,

your very humble,

and faithful ſervant,

H. O.

London, March 10, 1667-8.

SIR,

HOWEVER you are ſo ſparing in your intimation of the entertainment, you gave the Italian virtuoſi, yet I doubt not, but, when I ſhall ſee them, they will be very liberal in making their acknowledgments, as it deſerved. I found yeſterday, at Mr. *Martyn*'s, a book of the Florentine experiments which they had ordered to be bound for Thurſday next, to be then preſented by them from P. *Leopold* to the Royal Society. I could but caſt my eye upon the heads treated therein; which, as I remember, are theſe in their own expreſſions:

Experienze appartenenti alle naturale preſſione dell'aria.
——— *Intorno agli artificiali agghiaciamenti.*
——— *Intorno al ghiacio naturale.*
——— *Intorno alla variatione della capacita di metallo & di vetro.*
——— *Intorno alla compreſſione dell'aqua.*
——— *Per provare, che non v'é legherezza poſitiva.*
——— *Intorno alla calamita, o magnete.*
——— *Intorno all'ambra & altre ſuſtanze di virtu elettricha.*
——— *Intorno ad alcuni cambiamenti di colori in diverſi fluidi.*
——— *Intorno à movimenti del ſuono.*
——— *Intorno à i projetti.*
Experienze varie.

I DOUBT, by ſome circumſtances, I ſpied, that this book hath been craftily compoſed. But I ought not to anticipate.

YOU thought not fit to name the ſubject of that experiment, which you mention, you had made ſo, as it is likely it will diſpleaſe the peripateticks. I am to preſs nothing.

WE intend to try *Steno*'s experiment about the ceaſing of all motion upon the deſcending artery's being tied up, over and over again, before we decry it. Mean time, I neither ſay, nor found cauſe by *Steno*'s book to ſay, that he mentions it as a new thing, and a diſcovery of his own, that the gloſſopetræ and other ſuch ſtones have been animals petrified.

WE were aſſured, that the bottle thus coated, as I mentioned in my former, was never opened, ſince it was filled with the Malaga ſack; but, *ſit penes authorem fides*: we only ſet it down, as it was related to us, without putting any great weight upon it.

THURSDAY next we are again ſeverely to examine Mr. *Smethwick*'s glaſſes, though we are pretty well ſatisfied already, that they are not ſpherical, and that they exceed thoſe, that are ſo, conſiderably. But we cannot be too rigid in the examen, before we give a publick teſtimony of it to the world, as is deſired of us.

THERE is, it ſeems, a diſpute in *France*, about this argument, viz. *Si l'on peut juger de combien de degrez une lumiere eſt plus grande qu'une autre, comme l'on juge dè combien de tous un ſon eſt plus aigu qu'un autre.*

MONSIEUR

MONSIEUR *Auzout*, I am informed, ſaith this: *Que l'ouïe a cet avantage par deſſus tous les autres ſens, qu'elle juge non ſeulement de la difference, mais encore de la quantité & de la raiſon de ſon objet. Car outre que l'oreille connoit, qu'un ſon eſt plus aigu qu'un autre, elle connoit encore de combien de tous il eſt plus aigu: mais quoyque l'oeil appercoive, qu'une lumiere eſt plus grande qu'une autre, il ne ſcauroit determiner de combien de degrés elle eſt plus grande. Et le meſme Auzout adjouſte, qu'il faudroit taſcher de connoitre cette raiſon, par ce qu'on en pourroit tirer de grands avantages pour la perſpective & pour la peinture.*

FROM another place, viz. *Lyons*, I am informed, that there was lately opened the body of a child, that died of five years of age, and had ſo horrid an abſceſs in the left cavity of his thorax, that they took out above ſix pound of pus: beſides, they found the heart of the ſame child in the right ſide of the thorax, and the baſis downwards, and the apex upwards: whereof I intend, God willing, to give the particulars more at large, though not in the Tranſactions of this month (which are already full) yet in thoſe of the next.

SIR, I delivered on Sunday laſt to Mr. *Hatherton*, a big packet of letters for you from M. *Colepreſſe*, to be ſent by carrier; which I mention, that you may ſuſpend your writing to him, till they come to your hands, which doubtleſs they will do before the end of this week.

THE biſhop of *Saliſbury* took occaſion the other day of his own accord to expreſs his great earneſtneſs to ſee me provided for with a recognition for my labours and concerns for the Society. He would, he ſaid, have it urged in council, and was pleaſed to add, that he for his own part was aſhamed, that I was ſo long neglected, who had for ſo many years ſpent all my time and all my pains upon the buſineſs of the Society, without any conſideration for it. I confeſs, Sir, I make very hard ſhift to weather it out; and I could be contented, it were inſiſted on in the council, but that I ſhall want your preſence and favour there, to repreſent a little the particulars that paſs through my hands, and the difficulties, I groan under; which I cannot ſo well ſpecify to others, as I know you will give me leave to do to you. I am,

SIR,

your very humble and faithful ſervant,

H. OLDENBURG.

London, March 17, 1667.

SIR,

THE Society hath as yet had no account upon the letters, they ordered to be written by *D. Pope* and myſelf to Dr. *Wellington* and Dr. *Wren*. Whether they will on Thurſday next, time will ſhew. At our laſt meeting, the Florentines (towards whom I intend to diſcharge myſelf of the commiſſion, you have given me, as ſoon as I ſhall ſee them again) preſented in the name of prince *Leopold* the pompous book of their experiments to the Society; for which they received ſolemn thanks, which the ſecretary was commanded by the preſident to deliver in Latin. The book was committed to the peruſal of Dr. *Merrit*, and Dr. *Ball*, who are maſters of that tongue, in which it is written. When their account ſhall be brought in, you will not want it long, though I hope, you will by your much deſired return prevent my writing of it. Mean time, I underſtand, there is nothing new in it, as to us, except it be perhaps ſome experiments of amber, and a way of making a map of a country by ſounds. I perceive by your laſt, you have not left the former untried; and I am much miſtaken, if you have not ſpent ſome time in meaſuring the extent of the paſſage of ſounds. I am very glad, you have lighted on your papers again, which belong to the appendix of the Pneumatical Experiments; and thence hope, that appendix will now ſhortly come to light, in which hopes and wiſhes of mine I have the concurrence of very many. I wiſh, Sir, you had given me the titles of thoſe new treatiſes, you ſay to have ſeen, where you are. Surely, they are not yet tranſmitted hither. In the Tranſactions of this month I mention only two books, the Florentine Experiments (only as to the heads of them) and a pregnant mathematical book (*Vera circuli & hyperbolæ quadratura*) by Mr. *Gregory*, a Scotchman, a treatiſe much applauded by our preſident, as will appear by the account, given thereof in my papers, now under the preſs.

WHAT I mentioned to you in my laſt of M. *Auzout*'s conſiderations about ſounds, I can now enlarge with ſome animadverſions, made thereon by one *P. Poiſſon, Pere de l'Oratoire*, as they came to my hands ſince. He diſcourſeth thus:

Il faut remarquer, qu'il y a beaucoup de difference entre le ſon & le ton. Car le ſon eſt une choſe abſoluë; le ton eſt la rapport, & l'union, qui ſe fait d'un ſon à un autre: ainſi le fà, conſideré abſolument, eſt un ſon; mais il devient ton par rapport au ſol ou à ſon octave. Or je ſuppoſe, qu'une baſſe & un deſſus chante ce fà à l'uniſſon; je defie l'oreille la plus delicate de determiner, de combien de degrez cette baſſe eſt differente du deſſus. Mais ſi le deſſus chante un la, pendant que la baſſe chantera un fà, on s'appercevra bien alors de cette tierce majeure, & des degrez, qui la compoſent.

Cela poſé je dis, que l'oreille n'a aucun avantage ſur les autres ſens, & que chaque ſens eſt à ſon objet, come l'ouïe eſt au ſien. Car ſi l'oeil ne peut pas juger, combien une meſme couleur, comme le bleu, eſt plus ou moins chargé qu'un autre bleu; l'oreille ne peut pas non plus juger, de combien une voix, qui chante à l'uniſſon, eſt plus ou moins haut que l'autre; ſi l'oreille juge, de combien de degrez le ſol eſt plus eſlevé que l'oet, l'œil s'appercoit auſſi de la difference, qu'il y a entre le cramoiſy & le jaune, contant les degrez de difference par les couleurs compriſes entre deux, ſcav: la couleur de

de feu, le rouge, l'incarnat, &c. *Enfin, comme l'oreille connoit, ſi un ton ou un ſemi-ton eſt juſte, par exemple, ſi le Re n'approche point de l'Ut ou du Mi; l'oeil s'appercoit auſſi, ſi le rouge eſt dans ſa beauté, & s'il ne tire point trop ſur le jaune, ou ſur le cramoiſy, que je ſuppoſe eſtre le plus haut degré de rougeur. Voila ce qui n'eſt venu dans l'eſprit touchant cette difficulté, que je reſerve à traitter plus amplement dans un autre lieu.*

WHAT to ſay to this, I know not: I muſt leave it to knowing men, to conſider it farther.

I RECEIVED lately a letter from Mr. *Glanvill*, full of reſpects to you, and expreſſing his readineſs to make careful enquiries concerning the waters of the *Bath*, where he wiſhes, that Mr. *Boyle* would give himſelf the trouble of furniſhing him with ſome queries to direct him. Sir, I join my requeſts to his wiſhes, and, I doubt not, but we ſhall receive as good an account to ſuch queries, as we have done to thoſe about mines; which you will ſee upon your return to *London*. I can aſſure you, that thoſe letters of Mr. *Colepreſſe* had not been above two or three days in my hands, when I ſent them to M. *Hatherton* for you. But I ſuſpect, Mr. *Strode* had kept them long with him, by reaſon of his ſickneſs here in *London*, or of forgetfulneſs, or hope of ſeeing you here.

FROM *France* I have only this civil news: *M. Colbert doit aller à Aix vendredi, qui vient* (the letter was dated March 21, new ſtile) *avec tout cela on doute de la paix* (the former letter ſounded otherwiſe) *& tout le monde croit, que Caſtel-Rodrigo n' a point de pouvoir.*

I HOPE Dr. *Wallis* received my letter of March 10. I am,

SIR,

your very faithful ſervant,

OLDENBURG.

SIT, I had almoſt forgot to give you notice of what I had from a very good hand at *Copenhagen*, that ſignior *Borrhi* is there, in great favour and credit with that king, whom he is ſaid to have given great ſatisfaction in many things, beſides ſeveral great cures he hath done in that place.

SIR,

I FIND by your laſt return, I am guilty of an unſeaſonable importunity, expreſſed in my former, which yet, ſince I am not wont to be ſo in my own particular concerns, I am apt to believe, I ſhall the more eaſily obtain your pardon for, the more it proceeded from a zeal to further a publick and uſeful work, as the building of a college for the Royal Society is conceived to be by the council, as being that, which will in all likelihood eſtabliſh our inſtitution, and fix us (who are now looked upon but as wanderers, uſing precariouſly the lodgings of other men) in a certain place, where we may meet, prepare and make our experiments and obſervations, lodge our curators and operators, have our laboratory, obſervatory, and operatory all together. It is a maxim, I learned in my logick, when a boy; *Qui amat finem, amat & media ad finem.* And I confeſs, I am as averſe from, and as much a bungler in, begging, as any man; but I can deny myſelf, and go againſt the ſtream of my inclinations, when the proſecution of honour and publick uſefulneſs is in the caſe, as here it is; and therefore am not aſhamed to beg, when it is a means to accommodate and promote the good ends of the Society's inſtitution. I think, ſince I have endeavoured to ſerve them to the utmoſt of my power theſe ſix years gratis, and am a beggar to boot as to my private fortune, I may extend my endeavours ſo much farther, as to go a begging for the Society's eſtabliſhment, eſpecially in ſo good company, as our preſident Mr. *Henry Howard*, Sir *Robert Moray* (though abſent) and ſome others have a mind to be. Sir, you will pardon my fervor, though, perhaps, accompanied with new guilt (that of indiſcretion.)

I CAN eaſily gueſs the reaſon, which induces you not to pronounce at preſent in Mr. *Hook*'s propoſal. I ſhall be very glad to receive the thoughts of thoſe two ſagacious perſons, you have named, concerning it; which may be ſo managed, as that your way for obviating the main inconvenience of the baroſcope at ſea may be intimated in their declaration, as a thing, they have heard you diſcourſe of to them.

SIR, I am going to anſwer the letters and papers received from the *Baltick*, though I ſhall not ſend it away, till next week. If you think fit to ſay any thing to the new Dantiſcan conſul by my pen, I can inſert it; if not, I ſhall let him know, what you mentioned in your laſt, of your pre-engagement in other matters.

WE had before us at our laſt meeting the two weather-glaſſes, contrived by Mr. *Hook*, for the obſervation of weather at ſea; as alſo a new contrived engine for grinding and preſſing of cyder-fruit all at once: and likewiſe a way of promoting the vibrations of pendulums ſtraight, without checking them at all. But my lord *Brounker* was not there. You know, Sir, what I mean.

I RECEIVED lately a return of that Turkiſh ſheet of the New Teſtament, which, a good while ſince, I ſent to *Amſterdam*. It came back with many animadverſions, and with a letter reflective enough on the author of that verſion. But having ſpoken with Mr. *Seaman* hereupon, I am pretty well ſatisfied about it, and have deſired him, to vindicate both himſelf and his work as fully as he can. I ſuppoſe, he has already written about it to *Oxford* (as I intended to have done to you laſt week, but that I forgot it) and conſulted with his friends there. Mr. *Hyde* will do a good ſervice to ſome proteſtants in *France*, to give what information he can about the ſenſe of the Greeks of this laſt fifty or ſixty years in the point of tranſubſtantiation (for that is par-

particularly deſired, the Romaniſts pretending, that they have of late years complied with them) and that as ſoon as conveniently he can. I am ready to ſerve him again to my power upon all occaſions.

SIR, doubtleſs you have heard ere this of our league with the Dutch, Swedes and Brandenburg, for interpoſing as umpires in the conteſt between *France* and *Spain*, reſolved to oblige thoſe two parties to comply with what the allies ſhall judge reaſonable and juſt, or to expoſe the refuſing party to the danger of being invaded by thoſe judges. This certainly will put the French king to new counſels, who, we hear, is reſolved for a journey, to be begun, as the laſt letters ſay, the 3d of February (new ſtile) but not certainly known whither, nor for what deſign, though intimated to be of great importance. And ſome do venture to write, that it is to ſurpriſe *Antwerp*; others, to attend Don *Juan d'Auſtria*'s motion, and, if poſſible, to cut him off in his paſſage into the Spaniſh Netherlands, he being reported to be in the head of 10000 men, moſt Germans.

IF you will have the patience to hear the magnifying diſcourſe for the French king, I will give it you in my author's own words, *viz.*

Le voyage du roy eſt certain. Il y a bien de l'apparence, que les Païs Bas ſeront bien toſt à luy, ſes ennemis n'ayans ny conſeil, ny ſoldats, ny capitaines. L'empereur ſera neutre. Les Hollandois n'oſeront l'irriter, & les autres princes ne pouvent pas agir d'eux meſmes. La compagne, qui vient, en toute apparence ſera auſſi heureuſe que celle de l'année paſſée, & peut eſtre d'avantage, ſi la paix ne ſe fait pas; à quoy il y a peu de diſpoſition.

Non obſtant la guerre, on va payer les penſions des gens de lettres, qui montent à pres de 100000 livres par an. Outre cela, il y a un fonds pour les baſtimens. Enfin jamais il n'y a eu de roy, qui ait plus de lumiere, de conduite & de bonheur que le noſtre. Beſides this, he ſaith, *Qu'un des principaux de l'Academie de Caën a propoſé à M. Colbert, le ſecret d'adoucir l'eau de la mer, qu'on doit examiner.* This we did let fall to the ground. I am,

SIR,

your very humble ſervant,

H. O.

London, March 24. 1667.

SIR,

THERE was at our laſt meeting brought in a ſlight account concerning the book of the Florentine Experiments; but it was not Dr. *Merret*'s, who intends, as himſelf told me this very morning, to read it thorough with attention, and compare it with what he knows to have been already done in *England*. After his company, I received the viſit of a gentleman, who gave me notice, that a friend of his, whom he ſcrupled to name, reſiding now at *Rome*, had ſent him an Italian journal *dès Scavans*, or philoſophical Tranſactions, which he ſhewed and left with me, lately begun to be publiſhed at *Rome*, in imitation of the French and Engliſh: beſides, he acquainted me, that his ſaid friend offered himſelf (which he read to me out of the letter) to procure for the Royal Society a correſpondency all over the world, by means of the miſſionaries, who from *Rome* are ſent into all parts, ſaid by the author of the letter to be learned men, and capable to give full ſatisfaction in matter of curioſities of all ſorts. This latter part I much doubt of, conſidering the principal end of ſuch men's voyages, which is, to propagate their faith, and to greaten and enrich themſelves by their craft; though I deny not, but ſome of them are alſo ingenious, and curious in matters of a philoſophical nature; but thoſe that are ſo, are, I doubt, obliged, or, at leaſt, think themſelves ſo, to diſcover ſuch obſervations to their own tribe, and would, I believe, be unwilling to communicate them to hereticks, except they were ſure, they ſhould be very well requited for it. Mean time, I can do no leſs, than acquaint the Society with ſo civil an offer; and, if they will be at the charge of ſuch a commerce, and ſhall judge it beneficial to their deſign, I am ready to extend my ſervice that way.

IN the aforeſaid Italian journal (which they call *Il Giornale de Letterati*) are contained, 1. An account (but a very ſlender one) of the book of the Florentine Experiments. 2. An account of ſome eccleſiaſtical books, and a book of the lives of painters by *Carlo Dati*. 3. Obſervations, *della ſtella rinaſcente nel collo della balena li* 14. *Giennaro* 1668. *h.* 2. *n. s.* (I think, it was about the ſame time, that you, Sir, and Dr. *Wallis*, obſerved the ſame ſtar at *Oxford*.) 4. Obſervations made upon a great fiſh, diſſected in the Pariſian academy. (This was printed long ago in one of the Tranſactions.) 5. An extract out of the Journal of *England*, (ſo they miſcal the Tranſactions) concerning a way of keeping a dog alive without the motion of his lungs, by keeping them only extended with freſh air.

IF this way of printing journals ſpread over all, we may have a good general intelligence of all the learned trade, and its progreſs.

FROM *Caën* in *Normandy*, I received lately this anatomical account.

On a fait icy la diſſection des yeux d'une taupe. Il eſt certain, que la peau eſt ouverte & fenduë à l'endroit des yeux, ce qu'on n'avoit pas remarqué icy auparavant. L'oeil eſt enveloppé dans les membranes, dont la peau eſt compoſée. Il n'eſt pas plus gros, que la teſte d'une petite eſpingle. Il eſt obſcur & noir, horſmis quand il eſt regardé ſelon ſon axe oppoſé au jour. Car eſtant vû en ce ſens là, l'axe & ſes environs paroiſſent tranſparens. L'ayant ouvert, on n'y remarqua pas de chriſtallin; mais cela eſt ſi petit, qu'on s'y peut tromper. Il ne paroit point non plus de nerf optique parmy les petits muſcles, qui y eſtoient attachez.

attachez. Il n'y à point d'orbite au crane; mais l'une des cavitez, qui ſont proche de l'os Zygoma, luy ſervent d'orbite. On à deſſein de deſſecher le crane, et d'examiner ce qui eſt dans la teſte. Cette diſſection ſe fera encore plus exactement.

CONCERNING grafting, this is added: *On à fait greffer des contes les plus bizarres, pour voir ce qui en arrivera. Ce qui ſervira non ſeulement à connoitre juſques où la nature peut aller en la multiplication des vegetaux, mais encore à augmenter le nombre des fruits.*

AT our laſt meeting we had the ſight of a new kind of large furnace for hatching of chickens; as alſo a new cyder-preſs engine, to make cyder with more expedition: both are to be put into practice, which will try their ſufficiency.

MR. *Glanvill* hath ſolicited it ſeveral times (though I have, I think, mentioned it but once to you) that you would favour him with ſome queries for the *Bath*, he not judging himſelf to be philoſophical enough to deviſe matter of his own. But, I ſee, we muſt leave this to your better leiſure. I ſhall endeavour to get an extract of the charter of the Engliſh Hamburgh merchants, and when I have got it, it will quickly be ſent you from,

SIR,

your very humble ſervant,

H. OLDENBURG.

THE French act craftily. They will doubtleſs ſurprize the Spaniards; but, I hope, they will not us in the Channel, becauſe we have abroad about twenty frigats, and are equipping twenty five more. The French king courts the whole electoral college highly, and would have them the mediators of the peace; of which thing, I am apt to believe, he thinks no farther, than to amuſe his antagoniſts with it.

SIR,

I CANNOT yet obey you in delivering your letter for Sir *John Finch*, nor your book to be ſent to prince *Leopold*, becauſe the one is not yet returned to *London*, nor the other come to my hands; neither have I given your letter to Mr. *Povey*, wherein the Ethiopian gentleman is concerned, finding that by reaſon of my long ſilence, who made him diffident of the ſucceſs of his deſires, he hath let fall the deſign of that voyage, and before the arrival of your intended favour (which notwithſtanding he is very ſenſible of) engaged himſelf another way for this winter. The other ſtranger, who is a hard ſtudent in phyſick and chemiſtry, and a great friend to that philoſophy, that explicates things by mechanical and intelligible principles, will be very glad to hear your objections againſt his menſtruum, and will be found, I think, pretty ready to ſatisfy ſome of them; though he pretends not to make that liquor to be the ſame with the grand alkaheſt, but analogous thereunto. Another gentleman, that came not long ago from *Paris* hither, preſented me with a ſmall treatiſe, but of a big title, bidding all the world to make bone-fires, becauſe henceforth merchants and ſeamen ſhall be enabled to ſail againſt wind and tide, huſbandmen to plough without horſe or oxen, all that uſe waggons, mills, watches, *&c.* to make all thoſe machines move inceſſantly and of themſelves. To the perpetuum mobile he joins the promiſe of the quadrature of the circle, the ſecret of longitudes, the cauſes of the reciprocation of the ſea, of the winds, and of intermitting fevers. I believe, himſelf was in a continual raving one, when he wrote this piece, conſidering the commonneſs of what he ſaith, and the flatneſs of his ſtyle, eſpecially the confidence and oſtentation, wherewith he delivers all, pretending, that he carries away the bell from the renowned prince of *Mirandola*, that anſwered upon all things known, and ſaying, that himſelf can anſwer to things not known, and unty Gordian knots, and reſolve inſoluble queſtions: yet the philoſopher's ſtone he will not meddle with, becauſe he eſteems that ſecret, if diſcovered and divulged, would prove more pernicious than beneficial. But I will leave this advocate (for that is his profeſſion at *Rouen*) to plead for his own dotage, and tell you, what is more credible, *viz.* that the Spaniſh embaſſador, the count of *Fuenſaldagna*, refuſed the king of *France* his preſent, which was a diamond of 50,000 livres, becauſe that king refuſed to ſee him by reaſon of the late ceremonious ſcuffle between the two embaſſadors here at *London*: and that *Fouquet* is rendred every day more and more odious, by reaſon of the farther diſcoveries that are made of his deſigns and intrigues, to remove the queen-mother of *France* for the compaſſing of his ambitious ends.

SEVERAL of the chief of our *Greſham* Society, and among them the preſident, being out of town, I went not yeſterday thither, thinking there would be little or no company. I hope we ſhall ſhortly enjoy yours here, and have then a ſhare in that, which your phyſick will not permit him to have now, who is,

SIR,

your faithful and humble ſervant,

H. O.

MR. *Herringman* preſents his humble ſervice to you, and ſaith, that Mr. *Browne* is ſo inconſiderate, as to offer him, in good earneſt, loſs for the Latin books of Eſſays: whereupon I told him, that he needs not to be haſty, nor pin the book upon any, being ſure, he will want no opportunity in time, to diſperſe it with great advantage.

WHEN I was going to ſeal this, a porter brought me from *Warwick Lane* two copies of your

your Latin pneumatical book, whereof I ſhall immediately deliver one to Mr. *Herringman*, to have it princely bound up, the other I know not whom it is for, ſeeing you left one with me very handſomely bound up for Sieur *Viviani*.

London, March 30, 1668.

SIR,

I AM as well obliged to you, as M. *Paiſen*, for the philoſophical entertainment given him. The fame of the Society riſeth very high abroad, and makes ſtrangers flock hither in troops; inſomuch that ſince this March I have had no leſs than two dozen travellers addreſſed to me, whereof ſome make quick diſpatch, others ſtay longer; and of this latter ſort you have now and then your ſhare, and perhaps a greater than you care for. I have not yet had time to read *Bartholinus*'s three and four centuries of experiments; but I have peruſed, ſome weeks ago, *Barbatus de ſanguine, &c.* in order to mention him in the Tranſactions, but I found, I had no room for him, nor had I ſince. I have alſo ſeen the *Obſerv. Anatom. Coll. privati Amſtel.* and *Sanguerdius de Tarantula*, and I may find place to ſay ſomething of this laſt in the next book. However, Sir, my thanks are the ſame to you for naming them to me, as if I had known nothing of them. I am now contriving a method to ſettle my correſpondence with *Rome*; and I have a proſpect, if God bleſs us, of a compendious way of fetching in for the Society whatever is ingenious, curious, and new, from the moſt conſiderable and moſt civilized parts of the world, *nî deſit rerum gerendarum nervus.*

I WAS lately offered alſo to correſpond with the new academy of experimenters at *Caen* by the means of Monſieur *Huetius*, of whom they write me from *Paris*, *que c'eſt un homme d'eſprit, et capable de faire beaucoup de choſe.* And it is added, *que monſieur Colbert à promis auſſi un fonds à cette nouvelle academ. de Caen pour faire des experiences, et que, ſi on ne fait rien en France, il ne tiendra pas au roy, qui contribue autant qu'il peut pour aider ceux, qui ont envie de bien faire.*

THIS, methinks, ſhould be lodged and improved in a proper place here; but that we want zeal and induſtry, and conſequently muſt needs fall under them in a ſhort time.

THE Pariſians have made lately a diſſection of a camel, where they ſay they have obſerved no inconſiderable particulars; and thoſe of *Caen* have made the diſſections of the eye of a hawk, and of the body of an oiſter; which, I find, are like to be publiſhed ere long.

MONSIEUR *Sluſius* at *Liege* ſent me lately a large letter, by which I find his readineſs of giving us an account to what enquiries we ſhall make about their country, eſpecially mines, Spa-water, immature and volatile metals, of divers ſorts of coals, ſuch as take fire quickly, and are alſo quickly conſumed, and others of a contrary quality. And after he hath given me in his letter a general deſcription of the country, he concludes that part thus; *Et hæc quidem ὡς ἐν τόπῳ dicta ſufficiant. Exequar uberius et per partes, cùm quòd potiſſimùm vobis gratum futurum eſt, indicaveris.*

AFTER this he comes to yourſelf, Sir, in theſe words:

Incidi nuper in viri nobiliſſimi R. Boylii experimenta phyſica, (ſerò enim ſimiles deliciæ ad nos perveniunt) in quibus cùm ea legerem, quæ de natura fluiditatis ac firmitatis obſervat vir nunquam ſatis laudatus, rediit in memoriam experimentum olim à me factum non abſimile illi, quod commemorat, p. 129. (which in the Engliſh is p. 231.) *de liquore ſcil. qui calore non magno fluiditatem, et levi frigore firmitatem adipiſcitur. Salinus nempe eſt, ex nitro fixo per deliquium ſoluto, ſeu Glauberi alcaheſto, et ſpiritu chalcanthi præparatus. Si enim liquores illos ſimul junxeris, et ſalem præcipitatum ſiccaveris, ac demum adhibito ſpiritu chalcanthi, quantum opus erit, eundem diſſolveris, hic liquor leviſſimo frigore concreſcet. Ac memini, æſtate proximè elapſâ in phiala à me ſoli expoſitum ut liqueſceret, in umbra, quamvis aurâ tunc minimè frigidâ, concreviſſe. Variis autem modis idem fieri poteſt, quorum multos cum expertus fuerim, videtur mihi fore, ut hoc ſemper accidat, mixtis, ut præſcriptum eſt, duobus ſalinis liquoribus, dummodò ex diverſæ ſpeciei ſalibus, uno volatili, altero fixo, parati ſint.*

MAY not ſuch liquor as this be of good uſe in thermometers?

FOR ſtate-news this:

Tout ſe prepare à la guerre; neantmoins les officiers craignent la paix. On n'entend plus parler de D. Jean. Le roy pourra prendre encore quelques bonnes places cette campagne, et avancer touſjours; les Eſpagnols n'eſtans pas en eſtat de luy reſiſter, ny de tenir la campagne. On mande de Hollande, qu'on y fait de grands preparatifs, et qu'on croit, que la paix ne ſe ſera pas.

L'Eveſque de Munſter marchera contre Mrs. les Eſtats, quand le roy ſera en Flanders.

Si la reyne d'Eſpagne continue à ne vouloir point oüir parler de tracter ſur le pied de l'alternative, la paix ne ſe pourra pas faire.

On à veu à Bayonne une comete, et en Provence auſſi. Un Jeſuite l'a veuë auſſi à Lyon; mais perſonne ne lá obſervée icy à Paris.

On me doit envoyer de Caen des ſels, qui ont eſté tirés de la roſée, ou du moins une relation exacte de ce qu' à fait ſur cela un chemiſte fort habile. I am,

SIR,

your very humble

and faithful ſervant,

H. OLDENBUGR.

London, April 7, 1668.

SIR,

MONSIEUR *Paiſen* gave me his farewell on Saturday laſt, and ſeemed to be very well pleaſed with the commiſſion I

gave

gave him, for several philosophical matters, to be enquired after and promoted in *Germany*. There is a very able man, by description, at *Hamburgh*, a disciple of *Jungius*, and a keeper of many of that able man's unpublished papers. Among other things, I have by a letter to that person urged the dissection and edition of those manuscripts, especially his animadversions upon *Gassendus* and *Descartes*, and his thoughts upon our *Verulam*; as also his collections concerning arts and trades, of which I hear he had made considerable ones. I hope I shall receive a good account of these particulars, by the procuration of the said M. *Paisen*, who presented me at his departure with a copy of the disputation he held at *Leyden*, *pro gradu*, *de humorum vitiis*, *eorumque restitutione*; wherein I meet with things that please me not a little.

I AM obliged to write very shortly to M. *Slusius*, to return him thanks for his communications, and to give him an account of some things he desired to be informed about. I am sorry, I am not like to make your designed queries about the mines of his country one of the ingredients of my letter.

MR. *Colepresse* is gone, I think, by this time to *Holland*. In his last letter he relates, that lately pleasuring a person of honour, by composing a barometer and some thermometers for him, he met with a pleasing observation, relating to your experiments of the nephritick wood in History of Colours; where spirit of vinegar is instanced for destroying of blue colour; but, contrary to his expectation, brandy did the work, and spirit of harts-horn recovered it again. He inserts in the same letter some observations made about apple-trees, and for preserving young fruit; as also some odd relations concerning a ternary and quaternary of testicles found in father and son, and odd monstrosities in that country, and unusual peculiarities of nature in some persons there, which would be too long and tedious to transcribe. I reserve them till your happy return, which, I hope, will now be so very shortly, that by your next you will forbid me writing any more.

I HAVE made several applications about the English Hamburgh merchants charter; and am now promised to have a sight of it to morrow, and I hope also permission to make an extract out of it.

THE French letters do still assure me of the encouragements, which their philosophers receive for experiments. They have lately dissected at *Caen* a Macreuse, whereof they relate several particulars, to be imparted, when you shall be here.

FOR state-news they write thus:

On ne parle plus que de guerre. Les gardes sont desia parties; le roy s'en ira à la fin du mois (Avril) cependant on ne laisse pas de negotier. Le bruit court, que les vaisseaux de D. Jean ont esté dissipez par la tempeste. Cette nouvelle à besoin de confirmation. Les Hollandois se preparent, et sont tout ce qu'ils peuvent pour detourner la guerre de leur frontiere, et pour conserver les places des Espagnols, qui sont dans leur voisinage. La Suede offre 12000 hommes à ceux, qui se sont ligués ensemble contre nous, moiennant 60,000 escus par mois. Vous ne manquerez pas de vostre costé de contribuer, comme les autres, par mer et par terre, et ainsi la guerre se fera tout de bon. Avec tout cela, l'armee de France est forte, et le roy à deux generaux, qui n'ont pas leurs pareils dans l'Europe. Il n'y à que Monsieur Wrangel, qui leur puisse estre comparé. D. Jean n' à pas assez d'experience pour resister à deux capitaines consommés comme eux. Il y à bien de l'apparence, que le roy sera encore maitre de la campagne; mais il aura plus de peine que l'année passée. Les Suisses sont mal contents, mais on les conte pour rien. L'empire sera spectateur de la tragedie. L'empereur ne dit mot; mais on croit pourtant, que soubs main il agit aussi. Le temps nous decouvrira bien des choses. Dieu sur tout.

I HAVE not yet received Dr. *Needham*'s letter. I hope, I shall use it so, as may rather appease, than exasperate; who am,

SIR,

your very humble,

and faithful servant,

H. O.

OUR good friend Dr. *Beale* presents his very humble service to you with very affectionate expressions; and saith, that he utterly disowns to have any power with M. *Glanvill* in his last writings, since he wrote against dogmatising.

London, April 14, 1668.

SIR,

THE fossils, most to be met with in the country of *Liege*, are cadmia, alum, chalcanthum viride, ferrum, plumbum, and stibium, but mixed with much lead: it abounds also with marl, chalk-stones, pit-coal; which latter are of two sorts, one catcheth fire easily, and by a kind of melting shews to hold store of bitumen; the other, taking fire and consuming more slowly, melteth not at all, and hath a sulphureous smell. There are also marble, and transparent stones, both white and amethystin; and several Spaw-waters, not used by reason of the want of convenient lodgings, yet of no less virtue than those that are.

DR. *Needham*'s letter is indeed material, and suggests several good experiments, which will invite me to present it to the Society, if M. *Hook*, whom I intend to shew it first, shall not earnestly express himself to be concerned for the not doing it. It seems, that I am by him thought guilty of having mistaken his notion of sanguification; which, I confess, I cannot well see, when I compare, the second time, my expressions of p. 516. with his p. 172. 173.

I THINK, it is not any matter of doubt, whether your notes and suggestions about experiments of respiration will be welcome to the Society; nay, I am sure, they will be both

both ſerviceable and pleaſing to them; and I ſhall take care, that they be kept from being publiſhed any other way, than you take or order to be taken yourſelf.

ALL your experiments concerning the light in ſhining wood and fiſh, and the effects of air on them (which you enriched the Tranſactions with) the French have taken into their laſt journal, which is, in the greateſt part of it, made up of them, done handſomly enough, and with taking due notice of the worth of their author. This you will ſee at their return, among other things; of which Sir *R. Southwell*'s collections in *Portugal*, both as to written accounts, and divers curioſities, will make no ſmall part.

I CANNOT yet give you any account of the Hamburgh merchants charter, becauſe the perſon, I engaged in it, has not yet performed his word; which neglect is now ſo common, that it maketh a man altogether ſhy to promiſe any thing, wherein there is a dependance on another.

IT ſeems, it is certain, that a new comet hath been lately ſeen in other parts. From Dom. *Caſſini* at *Bononia* came to me this account:

A. 1668. *d.* 10. *Martii h.* 1. *noctis ſequent. obſervavi lucis ſemitam, à ceto per Eridanum extenſam, quam cometæ caudam judicavi tum ex figura et colore, tum quòd ejus directio, imaginatione continuata, producere videret ad gr.* 21. *piſcium, ubi tunc ſol erat, & proinde in partem ſibi oppoſitam vergeret, more aliorum cometarum. Apice pertingebat ad ſtellam in Eridano, quæ* 14. *dicitur à Bayerio. Egrediebatur autem è nubibus horizontalibus, ita ut cenſerem, cometæ caput vel iiſdem condi, vel infra horizontem latere. Sequebatur motum diurnæ revolutionis ad occaſum, conſpicique potuit ad hor.* 2. *noctis; tunc verò inter horizontales nebulas demerſa eſt.*

D. 11. *veſpere, apparuit inter nubes horizontis humidiores poſt hor.* 1. *noctis.*

D. 12. *veſperi, nubes humiliores partem cæli occidentalem occupabant, cumque cœlum mediaret Sirius, apparuit rurſus eadem cauda. Tranſibat per ſtellam in Eridano,* 14. *Bayero, relinquebatque ad auſtrum* 14. *ad quam d.* 10. *terminabatur, producebaturque ulterius.*

Ad tres circiter gradus, ulteriuſque per imaginationem producta, mediante filo, arcu tenſo, dirigebatur ad auſtraliorem in præcedente auriculam leporis: ſeptentrionalior igitur erat, quàm nudius tertius, & orientalior, pariterque in plagam ſoli oppoſitam vergebat.

Ad occidentem ejus regreſſio erat è nubibus; itaque utrum ab iis occultaretur caput cometæ, an infra horizontem lateret, incertum; linea autem à Jove ad terminum caudæ in nubibus erat ipſi caudæ perpendicularis. Erat igitur in ceto, & caudæ pars apparens protendebat grad. 32. *circiter.*

THE ſtone, I think, I formerly mentioned to have been taken out of a horſe at *Paris* (of four pound four ounces and an half weight) was found in a fatty membrane over againſt the kidneys, faſtned in two places to the ſpine; and had ſuch a poliſh, that it reflected images.

I RECOMMEND the incloſed to the care of your ſervant for Dr. *Needham*, and remain,

SIR,

your very humble and

faithful ſervant,

H. OLDENBURG.

London, July 27, 1668.

SIR,

THE incloſed from monſieur *Paiſen* came to my hands on Saturday laſt, under a cover of the ſame perſon to myſelf, together with a letter from monſieur *Fogel*, at *Hamburgh* (one of the diſciples of the famous *Jungius*) who tells me of the pains he taketh, in promoting the publication of the manuſcripts of that learned man; and in particular his *Phoranomica*, *Hiſtoria Inſectorum*, *Hiſtoria Naturalis ſimilarium Corporum*, *Hiſtoria Plantarum*, & *ad eam Iſagoge Phytoſcopica*, and then his *Apollonius Saxonicus*. But he complains of the great want of patrons to encourage and aſſiſt in that work, and of the difficulty of getting ſcholars to labour in the digeſting and tranſcribing of thoſe papers; uſing theſe words:

Cùm nobis deſint præmia philoſophica, adoleſcentes noſtri omnes properant ad facultates, quas vocant, lucroſas, theologiam puta juris prudentiam & medicinam, philoſophiæ ſtudio planè neglecto.

I HAD uſed ſome words in my letter to him, preſſing my wiſhes for the erecting of an experimental ſociety of philoſophers in *Germany*. To that he anſwers: *Perſuaſiſſimum tibi habe, vix aliquem mortalium tam impensè deſiderare ſimilem cœtum in Germania, quàm meipſum. Et jam pluſculi anni ſunt, quod de erigenda tali ſocietate laboravi. Imò cùm Romæ viverem, collegi inſignem Lynceorum hiſtoriam, nunquam hactenus editam, cujus primus tomus, præter hiſtoriam Originis ejus, continet integrum Lynceographum principis Cæſii, in quo plura quæ ſocietati veſtræ utilia eſſe poſſunt. Sed cùm veſtra ſocietas ditiſſimis abundet patronis* (This is *fallacia compoſitionis & diviſionis*; there are amongſt us many, that are rich enough; but where are the rich patrons?) *& legatum ſuum rex Angliæ hac in urbe alat, nunquid hic ſperari poterit fundatio alicujus collegii parvi, quod à majori veſtro dependeat? Hoc olim erat ſocietatis principis Cæſii inſtitutum, habere ſc. in Italia, Germania, Gallia, Polonia, &c. varia collegia, quæ à ſe, Romano principe, dependerent.*

WHAT an honour would that be for *England*, if, when foreign nations ſhould offer to enter into ſuch learned ſocieties, and they depend from the Royal they might receive encouragement from hence? But it were vanity, to flatter one's ſelf with ſuch hopes.

I INTEND, God willing, very ſhortly to return an anſwer both to M. *Paiſen* and M. *Fogel*; and if you pleaſe, Sir, to have ſome-

thing of yours conveyed in the ſame packet, I ſhall take the ſame care of it, I do of my own.

I HAVE heard nothing from *Oxford* concerning the printing of the Latin Hydroſtaticks, nor the continuation of the Pneumatick Experiments; nor is Mr. *Crook* forward in printing the Latin Hiſtory of Cold; yet he promiſes, that between this and Michaelmas it ſhall be done.

AT *Paris* the philoſophers are buſy in diſſections; and ſo they are at *Caen*, where chiefly they anatomiſe fiſhes; among which, they have lately diſſected a ſturgeon, whereof I have a large account, too long to be inſerted here. They are examining more and more the circulation in plants; and ſay, *Qu'il faut placer le centre de la circulation des plantes à l'endroit, où s'aſſemblent les branches de la racine, qui eſt juſtement l'endroit le premier formé: car coupez le tronc de l'arbre juſques aupres de la terre, il repouſſera des branches; coupez les racines, ſi le tronc des racines demeure entier, l'arbre ne mourra point, mais coupez cette partie, toute la plante mourra infalliblement. C'eſt donc là proprement qu'il faut placer le principe de la circulation.*

AT our Society, we are ſtill upon the mixing of different bodies, and of incorporating them into one another, to explore the weight of the total, and of the ingredient parts. We have alſo begun to examine the life of birds in free and compreſſed air: and for the trial of the duration of their life in free air, we take birds of the ſame kind, and put them up in cloſe veſſels of differing capacities; to ſee, what proportion the duration of their life holds to the quantity of common, though cloſe air, they live in. Lately we fell upon the examination of pendulums, which was occaſioned by a propoſition advanced by *Borelli de vi percuſſionis*, who ſeems to aſſert; "That "the line of a pendulum being ſtopped by "a pin or other thing in the perpendicular "line any where, the bullet holds on its mo-"tion beyond the perpendicular (though in "another circle) to near the altitude of the "ſame horizontal line, from whence it fell, "decreaſing after the ſame velocity, in which "it before accelerated, *viz.* moving like "ſpaces in proportionable times, accounted "from the perpendicular each way, where "the two circles unite." Some of our Society judge it to be true, and are labouring to find the demonſtration for it.

SIR, this was accompanied with the *Unum Neceſſarium* of honeſt *Comenius*. I can gueſs, what will be thought of it and the preface. Oblige me, I pray, to preſent my very humble ſervice to my lady *Ranelagh*, and all the other noble company, where now you are.

SIR,

your very humble ſervant,

H. O.

PARDON my haſty ſcribble.

London, July 10, 1674.

SIR,

I HEREWITH take the liberty of ſending you my tract of June, which, I hear my lord chief juſtice *Hale* ſent for, almoſt as ſoon as it was out of the preſs, and at which, I think, he cannot juſtly be offended in reference to what concerns him, though ſome inconſiderate men give out, that he will upon occaſion reſent the non-acknowledgment of greater worth in his book; which humour I can hardly think ſuch a man capable of.

CONCERNING Dr. *Coxe*'s diſcourſe, though I did once intend to take notice in theſe papers of the concurrence of your thoughts with his in ſome particulars; yet upon hearing you ſay, when I mentioned it to you, that you conceived he did not interfere with you in theſe obſervations, I altered my purpoſe. Mean time, I have delivered your papers about the hidden qualities of the air to Mr. *Pitt*, who ſaith, he will get them printed with all convenient ſpeed, and hopes as well as I, you will find ſome other ſuitable ſubject to join with that, and thereby to give the book a juſter bulk.

I HEAR ſome very learned and knowing men ſpeak very ſlightly of the *quinque Tractatus* of *J. M.* and a particular friend of yours and mine told me yeſterday, that as far as he had read him, he would ſhew to any impartial and conſidering man more errors than one in every page.

SIR, there is come to my hands ſince you left *London*, but little philoſophical news from abroad. My lord *Herbert* writes me from *Blois*, that a phyſician of *Aix* in *Provence* hath promiſed to indicate an herb to him, by the juice of which a man's hand dipped in molten lead ſhall not be burnt, nor ſcarce feel any conſiderable heat.

MONSIEUR *Auzout* writes thus from *Rome*; *Que les cheveux ſont crûs de la moitié d'un doigt à un criminel, à qui on à donne la Veglia, quil à ſoufferte 12 heures. C'eſt une eſpece de queſtion fort douleureuſe. On à remarqué, que les patients ſuent quelquefois de telle ſorte, que l'eau coule de leur corps comme un ruiſſeau, et qu'ils enflent par tout le corps apres un certain temps.*

MONSIEUR *Juſtel* relates in his laſt letter to me; *Qu'il y à Paris un gentilhomme, qui, apres une grande colique, à jetté pars les ſelles un animal fait comme un poiſſon, qui eſt en petit de la forme d'un Dauphin, une matiere qui eſt comme une pierre et du bois; et qu'il y avoit auſſi du pourpier, et du cerfeuil et des mouches. Il ſouffre de grandes douleurs, et continue à vuider ces ſortes de matieres là. Les medicins ne ſcavent qu'en dire, et ſont ſurpris de cette avanture. Ce mal l'a pris à Bezancon, et à continué juſques à preſent.*

THE political news, he adds, are theſe: *Les Hollandois ſe ſont retirez de Belle Iſle ſans rien faire. M. de Turenne à repaſſé le Rhin pour aller combatre les ennemis. M. le Conte de Tot eſt icy, ce qui fait eſperer, que le traitté de paix ſe pourra renouër, quoy qu'il y ait peu d'apparence. Les Allemands ſont tousjours ſur la Meuſe. Apparemment*

paremment ils ne feront pas plus de choses que les Hollandois. On à escrit de Suratte, que M. de la Haye, qui est à St. Thomé, à defait dix mille Indiens avec 500 hommes, et brulé Masulipatan: ce qui à besoin de confirmation.

THE news come from *Windsor*, is, that the French king hath written to our king, that M. *de Turenne*, in a second fight, hath quite routed the Lorainer and his adherents. But other letters affirm, that the Germans being in march against *Turenne*, and he hearing of it, marched with all diligence to meet them; and having surprised them by appearing in battalia and good order, when they were not ready, caused them to retreat; whereupon he was encouraged to follow them, cutting off a considerable number of their rear, and taking five or six pieces of cannon, and pursuing them to the very gates of *Franckfort*; and now threatning to besiege either *Heidelberg* or *Frankendal*. Unfortunate country!

Extract out of Mr. Newton's *letter written to* H. O. *from* Cambridge. *April* 26, 1676.

YESTERDAY reading the two last Philosophical Transactions, I had the opportunity to consider *R. B.*'s uncommon experiment about the incalescence of ☉ and ☿. I believe the fingers of many will itch to be at the knowledge of the preparation of such a ☿; and for that end, some will not be wanting to move for the publishing of it, by urging the good it may do in the world. But in my simple judgment the noble author, since he hath thought fit to reveal himself so far, does prudently in being reserved in the rest. Not that I think any great excellence in such a ☿, either for medical or chemical operations; for, it seems to me, that the metalline particles, with which that ☿ is impregnated may be grosser than the particles of the ☿, and be disposed to mix more readily with the ☉ upon some other account than their subtilty; and then in so mixing their grossness may enable them to give the parts of the gold the greater shock, and so put them into a brisker motion than smaller particles could do: much after the manner, that the saline particles, wherewith corrosive liquors are impregnated, heat many things, which they are put to dissolve, whilst the finer parts of common water scarce heat any thing dissovled therein, be the dissolution never so quick; and if they do heat any thing, (as quick lime) one may suspect, that heat is produced by some saline particles lying hid in the body, which the water sets on work upon the body, which they could not act on whilst in a dry form. I would compare therefore this impregnated ☿ to some corrosive liquor, (as aqua fortis) the mercurial part of the one to the watry or phlegmatick part of the other, and the metallick particles, with which the one is impregnated, to the saline particles, with which the other is impregnated; both which I suppose may be of a middle nature between the liquor, which they impregnate, and the bodies they dissolve, and so enter those bodies more freely, and by their grossness shake the dissolved particles more strongly, than a subtler agent would do. If this analogy of these two kinds of liquors may be allowed, one may guess at the little use of the one by the indisposition of the other, either to medicine or vegetation. But yet, because the way, by which ☿ may be so impregnated, hath been thought fit to be concealed by others, that have known it, and therefore may possibly be an inlet to something more noble, not to be communicated without considerable damage to the world, if there should be any verity in the hermetick writers; therefore I question not, but that the great wisdom of the noble author will sway him to silence, till he shall be resolved of what consequence the thing may be, either by his own experience, or the judgment of some other, that thoroughly understands what he speaks about, that is, of a true hermetick philosopher, whose judgment (if there be any such) would be more regarded in this point, than that of all the world besides to the contrary, there being other things besides the transmutation of metals (if those great pretenders brag not) which none but they understand. Sir, because the author seems desirous of the sense of others in this point, I have been so free as to shoot my bolt.

Crayford in *Kent*, Sept. 19, 1676.

SIR,

SINCE the trouble, still given me by my tenant, will not suffer me to return with my family to *London* on the day mentioned to you, I thought to let you know so much by these lines, and withall to assure you, that the version of your book into Latin doth go on here as well as if I were in town. I wish only, that Mr. *Pitt* be as ready to print, as I intend to be, God willing, to deliver him copy. If it be possible, we shall be all at *London* on Tuesday or Wednesday of the next week. I pray, Sir, to let little *Tom* carry the enclosed to my house, and to tell the maid, she must deliver the letter he carries to her, to her brother immediately, the matter requiring haste. Almighty God bless you, and confirm your health for many years, for the publick good, and the particular concern and joy of,

SIR,

your very humble

and faithful servant,

H. OLDENBURG.

Noble

Letters from John Evelyn *Eſq; to Mr.* Boyle.

Say's-Court, May 9, 1657.

Noble Sir,

I SHOULD infinitely bluſh at the ſlowneſs of this addreſs, if a great indiſpoſition of body, which obliged me to a courſe of phyſick, and ſince, an unexpected journey (from both which I am but lately delivered) had not immediately intervened, ſince you were pleaſed to command theſe trifles of me. I have omitted thoſe of braſs, *&c.* becauſe they properly belong to etching, and ingraining, which treatiſe, with five other, (*viz.* painting in oil, in miniature, ancaling in glaſs, enamelling, and marble paper) I was once minded to publiſh (as a ſpecimen of what might be farther done in the reſt) for the benefit of the ingenious. But I have ſince been put off from that deſign, not knowing, whether I ſhould do well to gratify ſo barbarous an age (as I fear is approaching) with curioſities of that nature, delivered with ſo much integrity as I intended them; and, leſt by it I ſhould alſo diſoblige ſome, who make thoſe profeſſions their living; or, at leaſt, debaſe much of their eſteem by proſtituting them to the vulgar. Rather, I conceived, that a true and ingenuous diſcovery of thoſe, and the like arts, would, to better purpoſe, be compiled for the uſe of that mathematico-chymico-mechanical ſchool, deſigned by our noble friend Dr. *Wilkinſon*; where they might (not without an oath of ſecrecy) be taught to thoſe, that either affected, or deſired any of them; and from thence (as from another *Solomon*'s houſe) ſo much of them made publick, as ſhould, from time to time, be judged convenient by the ſuperintendent of that ſchool, for the reputation of learning, and benefit of the nation: and, upon this ſcore, there would be a moſt willing contribution of what ingenious perſons know of this kind; and, to which, I ſhould moſt freely dedicate what I have. In the mean time, Sir, I tranſmit you this varniſh; and ſhall eſteem myſelf extremely honoured, that you will farther command whatſoever elſe of this, or any other kind, is in the power of,

SIR,

your moſt humble, and
moſt obedient ſervant,

EVELYN.

I BESEECH you, Sir, to make my moſt humble ſervice acceptable to Dr. *Wilkinſon*; and that you be pleaſed to communicate to me, what ſucceſs you have, in the proceſs of this receipt (myſelf not having had time to examine it) that in caſe of any difficulty, I may have recourſe to the perſon from whom I received it.

Say's-Court, Aug. 9, 1659.

Honoured Sir,

I AM perfectly aſhamed at the remiſſneſs of this recognition for your late favours from *Oxon*: where (though had you reſided) it ſhould have interrupted you before this time. It was by our common and good friend Mr. *Hartlib*, that I come now to know you are retired from thence; but not from the muſes, and the purſuit of your worthy deſigns, the reſult whereof we thirſt after with all impatience; and how fortunate ſhould I eſteem myſelf, if it were in my power to contribute in the leaſt to that, which I augure of ſo great and univerſal a benefit! But, ſo it is, that my late inactivity has made ſo ſmall a progreſs, that, in the Hiſtory of Trades, I am not advanced a ſtep; finding (to my infinite grief) my great imperfections for the attempt, and the many ſubjections, which I cannot ſupport, of converſing with mechanical capricious perſons, and ſeveral other diſcouragements; ſo that, giving over a deſign of that magnitude, I am ready to acknowledge my fault, if from any expreſſion of mine, there was any room to hope for ſuch a production, farther than by a ſhort collection of ſome heads and materials, and a continual propenſity of endeavouring in ſome particular, to encourage ſo noble a work, as far as I am able, a ſpecimen whereof I have tranſmitted to Mr. *Hartlib*, concerning the ornaments of gardens, which I have requeſted him to communicate to you, as one, from whom I hope to receive my beſt, and moſt conſiderable furniture; which favour, I do again and again humbly ſupplicate; and, eſpecially, touching the firſt chapter of the third book, the eleventh and twelfth of the firſt; and, indeed, on every particular of the whole. Sir, I thank you for your receipts: there is no danger I ſhould proſtitute them, having encountred in books, what will ſufficiently (I hope) gratify the curioſity of moſt, when in my third I ſpeak of the elaboratory. But I remit you to what I have written to Mr. *Hartlib*, and begging pardon for this preſumption, crave leave to remain,

SIR,

your moſt humble,
and obedient ſervant,

EVELYN.

SIR, do you know, whether *Campanella* has ſaid any thing concerning altering the ſhape of fruits, *&c.* and how I may obtain the peruſal of *Benedicti Curtii Hortorum Lib.* 30. *Lugd.* 1560. *fol.?*

Say's-Court, Sept. 3, 1659.

Noble Sir,

TOGETHER with theſe teſtimonies of my chearful obedience to your commands, and a faithful promiſe of tranſmitting the reſt, if yet there remain any thing worthy your acceptance amongſt my unpoliſhed and ſcattered collections, I do here make bold to trouble you with a more minute diſcovery of the deſign, which I caſually mentioned to you, concerning my great inclination

tion to redeem the remainder of my time, conſidering, *quam parum mihi ſuperſit ad metas*; ſo as may beſt improve it to the glory of God Almighty, and the benefit of others. And, ſince it has proved impoſſible for me to attain to it hitherto (though in this my private and mean ſtation) by reaſon of that fond morigeration to the miſtaken cuſtoms of the age, which not only rob men of their time, but extremely of their virtue and beſt advantages; I have eſtabliſhed with my ſelf, that it is not to be hoped for, without ſome reſolutions of quitting theſe incumbrances, and inſtituting ſuch a manner of life, for the future, as may beſt conduce to a deſign ſo much breathed after, and, I think, ſo advantageous. In order to this, I propound, that ſince we are not to hope for a mathematical college, much leſs, a *Solomon*'s houſe, hardly a friend in this ſad *Catabyſis*, and *inter hos armorum ſtrepitus*, a period ſo uncharitable and perverſe; why might not ſome gentlemen, whoſe geniuſes are greatly ſuitable, and who deſire nothing more than to give a good example, preſerve ſcience, and cultivate themſelves, join together in ſociety, and reſolve upon ſome orders and oeconomy, to be mutually obſerved, ſuch as ſhall beſt become the end of their union, if, I cannot ſay, without a kind of ſingularity, becauſe the thing is new; yet ſuch at leaſt, as ſhall be free from pedantry, and all affectation? The poſſibility, Sir, of this is ſo obvious, that I profeſs, were I not an aggregate perſon, and ſo obliged, as well by my own nature, as the laws of decency, and their merits, to provide for my dependents, I would chearfully devote my ſmall fortune towards a deſign, by which I might hope, to aſſemble ſome ſmall number together, who would reſign themſelves to live profitably and ſweetly together. But ſince I am unworthy ſo great a happineſs, and that it is not now in my power; I propoſe, that, if any one worthy perſon, and *queis meliore luto*, ſo qualified as Mr. *Boyle*, will join in the deſign (for not with every one, rich, and learned, there are very few diſpoſed, and it is the greateſt difficulty to find the man) we would not doubt, in a ſhort time (by God's aſſiſtance) to be poſſeſſed of the moſt bleſſed life, that virtuous perſons could wiſh or aſpire to in this miſerable and uncertain pilgrimage, whether conſidered, as to the preſent revolutions, or what may happen for the future in all human probability. Now, Sir, in what inſtances, and how far this is practicable, permit me to give you an account of, by the calculations, which I have deduced for our little foundation.

I PROPOSE the purchaſing of thirty or forty acres of land, in ſome healthy place, not above twenty five miles from *London*; of which a good part ſhould be tall wood, and the reſt upland paſtures, or downs, ſweetly irrigated. If there were not already an houſe, which might be converted, *&c.* we would erect upon the moſt convenient ſite of this, near the wood, our building, *viz.* one handſome pavilion, containing a refectory, library, withdrawing room and a cloſet; this the firſt ſtory; for we ſuppoſe the kitchen, larders, cellars and offices to be contrived in the half ſtory under ground. In the ſecond ſhould be a fair lodging chamber, a pallet-room, gallery and a cloſet; all which ſhould be well and very nobly furniſhed, for any worthy perſon, that might deſire to ſtay any time, and for the reputation of the college. The half ſtory above for ſervants, wardrobes, and like conveniencies. To the entry fore front of this a court; and at the other back front a plot walled in of a competent ſquare, for the common ſeraglio, diſpoſed into a garden; or it might be only carpet, kept curiouſly, and to ſerve for bowls, walking, or other recreations, *&c.* if the company pleaſe. Oppoſite to the houſe, towards the wood, ſhould be erected a pretty chapel; and at equal diſtances (even with the flanking walls of the ſquare) ſix apartments or cells, for the members of the Society, and not contiguous to the pavilion, each whereof, ſhould contain a ſmall bedchamber, an outward room, a cloſet, and a private garden, ſomewhat after the manner of the Carthuſians. There ſhould likewiſe be an elaboratory, with a repoſitory for rarities and things of nature; aviary, dove-houſe, phyſick-garden, kitchen-garden, and a plantation of orchard fruit, *&c.* all uniform buildings, but of ſingle ſtories, or a little elevated. At convenient diſtance towards the olitory garden ſhould be a ſtable for two or three horſes, and a lodging for a ſervant or two. Laſtly a garden-houſe and conſervatory for tender plants.

THE eſtimate amounts thus. The pavilion 400 l. chapel 150 l. apartments, walls, and out-houſing 600 l. The purchaſe of the fee for thirty acres, at 15 l. per acre, eighteen years purchaſe, 400 l. The total, 1550 l. 1600 l. will be the utmoſt.

THREE of the cells or apartments, that is, one moiety, with the appertenances, ſhall be at the diſpoſal of one of the founders, and the other half at the other's.

IF I and my wife take up two apartments (for we are to be decently aſunder, however I ſtipulate, and her inclination will greatly ſuit with it, that ſhall be no impediment to the Society, but a conſiderable advantage to the oeconomick part) a third ſhall be for ſome worthy perſon; and to facilitate the reſt, I offer to furniſh the whole pavilion compleatly, to the value of 500 l. in goods and moveables, if need be, for ſeven years, till there be a publick ſtock, *&c.*

THERE ſhall be maintained, at the publick charge, only a chaplain, well qualified, an ancient woman, to dreſs the meat, waſh and do all ſuch offices; a man to buy proviſions, keep the garden, horſes, *&c.* a boy to aſſiſt him, and ſerve within.

AT one meal a day, of two diſhes only (unleſs ſome little extraordinary upon particular days, or occaſions, then, never exceeding three) of plain and wholeſom meat; a ſmall refection at night: wine, beer, ſugar, ſpice, bread, fiſh, fowl, candle, ſoap, oats, hay, fuel, *&c.* at 4 l. per week, 200 l. per ann. wages 15 l. keeping the gardens 20 l. the chaplain 20 l. per ann. Laid up in the treaſu-

ry yearly 145 l. to be employed for books, inſtruments, drugs, trials, *&c.* The total 400 l. a year, comprehending the keeping of two horſes for the chariot, or the ſaddle, and two kine: ſo that 200 l. per ann. will be the utmoſt, that the founders ſhall be at, to maintain the whole Society, conſiſting of nine perſons (the ſervants included) though there ſhould no others join, capable to alleviate the expence: but if any of thoſe, who deſire to be of the Society, be ſo qualified, as to ſupport their own particulars, and allow for their proportion, it will yet much diminiſh the charge; and of ſuch there cannot want ſome at all times, as the apartments are empty.

IF either of the founders thinks expedient to alter his condition; or that any thing do *humanitus contingere*, he may reſign to another, or ſell to his collegue, and diſpoſe of it as he pleaſes; yet ſo as it ſtill continue the inſtitution.

ORDERS.

AT ſix in ſummer prayers in the chapel. To ſtudy till half an hour after eleven. Dinner in the refectory till one. Retire till four. Then called to converſation (if the weather invite) abroad, elſe, in the refectory. This, never omitted, but in caſe of ſickneſs. Prayers at ſeven. To bed at nine. In the winter, the ſame, with ſome abatements for the hours; becauſe the nights are tedious, and the evenings converſation more agreeable. This in the refectory. All play interdicted, *ſans bowls, cheſs, &c.* Every one to cultivate his own garden. One month in ſpring a courſe in the elaboratory on vegetables, *&c.* In the winter a month on other experiments. Every man to have a key of the elaboratory, pavilion, library, repoſitory, *&c.* Weekly faſt. Communion once every fortnight, or month at leaſt. No ſtranger eaſily admitted to viſit any of the Society, but upon certain days weekly, and that only after dinner. Any of the Society may have his commons to his apartment, if he will not meet in the refectory, ſo it be not above twice a week. Every Thurſday ſhall be a muſick meeting at converſation hours. Every perſon of the Society ſhall render ſome publick account of his ſtudies weekly, if thought fit, and eſpecially ſhall be recommended the promotion of experimental knowledge, as the principal end of the inſtitution. There ſhall be a decent habit and uniform uſed in the college. One month in the year may be ſpent in *London*, or any the univerſities, or in a perambulation for the publick benefit, *&c.* with what other orders ſhall be thought convenient, *&c.*

THUS, Sir, I have in haſte (but to your loſs not in a Laconic ſtile) preſumed to communicate to you (and truly, in my life, never to any but yourſelf) that project, which for ſome time has traverſed my thoughts; and therefore, far from being the effect either of an impertinent or trifling ſpirit, but the reſult of mature and frequent reaſonings. And, Sir, is not this the ſame, that many noble perſonages did at the confuſion of the empire by the barbarous Goths, when St. *Hierome*, *Euſtochium*, and others, retired from the impertinencies of the world to the ſweet receſſes and ſocieties in the eaſt, till it came to be burthened with the vows and ſuperſtitions, which can give no ſcandal to our deſign, that provides againſt all ſuch ſnares?

Now to aſſure you, Sir, how pure and immixed the deſign is from any other than the publick intereſt, propounded by me, and to redeem the time to the nobleſt purpoſes; I am thankfully to acknowledge, that, as to the common forms of living in the world, I have little reaſon to be diſpleaſed at my preſent condition; in which, I bleſs God, I want nothing conducing either to health, or honeſt diverſion, extremely beyond my merit; and therefore, would I be ſomewhat choice and ſcrupulous in my collegue; becauſe he is to be the moſt dear perſon to me in the world. But oh! how I ſhould think it deſigned from heaven, and *tanquam numen* διοπετὲς, did ſuch a perſon as Mr. *Boyle*, who is alone a ſociety of all that were deſirable to a conſummate felicity, eſteem it a deſign worthy his embracing! Upon ſuch an occaſion, how would I proſtitute all my other concernments! how would I exult! and, as I am, continue, upon infinite accumulations and regards,

SIR,

his moſt humble, and

moſt obedient ſervant,

EVELYN.

IF my health permit me the honour to pay my reſpects to you, before you leave the town, it will bring you a rude plot of the building, which will better fix the idea, and ſhew what ſymmetry it holds with this deſcription.

Say's-Court, Sept. 29, 1659.

SIR,

I SEND you this encloſed, the product of your commands, but the leaſt inſtance of my ambition to ſerve you: and when I ſhall add, that if an oblation of whatever elſe I poſſeſs, can verify the expreſſion of my greater eſteem of your incomparable book; which, as indicted with a pen ſnatched from the wing of a ſeraphim, exalts your divine incentives to that height, that being ſometimes raviſhed with your deſcription of that tranſcendent ſtate of angelical amours, I was almoſt reconciled to the paſſion of *Cleombrotus*, who threw himſelf into the water upon the reading of *Plato*; and (as deſpairing to enjoy it) ready to cry out with St. *Paul*, *cupio diſſolvi*, and to be in the embraces of this ſeraphick love, which you have deſcribed to that perfection, as if in the company of ſome celeſtial harbinger, you had taken flight, and been raviſhed into the third heaven, where you have heard words unutterable, and, from whence, you bring us ſuch affections and divine inclinations, as are only competent to angels and to yourſelf: for ſo powerful is your eloquence,

eloquence, ſo metaphyſical your diſcourſe, and ſublime your ſubject. And though by all this, and your rare example, you civilly declaim againſt the miſtakes we married perſons uſually make; yet I cannot think it a paralogiſm or inſidious reaſoning, which you manage with ſo much ingenuity, and purſue with ſo great judgment. But certainly it was an extraordinary grace, that at ſo early years, and amidſt the ardours of youth, you ſhould be able to diſcern ſo maturely, and determine ſo happily; avoid the Syren, and eſcape the tempeſt: but thus, when the curioſity of *Pſyche* had lighted the taper, and was reſolved to ſee what ſo ardently embraced her, ſhe diſcovered an impertinent child, the weakneſs and folly of the paſſion. You, Sir, found its imperfections betimes; and that men then ceaſed to be wiſe, when they began to be in love, unleſs, with you, they could turn nature into grace, and, at once, place their affections on the right object. But, Sir, though you ſeem tender of the conſequence all this while, the concluſion will ſpeak as well as your example; that though you have ſaid nothing of marriage, which is the reſult of love; yet you ſuppoſe, that it were hard to become a ſervant without folly; and that there are ten thouſand inquietudes eſpouſed with a miſtreſs. That the fruits of children are tears and weakneſs, whilſt the productions of the ſpirit put their parents neither to charge nor trouble; that all theſe heroes, of whom we read, eſteemed moſt precious of the celibate. *Alexander* had no child, and *Hercules* left no heir: *Pallas* was born of the brain of *Jupiter*; and the *Venus Urania* of the Platoniſts made love only to the ſoul, which ſhe united to the eſſence of God (according to their divinity) and had no lower commerce than what you ſo worthily celebrate in your book, and cultivate in your life. But though theſe were all true, and all that you have added, ſince I find the paſſion of *Lindamore* rather to be pitied, than criminal, becauſe *Hermione*'s was not reciprocal; though ſhe were cruel, the ſex is tender, and amiable; pious, and uſeful, and will never want champions to defend their virtues, and aſſert their dues, and that is our love and our ſervice. For if it be virtuous, it is the neareſt to the ſeraphical; and whatever can be objected againſt it, proceeds from the vices of the perſon's defect, or extremes of the paſſion. But you inſtance in the jealouſies, diſeaſes, follies, and inconſtancies of love: the ſenſual truly is obnoxious to all theſe; but who have been the martyrs, where the deſign was not plainly brutiſh, indifferent to the education, or blinded with avarice? And, if you have example of their hatred, and perfidy, I can produce a thouſand of their affection and integrity. What think you, Sir, of *Alceſte*, that ran into the funeral pile of her huſband? The goodneſs of *Æmilia*, the chaſtity of *Lucretia*, the faith of *Furia*, of *Portia*, and infinite others who knew nothing, that the Chriſtian inſtitution has ſuperadded? And the Scriptures are full of worthy examples, ſince it was from the effects of conjugal love, that the Saviour of the world, and that great object of ſeraphick love derived his incarnation, who was the ſon of *David*. Take away this love, and the whole earth is but a deſert; and though there were nothing more worthy eulogies than virginity, it is yet but the reſult of love, ſince thoſe, that ſhall people paradiſe, and fill heaven with ſaints, are ſuch, as have been ſubject to this paſſion, and were the products of it. In ſum, it is by that, the church has conſecrated to God both virgins and martyrs, and confeſſors theſe five thouſand years; and he that ſaid, it was not good for man to be alone, placed the celibate amongſt the inferior ſtates of perfection, whatſoever ſome affirm; ſeeing that of St. *Paul* is not general, and he confeſſes, he had no command from the Lord. It was the beſt advice in a time of perſecution, the preſent diſtreſs, and for an itinerant apoſtle; and truly it is what I ſo recommend to all of that function, that, for many regards, I could wiſh them all as ſeraphims, who do neither marry, nor are given in marriage. But, I cannot conſent, that ſuch a perſon as Mr. *Boyle* be ſo indifferent, decline a virtuous love, or imagine, that the beſt ideas are repreſented only in romances, where love begins, proceeds, and expires in the pretty tale, but leaves us no worthy impreſſions of its effects. We have nobler examples: and the wives of philoſophers, pious and ſtudious perſons, ſhall furniſh our inſtances: for ſuch was *Pudentilla*, that held the lamp to her huſband's lucubrations: ſuch a companion had the learned *Budæus*; and the late adventure of madam *Grotius*, celebrated by her *Hugo*, who has not heard of? We need not go abroad; the committee chambers, and the parliament lobby, are ſad, but evident teſtimonies of the patience, and the addreſs, the love, and the conſtancy of theſe gentle creatures. In fine, they bear us out of love, and they give us ſuch; they divert us when we are well, and tend us when we are ſick; they grieve over us when we die, and ſome, I have known, that would not be comforted and ſurvive. But, Sir, *Ludov. Vives* has written a volume on this ſubject, and taken all his hiſtories from the love of Chriſtian women. *Jacobus de Voragine* gives us twelve motives to acknowledge the good we receive by them, and I could add a thouſand more, were not that of *Pliny inſtar omnium*, who writing to his mother-in-law *Hiſpulla*, that brought his lady up, gives her this character. *Summum eſt acumen, ſumma frugalitas: amat me, quod caſtitatis indicium eſt. Accedit his ſtudium literarum, quod ex mei charitate concepit. Meos libellos habet, lectitat, ediſcit etiam. Qua illa ſolicitudine, quum videor acturus; quanto, quum egi, gaudio afficitur?* and a little after, *Verſus quidem meos cantat, formatque cithara, non artifice aliquo docente, ſed amore, qui magiſter eſt optimus:* whence he well foreſees, *perpetuam nobis majoremque indies futuram eſſe concordiam:* diſcourſing in that which follows, of the nobleneſs and purity of her affection, with this elegant and civil acknowledg-

acknowledgment, *certatim ergo tibi gratias agimus: ego, quod illam mihi: illa, quod me ſibi dederis, quaſi invicem delegeris.* And what if Mr. *Boyle* himſelf did love ſuch a lady, *gratâ aliqua compede adſtrictus*, would it hinder him from the ſeraphick, or the purſuit of his worthy enquiries? There is no danger, that he ſhould be taught philoſophy as *Socrates* was, who already commands his paſſions, and has divinity ſufficient to render even *Zantippe* a ſaint; and whoſe arguments for the ſeraphick love would make all men to envy his condition, and ſuſpect their own, if it could once be admitted, that thoſe, who are given to be *auxilia commoda*, ſhould hinder them in the love of God, whereof marriage is a figure: for ſo the apoſtle makes the parallel, when he ſpeaks of the ſpouſe, *Epheſ.* v. and devotion is ſo generally conſpicuous in the female ſex, that they furniſh the greater part of many litanies, and, whom if we may not pray to, we ought certainly to praiſe God for; not ſo much becauſe they were virgins, as that they were the mothers and the daughters of the greateſt ſaints, and lights of the church, who propagated the ſeraphick love with their examples, and ſealed it with their blood. But, dear Sir, miſtake me not all this while, for I make not this recital, as finding the leaſt period in your moſt excellent diſcourſe prejudicial to the conjugal ſtate; or that I have the vanity to imagine my forces capable to render you a proſelyte of *Hymen*'s, who have already made the worthieſt choice; much leſs to magnify my own condition, and lay little ſnares for thoſe obvious replies, which return in compliments, and odious flatteries. I have never encountered any thing extraordinary, or dare lay claim to the leaſt of the virtues I have celebrated: but if I have found the converſation capable of exalting and improving our affections, even to the higheſt of objects, and to contribute very much to human felicity; I cannot pronounce the love of the ſex to be at all miſapplied, or to the prejudice of the moſt ſeraphical. And if to have the fruition and the knowledge of our friends in heaven, will be ſo conſiderable an augmentation of our felicity; how great is that of the married like to prove, ſince there is not on earth a friendſhip comparable to it? Or if paradiſe and the ark be the moſt adequate reſemblances of thoſe happy manſions, you may remember there were none but couples there, and that every creature was in love.

BUT why do I torment your eyes with theſe impertinencies! which would never have end, did I not conſider, I am but writing a letter, and how much bettet you are wont to place your precious hours. But, Sir, I have now but a word to add, and it is to tell you, that, if after all this, we acknowledge your victory, and find all our arguments too weak to conteſt with your ſeraphical object, pronounce you wiſe, and infinitely happy; yet, as if envying, that any elſe ſhould be ſo; you have too long concealed the diſcourſes, which ſhould have gained you diſciples, and are yet not afraid to make apologies for employing that talent, which you cannot juſtify the wrapping up all this while in a napkin. We therefore, that are entangled in our miſtakes, and acknowledge our imperfections, muſt needs declare againſt it, as the leaſt effects of a ſeraphick lover, which were to render all men like himſelf. And ſince there is now no other remedy, make the beſt uſe we can of, as St. *Paul* adviſes, *ut qui habent uxores, ſint tanquam non habentes, &c.* and for the reſt, to ſerve and to love God as well as we may in the condition we are aſſigned; which if it may not approach to the perfection of Seraphims, and that of Mr. *Boyle*, let it be as near as it can, and we ſhall not account ourſelves amongſt the moſt unhappy, for having made ſome virtuous addreſſes to that fair ſex.

DEAREST Sir, permit me to tell you, that I extremely loved you before; but my heart is infinitely knit to you now: for what are we now to expect from ſo timely a conſecration of your excellent abilities? The Primitiæ ſanctified the whole harveſt; and you have at once, by this incomparable piece, taken off the reproach, which lay upon piety, and the enquiries into nature; that the one was too early for younger perſons, and the other the ready way to atheiſm, than which, as nothing has been more impiouſly ſpoken, ſo, nor has any thing been more fully refuted. But, Sir, I have finiſhed; pardon this great exceſs; it is love, that conſtrains me, and the effects of your diſcourſes, from which I have learned ſo many excellent things, that they are not to be numbered and merited with leſs than I have ſaid, and than I profeſs, which is to continue all my life long,

SIR,

your moſt humble, obliged,

and moſt affectionate ſervant,

J. EVELYN.

Say's-Court, Sept. 13, 1661.

SIR,

I SEND you the receipt of the varniſh, and believe it to be very exact; becauſe it is ſo particular, and that I received it from the hand of a curious perſon, who, having made trial of it himſelf, affirms it to have ſucceeded. I ſend you alſo another trifle, which has a nearer relation to me; and you will eaſily pardon my indignation, however you pity the reſt of my errors, to which there is ſuperadded ſo great a preſumption: not that I believe what I have written ſhould produce the deſired effects; but to indulge my paſſion, and in hopes of obtaining a partial reformation; if, at leaſt, his majeſty purſue the reſentment, which he lately expreſſed againſt this nuiſance, ſince this pamphlet was prepared. Sir, I am your creditor for *Schotti*, and ſhall faithfully render it whenever your ſummons calls: my leiſure has not yet permitted me to tranſcribe ſome things out of it, which

which concerns me on another ſubject; but if the detaining of it longer be no prejudice to you, it is in a ſafe depoſitum. Sir, I have not bought two of your laſt books, and yet (poſſibly) I could render you ſome account of them. My thirſt and impatience is too great to ſhew the leaſt indifferency, when any thing of your's is to be had: this does not abſolve you from making him a preſent, who (it may be) takes no greater felicity in the world, than to ſee his ſmall library enriched with your illuſtrious works, and they to come to me *ex dono authoris*. Deareſt Sir, pardon this innocent ſtratagem, and the preſumption of,

SIR,

your moſt faithful, and

moſt obedient ſervant,

J. EVELYN.

SIR, I muſt take this opportunity to give you thanks for your great civilities to my couſin *Baily*, and to ſupplicate the continuance of your favour to him, as by which you will infinitely oblige an induſtrious and deſerving gentleman.

Say's-Court, Nov. 23, 1664.

SIR,

THE honour you deſign me by making uſe of that trifle, which you were lately pleaſed to command an account of, is ſo much greater than it pretends to merit, as indeed it is far ſhort of being worthy your acceptance: but if by any ſervice of mine in that other buſineſs, I may hope to contribute to an effect the moſt agreeable to your excellent and pious nature, it ſhall not be my reproach, that I did not my beſt endeavour to oblige it. I do every day, both at *London* and at home, put Sir *Richard* in mind of this ſuppliant's caſe; and, indeed, he needs no monitor, myſelf being witneſs, that he takes all occaſions to ſerve him in it; nor wants there any diſpoſitions, (as far as I can perceive) but one ſingle opportunity only, the meeting of my lord privy ſeal, (who, for two or three council days, has been indiſpoſed, and not appeared) to expedite his requeſt; there being a reſolution (and which Sir *Richard* promiſes ſhall not ſlacken) both to diſcharge the poor man's engagements here, and afford him a competent viaticum.

As for that ſacred work you mention, it is ſaid, there is a moſt authentick copy coming over, the laudable attempt of this perſon being not ſo fully approved. This is, in ſhort, the account I have, why the impreſſion is retarded. I ſhould elſe eſteem it one of the moſt fortunate adventures of my life, that by any induſtry of mine, I might be acceſſary in the leaſt to ſo bleſſed an undertaking.

IF my book of architecture do not fall into your hands at *Oxon*, it will come with my apology, when I ſee you at *London*; as well as another part of the *Myſtery of Jeſuitiſm*, which (with ſome other papers concerning that iniquity) I have tranſlated, and am now printing at *Roylton*'s, but without my name.— So little credit there is in theſe days, in doing any thing for the intereſt of religion!

I KNOW not, whether it becomes me to inform you, that it has pleaſed his majeſty to nominate me a commiſſioner, to take care of the ſick and wounded perſons during this war with our neighbours: but ſo it is, that there being but four of us deſigned for this very troubleſom and ſad employment, all the ports from *Dover* to *Portſmouth*, *Kent* and *Suſſex*, fall to my diſtrict alone, and makes me wiſh a thouſand times I had ſuch a collegue as Mr. *Boyle*, who is wholly made up of charity, and all the qualifications requiſite to ſo pious a care. But I cannot wiſh you ſo much trouble, the proſpect of it would even draw pity from you, as well in my behalf, as for the more miſerable, who foreſee the confuſion and importunities of it, by every article of our buſy inſtructions. But the king has laid his poſitive commands on me; and I am juſt now going towards *Dover*, &c. to provide for miſchief. Farewel ſweet repoſe, books, gardens, and the bleſſed converſation you are pleaſed to allow,

Dear Sir,

your moſt affectionate, and

moſt obedient ſervant,

J. EVELYN.

P. S. Mr. *Goldman*'s dictionary is that good and uſeful book, which I mentioned to you.

HERE is Mr. *Stillingfleet*'s new piece in vindication of my lord of *Canterbury*'s. I have but little dipped into it as yet: it promiſes well, and I very much like the epiſtle; nor is the ſtile ſo perplexed as his uſually was. Dr. *Mer. Caſaubon*, I preſume, is come to your hands, being a touch upon the ſame occaſion.

ONE *Rhea* has publiſhed a very uſeful and ſincere book, concerning the culture of flowers, *&c.* but it does in nothing reach my long ſince attempted deſign of that entire ſubject, with all its ornaments and acceſſories; which I had ſhortly hoped to perfect, had God given me opportunity.

YOUR ſervant, my wife, moſt humbly kiſſeth your hands, as I do Dr. *Barlow*'s, &c.

Say's-Court, April 13, 59.

SIR,

HAVING the laſt year drawn a good quantity of the eſſence of roſes, by the common way of fermentation; and remembering how ſoon it went away, amongſt the ladies, after they had once ſcented it; the ſeaſon of flowers now approaching, makes me call to mind, to have known it ſold by ſome chemiſts (and in particular by one *Longſire* at *Chicheſter*) mixed with a ſubſtance not unlike it; which retained the odor of it wonderful exactly; but in ſuch a proportion, that for ſeven or eight ſhillings a ſiſter of mine was uſed to purchaſe more, than any man living

living can extract out of three or four hundred weight of roſes, by the vulgar, or *Glauber's* preparation: by which means, that precious eſſence may be made to ſerve for many ordinary uſes, without much detriment. Sir, I am bold to requeſt of you, that if you know what it is (for if you know it not, I deſpair of encountering it) you will be pleaſed to inſtruct me; and, in lieu thereof, to command me ſome ſervice, by which I may teſtify my great ambition to obey you, and how profoundly ſenſible I remain, of my many obligations to you, which, I ſhould not have been thus long in expreſſing, had not I apprehended, how importune letters are to ſtudious perſons, where the commerce is ſo jejune; and that I can return you nothing in exchange, for civilities I have already received. Sir, I have reaſon to be confident, that you are upon ſome very glorious deſign, and that you need no ſubſidiaries, and therein you are happy; make us ſo, likewiſe, with a confirmation of it; that ſuch as cannot hope to contribute any thing of value to the adornment of it, may yet be permitted to augure you all the ſucceſs, which your worthy and noble attempts do merit; in the mean time, that ſome domeſtick afflictions of mine have rendered me thus long uſeleſs, both to my friends, and to myſelf; which I wiſh may be thought a juſt apology for,

Noble Sir,

your moſt humble and

moſt obedient ſervant,

J. EVELYN.

SIR, I know the impoſtors multiply their eſſence of roſes with *ol. lig. Rhodii*, others with that of *Ben*; but it can be neither; for the oil of roſe-wood will vanquiſh it exceedingly, neither is it ſo fluid; and the other grows rancid. Some have told me, it was ſperma-ceti, which I have not eſſayed.

YOUR commands will at any time find me, directed to the Hawk and Pheaſant upon *Ludgate-hill*, at one Mr. *Saunders's*, a woollen-draper.

Letters from Sir Robert Southwell *to Mr.* Boyle.

Kingſale, July 16, 1658.

Moſt Honoured Sir,

I AM ſorry I cannot return a more ſuitable acknowledgment unto your favours, than what a ſorry piece of paper will expreſs; and yet in thanks (the moſt eaſy way of gratitude) I find a ſcarcity, when I judge of your courteſies by a proper and due valuation. I can only hope, that I may live to be grateful, and to have opportunity of manifeſting, that your favours have not been caſt into a forgetful hand. And to that purpoſe I ſhall implore my better fortune to make me ſerviceable unto you, if it ſhould happen, that any of your occaſions ſhould ſtoop ſo low, as that my impertinent endeavours might contribute any thing to their advantage. My moſt humble ſervice to my lord *Dungarvan* and his brother. My mother and ſiſter (who are only now at home) preſent their humble reſpects unto you, and ſo, begging your pardon, I reſt

your moſt obedient ſervant,

ROBERT SOUTHWELL.

Florence, Oct. 10, 1660.

Moſt Honoured Sir,

HAVING now paſſed three months at *Florence*, and the ſeaſon giving me liberty to enter *Rome*, I ſhall, before I leave this place, give you ſome account of the time I have here ſpent, as the perſon, whoſe favour my chiefeſt ambition has always courted. At my firſt arrival here, obſerving ſo rare a frame of government, for order and harmony, more like that of a family, than of a commonwealth; and underſtanding, that all perſons ought to live here as upon the ſtage; ſo exact a knowledge, and ſo common a reſort is the prince's ear, of all particulars that paſs; I thought it requiſite, for the arriving unto ſome kind of admiſſion in the court, wanting the benefit of friends, to ſettle my reputation in a lower claſs. And obtaining entrance into a meeting of their virtuoſi, I alſo put in an oar, and ſhot my bolt among them; and then got not only the occaſion of chooſing good acquaintance, but heard, that at the court ſome favourable words paſſed of me; ſo that thence I took hint to go and make my reverence to the Great Duke, and ſome time after to prince *Leopold* his brother; who certainly is a perfect Mæcenas, not only the patron to all that pretend to letters, but alſo admirably knowing, and illuminated himſelf. The truth is, I was treated by his highneſs, according to the ſtandard of his goodneſs, not my ſorry merit; having admiſſion by his favour to partake of the magnificent ſolemnity at his academy of the *Cruſca*, where both the body and the mind had an incomparable regale. Beſides the invitation I had to come every night to the palace, and view the ſtars, eſpecially Saturn; whereof his highneſs took ſpecial obſervations, according to *Eugenius*, having proſpective glaſſes of nine ells long. But, in fine, his highneſs's darling ſtudy is that of natural experiments, for the proſecution of which he has a ſelect company, that with him every morning make a private academy. He was pleaſed to aſk me of thoſe in *England*, that have the vogue, as to that kind of application. And having named two or three, I finally repreſented unto his highneſs, in thoſe ſlender terms I was able, the imperfect character of Mr. *Boyle*; for whom I can aſſure you his highneſs expreſſed ſo great a paſſion to be acquainted, that, letting him know,

know, he was as much a maſter of civility as knowledge, and that I believed I might be the mediator of a correſpondence, his highneſs told me, that I would engage myſelf in a very grateful embaſſy. So that to tell you the naked truth, the encloſed, that I here ſend you, is written in *Florence* (though dated from abroad) with deſign to be ſent unto you within this of mine; but with pretext directed to me, that ſo the prince may a little keep ſtate, and yet ſecure your correſpendence.

THE perſon, that writes the letter, is the duke's chief mathematician, a perſon of an admirable clear head, very great ſincerity, and much eſteemed by them. I having, by very great favour, obtained to be his ſcholar, for my introduction into the mathematicks, with the ſix firſt books of *Euclid*; he deſired my advice in the preſenting ſome of his books to the Engliſh virtuoſi; being a treatiſe in folio *de maximis & minimis*, and a divination or ſupplement of what is wanting of *Apollonius*. There are half a dozen ſent away to be ſhipped at *Leghorn*, he having ſuperſcribed the firſt unto yourſelf. He was *Galilæus*'s ſcholar three years, and the only one, that is now living. I ſhall mention more of him to Mr. *Oldenburg*. And being moſt confident, that if you ſhall pleaſe to embrace this occaſion of correſpondence with the prince, it will highly redound, not only to your own ſatiſfaction, but even a general advancement of learning; and I ſhall number it among the felicities of my life, that I was but inſtrumental unto ſo great a good.

I AM ſure there will paſs the communication of great ſecrets between you, although I do remember the prince told me, that they ſearched not ſo much after particular experiments, as thoſe fundamental ones, that augmented the limits of nature. They are here at preſent very intent on extracting the ſalts from all kind of things, and do, by the help of glaſſes, draw the perfect figures of all; and theſe obſervations at large are made, that the moſt pointed ſalts come from the more ſour or bitter herbs or roots; and from ſweet herbs more blunted ſalts are extracted. Thoſe herbs, *&c.* that afford the moſt ſharp and edged ſalts, are of fierceſt operation in phyſick. The others, that have not ſo much edge to cut and penetrate the humours, are of leſs activity. And the duke's deſign is, to find a way for the adminiſtring theſe ſalts in phyſick, mixing them with things more congenical unto nature, than their own drug, which operates nothing after this ſeparation.

I HOPE in my next to ſend you two or three very good experiments, which I have now in chace. And I am trying, if it be poſſible, to obtain the ſecret of the incombuſtible cloth; which is in the hands of a frier of *Genoa*, that made for the cardinal here many fine things, purſes, hatbands, handkerchiefs, lace, *&c.* I have ſent you a bit of the thread, and a ſhred of the paper he made. But I underſtand, that he was wonderfully ſhy and ſecret when he wrought here.

I HAVE one of the Bologna ſtones (*ſpongia lucis*) ready calcined, which truly I forgot to put into the box, or you had received it together with ſignor *Viviani*'s books. I have alſo fine ſtones uncalcined, which ſhall be at your ſervice, given me, when I was at *Bologna* (and ſeeing of *Aldrovandus*'s Cabinet) by Dr. *Ovidio Montalbano*, the antiquary, with whom I hold correſpondence, and can ſerve you in that place in what you pleaſe.

THE prince has correſpondence with monſieur *Bullialdus*, and others of *Paris*, unto whom he punctually repays all their addreſſes. So that if you pleaſe to write to the prince under cover to ſignor *Viviani*, for the firſt time, taking notice to this of the preſent of his book, and to the prince, of the notice I gave you, of his courteous inclination to your acquaintance, you will find all things afterward run in a prompt and ſmooth channel. For beſides what I mentioned of you myſelf, they found afterwards a piece, that Dr. *Wallis* dedicated to you, the epiſtle whereof was very conſonant with what I had ſaid.

NOBLE Sir, I might have propoſed this affair in more ſtudied terms of my reſpect. But at this age of your acquaintance, and moſt benign condeſcenſion towards me, I cannot but know, how much your goodneſs outbids all my faults. If this winter, at *Rome*, I may receive your commands in any nature, you will infallibly find me,

Noble Sir,

your moſt devoted and

moſt obedient ſervant,

ROBERT SOUTHWELL.

Rome, March 30, 1661.

Worthy Sir,

ALTHOUGH I have not the happineſs to hear from you; yet the freſh reſentment, that I have of your paſt civilities, keeps me ſtill to an obſervance of my duty and gratitude. From *Florence*, the laſt ſummer, I wrote unto you; and at the ſame time the mathematician of the Great Duke, a perſon of excellent qualities, ſent you one of his books; and I was in hopes, that long before this time there would have been a firm correſpondence between you, for it is deſired here; and on the other ſide I know you have no averſion to it, but rather a genius to confer with all perſons, that are ſingular in their kinds.

THERE is certainly ſome unhappineſs arrived in the buſineſs, and I am ſorry for it.

I HAVE now ſpent ſome months at *Rome*, and to my very great ſatisfaction, having viſited and made acquaintance with ſeveral perſons of great excellency in this place; of which hereafter I ſhall be ready to give you an account.

FATHER *Kircher* is my particular friend, and I viſit him and his gallery frequently. Certainly he is a perſon of vaſt parts, and of as great induſtry. He is likewiſe one of the moſt

moſt naked and good men, that I have ſeen, and is very eaſy to communicate whatever he knows; doing it, as it were, by a maxim he has. On the other ſide, he is reputed very credulous, apt to put in print any ſtrange, if plauſible, ſtory, that is brought unto him. He is philoſopher enough, to give ſome kind of reaſon or other for whatſoever you will demand of him. He has often made me ſmile, to ſee how he will fetch about things; as concerning the Soland gooſe in *Scotland*, he argues thus, that the Dutchmen, that went to *Nova Zembla*, ſaw on the ice near the North Pole ſuch quantity of eggs, that were ſufficient to feed all *Europe*; now the ice coming to melt, and theſe eggs to drop into the ſea, and there lye at the mercy of the waves, they turn the ſea into ſuch a caudle, that thoſe iſlands, that are moſt near, as in particular *Scotland*, come to receive ſome of theſe eggified waves daſhing againſt them. Now if it happen, that certain trees are ſo favourably planted near the ſhore, as that the ſparkling and drops of ſuch waves light on and ſoak into them, it may ſo fall out, that, by the ſpecifick virtue of the eggs, ſtill inherent in ſuch water, the natural vegetation of the tree, and the omnipotent influence of the ſun, all theſe combining together, may hatch a Soland gooſe. What you will ſay to this pedigree, I do not know. The truth is, the father has ſtrange ſtories, as to generation. He told me of a wench, that after long complaint, felt ſomething crawling in one of the great muſcles of her back; which being opened, there hopped out a frog. The reaſon he aſſigns, that the ſmock of this maid being where the frogs came to ſport, ſome kind of ſperma fell on it; which after, by the heat of the girl's back (as girls are warm) was attracted in between ſome muſcles, and there nouriſhed, till the ſurgeon plaid the midwife.

As to the flower growing from its aſhes, he had ſuch a thing, but it is now ſpoiled; he made it not himſelf, but it was given him. However he has given me the receipt thereof, upon a ſwop, wrote with his own hand; it is long and intricate, and of a nice preparation. At our meeting you ſhall have it.

ALL the queſtions you bid me aſk him, he affirmed to me in the ſame manner, as you find them written. As to the *ſpelunca ſerpentum*; he is out, to attribute the cure to the licking of the ſerpents; for being, a while ſince, about twenty miles off, hunting with cardinal *Urſino*, his eminence ſhewed me the place, at ſome diſtance, on his own land; ſaying there was a hole, of ſome capacity, which, in the ſummer time, when the air was favourable, did make people ſweat, that went into it, by a kind of mineral vapour, that does ariſe (as at *Naples* there are two or three.) In the ſame place are alſo many ſerpents, which crawling about, and finding a man ſweating, lick the moiſture they find on him (he lying with a hollow glaſs over his face.) But all this does nothing; for if one would ſtand in the hole, with a ſtick, while the other ſweat, and beat away the ſerpents, and wiped the body with a cloth, the ſame ſucceſs would follow. This the cardinal himſelf told me, with whom I ſtaid two or three days. He is a perſon of great curioſity and infinite civility.

I FORGOT to tell you from *Florence*, of a pretty humour, obſerved in two flowers there; the one is yellow in the morning, and about noon turns red. The other has no ſmell at all till at an hour in the night, and then for an hour it begins to ſmell with great flagrancy; and ſo to ceaſe till the night following.

SIR, about the latter end of this ſummer, I hope to kiſs your hands in *London*. Mr. *Sidney*, that lives very handſomly here, and in great eſteem, ſince he quitted his charge in *Denmark*, talks often of you when we meet. I much deſire to hear from you, which I may do, if you ſend your letters to Mr. *Stanye*, merchant in St. *Mary Axe*, *London*.

SIR, I kiſs your hands, and with all affection (and in very good health) I reſt,

your moſt humble ſervant,

ROBERT SOUTHWELL.

Dublin, Aug. 12, 1662.

Noble Sir,

I AM eaſily convinced, that I cannot do myſelf a greater courteſy, than to manifeſt, at what diſtance ſoever I am, the ſignal value and veneration I have towards you; eſpecially conſidering how happy a portion of your civilities, and peculiar kindneſs, have fallen, as the ſucceſs of thoſe paſſions, unto me.

I AM only unhappy, that I am in no hope of having any other title to your friendſhip, than that of a long acquaintance; ſince an unfortunate backwardneſs makes me unuſeful to you in any point of commerce: and if you had not that rare practice of ſelf-denial, whereby you unbend yourſelf to the level of ordinary converſations, I ſhould not reach the leaſt degree of that intereſt I am now ſo fortunate in.

I WISH, that I might have the honour of hearing from you, while I am here, to redeem the longing I had at *London*; and, to know, in fine, what is the product of our ſecret for the fuſion of cryſtal. I know your great curioſity for all trials, beſides the particular paſſion you had for the knowledge of that, has ſhewed you, by this time, the full extent of it: and, for my own part, I have ſo high an expectation from it (conſidering the manner and terms on which it was entruſted to me) that I ſhould have continued puddering myſelf till I had ſeen the end, if I had not met the warrant of ſo great and inviolable a ſecreſy, beſides the ſingular dexterity you have for it. And I was not a little confirmed in the atteſtation and effect thereof, given me by ſignior *Borrhi* (when he perſuaded himſelf obliged to reveal ſomething conſiderable unto me) that at your reading of the

the proceſs, you found no matter of exception, which would have certainly been obvious to you, having made ſome adventures and eſſays on that ſubject before.

IF you have made any pieces of the matter, you may pleaſe, by the opportunity of Mrs. *Johnes*, or any other, that comes ſooner this way, to let me have a ſhare of it, and I ſhall be very glad to ſee it.

SIR *John Percival*, his lady, and my father, who is now here, preſent all their humble ſervices unto you; and thus, with my true reſpects unto the noble family, where you ſometimes are, I kiſs your hands, and ever am,

Noble Sir,

your moſt humble,

and obedient ſervant,

ROBERT SOUTHWELL.

Kingſale, March 20, 1675.

Moſt Honoured Sir,

IT has often come into my mind, and indeed I thought, that I had accordingly wrote lately of it, that concern of your's, which, long ſince, you were pleaſed to honour me with the truſt and care of; I mean, that ſtock of money, which, out of your great bounty and charity, you were pleaſed to diſtribute amongſt thoſe miniſters, that had ſerved the cures upon your impropriate eſtate in this kingdom, and of the diſtribution of which I did long ſince return you an account, and alſo what balance remained unto you, after ſatisfying all the concerned, which was forty-five pounds, and has ever ſince lain ready for your order of diſpoſal, and I have ever ſince waited for it: and I did the laſt year, when I was in *London* with my ſon, wait on you at your houſe, there to receive your orders about it, but you were not then at home, nor was my ſtay after that very long in *London*. But, methinks, it is now high time for me to conſider, whether in this long ſilence, the maſter have not forgot his ſteward; or that, which is moſt dangerous, whether the ſteward have not forgot his maſter in this account. But that muſt not be; and therefore, I do here make bold, to put you in mind of it; that forty-five pounds of your ſaid ſtock does yet remain in my hands, and that I do but wait for your order to diſpoſe of it; and ſhall as punctually obſerve it when it comes; and yet ſhall ſtill reckon myſelf in your debt for the honour of that truſt and employ. And with my very hearty prayers unto God for your long life and proſperity, I take leave, and remain,

Moſt Honoured Sir,

your honour's moſt humble,

and faithful ſervant,

ROBERT SOUTHWELL.

Letters from biſhop Barlow *to Mr.* Boyle.

Queen's College, Oxon, Sept. 13, 1659.

SIR,

IT is now a good while ago ſince (in obedience to your command) I ſignified to Dr. *Sanderſon*, that in caſe he would ſeriouſly ſet himſelf to write caſes of conſcience, (1. explaining the nature of conſcience, the obligation of it, how far that extends, and the reaſons of it, with ſome univerſal principles, and general rules, concerning it, *in theſi*; and then, 2. *In hypotheſi*, to fall to the reſolving particular caſes) you would allow him fifty pounds per annum, to encourage him in that good work. With what thankfulneſs the good old man accepts of this your great charity (rare in any age, and unheard of in this) you may (in part) ſee by this encloſed; and, I doubt not, but the preſent age and poſterity may have juſt cauſe to bleſs God in this particular, and thank you for being the only occaſion, and ſole encourager of ſo good a work. May the gracious good God of heaven and earth bleſs you, and all thoſe pious and generous ſouls, who dare be good in bad times. This is, and ſhall be, the prayer of,

SIR,

your moſt obliged,

humble ſervant,

THOMAS BARLOW.

WE have no news, ſave what this bearer (your great ſervant) can better tell, than I write. Dr. *Wilkins* is gone *(cum pannis)* to *Cambridge*, and left his great teleſcope to the library: our buſineſs now is to place Mr. *Selden*'s books, which will go near to fill up the other end of our library: they are conſiderable for the number (about eight thouſand volumes) but more for the quality, eſpecially his oriental manuſcripts, being many, and choice.

Queen's-College, Oxon, Jan. 30, 1659.

SIR,

TWO days ago, I received a letter from Dr. *Sanderſon*, with an acquittance (here encloſed) for the receipt of thoſe monies your charity was pleaſed to give him, as an honorary ſtipend and encouragement, for writing caſes of conſcience. If this form (by him ſubſcribed and ſent) be not ſuch as you would have, he will cheerfully ſubſcribe any other, which your prudence ſhall think more convenient. He further deſires (as you will ſee by the encloſed piece of his letter) to know your commands, in order to his progreſs in the work, which, by your encouragement, he has undertaken; that ſo he may (as in reaſon he ſhould) conform himſelf and ſtudies to your deſires. If you have no better way to communicate your commands to him, if you ſhall

ſhall be pleaſed to convey them to me, I ſhall to him. My reſpects and humble ſervice to yourſelf, my love to Mr. *Pett* (who I know will wait upon you). God Almighty bleſs you, and all thoſe generous ſouls, who dare be charitable and good in bad times, who have munificence, and courage enough, to embrace virtue, though coſtly and dangerous. This is the hearty prayer of,

SIR,
your moſt obliged,
humble ſervant,

T. BARLOW.

Incloſed in the preceding.

I WOULD willingly know Mr. *Boyle*'s mind, whether he would rather I ſhould proceed to finiſh this work, according to the deſign exhibited in the ſcheme prefixed before the lectures, or make choice of ſome other argument; and whether in Latin, or Engliſh: for I ſhall endeavour to apply myſelf to his direction for that matter, in any thing within my ſphere. I deſire my thanks and ſervices may be preſented to him; wiſh your proſperity, and reſt,

your affectionate friend,
and humble ſervant,

ROBERT SANDERSON.

Botheby-Paynell,
Sept. 20.—59.

Mr. Boyle *to biſhop* Barlow.

My Lord,

THE commands your lordſhip was pleaſed to give me, to acquaint you with what I might hear about the conteſt between the French king and the pope, gives me a welcome excuſe for the liberty I take of putting you in mind of one of your old and true ſervants, who lately, upon enquiry ſolicitouſly made about the French affair, received an account of it, that the diſpute about the Regale ſeems rather to grow ſharper than calmer. For the laſt letters from *Paris* inform us, that there is a breve come thither from the pope to the provincial of the jeſuits, to expel father *Maimbourg* out of their order, and that the provincial carried it to the king's attorney, who acquainted the parliament with it. Whereupon there enſued either an arreſt (as they call a decree) or a reſolution ſpeedily to make one (for I do not preciſely remember which it was, though I think it was the former) importing, that if any order whatſoever of monks or friers ſhould receive and admit any breve from the pope, without leave from the king, they ſhould forfeit all temporalities that order poſſeſſes in *France*. It is ſaid, and very eaſily to be believed, that this doth not a little alarm and puzzle the cloiſters, particularly thoſe of the Jeſuits, who will now perhaps be put to give ſome inſtance of thoſe refined politicks, that the world has long thought them maſters of. For my part, I know not what to think, if this pope be not, what I ſuppoſe your lordſhip believes moſt of his predeceſſors have been, more a bigot than a politician; but I am pretty confident, againſt the jealouſies of many here, that whether or no this conteſt will prove the cauſe of a rupture, it is not at leaſt the effect of a colluſion, which both the pope and the French king are too haughty to allow me to think it; and which, if it were real, would not perchance compenſate the inconveniences, that what has been done already is like to bring upon the Roman ſee. But I wiſh this were all the news about matters of religion I could ſend your lordſhip out of *France*. For the day before yeſterday I was viſited by a rich knight of that country, that come purpoſely to let me know, that the French king was putting out a decree, (whereof within leſs than a week he might expect a copy) ordaining, that all the children of proteſtants, at the age of ſeven years, after having been for ſome days taken from their parents, who, it is pretended, might hinder the freedom of their choice, be put to declare what religion they would be of: and thoſe, that ſhall embrace the Roman, ſhall be bred up in it in ſpite of their parents, who ſhall not have power to deny them maintenance. And this decree is to be followed by another, ordaining, that if the child of any proteſtant parent be not baptiſed within three days after its birth, (which in many places cannot be done, the churches being demoliſhed, and the miniſters driven away) the Roman catholick prieſt ſhall baptiſe the child, and ever after breed him in their religion. I willingly acquaint your lordſhip with theſe particulars, becauſe the knowledge I have of your zeal for proteſtaniſm in general, and your moderation towards thoſe, that profeſs it, though in ſomewhat differing forms, makes me hope your lordſhip, and other prelates of our church, will take this fair opportunity to recommend its moderation to other churches, by protecting and countenancing thoſe poor people, whom this rigorous perſecution has induced to take ſanctuary here, where already there were lately ſeen in the ſingle port of *Dover* above one hundred and fifty boys and girls newly brought over, for fear of the daily expected edict. And if to the conſideration of religion I thought it neceſſary, when I write to your lordſhip, to add any others, I might tell you, that though many of theſe perſecuted people are far more rich in faith than in the goods of this world; yet there are many others, that bring over, as ſome of them have already, conſiderable ſtocks with them, ſo that if they be encouraged, it is thought, that above a hundred thouſand pounds, or perhaps double that ſum, will in no long time be brought or returned into *England*, in caſe the owners ſettle here. But to return to what I was ſaying about the French conqueſts, a thought has ſeveral times run in my mind, that, with my wonted freedom, I ſhall not ſcruple to acquaint my confeſſor with, which is, that perhaps providence will bring this affair to ſome

ſome ſuch reformation, as was made here in *Henry* VIII.'s time; ſince this French king does, as that Engliſh monarch did, at the ſame time both perſecute the proteſtants, and affront the pope. If I hear any thing of the progreſs of this buſineſs worth your lordſhip's knowledge, the commands you were pleaſed to impoſe on me in reference to it, will continue to have their accuſtomed influence on,

My lord,

your lordſhip's moſt humble

and moſt affectionate ſervant.

I BEG to know, how your lordſhip enjoys your health in this ſickly time, and that you will be pleaſed to remember the paper I preſumed to put into your hands, when I kiſſed them at Mr. *Notts*'s.

Superſcribed thus,
To the right reverend father in God, Thomas *lord biſhop of* Lincoln. *Preſent at* Buckden: *dated* July 7, 1681.

Buckden, July 12, 1681.

Moſt honoured friend,

I RECEIVED your letter, and this comes (with reſpects and ſervice, which are moſt due) to bring my thanks for the honour you have done, and the great kindneſs in communicating (which, beſides yourſelf, very few could) ſuch ſignificant and material intelligence. For your foreign news, though I could wiſh (rather than hope) that all Chriſtians were (as they ought) at peace one with another; yet I am well content, that the French king and the old gentleman at *Rome* do quarrel. I do not doubt, but that *Rome* is myſtical *Babylon*, and the pope that beaſt, that antichriſt who rules there: and as the infinitely wiſe and juſt providence of heaven ordered things ſo, that the kings of the earth gave their power to the beaſt to make him great; ſo the ſame good providence will (in his good time) put it into the heart of thoſe kings to ruin *Rome* and the beaſt too. If I could ſee the French king (who, I believe, cares not much for *Rome*, or its religion) fall off from his obedience to the pope, and ſet up a patriarch, (as has been in *Richelieu*'s time threatned) in *France*, independent on the pope, I ſhould not doubt the ruins of antichriſt and *Rome* would ſoon follow. *Faxit, qui ſolus poteſt, Deus.* For the poor perſecuted proteſtants in *France*, they have my compaſſionate pity and prayers; that God Almighty would be graciouſly pleaſed to ſanctify their afflictions, (which really are to all his ſervants *Actus patris, et miſericordiæ*, not *actus judicii et vindictæ*) and in his good time free them from thoſe calamities, and give them reſt and peace; and in the mean time ſupport them with his grace, ſo that they may bear thoſe perſecutions to his glory, the advantage of the goſpel, and the benefit of their ſouls here, and the ſalvation of them hereafter. This we may be ſure of, that when our moſt gracious God brings his people into the fire of perſecution, (as many times he does) it is not out of anger to conſume, but of a paternal care to refine and try them. God's own people, the Jews, were (by the Chaldeans) carried captive to *Babylon*, and (as to outward things) in a miſerable condition. And yet (though neither the Chaldeans nor the Jews ſought for) it was God himſelf, who ſent his people into that captivity, and for their good. However, an indiſpenſable obligation lies upon us here, to be kind and comfortable to thoſe poor perſecuted proteſtants, who fly hither for protection, I hope I ſhall, to the utmoſt of my ability. It is their turn now to ſuffer for the truth; and how ſoon it may be ours, God only knows. Sure I am, that the crying ſins of this nation are ſo many, and ſo great, that they do not only need a refining, but deſerve a conſuming fire. *Dirum omen miſericors (qui ſolus poteſt) averruncet Deus.* For the caſe you left with me, and your commands about it, you may be ſure they ſhall be obeyed, and that ſhortly too. Since my coming hither, partly by my infirmities, and phyſick which I was forced to take for them, and partly through a hurry of unavoidable buſineſs, I have not been able to execute your commands about that caſe: but now (bleſſed be God) being in a better condition of health, and ſomething more free from buſineſs, I ſhall (God willing) give you ſome account of that caſe. My reſpects and ſervice once more remembred, your prayers are deſired for and by

Your obliged friend,

and thankful ſervant,

THO. LINCOLN.

Buckden, Aug. 26, 1682.

My honoured friend,

I HAVE received yours, and this comes (with my reſpects and ſervice) to bring my thanks for all civilities. It ſeems, that the old gentleman at *Rome*, and the moſt Chriſtian (but ſemi-catholick) king, are not cordially reconciled, and I am not troubled at it. Though I love peace, yet I wiſh war with *Rome* (ſuch as the Jews were to have with *Amalec*) till it be ruined. I commiſerate the ſad condition of the poor French proteſtants; ſome of them in priſons, and ſeverely perſecuted at home; others exiles in other kingdoms: yet theſe calamities (though great) ſhould be to them cauſe of joy, if they live according to that good religion they profeſs; for to men truly pious, impriſonments, exile and captivity are for their good, (though to wicked men, and impenitent ſinners, they are not ſo.) To God's children, the

Deut. xxv. 19.

Acts v. 41.

Jer. xiv. 5.

Heb. xii. 10.

Jer. xiv. 9, 10.

the greateſt afflictions and perſecutions, are *Actus patris, non judicis*; *actus miſericordiæ, non vindictæ*; they are *chariſmata, non ſupplicia*, bleſſings, and not puniſhments; *non pœnæ, ſed medicinæ*. But I hope you will pardon this extravagance. All our diſcourſe here is about the comet, which now appears in the north. I am no aſtrologer, yet if you will pardon my confidence, I will tell you what I think of comets. 1. In the general, it has been the received opinion of pagans and Chriſtians, that they portend ſome calamity to come upon ſome nation, country, or city, &c. Οὐδεὶς κομήτης ὅστις ἐ κακὸν φέρει, ſay the Greeks; and the Latins, *Nunquam futilibus excanduit ignibus æther*. 2. There are ſome things concerning comets, which may be calculated by art, and certainly known. As 1. Their motion. 2. Their magnitude. 3. Their altitude, by the parallax. 3. But there are other three things, which (to me) ſeem not only δυσνόητα, difficult, but ἀνεξιχνίαστα, impoſſible to be known by any. As 1. Their generation, how they come to appear, and of what matter they are made. 2. Their ſignification, what they (in particular) portend, and to what particular nation, country, city, or perſon they relate, for I ſuppoſe, that it is not all the world they threaten, becauſe there may be, and are ſome parts in the world, to which ſome comets do not at all appear, and therefore cannot threaten them. 3. Their vaniſhings, how, and by what means they diſappear, and what becomes of them, when they ceaſe to appear to us. Theſe three things ſeem to me impoſſible to be known by any art, or artiſt. But this is another extravagance, for which I beg your pardon; it was not concerning comets, but a caſe of conſcience, of which you required my opinion; and how that caſuiſtical rule (*in dubiis pars tutior eſt eligenda*) is to be underſtood. I have not forgot your commands; I have oft thought of it, ſince I received your commands in *London*; and having never *ex profeſſo*, ſeriouſly ſtudied that point, I find many perplexed and difficult caſes, which will not eaſily be explicated, ſo as to give clear and full ſatisfaction. There was ſomething (if I forget not) about this point, in the papers *De Voto*, I formerly ſent you; if you would be pleaſed to lend me them, (for I have no copy of them) I ſhould be better able to ſtate the whole caſe, and bring it, and your papers with it, at my return to *London*, which will be about *Michaelmas*. I once more beg your pardon for this tedious and impertinent ſcribble, and ſhall only add, that I am,

Phil. it 29. To you is given, κεχάρισται.

Your moſt obliged, thankful,
and faithful ſervant,
THO. LINCOLN.

Buckden, Oct. 10. 1683.

My Honoured Friend,

MY laſt night's letters tell me of an earthquake, with a prodigious noiſe accompanying it, in the country; and this comes to tell you (my humble ſervice remembered) that here, in this county, and (as I am informed) in ſome other counties adjoining, we had an earthquake too, on Saturday laſt, about eleven and twelve o'clock at night, but without any noiſe of winds or thunder. I was in bed reading (as uſually) a chapter in the bible, and I perceived my bed to move a little, and a little cracking of ſomething above; but I little dreamed of any earthquake, but read on, and then ſlept quietly till the morning; when ſome of my ſervants told me, there was an earthquake, and that they perceived their chambers to ſhake, ſo ſenſibly, that one of them roſe out of bed; I ſcarce believed them, till ſeveral of the town and county told me, that their houſes were ſo ſhaken, the ſame night, and ſome more, ſome leſs; but no harm any where done, unleſs ſome pewter ſomewhere caſt down, or ſome panes of glaſs broken. Theſe are *portenta*, and *prodigia*, and what they ſignify, I neither know, nor ſhall enquire. But ſure I am, unleſs we repent of our crying ſins and iniquities, our highly offended God and moſt gracious father, may juſtly ſhake us, with ſeverer judgments. Your prayers are deſired by and for

your moſt obliged
thankful ſervant,
THOMAS LINCOLN.

I HEAR nothing ſince your laſt, of the old gentleman at *Rome*.

Buckden, April 2, 1683.

My Honourable and Worthy Friend,

I HAVE received yours, which was very welcome to me, becauſe yours. I am glad your illneſs and indiſpoſition is only ſuch, as does not confine you to your chamber, though to your houſe it do. It is (and ſhall be) my prayer, that God Almighty would be graciouſly pleaſed, to grant you health, to his glory, the publick good, and the comfort of your friends and relations. That the differences between the French king and the pope are (as it ſeems they ſay) almoſt terminated, I am of your opinion, they may poſſibly be kept from an open rupture, but that they ſhould be really made friends, I neither do, nor can believe. The pope has ſo exceedingly provoked the French king (who is, they ſay, more apt to revenge, than remit injuries) by his excommunications, interdicts, denying the privileges of his embaſſadors, &c. that they will not eaſily be forgiven or forgotten. So that the old verſes, a little altered, may ſuit well with the French king:

——— *manet altâ mente repoſtum*
Judicium papæ, ſpretique injuria Galli.

FOR the little pamphlet you are pleaſed to mention, and kindly approve, I muſt confeſs (how

(how weak ſoever it may be) I am the author of it, though for ſome reaſons (which ſeemed juſt to me) I did conceal my name. But now it is known to be mine, and as I do really believe the things ſaid in it to be evident truths, ſo it is my hope, that (by the aſſiſtance of our moſt gracious God) I ſhall never be aſhamed, nor afraid publickly to profeſs it; notwithſtanding any threatning circumſtances, in which the good providence of heaven may place us. Thoſe ſayings of our bleſſed Saviour ſhould not be forgotten. When that poor pamphlet came to be licenſed, the firſt and laſt argument (about the idolatry of the church of *Rome*) could not be licenſed, and ſo was left out, which I did not a little wonder at. I do herewith ſend you a copy of it, and deſire your cenſure. For I have this opinion of your great underſtanding, that if there be any error, you will ſoon find it, and of your kindneſs to me, that you will tell me of it, that I may ſpeedily correct and retract it. Your pardon for this tedious ſcribble, and your prayers are deſired by and for

Mat. x. 32, 33. Mar. viii. 38.

your moſt obliged, thankful,

and faithful ſervant,

THO. LINCOLN.

Buckden, April 7, 1684.

My Honoured Friend,

THE papers I herewith ſend you, were (at firſt) intended only for a letter, but are grown into a tedious and (I fear) an impertinent diſcourſe. What they concern, when you have opened them, you will ſoon ſee. If you will take the trouble to read them, I deſire your cenſure of my miſtakes, if you find any, as (I fear) you may. Two things I have affirmed in thoſe papers, which may ſeem to you (as they do to many) paradoxes, if not manifeſt errors. That is, firſt, when I ſay, "that the ſin againſt the holy-"ghoſt, cannot now be committed." Secondly, when I intimate, "that the departed "ſouls of the ſaints are not in heaven, nor "do enjoy the *viſio Dei beatifica*, till the day "of judgment." If this be true, as for many (to me) evident occaſions, I believe it is; then it will manifeſtly follow, that your popiſh canonization and invocation of ſaints, their purgatory, indulgences, their jubilees, and ſuch other gainful tricks to get money, will and muſt vaniſh, as impious frauds, to cozen the poor people, and enrich themſelves. So that if it ſhould be known, as (God willing) in good time it may, that I hold this opinion, then I may be ſure, that the old gentleman at *Rome*, and his party, will (with bell, book and candle) anathematize and damn me for a deſperate heretick. But (I thank God) their *bruta fulmina* do not fright me; nor ſhall I think my ſelf leſs catholick, becauſe they call me (what they really are) an heretick. I ſhall deſire this favour, that when you have read theſe papers (if you will caſt away ſo much time to do it) I may have them again (for I have no other copy) that I may have time to conſider and correct them. For upon a review of them, I find (and ſo will you too) that more might have been ſaid on this ſubject, in leſs room, and with more evidence and perſpicuity than I have done; having writ them (as I got time from other buſineſs) by fits only, and not with a fixed and continued conſideration. However (my humble ſervice and thanks for a thouſand civilities remembered) he dare truſt you with all his infirmities, who is

your moſt obliged

friend and ſervant,

THO. LINCOLN.

THAT the carriage may not coſt you more than the papers are worth, the carriage is paid.

Buckden, May 5, 1684.

My honoured friend,

I RECEIVED yours, and (with my humble ſervice) return my thanks. For that paradox, which I mentioned in my papers (which you were pleaſed ſo kindly to accept) "That the ſouls of good or bad men departed "this life, are not in heaven or hell" (as the words are commonly underſtood) before the day of judgment, but in Ἅδης (as the Greeks call it) or a middle ſtate; I was (about three years ſince) aſked my opinion, by a friend, in behalf of a learned gentleman, prebend of *Norwich*; and what I writ to him, I do here ſend you, whom (as I have formerly told you) I dare truſt with all my (very many) infirmities. I do not (as you will ſee by the papers I do now ſend) categorically and peremptorily determine the queſtion, whether there be ſuch a *ſtatus animarum medius, vel non*; nor do I cenſure any of either opinion: yet (at preſent) this I do believe and ſay: that although proteſtants and papiſts generally agree, that the ſouls of all pious men and true penitents, are immediately received into heaven, and enjoy (as the ſchoolmen call it) *viſionem beatificam Dei*; yet I do (with humble ſubmiſſion to better judgments) believe, that the other opinion (that ſuch ſouls are in Ἅδης, or a middle ſtate, till the day of judgment) is more agreeable to ſcripture and the declared and conſtant opinion of the moſt pious and primitive fathers. Some of my reaſons for this, you will find in the papers I now trouble you with: other reaſons there are, which (when there is any neceſſity or opportunity) may be produced. For the other paradox, about the ſin againſt the Holy Ghoſt, you ſhall (when I have a little more time and leiſure) have the reaſons of your moſt obliged and faithful ſervant,

THO. LINCOLN.

THESE

THESE papers (if you think them worth the while) you may tranſcribe, but I deſire, that none elſe may have any copy of them. I deſire alſo, that my name may be concealed; and I ſhould take it as a favour, if any would give their objections againſt this *ſtatus medius*, either from ſcripture or antiquity.

Buckden, May 25, 1684.

My honoured friend,

I HAVE received yours, and this comes (with my humble ſervice) to bring my hearty thanks. For *Peter Walſh*'s book, I had notice of the preface of it (in which I am only concerned) before Chriſtmas, while it was in the preſs; and an eminent perſon, who had ſeen ſome ſheets of the preface, ſignified to me, what he ſaid againſt me; "that "I imputed thoſe rebellious doctines to their "church, which the court of *Rome* did, but "the church of *Rome* did not maintain." I had a purpoſe preſently to have anſwered it. But when I got the book (which was ſent me three months ſince by the ſaid eminent perſon) and had carefully read it; I did, and do judge it unworthy of any particular anſwer. For 1. He pretends not to anſwer any of my reaſons, upon which I impute thoſe doctrines to their church. Their general councils (ſuch as the great Lateran council, thoſe of *Lyons*, *Conſtance*, *Trent*, *&c.*) do (*ex profeſſo*) approve and maintain thoſe rebellious doctrines. Now it is moſt certain, that (if any thing be) the definitions of their general councils is the doctrine of their church. 2. As he pretends not, nor endeavours to anſwer any of my arguments, ſo he no way proves what he objects againſt me; only he affirms ſomething, but proves nothing, unleſs a poſitive and confident aſſertion may paſs for a proof. If you meet with any, who think otherwiſe, if I may know what it is, which he thinks cogent and concluſive againſt any thing I have ſaid, I ſhall be willing, and (I hope) able to give him ſatisfaction. In ſhort, father *Walſh* is an ingenuous perſon, but far from being a rational writer, as wanting a comprehenſive knowledge of ſcripture and antiquity. For ſcripture, he makes no uſe of it at all, nor do I remember, any one text of ſcripture made uſe of by him to prove any of his poſitions. Sure I am, that while he grants (what is moſt true) that the pope and court of *Rome* maintain, "that the pope has ſuch a ſupreme "extravagant power to depoſe kings and ab-"ſolve their ſubjects from all oaths of alle-"giance," he does (*ipſo facto*) grant, that the pope has that indelible character of antichriſt (2 Theſſ. ii. 4.) which is, "to exalt "himſelf above all that is called God;" or above all kings and emperors. The truth is, father *Walſh* has ſaid many things againſt *Rome*, which they value not, nor can they be of any real advantage to us; he being an angry excommunicated perſon, and therefore his teſtimony of little validity againſt them, or for us. As for thoſe impertinent papers I laſt ſent you, concerning the *ſtatus medius* of ſouls departed this life; when you have done with them (if you will loſe ſo much time, as to read them) I deſire you would be pleaſed to return them to

your moſt obliged, thankful,

and faithful ſervant,

THO. LINCOLN.

Buckden, Jan. 10, 1684.

My Honoured Friend,

I HAVE received your's, and (with my humble ſervice) return my hearty thanks, 1. For the information you ſo kindly gave me of *P. Walſh*'s book; for though I had the Book, and had read it long before, yet your kindneſs was no leſs. 2. I return my thanks for your friendly advice, to anſwer father *Walſh*'s objections in Latin, becauſe my book (as you conceive) being only in Engliſh, his objections will come to many, to whom the Engliſh is not underſtood. But the truth is, my pamphlet, againſt which he brings thoſe objections, is extant in French, in Latin, (prince *Rupert* being at the charge of the tranſlation) and (as I am aſſured) in Italian. Yet (upon the reaſon you give) I am reſolved (God willing) as ſoon as I can have a little leiſure, to take his objections into conſideration; becauſe they will give me juſt occaſion to ſay ſeveral things againſt him, and his pſeudo-catholick church, which they would not willingly hear, nor (I believe) eaſily anſwer. 3. For the paradox, concerning the middle ſtate of ſouls, you judge rightly, that I am inclined to believe it: indeed I do believe it, and, after long conſideration, for theſe nine or ten years, have believed it. This I have ſeldom ſaid to any, which I freely ſay to you; whom I dare make my confeſſor, and truſt with all my infirmities. This middle ſtate, is to all God's ſaints and ſervants, a happy eſtate, of great joy and comfort; (though far leſs than that complete glory and happineſs, which they ſhall have after the reſurrection) it is called paradiſe: "This day ſhalt thou be with me in para-"diſe," (ſays our bleſſed Saviour to the penitent thief.) That paradiſe was that Ἅδης, or middle ſtate we ſpeak of: for, *in triduo mortis*, our bleſſed Saviour's ſoul was in it: "Thou ſhalt not leave my ſoul (εἰς Ἅδη) in "hell, nor ſuffer thy holy One to ſee corrup-"tion." His ſoul was not left in hades, nor his body in the grave to ſee corruption; but his body was within that three days raiſed out of the grave, and his ſoul brought out of hades, and united to it, at his reſurrection. Whereas *David*'s body continued in the grave, and ſaw corruption; and (though he was dead above 1000 years before) his ſoul remained in hades, and was not aſcended into heaven. This hades (I ſay) is in ſcripture called paradiſe,

Luke xxiii. 43.

Acts ii. 27.

Acts ii. 31.

Acts ii. 29.

xi. 34.

diſe, a place of poſitive joy, and great comfort, to the ſaints of God; and of great torment to impenitent ſinners. *Lazarus* and the rich man (in the parable) were both ἐν Ἅδῃ, *in communi animarum receptaculo* (as the ancients called it) though in different places, and parts of it. There was χάσμα μέγα, a great gulf between them; and, as the places, ſo the condition of the ſouls in them, was very different. The ſouls of good men were comforted, of bad men tormented: ſo that the ſaints in that middle ſtate are in a happy condition in paradiſe, a place of joy and comfort, freed from all ſin, from all the temptations of Satan, the allurements of the world, from that body of death, or corruptions of the old man, which remain even in the beſt ſervants of God, while alive in this world, of which St. *Paul* complains. And beſides all this, they are abſolutely freed from all deſpair and doubtings, and reſt (for that ſtate is a ſtate of reſt) ſecure, and with a certain and undoubted hope of glory at the reſurrection. It is true, St. *Paul* ſays, "he had a deſire to "be diſſolved, and be with Chriſt, which "was far better," than his being here in this world. 1. To be with Chriſt after his diſſolution immediately; and, no doubt, though our bleſſed Saviour tell his diſciples, that he will be with them here, "to the end of the "world;" (with them, by his grace comforting, and his power protecting them) yet after their diſſolution, he is far nearer to them, both by his grace purifying them from all remains of ſin, compleating all his graces in them, and giving them perfect hope and charity, ſo that they ſin no more, and by his power protecting them, ſo that nothing can diſquiet their reſt, diſturb their peace, or any way hurt them. And hence it is, that he ſays, that it is far better to be diſſolved, than be here in the fleſh; his condition, he ſays, would be far better after his diſſolution, than it was here; (which is moſt certain, and, for the reaſon aforeſaid, granted) but he does not ſay, that it will be a ſtate of beatitude, and enjoying of the beatifical viſion, and that crown of glory. For he himſelf expreſly tells us, that neither he, nor any ſaint ſhall have that crown, "till the day of "judgment." And our bleſſed Saviour tells us, that recompence and reward, which God will graciouſly give his ſaints and ſervants for their piety and charity, is to be given them, not immediately after their death, but "at "the reſurrection of the juſt." I know it has (for ſome ages laſt paſt) been the general opinion, (eſpecially of popiſh writers) that there is no ſuch middle ſtate of ſaints, but that they go *uno ſaltu in cœlum*; and this they muſt ſay, elſe their invocation and canonization of ſaints (by which they cozen the people of their money, and enrich themſelves) would be ridiculous as well as erroneous. But I do alſo well know, that the Jewiſh church, and the primitive Chriſtians, did believe, and their beſt writers did profeſs and vindicate this middle ſtate we ſpeak of; and I do not know any text of ſcripture againſt it: nay, it ſeems evident to me, (with ſubmiſſion to better judgments) that ſcripture clearly confirms the doctrine of the middle ſtate of ſouls. However, though this be my opinion (at preſent) yet I dare not any way cenſure, much leſs condemn any, who are of another judgment. Pray pardon this rude, tedious, and (I fear) impertinent ſcribble, and pray for,

THE papers you mention to be ſent by the carrier, are not come; and he ſays he had no ſuch papers.

Buckden, Jan. 12, 1684.

My Honoured Friend,

YOUR great and undeſerved kindneſs has given me confidence to trouble you. I am lately informed, by a perſon of great honour, who has good intelligence, that ſome are about a tranſlation of the popiſh canon law into French; which I wonder at. Sure I am, the pope and his party (if they can hinder it) will never permit ſuch a tranſlation to be publiſhed; and, if they cannot hinder it, their power is not ſo great as it has been. I hope it is true, that they are about ſuch a tranſlation; and I ſhould be glad to hear it were finiſhed, and made publick: for there are ſo very many prodigiouſly erroneous and impious canons and decrees in that law, that were it in French, or any vulgar tongue, the honeſt and unlearned laity (who had any love for truth or piety) would abhor that law, and the authors and owners of it. Give me leave to ſet down an inſtance or two, which (I believe) are not unknown to you; and the places I ſhall mention are in their beſt and moſt correct editions of their [a] canon law, and (as ſuch) publiſhed by the pope's authority. And here,

1. *Gratian* tells us, (what pope *Agatho* told him) that all the popes conſtitutions *irrefragibiliter ſunt obſervandæ*, as if *Peter* himſelf had confirmed and publiſhed them. *Sic omnes apoſtolicæ ſedis ſanctiones accipiendæ ſunt, tanquam ipſius divini Petri voce firmatæ ſint.* They are the [b] words of the canon. And that we may know, what he does mean by theſe words, and how highly we are to prize them, he adds, [c] *Decretales papæ epiſtolæ inter canonicas ſcripturas connumerantur.* So that, by this law, we are like to have a large bible; not only the Old and New Teſtament, but all the new decretals of the old gentleman at *Rome*, and they not apocryphal, but moſt properly canonical.

2. *Gratian* tells us in that law, that the pope may depoſe kings, abſolve their ſubjects from all oaths of allegiance, and then prefer another to their vacant throne; and gives inſtance in the French king (though the inſtance as to matter of fact be moſt falſe) thus.

[a] I mean the editions at *Paris*, 1612. with the gloſs; and at *Paris* again, *anno* 1618. and at *Lyons*, 1661.
[b] *Can. ſic omnes. 2 diſtinct.* 19.
[c] *Ibid. diſt.* 29. *Can.* 6. *in lemmate & canone.*

Alius Rom. pontifex, Zacharias scilicet, regem Francorum, non tam pro suis iniquitatibus, quam pro eo, quod tantæ potestati esset inutilis, à regno deposuit, & Pipinum in ejus locum substituit; omnesque Francigenas à juramento fidelitatis absolvit, &c. Though the matter of fact be evidently false (for so the learned French writers have plainly proved it) yet it stands still in the body of their law, in all the editions of it.

Can. Alius 3. Caus. 15. Quæst. 6.

Johannis Launoius, epist. tom. 7. p. 117. 118. & p. 245, 246.

3. GRATIAN tells us (out of pope *Clement* the Vth's epistle) "That in the primitive "church, they had all things common" and that the philosopher said, *Amicorum omnia sunt communia*; and that "iniquity brought in division and propriety." Having said this, he adds: *In omnibus autem sine dubio sunt & conjuges.* This (though most impious, as well as erroneous) may be pleasing to their clergy, who, having no wives of their own, may make use of their neighbours.

Ca. Dilectissimis. 2. Causa. 12. Quæst. 1.

4. THE same Italian, in the same canon-law, and all editions of it, tells us, that *Meretrix est, quæ multorum libidini patet.* It must be many, who must make a whore; and if you ask how many will do it? courteous *John Semea*, the learned glossator, will tell you, that in the cannon, she is said, *multorum libidini patere, quæ admiserit plures, quam 23. millia hominum.* And this he proves out of St. *Gregory*, who speaking of 23000 men, calls them *pauci*; and therefore, if *meretrix* be she only, *quæ multorum libidini patet*, then (by this law and logick) none can be a whore, who has not laid with more than 23000. And if this were true, I dare say, *Rome*, "the mother of harlots," has not one whore in it. My dear friend, pardon this impertinent extravagance, and pray for

your faithful friend and servant,

THO. LINCOLN.

Buckden, 18, 1684.

My honoured friend,

IT is now a good while since I troubled you (as in other cases I have often done) with a story of images unlawfully) (as I did, and do think) set up in a church in my diocese. The painter and some few of the parishioners (upon pretence of beautifying the church) washed out all the sentences of scripture formerly writ upon the walls; then they set up in their places the images of thirteen apostles (St. *Paul* for one) and twelve patriarchs, and *Moses* and *Aaron*. The picture of St. *Peter* they placed above the ten commandments, and that of *Paul* above the king's arms, and they picture *Moses* (after the ridiculous popish way) with horns. They then (*ex post facto*) procured an order from the deputy chancellor of *Lincoln*, (the chancellor being absent) to approve and confirm what they had done. I caused the chancellor to null that order: then they appealed to the Arches, where the appeal now depends, and (this next term) the cause will come to be heard and determined, whether those images shall stand or fall. I am no party in the cause, neither appellant nor appellee, nor so much as named in their appeal, which is only from the chancellor. However, I abhor their setting up such images in the church; and to shew my dislike, and the reasons of it, I have writ a breviate of the case, and sent it to my lord of *Canterbury*, who (being judge of the court of the Arches, though executed by a deputy) may, and (I doubt not) will take care, *ne quid detrementi capiat ecclesia.* A copy of that breviate I send here enclosed to you, as to a person, who very well understands and loves our reformed religion. If (upon perusal) you approve of my design against popish images, and my reasons for it, it will be a great encouragement and comfort to

your affectionate and faithful

friend and servant,

THO. LINCOLN.

Buckden, Oct. 28, 1684.

My honoured friend,

I RECEIVED yours, and this comes to bring (what is must due) my humble service and thanks. It is an encouragement and comfort to me, that you do not condemn those papers I sent you. I confess you do judge rightly, when you say, that better and stronger reasons might be brought against images (and setting them up in churches, and places of God's publick worship) from scripture, where God so often, and so severely forbids the making of them for any religious use. And when they were any where made, he has severely commanded to break them down, and utterly destroy them as abominable to God, and pernicious to the people, being teachers of lies. To avoid this our adversaries do two things. 1. They have (with horrid impiety and impudence) put one commandment (that against images) out of the decalogue, where God himself had placed, and with his own finger writ it, which is an evident demonstration, that their own consciences convince them, that the second commandment condemns their image worship; else it is certain, they neither would, nor needed they leave it out. But seeing this will not do their business (there being an hundred other places in *Moses* and the prophets against images) they say, 2. That it is confessed, that images and worshipping of them was absolutely forbid to the Jews in the old testament; but it was by a positive (not any natural) law, which did bind the Jews then, but binds not us in the new testament, which is evidently untrue, as might, and (God willing) in good time shall be proved, for it is not a work for a letter. I should only desire our adversaries

Exod. xl. 4. Deut. iv. 12, 15, 16, 17, 18, 23, 25. Exod. xxiii. 24. Deut. vii. 5, 25. & Deut xvi. 22. Hab. ii. 18. Jer. x. 14, 15.

1 Joh. v. 21. adverſaries to conſider what St. *John* admoniſheth us; the word is εἴδωλα, which in our tranſlation, we retain, keep ourſelves from idols: which word properly ſignifying images (as the beſt gloſſary tells us) and their authentick Latin ſo renders it, *cuſtodite vos à ſimulacris*, keep yourſelves from images. I beg your pardon, and prayers for,

Heſychius has it thus. Εἴδωλον, ὁμοίωμα, εἰκὼν, σημεῖον, &c.

Your obliged faithful ſervant,

THO. LINCOLN.

I SHALL ſhortly trouble you with another letter.

Mr. *Boyle* to the biſhop of *Lincoln*.

My lord,

THOUGH I ſuppoſe, that it is out of condeſcenſion, not curioſity, that your lordſhip is pleaſed to command my opinion in a caſe, wherein your very letter makes it appear, that no body is more fit and able to give a well grounded reſolution than yourſelf; yet I ſhall adventure to tell your lordſhip on this occaſion, that having lived in ſeveral popiſh countries, I was by the obſervations I made there very little invited to expect as much benefit as danger from the uſe of images in churches, eſpecially in ſuch where their very novelty may ſtartle many, if not ſcandalize them too. And ſince your lordſhip has the law and goſpel on your ſide, and knows very well the reaſonableneſs of that advice, *principiis obſta*, it ſeems a thing well becoming your ſtation and your wonted zeal for the purity of religion, to endeavour the early cloſing of a gap, that, left open, will probably be more and more widened, and prove an inlet to innovations dangerous to the church of *England*, and conſequently to the proteſtant cauſe. Though I write in much haſte, yet I dare not conclude this ſcribble, without giving your lordſhip a touch of the news I learned yeſternight. It is here taken for granted (and I think may be ſo) that the United Provinces will accept of the king of *France* his truce for twenty years, though the prince of *O.* be ſo diſſatisfied with it, that it is affirmed he has ſent for the princeſs to *Breda*, where he means to paſs this year. The French allow the emperor and the German princes a month's time, and the *Spaniards* ſix weeks to come into the treaty. But whether either of them will embrace the offer is not yet known. The Venetian preparations both by land and ſea are ſaid to be the greateſt, that ever that republick made, and the numbers of that foot (amounting to 16,000) together with that ſtore of materials fitted for building, make it ſuſpected, that they intend no leſs than to attempt the Dardanels, and fortify themſelves there. The king of *Poland* proceeds vigorouſly, and in likelihood will do it proſperouſly. The imperial troops in *Hungary* are not like to be reſiſted by an army, but only by garriſons. There goes a French letter, which I expect a ſight of, ſaid to be written by count *Teckely* to the pope, which ſome commend for a fine as well as real piece. We are told, that when his holineſs received an account of the miſchiefs the French had done in the *Netherlands*, and at *Genoa*, he led the cardinal *d'Eſtrees* to a fair crucifix, that was in the room, and falling at the feet of it, declared with great earneſtneſs, that he had done all that lay in him to protect the Chriſtian church from the common enemy. But ſince ſome of her own children had, by their unſeaſonable animoſities, defeated all his endeavours, he humbly begged the divine founder of the church to take the preſervation of it into his own care, and then turning to the cardinal, added, that there was indeed one thing, that he might do himſelf towards the redreſs of theſe grievances. But though his unwillingneſs had ſtill made him forbear that remedy, yet ſuch extraordinary proceedings might neceſſitate him to employ it. For which we ſhall have the free conſent of,

My lord,

your lordſhip's moſt &c.

Buckden, Nov. 4, 1684.

My honoured friend,

I DID in my laſt threaten to trouble you with another letter, and this comes (with my ſervice) to do it. For I ſhall tell you a ſtory, which really troubles me, and will (I believe) not be very well pleaſing to you, or any who love truth, and our reformed religion. The ſtory is this. There is a book lately printed with this title: "The Order of the "Inſtallation of P. *George* of *Denmark*, *C.* duke "of *Somerſet*, and *G. D.* of *Northumberland*, "in the Royal Chappel at *Windſor*, April 8, "1684'.' wherein we have theſe paſſages, as part of the form uſed at their inſtallation. 1. When the garter was given them, there was this admonition, "To the honour of "God, his immaculate mother, and to St. "*George* the holy martyr, gird on this garter, "&c." where, 1. By God in this form, God the ſon muſt be meant, for the Virgin *Mary* was not mother of God the father: and then our bleſſed Saviour, his mother and St. *George* are joined in the ſame honour. 2. The Virgin *Mary* is (moſt erroneouſly, againſt expreſs ſcripture) declared to be immaculate. Next we have this form uſed (as the book ſuits) at the putting on the George. "To the en- "creaſe of your honour, take this ribband "about your neck, with the image of the holy "martyr, and Chriſt's knight, St. *George*, "by whoſe aid you being defended, may "may have here the victory of your ghoſtly "and bodily enemies, and at laſt the ever- "laſting reward of victory." So by the aid of St. *George*, they may get the victory of all their

Page 3. of that book.

Page 4, and 9.

their enemies, ſpiritual and temporal, and at laſt eternal glory. This is not by obſervation, for I had it from a reverend and learned gentleman from *Newcaſtle* in *Northumberland*, who (before I had ſeen or heard of that book) gave me this account by letter, that the papiſts in that country made uſe of that book, to ſeduce ſome proteſtants to popery, telling them, that ſuch things were uſed, and approved in the king's chappel at *Windſor*, Hereupon the gentleman ſent to *Windſor*, to one of the prebends, (who had been his ſcholar in *Oxon*) to enquire, whether thoſe forms had been uſed at the inſtallation of thoſe three noble perſons, and found, that it was a Roman *pia fraus*, an impious popiſh fee, for no ſuch forms were uſed at the inſtallation, and complaint was made of it to my lord of *Canterbury*, who ſent for the printer, and will (I doubt not) ſee juſtice done. By the premiſes you may ſee, that there are deſigns on foot to bring in popery, not only in *Lincolnſhire*, by images at *Moulton*; but in other counties; and if we ſleep while they ſow tares, we neglect our duty, and give our adverſaries opportunity to do miſchief, which that our moſt gracious God (who neither ſlumbers nor ſleeps) may prevent, is the prayer of,

Your moſt obliged thankful ſervant,

THO. LINCOLN.

Buckden, Nov. 29, 1684.

My honourable and honoured friend,

I RECEIVED yours, and (with my humble ſervice) return my hearty thanks, for the great (and as I hope in that iſſue, it will prove good) news, concerning Mr. *Maimburg*'s book, and the buſineſs of *Genoa*. Both which will doubtleſs highly diſpleaſe the old gentleman at *Rome*, and is an evident argument, that the French king has little favour for his holy father at *Rome*, who may poſſibly (if he continue diſobedient) diſinherit his eldeſt ſon, and (what he has formerly done, I mean ſome of his predeceſſors have done) ſend an angry and roaring bull to depoſe him; though (at preſent I do believe) he dare not do it, conſidering the French king's greatneſs, who will (as our *Hen.* VIII. did) account the thunder of a papal anathema, no more than an *ignus fatuus*, or inſignificant ſquib, though thrown from the capitol. What the iſſue of thoſe animoſities will be, I know not; but leave it to that infinitely wiſe, powerful, and good God, who has, I believe (conſidering the ſtrange and great commotions in *Europe* and *Turkey* too) ſome great work to do in this weſtern part of the world, and (in deſpite of all human politicks and deſigns) will do his own work his own way (with infinite juſtice and wiſdom) for theſe is no power nor policy againſt his good providence. I cannot requite your kindneſs, by ſending you (what you ſent me) foreign news: yet give me leave to ſay ſomething of a new book, which came to my hand this week; the title this: "A Diſ-"courſe concerning the Meſſias, by *John Tur-*"*ner*, *&c.*" In this book the epiſtle dedicatory is more than half the book, and moſt of it againſt Dr. *Cudworth*'s Syſtem. I am told, that Mr. *Turner* was of Dr. *Cudworth*'s college, and by him turned out of it, *& hinc illæ lacrymæ*. 2. In the book itſelf, pag. 63. he propoſes to explain the nature of God, and defines God to be, "an Infinite Extenſion or "Space. 2. He endeavours to prove (having poſitively affirmed it, in the lemma to his third ſection, pag. 80.) that *Des Cartes* was an atheiſt. I ſuppoſe he does not mean, that *Des Cartes* is a profeſſed atheiſt, ſo as to deny the being of a Deity; but that it will follow from his avowed principles, that there is no God; which whether it do or no, I have neither a mind, nor time to determine. However, one thing he has, which I approve; (and it is the trueſt thing in his book) he makes honourable mention of Mr. *Boyle*, pag. 77. which thouſands, beſides him, will do, when there is occaſion; and of that number he is one, who begs your pardon for this rude ſcribble, and ſubſcribes himſelf

your faithful friend and ſervant,

THO. LINCOLN.

Buckden, Oct. 1, 1685.

My honoured friend,

I HAVE received your letter, which (as all yours) was very welcome to me; not only becauſe yours, but for the good news, which you did ſo kindly communicate. I perceive, that the animoſities and differences between the French king, and the old gentleman at *Rome*, are very great; yet (as *Herod* and *Pontius Pilate* could, and did agree, to perſecute our bleſſed Saviour) they can agree to perſecute the poor proteſtants, with a barbarous, inhuman, and unheard of cruelty; which will, (I doubt not) haſten their ruin. For there is an infinitely juſt and good God, who ſees, and (in his good time) will puniſh the impious and cruel oppreſſors of his poor people. By theſe four theſes (you mention) ſo publickly approved and defended in the *Sorbonne*, we are furniſhed with a juſt anſwer to their common objection; "that our church having ſo "many differences and ſects (as preſbyterians, "independents, *&c.*) muſt needs be imper-"fect, as wanting an infallible guide and "judge to determine thoſe queſtions, which "(they ſay) they have." Now they have given us a juſt anſwer to this frivolous objection. For 1. Our differences are in things of leſſer moment, about government, whether biſhops, or no biſhops, whether churches be independent, whether the croſs in baptiſm, *&c.* But they (as appears by their theſes) differ in the very fundamentals of their church; the Jeſuits, Canoniſts, Caſuiſts, *&c.* and

and generally all their writers have and do maintain the pope's infallibility, and his ſupremacy, even in temporals, that he has power to depoſe kings, abſolve their ſubjects from their oaths of allegiance, and give away their kingdoms to catholicks, that the clergy are not ſubjects to kings, nor can be guilty of treaſon, though they kill their king. Now the *Sorbonne* and the French divines deny all this, as appears by thoſe theſes. And indeed it is ridiculous for them, to object our little differences to us, when they have far greater amongſt themſelves. 2. But without them, we have anſwer ſufficient to that objection, concerning our diverſity of ſects and opinions. For that diverſity of ſects, and hereſies, and erroneous opinons, doth not ariſe from the want of (what they irrationally pretend to) an infallible judge; for while our bleſſed ſaviour and his apoſtles lived, there wanted not an infallible judge, and yet there were many ſects and erroneous opinions: which aroſe from the want of humility, faith and piety in the people, who would not (as they ought) ſubmit to and humbly receive thoſe divine doctrines, our bleſſed Saviour and his apoſtles infallibly taught them. 3. But the fourth theſis does utterly overthrow their whole religion; I mean popery, as it conſiſts in thoſe doctrines all proteſtants deny: which (God willing) I hope to make evidently appear in good time. In the mean time, I hope to be in *London* before the parliament ſit, and then (as heretofore) you will be troubled with

your moſt obliged friend,

and thankful ſervant,

THO. LINCOLN.

I CASUALLY got a fall, coming out of the chapel on Monday laſt, a little bruiſe of my hip, and a little pain followed; but (I bleſs my good God) the pain is almoſt gone. But it has kept me in my chamber (being not able to walk without pain) this four days. So that I was not able to wait on my good lord *Burlington*, who going through our town kindly ſent to ſee how I did.

Buckden, Thurſday, Jan. 14, 1685.

My honourable and honoured friend,

I RECEIVED yours, and this comes (with my humble ſervice) to bring my hearty thanks. My health (which you ſo kindly enquire of) is much better (I bleſs God for it) than I could have expected, my great age (79 almoſt complete) and the infirmities, which uſually accompany it, conſidered: only my ſhortneſs of breath is a weakneſs troubleſome, but (I bleſs God) not painful to me. I pity, and pray for the poor perſecuted proteſtants in *France*; I believe thoſe calamities fall on the good and bad, as the captivity on the Jews (in that excellent chapter *Jer.* 24.) and with the ſame difference. The wicked Jews were ſent into captivity, "for their hurt," ver. 9. but the pious Jews, "for their good," ver. 5. And I do not doubt, but the honeſt French proteſtants (though their calamity be great) will find thoſe great and moſt gracious promiſes made true to them, which are made to the Jews in their captivity, ver. 5, 6, 7, of that chapter. For the good men, *a patria exulant, ut ad Deum redeant.* The miſeries, which good men ſuffer, are not *ſupplicia*, but χαρίσματα. They are not *pœnæ*, but *medicinæ*, intended and given for their health. They are *actus patris miſerentis*, not *judicis peccata vindicantis*, &c. And indeed, we evidently ſee, that thoſe poor perſecuted French proteſtants find great favour in all places, whither they come for protection and refuge. The French king's perſecution of his poor ſubjects, is not only unchriſtian, but barbarous and inhuman; and I doubt not, but as his ſin, ſo his puniſhment will be ſignal, even in this life. For the confeſſion of the Popiſh faith you mention, I ſend you one encloſed, as it was lately ſent me. The firſt part of it is the Conſtantinopolitan creed, the very ſame with that creed we have at our communion in our liturgy. The ſecond part is that we call the new Trent creed, which was never heard of, till *Pius* IV. publiſhed it at the end of the Trent council, anno 1564. Now the new Trent creed added to the old creed is a full comprehenſion of popery, where it is clearly and authentickly propoſed, without mincing and miſrepreſentations; and we have it ſometimes in the [a] Trent council itſelf, ſometimes, after the end of the council, as in many editions. Now in this new creed, every article is evidently erroneous, and many ſuperſtitious and idolatrous. I ſay, (pardon my confidence) evidently erroneous, ſuperſtitious, or idolatrous; and I doubt not, but it may, and (in time) will appear, that there is good reaſon and evidence enough for this confidence. Pray pardon this rude ſcribble of

Phil. i. 29. ἐχαρίσθη.

Heb. xii. 6, 7.

[a] See in the edition of the Trent council at *Antwerp*, 1633. Seſſ. 24. *De reformatione* pag. 450. which is the moſt uſeful edition for us in many reſpects.

your moſt obliged, thankful,

and faithful ſervant,

THO. LINCOLN.

Buckden, Nov. 22, 1686.

My honoured friend,

I RECEIVED yours, and (with my humble ſervice) return my hearty thanks for the news you did ſo kindly communicate. That which you write concerning the king of *France*'s diſtemper, is (to me) very great and conſiderable news. When firſt I heard of the French king's diſtemper, and the extraordinary quality and condition of it, and conſidered his unchriſtian, nay, inhuman and barbarous cruelties exerciſed upon the poor proteſtants (his innocent ſubjects) I did, and do look upon

upon his diſtemper, not as any caſual or ordinary diſeaſe, but as a puniſhment upon him, from the immediate hand of divine juſtice, ſuch as no human art can cure. *Raro antecedentem ſceleſtum ſubſequitur pœna pede claudo:* great ſins (even in this life) have uſually ſignal puniſhments; if not to better and reform the ſinner, yet to fright others from the like impieties. Concerning the French tract you mention, I am glad to hear, that a perſon of quality, and a Roman catholick (as they call them) ſhould write againſt tranſubſtantiation (a word never heard of in the Chriſtian world, for above one thouſand years after our bleſſed Saviour) and the doctrine ſignified by it ſo contradictory to the reaſon and ſenſes of all mankind, that I think it impoſſible for any to believe it, who "has not ſtrong delu-"ſion to believe a lie." And ſeeing the French clergy have ſo lately and publickly declared againſt the pope's power in temporals, his infallibility and ſupremacy, *&c.* it is my prayer and hope, that the good God of heaven and earth, who hath given them the knowledge of ſo much truth, and courage to profeſs it, will in his good time reveal to them thoſe other truths, which (by the church of *Rome*) have been miſcalled hereſies, and the profeſſors of them (with anti-chriſtian cruelty) perſecuted. If you could ſpare me the ſight of the French tract you mention, I ſhould ſpeedily and thankfully reſtore it. His argument, that tranſubſtantiation was not received and profeſſed in the primitive church, becauſe neither Jews nor Pagans ſpoke againſt it, is good, but not new; others have uſed the ſame argument, which (with many others, more cogent and evident) never has, nor can be truly anſwered. The money you gave me for the poor, I have diſtributed; and with it refreſhed about forty widows and fatherleſs, *&c.* And though they know not their benefactor, yet the infinitely good and gracious God, who gave you money, and (which is more) a mind to uſe it charitably, he knows, and can and will reward you. I beg your pardon for this rude, and (I fear) impertinent ſcribble, and your prayers for

your moſt obliged and

faithful ſervant,

THO. LINCOLN.

Buckden, Jan. 4, 1686.

My honoured friend,

I DO herein encloſed ſend you (with my humble ſervice) a paper, which (if you have not ſeen) may be not unworthy your peruſal. It is a letter writ ſome years ſince by Mr. *Walker* of Univerſity college, to a friend of his beyond the ſeas, who had heard, that he was inclined (if not turned) to popery, and gave him ſome reaſons againſt it. Mr. *Walker* (as appears by his letter) confeſſes, that he is a Roman catholick, (as they love to miſcal themſelves) and gives his reaſon why he is ſo, naming ſome books, which he vainly conceives ſufficient to convince him of the truth of that religion. I do not wonder (the circumſtances we are now in conſidered) that he ſo lately declared himſelf to be a papiſt; but I wonder, that he did it no ſooner, but continued ſo long in the communion of the church of *England*; for he has been my intimate acquaintance above fifty years, and has ever been reaſoning with me for the religion of *Rome*. Though God knows, and all intelligent and impartial ſeekers of truth may and ought to know, that there is no reaſon for it, but the ſacred ſcriptures, and primitive and purer antiquity, expreſsly and univerſally againſt it. Our letters into the country from your great town tell us, that the French king is perfectly recovered, and in their churches thanks given to God for it; which is no part of the creed of

Your moſt obliged,

and faithful ſervant,

THO. LINCOLN.

WE hear nothing of the old gentleman at *Rome*.

Incloſed in the preceding.

Illuſtriſſime domine,

LITERAS tuas Martii 13°. *ſcriptas tempeſtivè recepi, ſolitâ humanitate plenas, et propterea mihi ſummè gratas et jucundas. Quod de me, deque religione mea, uſque ad vos permanaſſe dicis, cognoſcere non ſum ſollicitus; neque ad me reſque meas pertinere arbitror, quid illi ſentiant de me, qui, cum opus erit eorum auxilio, nihil prorſus ad ſalutem meam conferre poterunt, cum ſinguli coram divino tribunali ſiſtemur. Ecquis obſecro vel patrocinium, vel miſericordiam mihi præſtabit, ſi in religionis ſuſceptione quidvis errâſſe convincar? Dabis ergo mihi veniam, uti ſpero, ſi conſcientia propria contentus, aliorum ſive cenſuras, ſive rumores poſthabeam: neque decet, vel vacat decrepitum adeò ſilicernium fine ſua declaranda male feriatorum aculeis ſeſe exponere: abunde diſputationum ubique proſtat, et ſi cui libeat, dentes, vireſque ſuas adverſus eccleſiæ Romanæ catholicæ doctrinam experiri, paratos habet quos perpendat libros nunquam adhuc confutatos; unum cui titulus,* (The Guide to Controverſy) *anno* 1673, *ſecundò editum; alium,* Conſiderations on the Council of *Trent*: *alium Dr. Stillingfleet*'s Principles conſidered, *ejuſdem libri adverſus* Stillingfleeti qualem qualem reſponſionem defenſio; *aliaque aliquammulta ejuſdem authoris. Quare, dum tantæ molis opera quaſi intacta remanſerint, mihi non imputabit notiſſimus tuus candor, ſi operam prorſus ſupervacaneam ipſe minimè conferam, neque ferram ipſe debiliter traham, dum fortiora brachia otioſa reſtabunt. Quid Syrus ille tuus ſibi velit, fateor, ex iis, quæ perſcripſiſti, me non intelligere: videtur ſane adverſus Neſtorium, vel Eutychem nonnihil moliri, ſed contra doctrinam eccleſiæ, de reali ſervatoris noſtri in euchariſtia præſentia, vel panis, vel vini abſentia,*

absentia, nihil eum asserere comperio: sed quicunque fuerit, vel quicquid dixerit, modo de ejus authoritate non plenè constiterit, nihil ad me spectare arbitror; gratias tamen habeo, quod vel horum fragmentorum partem aliquam communicasti, Deumque precor, ut tibi fælicitatem in hoc mundo, et æternam in futuro beatitudinem ex misericordia sua conferat, ut et servo tuo humillimo,

OBAD. WALKER.

Buckden, Jan. 19, 1686.

My honoured friend,

I RECEIVED your last, and (with my service) return my thanks. A piece of news comes to us here from *Cambridge*, which some of that university say is true, and may not be unworthy your knowledge. It is this. The master of *Sidney* college being dead, one *Basset* comes with a mandamus and dispensation (except for the oath of allegiance, that he must, and is willing to take) requisite. But there happens this remora, which hinders his entering upon that government. The founder of that college has this qualifying condition and limitation of his donation; that whoever is chosen head of that house, shall be a true protestant of the church of *England*, otherwise that land given to the college must revert to the founder's executors. This (as well it may) does hinder *Basset* to take possession of that hardship, being afraid, that the founder's executors will seize upon the land, as sure (by law) they may be: for *donatio conditionata, conditione non præstitâ, non obligat.* What will come of this business, time will tell. How your Roman catholicks (as they call them) come now to take the oath of allegiance, I know not: sure I am, that *ab origine* it was, and still is condemned at *Rome*, and unless the pope (*ex plenitudine potestatis*) dispense with it, they cannot be good Roman catholicks, who now take it. I am,

Your obliged friend and servant,

THO. LINCOLN.

Buckden, July 28, 1687.

My honoured friend,

I AM returned to *Buckden*, and though the weather was very hot, and the ways dusty, yet (I bless God for it) in perfect health. I have received your letter, which was (as all yours are) very welcome to me, not only because yours, but for the strange and good news you did so kindly communicate. We in the country hereabout are full of prophecies and predictions, that *Babylon* must fall (which is not far off) the very next year 1688. That *Babylon* must fall, we have (in St. *John*'s revelation) an infallible prophecy: but that it must fall the very next year, our late prophecies say, but neither do nor can assure us. But if your news from *Italy* be true, as I believe it is, (*facile credimus, quæ volumus*) it may be (if not absolutely certain) a significant symptom, that the old gentleman, who has been long called (and not miscalled) antichrist, is not far from ruin. A kingdom divided against itself cannot stand long. The Gallican church (especially of late) has declared against many of the papal usurpations, and long received errors in that church, as fiercely as we hereticks, as evidently appears, not only by the publick and printed writings of their learned doctors, (*Richerius, Launoy, Du Pin*, &c.) but by the published declaration of the Gallican clergy assembled at *Paris* 1682. But now, if in *Italy* and *Rome* itself (the state of the beast) there be risen up a sect of Quietists, (who as you well observe, are not likely to deserve that name long) of such numbers and quality; if Jesuits be amongst them; if the inquisition (which had no institution, nor till after the * year 1200 was ever heard of) be of divine institution, superior to all human authority ecclesiastical as well as civil: if they are come to that confidence, (or impudence) to pass by the pope as such, and consult him only as a private person, as Odescalchi, not as Innocent; though in their fourth vow they have vowed to give absolute obedience to all his commands, without questioning the lawfulness or unlawfulness of them, and though their whole Society has generally maintained his infallibility and absolute supremacy: I say, if they are come to such fatal divisions amongst themselves, this overthrows the very foundations of popery, and is a signal symptom of the ruin of the papal monarchy, *quod faxit Deus.* But for the old gentleman and Jesuits, *transeant cum suis erroribus.* For the money you concredited to me to be distributed amongst the poor, I have comforted many poor people with it; and though you will not have it known, who is their benefactor, yet he, who sees in secret, will reward you openly, and our blessed Saviour has assured us, that *merces charitatis magna erit et certa*, Mat. xx. 41, 42. Your prayers are desired by, and for

Your most obliged, thankful,

and humble servant,

THO. LINCOLN.

Letters from Dr. Sharrock *to Mr.* Boyle.

Jan. 26, 1659-60. *New-College.*

Most honoured Sir,

I HUMBLY thank you for the trouble I gave you in the conveyance of my book to the learned doctor, and the inconvenience

* *Particulare officium inquisitionis contra hæreticos non incepit nisi post annum millesimum ducentesimum. Vide historiam inquisitionis Pauli Veneti: Roterodami* 1651. *p.* 10, 11.

you

you pleaſed to incur in the leaving your noble friends for the diſpatch of your laſt anſwer, but moſt of all for the matter of the anſwer itſelf. This day I conſulted Mr. *Robinſon* about the printing of your piece, the paper and character, and time requiſite for the work; who tells me, that the ſame letter for character is at Mr. *Hall*'s our printer's, wherewith Mr. *More*'s book you mention was printed: that two ſheets may weekly in that letter and paper be printed off, and for need more; the performance of which by Mr. *Hall* he will undertake for. As to the correction and reviſe of the preſs, I am already bound to give you my utmoſt aſſiſtance, and ſhall faithfully do it in your behalf, and ſhall queſtionleſs be able to do much more now for the fairneſs of the copies, than when lately I had preſs-work of my own; not only becauſe I ſhall have leſs work (for then the buſineſs of compoſing and tranſcribing was upon me) and a better preſs, but becauſe I ſee the danger of doing the whole buſineſs of the ordinary corrector by myſelf ſometimes, and other whiles truſting him to do mine. What I ſhall do as to the matter of printing, I ſhall look to it myſelf, and ſend you patterns of paper and letter, but act by Mr. *Robinſon*, becauſe I will have his care jointly with my own in the proviſions for printing, and his trade muſt be uſed in the diſperſing of the books, as it is in my own books, with whom therefore the profit muſt be divided, which, as is eaſily computed, muſt not be expected overmuch in 500 copies.

WHAT you ſpeak of the tranſlating of theſe experiments into Latin, is certainly moſt neceſſary and befitting the matter of the piece: and I aſcertain you of what you needed not to have beſpoke any help or aſſiſtance, that I may further you with herein, or in any other matter within my ſphere; and that either by myſelf, or friends, or both, according as your buſineſs, mine, or other circumſtances ſhall require. However, the perfection and compliment of ſuch tranſlation cannot be ſo made, as to be publiſhed without your own reviſe. My faithful humble ſervice to your honour being duly preſented, I reſt,

SIR,

your honour's in all dutiful

and affectionate obſervance,

R. SHARROCK.

DR. *Willis*, *Dickenſon*, and Mr. *Stahl*, preſent you with their ſervice.

April 9, 1660.

SIR,

IN return to yours of April the 7th, after my humble ſervice, this may confirm to you my intentions of abiding in *Oxon* this ſpring and ſummer by God's furtherance, and that I ſhall be willing to employ a very conſiderable part of my time upon any buſineſs you ſhall employ me. I have employed ſeveral hands in your tranſlation, but the variety of words and phraſes that occur proper to divers mechanical trades, and the whole matter being ſo different from that they are ordinarily converſant with (which is generally the vulgar philoſophy, humanity, and divinity) it happens, that after much aſſiſtance given them as to words and phraſes, their help is ſo inconſiderable, that in ſome I have been forced to alter every period in every ſentence. However, I hope and queſtion not, but this will be tranſlated for you ready for the preſs by midſummer.

AND, Sir, you are to conſider, that it is not very proper, eſpecially for me, that communicate the copy, to begin the tranſlation before the Engliſh be printed; and ſo the time of its being ſet forth will not be ſo ſoon as the Latin. The thing, that I ſhall willingly promiſe, ſhall be, that except only ſome ſtudies altogether neceſſary for me, which will not take up one half of my ſtudying time, I ſhall do no other buſineſs but yours in this overlooking the copy, the preſs, and rendring them in Latin. Though I ſhall notwithſtanding employ Mr. *Robinſon* to manage the copies as his own, and require for this grant not much per ſheet. Nor can I, when he ſhall only have five hundred to diſpoſe. I have here ſent one ſheet; the other is not come off the preſs to

Your honour's humbly devoted ſervant,

R. SHARROCK.

PRAY, Sir, ſend more copy.

SIR,

I HAVE long waited for this opportunity to give your honour an account of Mr. *Stahl*'s next courſe, in order to your lad's improvement in chemiſtry, which now in ſhort he gives me thus. That though he ſhall be employed by ſome doctors on particular buſineſs, yet he ſhall not go through any exact courſe till after Chriſtmas; and then he promiſes, if you pleaſe to ſend him, to make him operate with his own hands; which he cannot do now, the perſons, that employ him, requiring him to uſe their own ſervants. I intend, God willing, by *Moore* next week to ſend your honour a packet, therein to preſent you with (beſides a trifle of my own writing) ſome of your own more nobly penned and more learnedly written ſheets; and withal a pattern of that powder, which I diſſolved by diſtilled May dew. I have likewiſe encloſed ſent you the copy of our proceſs, wherewith M. *St.* made the aqua cochleariæ ſpiritualis. For, as I remember, you once mentioned a deſire of the ſight of theſe toys, if indeed the ſpirit of ſcurvy graſs deſerve no better name. I intend for the country, if the weather and my health ſerve me, the beginning of the next week, but muſt make it my moſt humble requeſt, that

that your honour would expedite the whole copy (as ſoon as it may ſtand with your honour's convenience) of the tract *of the Uſefulneſs*, &c. For the paper has lain by as long as the book would have been ſold in the time, it bearing the credit of ſuch an author. I hearken more to the requeſts of Mr. *Robinſon*, becauſe I know he will be a loſer by having this Latin book of the phyſico-mechanical experiments printed ſmaller beyond ſeas; though for that I have promiſed and intend him ſome amends. The tract of Uſefulneſs being for want of more copy laid by, I have lately ſet the preſs on work with the Engliſh phyſico-mechanical experiments, which they have promiſed ſhall perfectly be done by my return after Chriſtmas; ſo that it lies upon me to make a ſecond requeſt for the ſupplement, or thoſe other tracts you mentioned, which you thought would make the ſecond impreſſion of the phyſico-mechanical engine a competent quarto, in which volume it is now begun, that it may bear a part anſwerable to your other books. I intend not to return till the latter end of January, and therefore I ſet them on that printed (and upon my reviſe at the tranſlation exactly lettered and pointed) piece, becauſe they cannot err in my abſence; which they would do too frequently in your written copy, notwithſtanding all their correctors. I have put them in hope, that they ſhall have all their copy at my return. I leave it to your honour (ſtill with a proviſo for your greater occaſions) to maintain my reputation therein. The letter in behalf of Mr. *John Maſter* the adventurer in *Ireland*, to ſignify, that the bearer is the perſon, for whoſe caſe your deſired favour is expected here, if your honour pleaſes to encloſe it in a blank paper to Mr. *Edward Maſter*, ſenior fellow of New College, your honour will both oblige him and the humbleſt of your honour's ſervants,

ROBERT SHERROCK.

Jan. 29, 1667.

Noble Sir,

I THOUGHT to have preſented you with ſome of my medicated bread by the return of *Tho. Egerton*, which I made with ſcurvy graſs, ſage, or any other herb, and find it very uſeful, and a good way to prevent and cure divers of the chronical diſeaſes, that are common in this over humid iſland; but coming to me on the very day of his intended journey to *Oxford*, he finds me quite unprovided; and therefore promiſing your honour a taſt of more of theſe kinds than one, I write myſelf a debtor until ſome further opportunity. A thing that doth much good alſo in fits of the mother, and convulſions in children, and hath cured divers with us, is a mixture of a water made by diſtilling feverfew [matricaria] in ale, and the finer oil of amber: for want of which oil I many times uſe the tincture of amber in ℞. a few drops of either of which turn the diſtilled water into a thickneſs and whiteneſs like milk. I have uſed great quantities of this medicine with good ſucceſs both in women and children, and have cured perſons of all qualities with it, ſo that they have continued well for ſome years, and I expect every day to hear of more good done by it.

I ACQUAINTED you then, that I think the ſcurvy may be cured by turpentine diſtilled in balneo, *cum ſpecificis*, better than any other way. For the ſpecificks are feeble alone; and ſteel leaves an ill impreſſion upon the body, and drieth too much not without danger of the lungs. *Fonſeca* was the firſt man, that ever hinted it to me, but this way is naught: for the boiling turpentine to pills ſends out the ſpirit, that is more ſovereign. I diſtil it moſt gently, that the water may come as oily as I can, with as little oil as may be ſwimming, which I either ſeparate or not, according to the ſtomach of the patient. The falſe news I heard in *Oxford* concerning my lord, did at the ſudden and firſt apprehenſion ſo diſcompoſe me, that I have now a ſecond, that I made but a troubleſom viſit: for I remember I had then no thoughts but of him, not out of intereſt of my own; but I know his integrity ſo well, and his careleſſneſs of court, which moſt men regard ſo much, and value others by, that I thought it might be true. And conſidering, that I thought the world would think he had miſcarried, I fear I ſhewed ſo much concern for him, to whom indeed I owe much, that if I miſcarried in want of due reſpects to your honour, this apology I hope will be able to beg an excuſe for,

SIR,

your honour's moſt obliged ſervant,

RO. SHARROCK.

Horwode, April 7, 1668.

Noble and ever honoured Sir,

I WAS loth to let *Egerton* return empty to your honour; and therefore having no readier preſent, I have ſent four rowls of ſuch medicated bread, as we commonly uſe, and alter *pro re natâ*, as is uſual in medical beers. Theſe are made the eaſieſt way only by ſhredding the leaves, and moulding them in the dough: ſomewhat a finer way, when we have plenty of the herb, is, mingling the juice with milk, and making the dough therewith, or in herbs, that give no juice, as ſage, to make a ſtrong decoction in milk, or for a need in water, and make dough with it, though ſage bread is made very well this way. I have known ſage bread do much good in drying up watry humours; and when we have had infectious diſeaſes among us, we conceived this angelica bread to be of good uſe among us. Egrimony bread is alſo very pleaſant, and certainly a good epatick ſcurvy-graſs ferments

ments well in bread, but will retain its mucid taſte, that it hath in beer and in broths. Medicated beers I uſe as much, and I think it an error in phyſicians, that they preſcribe their alterated ales to be drunk too new, before they are defecated and made fit to penetrate. Aqua limacum, according to the receipt ſent to your honour, I find (I think) the very greateſt medicine, that is ſtilled in the veſica, which is a ſtill with me continually employed: divers gallons of that water have I uſed this year, with ſtrange ſucceſſes in all obſtructions, icterical, hydropical, ſcorbutical: for I am moſt for chronical diſeaſes, becauſe I ſee therein the power of a medicine: in the rickets I do all with medicated breads and beers, and ſometimes ſome doſes of my aquæ limacum. But I have the fault of phyſicians, I ſtick not punctually to receipts, but accommodate my preſcriptions to my materia medica. For what I preſcribe I give for the moſt part.

As for domeſtick or oeconomick uſes of chemical preparations, I will venture to commend this one, which I found out this ſpring. Coming to this houſe, that is an old houſe of ſtone, the cupboards, wherein the maids threw the foul table linen, were full of ruſty ſweating nails. Theſe gave that ſort of linen the iron-mold, and that linen gave it to all the reſt. For whatever an iron-mold touches in linen, when wet, it infects. After divers experiments, which we found either noxious to the linen, or unſucceſsful to the ſtains, I gave them a glaſs of oleum ſalis, which I had had by me ever ſince *Stahl* wrought with me: this being dipped on with a pencil, and laid a day or two abroad with the whitening clothes, took out the iron-molds and all other ſtains perfectly (without any harm to the linen) upon their being waſhed: nay, many ſorts of ſtains vaniſhed immediately upon their being touched with this oil.

I HAVE tried to hatch thoſe little pullets eggs, that are not above three quarters of an inch diameter, and have no yolks, but with ſuch ill luck, that I was not able to make any conſiderable obſervation. I ſhould have tried them in birds neſts.

I HAVE been lately conſidering the medical laws, in the book of Leviticus, and it ſhall be with me at leaſt *diſputabilis opinio*, that very many of them were intended to have a medical uſe, as well as a ſacramental or ſymbolical one. Our Saviour went about curing diſeaſes, or rather healing them; and why ſhould it be for the diſhonour of a lawgiver, to have regard to the prevention and cure of endemick diſeaſes? I will grant Mr. *Calvin*, (for that is moſt true and undoubted) that they were commended to the people, by being made ſymbolical alſo. But it is time, that from this digreſſion I ſubſcribe myſelf,

SIR,

your honour's moſt obliged ſervant,

RO. SHARROCK.

IF your honour have any ol. ſalis, or other medical matter, that you ſhall not uſe, "give, and it ſhall be given," and your honour ſhall be ſure to have an account of the ſucceſs.

Letters from Dr. Edward Pococke *to Mr.* Robert Boyle.

Oxon, Baliol-Coll. Oct. 5, 1660.

Moſt honoured Sir,

I MUST in the firſt place entreat your pardon for my great incivility, in that I have not written ſooner to you, to give you thanks for a book of your own excellent experiments, that I received from Mr. *Robinſon*, the ſtationer, by your appointment. But I deferred it, hoping, before this time, to have given you account of the finiſhing of *Grotius*. Though my own diſtractions be great, that I could not attend, as I deſired, the buſineſs (for whereas I had hoped, to have found ſome ſettlement here, I can yet find none, having ſtill to deal with thoſe, that are too hard for me, and keep me out of my right) yet I muſt needs caſt the blame of this delay on the printer, though he wanted not for calling on. I hope now, that by the middle of next week all may be done. In the ſixth book, I thought it neceſſary to put no other things for matter of hiſtory, than will be acknowledged by the Mahometans. And indeed *Grotius* himſelf was of that opinion. And therefore I have left out what is ſaid of the pigeon flying to *Mahomet*'s ear; and that the mouſe was bred of the camels dung; and that half the moon came into his ſleeve; and ſome few things are ſo altered, as that they might rather agree with what they themſelves affirm, than what others rhetorically deſcant on the ſtory. Sir, that acknowledgment, which ought to be made of your great good intentions in this work, I ſuppoſe, will be better ordered, ſo as to be put in with thoſe copies, which ſhall have the Latin bound with them, and be retained in Chriſtian countries, than neceſſarily annexed with the Arabick. For I think it will be better, that any, which ſhould be ſent unto thoſe eaſtern parts, ſhould go without any name or title of perſons or place, whence they come, leſt the good thereby intended might by ſome malicious men, under that pretence, be hindered. But if you pleaſe to order it otherwiſe, your commands ſhall be obſerved. Sir, I muſt crave your pardon for all defects, which will be found in the work. My deſires were to ſerve the church, and your noble ſelf: wherein I have failed, I hope your candour will impute it not to want of will, but ability. I crave leave,

Honoured Sir,

your moſt humble ſervant,

EDW. POCOCKE.

Oxon, January 3, 1660.

Most honoured Sir,

YOUR goodness hath emboldened me to send up to you this enclosed note, desiring, if opportunity may serve, by your mediation to procure them from *Aleppo*. I have formerly written thither for them, but could never receive answer; which makes me desire the assistance of your credit, which I hope may more prevail. The former are to be gotten from among the Jews, and by the hand of some Jew, with which sort of people the English merchants there have continual negotiation. And I doubt not, but if any of them would make it a business, they might be procured, either at *Aleppo*, or from *Damascus*, or the like places. I conceive they are books, which might be much to the common advantage of that sort of learning, more perhaps than those, that ordinarily we have, which makes me much desire them; and among the other parts of *R. Tanchum*'s book, that he calls Al *Biyan*, which are notes on the scripture; especially his first part, wherein he hath *præmissa generalia* to the rest of his work, and concerning such things as ought to be heeded to in the interpreting of scripture. He often cites it under the title of כליאת or Generalia, in his other parts, some of which I have, and wish for that and the rest. *Cozari* I hear is coming forth in Hebrew and Latin at *Basil*. I wish therefore we could see it in Arabick, as it was by *R. Judah* first written. The latter two books, the titles of which I have written in Arabick, are to be had from the Christians there. And I would our men could procure some other of their ancient books. We know too little of what is among them. Sir, I beseech you, pardon this great boldness. I with more confidence beg it, because my design is not for private but publick interest; yet, Sir, I shall look on what favour you do in this respect, as a great heightning of those obligations (if they may be heightned) in which I stand engaged already to you.

SIR,

your most humble servant,

EDW. POCOCKE.

Oxon, March 13, 1660.

Most honoured Sir,

AFTER the receipt of your letter, as soon as I could speak with Mr. *Clarke*, (for he was not then in town) I desired him, that 200 copies of *Grotius* might be gathered by the printer, to be sent up to you; and being then to go out of the town, hoped, that at my return, I should have found them either to have been sent, or ready to be sent; but it proved otherwise; yet I hope to no disadvantage, the occasion for which his sending them was delayed, being (as he tells me) that such faults, as were escaped in the printing, might be mended with the pen. This day it is promised, that some shall go forward towards *London*, and others follow; which I hope will come safe to your hands, as the rest also, when you shall see fit to have them thither. I shall, Sir, accept of your favour, in making bold with some few copies; and have made bold likewise to send inclosed some more papers, with the names of those books, according to that courteous intimation in your letter; having added to the former one other grammatical tract of *Abu Walid*: as likewise *Avicen* (entitled in the Latin translation *de Almahad*) *de resurrectione*; which last may, perhaps, most probably be had at *Constantinople*. Sir, give me leave to propose to you, whether at the end of the Turkish Catechism, it may not be convenient to have the Lord's Prayer, and the Creed, printed in Arabick. I cease at present farther to trouble you, and take leave, desiring, wherein I may, to approve myself,

Noble Sir,

your most humble servant,

EDWARD POCOCKE.

I HOPE, Sir, that together with the books you shall receive a copy of *Tograi*'s poem, here printed, though not worthy your acceptance, yet as a token of unfeigned respects.

A BOOKBINDER, that promised to bind up a book or two in imitation of the Eastern manner, hath failed: but, Sir, if they be bound up either in leather or vellum, so as that they may open well, and little of the margin taken away, it may do well.

Oxon, Christ-Church, Dec. 2, 1662.

Most worthily honoured Sir,

IT was my unhappiness in my short stay at *London*, not to have opportunity of waiting on you. I made bold to leave at the lady *Ranelagh*'s a copy of *Gregorius*, Arabick and Latin, which I hope is come to your hands. If at leisure you shall please to cast an eye on it, and find it in any thing to answer expectation, your good word and approbation will help vindicate it from that contempt, which, with other men used to writings of another kind, it is likely to find. However, I doubt not of your favourable acceptance, and pardon of those defects, which will be found in it. Those, to whom the edition belongs, are yet in dispute, whether they shall print some index to it; which being a matter of delay, and I having done (as I suppose) my work, I was willing it should come among the first to your noble hands. Sir, I crave leave,

your most humble servant,

EDWARD POCOCKE.

Letters from Dr. John Beale *to Mr.* Boyle.

October, 4, 1661.

I HAVE lately overbuſied you about a character worthy the knowledge of greateſt ſecretaries: which, as at this time it is ſomewhat more ripened by my own experience; ſo I ſhall herein give you a clearer model of it. You did once well accept of a civil problem, which, in ſpecie, or by tranſcript, (at your own choice) you may pleaſe to communicate to my couſin *Pye*, allowing him to ſhew it alſo to Mr. *Sherwyne*, whom I do chooſe to be witneſſes, that I engage my reputation, and all that I am worth, for the full performance, according to every article ſubſcribed. The time was, when a great counſellor told to Mr. *Sherwyne*, that if my better employment did not forbid it, I had been fit to be a ſecretary, *&c.* Now I dare allow to aſk ſecretary *Nicholas*, whether he knows any man, that can go beyond this? I ſhall hereafter ſhew you, that I learned my art of no man.

A mnemonical problem, Nov. 4, 1661.

1. To deviſe millions of millions of characters, each one ſo apparently differing from each other, throughout the whole immenſe variety, that the eye at firſt glance ſhall diſcern and diſtinguiſh the difference.

2. IN a mnemonical table, to appoint a diſtinct place proper for every diſtinct character.

3. BY this mnemonical table, and the art thereunto belonging, to find, ſuggeſt, and provide the proper character for each peculiar place, and with ready apprehenſion of the proper importance of the character; which, for the moſt part, containeth a whole Engliſh word, a real matter or buſineſs.

4. To produce the proper character in the proper place, and in readineſs for every occaſion, accordingly as the immenſe variety of occaſions may be offered; and all this in a moment, or in a twinkle of the eye.

5. To deviſe for this performance characters all of ſuch eaſy draughts, that any ordinary ſecretary or clerk may at firſt trial be prompt in it, and engroſs them with diſpatch.

6. To deviſe, that theſe characters of ſuch immenſe variety may (notwithſtanding the variety) be printed with ſo much eaſe and facility, as ſhall only require (at moſt) double pains of other printing. [This I lay down for fuller caution of liquid truth in all points, being of opinion, that it may be printed with more eaſe, and far greater diſpatch, than other writings.] Of the one I am ſure; of the other I will call it but hope, till I ſee the trial.

7. To change the ſhape, and alſo the force of this character, and to vary it into millions of millions of guiſes, to prevent the treachery of diſcovery, as oft as occaſion or care of ſafety ſhall require.

To the clauſes 3, 4, 5, 7, note, that the characters are not written in the peculiar places of the table; for that would engage and fix the memory to thoſe characters alone, and thereby hinder the further uſe of the mnemonical table; or, at leaſt, foreſtal againſt that variety, which may be neceſſary to prevent diſcovery; but, which is far better, and more ſtrange, and, indeed, the main point of the ſecret, the characters are retained in the mind, and, in a moment, producible in fit order for any kind of occaſion.

ALL this, the reading, writing, uſe and practice, ſo the learner be willing, and of ordinary capacity and ſkill in clerkſhip, I undertake to teach with eaſe, due vacancies, and refreſhments, in one week. To this I engage my credit, and all that I am worth.

JOHN BEALE.

Feb. 25, 1662.

Honourable Sir,

I HAVE made thus bold with you, for which I begged pardon by Monday carrier in a ruder draught; for then I was conſtrained to force my Pegaſus to out-run the carrier's horſe. And thus we deal with God and good men all over. We beg pardon, and commit the ſame faults in the ſame breath. Now I am to acquaint you, that there are in my hands five very large parchments of ſtrange alphabets, titles, and notations, which Mr. *Hartlib* beſtowed upon me, as the device of *Caleb Morley*, who (at a great age) ſhewed the moſt wonderful ſpecimen of artificial memory, that was ever ſhewed, as I think. And the Engliſh court (for many years) ſaw the proof of it. But by his death (which was ſudden by a fall from his horſe) theſe rolls are laid aſide as unintelligible; and the art deplored, as irrecoverably loſt; or the author ſuſpected of magic. Now, by caſting my eye on the rolls, I am become confident, that I can interpret every line, tittle, and blot (for thoſe alſo are ſeveral kinds of mnemonical marks.) And I can point out, in which order every parcel is to be learned (for that is alſo no ſmall difficulty, and no remark left, by which we might diſcern, which roll is 1, 2, 3, 4, or 5.) And there are ſome blinds, which for ſome time my eye had not diſcerned; now I have found them, and know their uſe. And that theſe rolls were apprehended by Dr. *Goad* (then chaplain to the archbiſhop, and famous at *Dort*, a ſtiff and ſtaunch perſon) to be uſeful, may appear by theſe words in the cloſe of the laſt roll under his hand.

THIS alphabet, conſiſting of five pieces of parchment, and being a diſpoſure of vowels and conſonants, tending to an art of facility and method invented by Mr. *Caleb Morley*, and preſented by him to the king's majeſty, I have peruſed, and think it convenient and profitable to the purpoſe of the author, and therefore fit according to his deſire to be printed

printed and published by his appointment, and to his use.

THOMAS GOADE.

Croyden, Sept. 17, 1623.

SIR,

THIS I refer to your own private thoughts, not offering to engage the Royal Society in it. For I take notice what prejudice most learned men have against all discourses of artificial memory; yet we cannot deny it the suffrage of the greatest wits, that ever were; *Aristotle*, *Cicero*, *Quintilian*, *Aquinas*, *Muret*, lord *Bacon*: to these I could add hundreds. And I know, I could once boast of a natural memory beyond belief, but I found it true, that Mr. *Hales* foretold me, the first grey hair would signify the decay of it; and since I have had some regard and aid from some methods of artificial memory.

BUT above all in present I take notice what vast aid might be to the memory in the very printing of books that are worthy to be learned in the reading. And for this cause, I do account, that by our prints we are at some loss in that we have omitted the beautifying letters, which in manuscripts did very distinctly adorn the fronts of chapters and sections. And other golden and fine coloured ornaments they had, which gave mnemonical remarks to main joints, and these were (in *Solomon*'s language) as studs and nails to fasten the memorandum. Neither were they of old at so great cost only to please children, as with painted babies. Therefore I am sorry the Elzivirian and other excellent printers, have despised these beauties.

AND that you may see I have primitive antiquity, zealous fathers, and first ecclesiastical liturgies on my side for these and more sacred uses, I have herewith sent you a transcript out of St. *Hierom*'s preface to the new testament. Which, besides the flourish of the cut, may bring *Caneparius de Atramentis* in some request for variety of beautifying colours. And though I love picture very much, yet this I prefer (for the substantial aid) before Mr. *Bloome*'s ornament. And this may be so devised, as to be no great charge nor much interruption to the press. And for some books, they deserve (by a round value) to be so far guarded from proletary use. To these I would recommend the mnemonical characters of *Publicius*, and those added by *John Pæepp* in his *Artificiosa Memoriæ fundamenta*. *Tu hujusmodi alphabetum ex instrumentis à Publicio excogitatum accipito, sed si ex benè feriatis fueris, ac hujus artis avidus, facilè proprio Marte melius formabis.* It is easy to propose variety of excellent and divine efficacy; and this can be no hurt to natural memory. Sir, I hope you will sometimes give me leave thus to whisper into your own ear, which I dare not offer to the whole body of the Royal Society.

Honourable Sir,

your vowed servant,

B.

Domino illustrissimo Roberto Boyle, *&c.*

J. B. S. P. D.

I pete, musa, virum, purâ qui mente colendus.
Quid tibi suffusis ignibus ora rubent!
Tu mollis nimium, nimium licet ille severi
Judicii censor, cum juvat, esse potest.
Non tamen arbitrium vereare subire faventis:
In caput haud stringet spicula dira tuum.
Dumque litas animi grati' lætique lepore,
In te nil juris triste tribunal habet.
Ex merito possit te quamvis ore verendo
Excipere, aut tetricâ spernere fronte levem,
Ille, nec officio dedignaturus amici,
Asseret amplexu, propitiâque manu;
Inceptumque tuum pacatâ mente fovebit,
Nec renuet, quamvis spargere es ausa sales:
Non tibi, musarum magnum decus, ilia adurit
Virus amicitiam suspicione gravans;
Neve supercilium curvos confringis in orbes,
Cum mea sunt manibus scripta recepta tuis.
Exul abi, timor omnis; habet securus amator,
Quo sua cuncta potest condere sensa, sinum.
Cur ungues saperet demorsos, ter repetitis
Ante tuos tornis litera trita pedes!
Artificem temnit limam, complexibus apta
Simplicibus, pulsat quæ tibi musa fores;
Inque tui cordis penetralia rectius ibunt
Quæ subito fundam, nec meditatus ego:
Nec mirum est pedibus si cespitet illa, citatos
Quæ superat cursu læta Thalia notos.
Vatibus æthereus justis exundet oportet
Spiritus, et pleno Nectar in ore fluens.
Mene mihi novosi gyaris compressa Lycæi
Sic respirandi gestit habere vicem.
Tu quoque quid senium primis accersis in annis!
Verna quidem lux est anteferenda nivi.
Lætitiæ comes est risusque, jocusque, Venusque,
Ipse Cupido puer, nudaque trina Charis:
Tristitiæ comites, livorque, horrorque, furorque,
In cædem et rutilis anguibus acta soror
Vos, O rectores populi, queis cingitur auro
Frons Augusta, oris vos prohibete minas.
Hinc lites, hic insidiæ, nec ab hospite tutus
Hospes, ubi est luctu fas violare lares.
Ille suis fatis injurius, ille benignis
Ingratus, cui non ampliat ora lepos.
Invidus et patriæ, qui seclo debita nondum
Agnoscit Britonum gaudia fixa solo.
Ecce et adhuc magnas durat conventus, abeste
Quotquot in his damno creditis esse locum.
Pallet Iber, trepidat Gallus, caput improba Roma
Dejicit, et lentè coccina longa trahit.
Nunc licet amoto sordes velamine totas
Cernere, nunc oculis ulcera nuda patent.
Debellata suos fastus jam ponit Ierne,
Visque infida, ultra nec recidiva, cadit.
Jamque Tago uberiora tument æraria regi,
Nunc et opes Indus fundit uterque suas.
Hoc qui contractâ meditatur fronte, malignus,
Credatur, legum fulchra ruenda studet.
Te quoque seraphicos tinxisse lepore calores
Æterno agnoscet Lindamor obsequio.
Nec minus aptus eras vel in aere prendere pondus,
Et quibus anguicalis urget ubique solum.
Sic, ubi perpetuis conduntur vellera gyris,
Arctè comprimitur, qui petit ima, glomus.

Quis

Quis modus et quantum eſt auræ vitale, et inane
Quid valet, ipſe oculis per tua vitra probas.
Ignis ad aſtra licet pernicibus avolat alis,
Spargit et eoos heſperioſque ſimul,
Siſtis, et arte tuâ proprios affigis ad uſus,
Ne ſuperet juſſum deſtituatve tuum:
Omniaque ex omni extorques elementa elemento,
Nec manet exuccus, te prohibente, cinis.
Quidlibet ex quovis, opifex divine, recudis,
Si non materiam ſuggeris, ipſe facis.
Ornatu polles ſophiæ, virtutis, et artis,
Nulla tamen frontem ruga moroſa fodit.
Clara Bovylorum proles, ignoſce fatenti,
Majus es, et noſtris viribus impar onus.
Succumbendum igitur, ſed in hoc mihi gloria reſtat,
Quod fari nequeo, mente animoque colo.

E cœno Somerſetenſi, Feb. 25, 1662-3. *Tui obſervantiſſimus,*

J. B.

Yeovell, Somerſetſhire, Sept. 28, 63.

Honourable Sir,

I HAVE in my heart an ambitious deſire to render you ſome acknowledgments of your favours; but I have no language for it; and am under many reſtraints, which ſeem to forbid it. For if I ſhould expoſe my apprehenſions, I ſhould not gratify, but rather afflict your countenance, and mine own alſo. And though we may and ought to make the largeſt of our offerings to God for his wonderful works, yet I am not certain, that we may give due applauſe in the ſame fulneſs to any mortal; but that we ſhould much rather bleſs God for the gifts, which he hath given to men; and make a right uſe of ſuch bleſſings, as he communicates by human aids, for our ſelves, neighbours and poſterity. Sir, in your behalf I praiſe God, who taught you in your childhood to offer to him the beſt of ſacrifices, far better than innumerable hecatombs; and then for putting it into your heart, to aſk for that wiſdom, which he was pleaſed to grant to you; and then for enabling you, in the firſt bloſſoming of your youth, to inſtruct the wiſeſt, how they alſo may offer a like acceptable offering to the father of all wiſdom; and in a factious age to direct all diſſenters to the moſt reaſonable liturgy. And now you have exemplified to the living, and to all poſterity, how they may receive from heaven into one center, and communicate to each other, all the obliging beams of nature, grace and art; and how we may heal our animoſities, verbal quarrels, diviſions, and diſtinctions, by freely taſting of the pure fountain of all good, and by freely diſtributing what we have freely received; that we neither divide the author of all graces from the author of all good arts and natural operations, nor divide ourſelves about fruitleſs verboſities.

BUT withal, Sir, you cannot forbid me to be much raiſed in my heart, to find ſuch univerſal obligings to condeſcend to particular and perſonal favours towards me. Yet I ſee I can do no better than ſome devout cowards, who ſay, that their prayers gave good aſſiſtance for the victory, which was gotten by other men's valiant atchievements.

BEING thus far at a loſs (till I was better directed by a ſurpriſing kindneſs from you on Saturday) my beſt and intended deſign of gratefulneſs was not unlike a poor man's ſhift, in *Cambridge*, who, finding himſelf unable to pay Dr. *Winterton* for his medical care of him in his ſickneſs, beſtowed by legacy his body on the doctor, for the beſt payment he could make. And our later experience (from lord *Bacon*'s advertiſements) confirming, that the anatome of the living is more inſtructive than of the dead, I began to make haſte, whilſt I drew breath, to give you the beſt and fulleſt inſpection, that could be deviſed, of my moſt reſerved phyſiognomy. And truly, I think, that kind of medical aid is ſomewhat wanting. For if perſons, that have ran many hazards of life, by various diſeaſes or ſickly complexions, ſhould ſhew their abilities herein, as faithfully as I was willing to ſhew my affections; this would ſometimes explain ſome of the cauſes, why many medicines prove ſo feeble, and would diſcover many ſpecifical medicines, which are not yet vulgarly known, eſpecially if arrived to my years, which are ripened under the proverbial dilemma of a phyſician, or a fool. Being alſo many times brought to the Elyſian borders by conſumptions, that affrighted the doctors; and ſometimes by unſatiable fevers and chronical inflammations, for many years together, becoming a fit engine, on which (as on your pneumatical glaſs) you might receive an anſwer to all your demands, and ſee viſibly the difference of all waters, drinks, diets; and remark all correſpondency of parts, how by outward applications to operate on the entrails; how by inward reliefs to allay outward griefs. And, I believe, you would accept of this ſervice, if it were offered by a more happy hand, as from ſome acute perſon, whoſe ſpirit held a more intelligent correſpondence with the more elementary parts of his body throughout. And truly this was in my thoughts, when I communicated ſtudies with our moſt ingenious virtuoſo Mr. *E. Waller* at *Beconsfield*, when he had a full family, a wife, himſelf, his mother, Mrs. *Tomkins*, and his other ſiſter, his niece *Crooke* (now the lady *Speke*) all complaining againſt the winds of the ſpleen; yet moſt of them ſurviving to confirm my paradox, that a Venice-glaſs, by ſuch aſſiduous and careful preſervation, may laſt as long as a ſtrong Mazor chalice. And I have oft-times obſerved athletic and ſturdy perſons, by a puff of furious air, blaſty vapour, or poiſonous fog, and a diſtemper thereby wilfully acquired, and obſtinately neglected, ſent haſtily to their graves, whilſt others (far more faint and feeble) have taken the firſt touch, as a ſeaſonable advertiſement for their eſcape, or cure. But this argute employment were fitter for the happy pen of your acute neighbour Mr. *Waller*, than for my dullneſs.

SIR, I fear I have tired you already, before I have made anſwer to your commands. And now I can only promiſe to give you a weekly trouble with ſome of the rudeſt rudera, which, in the beſt of my hopes, may poſſibly ſome of them ſerve in that ſylva of promiſcuous experiments, upon which you may diſcharge ſuch of your papers and informations, as are impertinent, or ſupernumerary for your other arguments in hand. And it is almoſt neceſſary, that ſuch a work ſhould be rejoined to your phyſiological eſſays, which were abroad by *Herringman*, 1661. And I have a ſolicitouſneſs, that *Daniel* (who is both a Londoner and Cantabrigian) ſhould receive ſome of your commands for the publick. His character is very fair. And it ſomewhat pertaineth to the advance of political conduct. For there you have a fair regiment of diſciples. And, though *Oxford* be your right hand, yet why ſhould not you uſe your both hands in ſuch a noble work?

SIR, I do heartily wiſh you very much happineſs, but not much reſt from theſe your troubles, theſe half hundred years.

SIR,

your moſt entire, and

truly faithful ſervant,

J. B.

OF mnemonicals I muſt give you a fuller account, when you can be at more leiſure.

Sept. 29, 1663.

Τα Μνημονικα.

SIR,

OBEDIENCE is better than ſacrifices, the beſt that my poor fold can yield, Therefore my firſt regard is to your commands. You require animadverſions, ſupplements, and chiefly mnemonicals. I begin with the laſt.

IT is a very trifle, as if it were to make pins, and place them in rows, or wire cards for the clothiers; which, without the right art, is an ugly hard work; and the art itſelf is but a ſlight and contemptible device.

IF you ſhall pleaſe to examine what *Ariſtotle*, *Cicero*, *Quintilian*, and *Aquinas* have written, with great wit and diligence recommending the art, and ſpecifying all the parts of it, you will find it conſiſt of as few and ſimple elements, as does the Turkiſh muſick; two ſtrings, or three at moſt; two notes, or three in all. *Ordinem eſſe maximè, qui memoriæ lumen afferret*, ſaith *Cicero*, from his own experience, and upon the authority of *Simonides*, *Itaque iis, qui hanc partem ingenii exercerent, locos eſſe capiendos, & ea, quæ memoria tenere vellent, effingenda animo, atque in his locis collocanda; ſic fore, ut ordinem rerum locorum ordo conſervaret, res autem ipſas rerum effigies notaret, atque ut locis pro cerâ, ſimulachris pro literis uteremur.* Theſe few being all the parts, and theſe being ſo argutely illuſtrated by thoſe four forenamed leading wits, ſo fully and moſt elaborately by *Quintilian*, there remains nothing for any ſober man to undertake; only the practice is our part and duty; and that is indeed the ſum total.

AND truly, in my childhood, I found, that all the art was a kind of clock-work, or wheel-engine, as *Ariſtotle* deſcribes it. The joining of ſpring wheels, and other parts of the watch, in ſuch coherence, that, by the touch of any part, the whole and every part may be put in motion, and yet all in order.

AND by reading *Ovid*'s Metamorphoſes and ſuch ſlight romances, as, the Deſtruction of *Troy*, and other diſcourſes and hiſtories, which were then obvious, I had learned a promptneſs of knitting all my reading and ſtudies on an everlaſting ſtring. The ſame practice I continued upon theologues, logicians, and ſuch philoſophers, as thoſe times yielded. For ſome years before I came to *Eton*, I did (in ſecret corners, concealed from others eyes) read *Melanchthon*'s Logicks, *Magirus*'s *Phyſica*, *Urſin*'s *Theologica*, which was the beſt I could then hear of. And (at firſt reading) by heart I learned them, too perfectly, as I now conceive. Afterwards, in *Cambridge*, proceeding in the ſame order and diligence with their logicians, philoſophers, and ſchoolmen, I could at laſt learn them by heart faſter than I could read them; I mean, by the ſwifteſt glance of the eye, without the tedioufneſs of pronouncing or articulating what I read. Thus I oft-times ſaved my purſe, by looking over books in ſtationers ſhops; and good reaſon, when I grew to the maturity of diſcerning, that much more was publiſhed under great names, and high pretences, than was fit to be recorded. Conſtantly I repeated in my bed (evening and morning) what I read and heard, that was worthy to be remembred. And by this habitude and promptneſs of memory I was enabled, that when I read to the ſtudents of *King's College Cambridge* (which I did for two years together, in all ſorts of the current philoſophy) I could provide my ſelf without notes (by mere meditation, or by glancing upon ſome book) in leſs time than I ſpent in uttering it: yet they were then a critical auditory, whilſt Mr. *Buſh* was ſchoolmaſter of *Eton*. This was no more pains, than to empty the honey into the combs, which are prepared ready. And to him, that conſidereth, how every perfect reader devours the whole period in a moment, before he can pronounce the firſt ſyllable with true emphaſes, it will be no ſtrange or incredible matter, that one ſhould ſtring up any diſcourſe, and ſort it to known topicks, and provide appendent topicks for novelties, with an undiſturbed diſpatch.

IN theſe beginnings, I accuſed my memory as much as any man, as defective for ſtrange names, words, alphabets and languages, not fully underſtood; but obſerving how, in the prints of thoſe days, the names were printed in a bright Roman print (all over the pages liquidly diſtinguiſhed from the black Engliſh print) I reviewed them apart, and learning them

them in order, made such as I had learned a kind of topicks, to assist me in the learning of the rest, and made them and the paragraphs the handles, on which I did hang the particular branches of the story.

THUS by the alphabet consisting of few elements, and those having their compartitions or rests upon the vowels (the leading letters linking their formations into syllables, as they fell out to be one, two, or more syllables) I found a regular aid, which afterwards would indifferently serve for the farther acquest of any words, names, or strange language; and the spirit delighting in order, relations, parallels, similitudes, and novelties, I did daily learn the names of places, persons, or things, so as to annex them always to some former impress; which renewed the former impression, and secured the new. And thus, by impressing the Parcæ, Cyclops, Furies, Charites, Muses, Sybills, *&c.* their names, significations, order, and number; one fastned another, and gave encouragement for the like promptness in other like matters.

OF these and other mnemonical matters I gave some account, by way of long letters and essays, to Mr. *Hartlib* some years ago.

I. IN some of these essays I observed the mistakes of some, who blame their memories, without just cause.

II. IN others I specified, what easy and obvious aids many, that complain of this want, may acquire; always (by particulars) exemplifying the peculiar aids and occasions, by which some were eminently famous for vast memories, and how others became notoriously defective.

III. In some I distinguished the art, habitude, or promptness of taking a quick and deep impression of arts, notions, or languages, to retain all firmly, from the versatile activity of rallying, or calling to order and rank, backwards or forwards, names or things, whether before known, or unknown, at first or second hearing.

To obviate a little of this for further illustration, I will here put down a few of those propositions.

I. To the first, I note, that some blame their memories, when they did not take care enough to give a sufficient charge to their memories, nor a due depth of impression; as when the wife forgot to advertise her husband to avoid an ambush; had she had a due care and tenderness for her husband's life, it had wrought strong enough on her fancy, to warm all the blood about her heart to attend her husband's safety. In many such cases, the default is more from stupidity and dulness, or carelessness, than from want of memory.

2. SOME commit the trust to outward and false aids, that are irrational, and cannot move, rather than to their own spirits and imagination, which is always active, stirring, and at hand. Thus the thread tied about the finger, or ring, may deceive, if the care of tying did not help the impression; and thus topicks and common places in books, and not in the brain, may make a learned dunce. And for this cause, men should take heed of engrossing in table-books, what they ought to learn by heart, except it be with purpose to take it off the table-book into the memory. Otherwise they may find *Plato* as true as an oracle, Μεγίστη δὲ φυλακὴ τὸ μὴ γράφειν, ἀλλ' ἐκμανθάνειν, ἃ γὰρ ἐστι τὰ γραφέντα μὴ οὐκ ἐκπεσεῖν. *Fieri enim non potest quin scripta nobis excidant.* That learning is our own, which we carry about us, and out of the reach of fortune. He that trusts to his table-books, more than to the tables of his mind, hath tempted his fancy to be treacherous or lazy; and is referred to his book in the hour of his need. And hence are some shepherds and clowns better provided of memory, than some more promising doctors.

3. SOME excellent wits blame their memory, when it is their nice and hotspur fancy is in fault. Let me name Mr. *Waller:* when we communicated studies at *Beconsfield*, he told me, that he could not trust his memory with the Lord's prayer, or a benediction for the table; yet I then admired his prompt sagacity, both for elegancies of language, and for depth of matter. And since those days, the greatest assemblies of *England* have found his harangues impregnable, and the politest wits do find enchantments in his poems. His case was this. He rode on a winged horse, Pegasus, whose flight was so swift and fervent, in a progress for fresh acquests (as the bees on mount *Hybla*) that he could not endure to task it, or to fetter it upon repetitions of known things. Or it was the curiosity, delicacy, or niceness of his spirit, which did rather constrain him to blank his mental tables, than to leave there any records, that were not choice and singular. And this in calmer stile was the case of Dr. *Andrews*, and other very profound persons. And every man's memory is so near of kindred to his own spirit, that it is generally fit and proper for the engagement of his fancy and affections.

4. SOME do blame the fickleness and unconstancy of their memory. They confess, they can recover frequently, but not at call, nor in time of need. It is the case of a well-stored salter, or merchant, whose wares are not placed in order; or he seldom in his own shop or warehouse. His store confounds him, when the fair comes.

So that memory first bears the blame for the faults of a dull apprehension, which should be awakened by interest or concernment. Or, secondly, is weakened by the charge and trust; of which, by oft miscarriages, we should take warning. Or, thirdly, by a hot and heady hand, which does sometimes fire the limbec with too much haste for the extract. Or, fourthly, by mere negligence, and can never be cured, but by assiduity and diligence.

II. To the second, For easy and obvious aids. It is the first rule, that whatever is not offered to the memory upon very easy terms, is not duly tendered. For fancy is the receiver and impressor. And that is a coy and humorous faculty. It must not be surcharged with

with violence, or obtrusion, but gently, by degrees.

2. WE should affect, and inwardly glory in the improvement of our own minds, and lay up there every valuable advertisement, as fitter to adorn our insides, than frontispieces, walls, and paper books.

3. REASON should wait the most acceptable seasons of dissuading fancy from the adventures of Phaeton, and offer some entertainments in the most pleasing review. And yet here the fancy (to poet, orator, or other composers) is to be allowed much freedom and curiosity. For he, that does not love to sing, *avia Pieridum peragro loca nullius ante trita solo*, but permits his memory to be so stiff, as to give us the same (though from the best inspired writers) rather than the result from his own alembec, his stomach is bad, and his egestions nauseous. I mean, when he undertakes as a composer and penman.

4. LET every man love his own home, and adorn his own Sparta, and find seasons to put his own ware in order, before he oppresseth himself with a greater burden. And by sorting his ware in fit places, he may find in these immense chambers room and fit places for much more, that henceforth may be produced at command. And a little at ready call, in time of need, is better than a great deal out of reach, or unuseful. I knew an industrious student (his name was *Deans* and *Combe* too) he studied dictionaries, and had them by heart; but another, with a few hundreds of words, would have written better than he, both in prose and verse. For use and practice enables us to have our wardrobe at full command. Every poet and orator finds, that when his spirit and imagination is heated, he hath such a brisk power over all his new and old notions and readings, words and conceits, and such variety throngs upon him (beyond his own expectation) that he is constrained to confess inspiration. To help memory, we must not attempt to mend divinity.

5. THE memory of words, names, and unknown language, is indeed a nicer needlework, and too like the primer's art; and it sheweth and requireth the strongest vigour and firmness of a natural memory, as the perception of the smallest object requireth the clearest eyesight. And when the cells of memory are replete with phlegm, or debilitated with age, then we remember nothing, but long stories; and we have need of table books to register the names of our friends and acquaintances. In this case I refer to the physician and his elixirs, which may quicken frozen, benumbed, and blunt fingers to handle small needles, and such small particles. Of this (which nature is capable of receiving a remedy) I have offered a touch of supply already, and shall further prosecute it in the following discourse. And no man will despair of a fair progress in it, when he shall see all imaginable formations of syllables and words reducible to a few heads, in a facile and obvious order, and in a brief model, at one view, as in my following design; especially when the studs or nails were engrafted in our childhood, as is the alphabet generally to all that know letters. And when memory is at the worst, in decay, we remember those younger days better than the last hour that past. And the smallest syllable may sometimes, in some language, signify the biggest of creatures. And fancy is as speedy at her work, as any spider, to tie the smallest particle to a thread long enough to make a clue for all the folds of any labyrinth. And it is a great help to a decaying memory, if we frequently review our first impressions in any matter of art, knowledge, or experience. And these will be the best topicks, upon which we should hang all our later memoranda. It is as the rivetting and better fastning of the boxes and pegs in the shop and warehouse.

6. IT is a great help to memory, if we accustom ourselves to search every thing inquisitively, as if we would find out the most immediate individuation, and all circumstances. My mother (after eighty years of age) was very famous for an incredible memory. Many would resort to her, to enquire of old matters; but that was a kind of delusion, since all of us do remember the affairs of our childhood best, but yet to me it was very strange, that she should so exactly remember all things from her infancy. At all conferences I made secret trials many hundreds of times to start up questions, which I guessed might never be discoursed by her to others, and she would always immediately (and with some pleasure to have it renewed) give me answer as freely and punctually, as if it were then before her eyes, although it seemed not to be revolved in her mind since her childhood, almost I might say infancy. But in her (and in others of extraordinary memory) I noted two things: 1. She would describe every thing by person, place, order, posture, motion, so as (if it related to any person) to describe the person by figure, stature, voice, tone, and dialect in any humour, that might be singular or remarkable; and she did always take deeper impression, and more of the character of every person, than others commonly do. This may advertise to take in every circumstance, as so many ways to secure the impression, and to make a small particle bear a bigger book. 2dly, I oft-times observed, that her account was generally, according to the first information that she received, because that made an over-deep impression. She would not easily yield to a second fame, though sometimes it might have more of truth. And this may advertise to practice a little the art of oblivion, which in due place may be more worth than memory.

7. AND hence I arrive to this paradox, that some to help their memories must begin (and make haste) to forget. He that would form a block or stone into the image of a breathing man, must with his chissel cut away much of the superfluous matter. No wonder that he cannot write legibly in such table books, as are all filled with scrawlings. Let him wipe all off, and then engross what is fit to be

be recorded: and fancy will never fail to provide freſh tables with alacrity.

8. AND to this note I may rejoin, that, when theſe combs are once put in order, you can never ſurcharge them with honey. The more we acquire, and the more often we viſit and employ memory, the firmer and ſtronger we find it. For example, if I began in geography, and (after the rules of longitudes and latitudes) ſhould remark ſome few of the grand partitions in *Africa*, *Aſia*, *Europe*, *America*, and the Polar Iſlands; the more I advance in the knowledge of more provinces, and rivers, mountains, *&c.* the more I do faſten and ſettle my firſt rudiments, by entering my new ſtore; for to find the fit place, the mind hath ſtill ſome glance of view upon the whole, and particularly upon the recent ſupplies. And hence, by order and degrees, do ſome men become ſo learned to the admiration, or beyond the belief of others. And without thus much of the art of memory, no man ever became famous or ſound in any kind of uſeful learning. And ſome by this art have become univerſally learned in a far larger compaſs than the old reputed encyclopedy. Thus our *Selden*, *Grotius*, *Salmaſius*, and other learned men, by continuing their progreſs ſecured their poſſeſſions. And thus others, who do now addict to the more obliging and better inſtructive experimental philoſophy, though their matter and object ſeem as infinite, endleſs, and immenſe, as all God's works, and all the ſecret and wonderful curioſities of God's workmanſhip; if they ſhall accuſtom to rally their ſtudies in any order of nature, conceipt, or received method, their progreſs cannot burden, but aid their memory. Yet in this, the felicity of method, as it does more ingratiate the conceipt, may be the greater aid. For example, if a man has fifty or an hundred buſineſſes, or affairs, to a fair, and ſhall think to direct and ſecure himſelf by the tale or number, he will find himſelf much perplexed; but if he firſt reduceth theſe hundreds to ſo many heads of uſes (and all things in art and nature are primarily or ſubſequently for the uſe of man, and will anſwer *cui bono*: if the provender be for the horſe, the horſe ploughs, harrows, or carries goods, or the maſter, friends, *&c.*) and ſubdivides every uſe, with the remark of concernment, and the loſs, that oblivion may cauſe, this will give fulleſt ſecurity for the main, and may be branched from few heads into ſuch clear order, as cannot be a burden. And now it is not the ſtring on the finger (which may be itſelf forgotten) but the places that muſt be viſited, and the perſons, who muſt be enquired, which are the fitteſt objects for remarks.

WHEN I hear a ſervant famous for remembring innumerable mercate errands, I do not diſdain to enquire his topicks, and remarks; and by enquiry I do oft-times make him more perfect in his own art, than he was before, or than he was aware of. And thus alſo by enquiring the method of every ſtudious perſon (for every intelligent hath a method) we revive, and confirm his memory, and lead him to make reflections upon his own art.

9. I HAVE ſaid it already, but will urge it as a freſh rule, that every man's ſtudies and buſineſſes are his moſt proper topicks for memory; eſpecially being in their own elements, and employed according to their affections. And though many learned men do not diſcern in themſelves, or do not acknowledge any art of memory, yet this is their art. For example; if one ſhould make a very conſiderable diſcourſe of mathematicks to a mathematician, of hiſtory to a hiſtorian, of chemiſtry or other experimental philoſophy to an experimental philoſopher, will not either of theſe in their ſeveral arts remember much more, than any perſon of the beſt memory, that naturally can be, if deſtitute of all art, order, or elements, in any of theſe arts? And every of theſe is more apt to remember, by how much the more he hath his own art in perfect method. My uncle, Sir *William Pye* (ſometimes attorney in the court of wards) was famous for his memory: his lectures were in great eſtimation, and attended with great reſort: beſides his great ſkill in the confuſed maſs of our voluminous and cobweb laws, they that were moſt intimate with him do report, that he could name every Engliſh gentleman (yeoman too would ſome ſay) his anceſtors, pedigree, coat of arms, their chief manſions, and other revenues. Being ſometimes a follower of the judges in their circuits, pleading in all courts, and, at laſt, for many years employed in that office, which made ſearch into all eſtates; he was well feed to remember names, families, and eſtates, and the coat of arms was a farther remark to guard the name in firm cogniſance. As oft as I waited on him, he would diligently enquire, whence, through what towns, by what houſes of note I paſſed? and could better deſcribe my way, than I, that had ſo lately viewed it. This was the practice of his memory.

10. IT is good to lay the ſtrongeſt foundations for a vaſt memory upon the ſenſes. It is one of lord *Bacon's* rules, (and in all mnemonical writers recommended) *Deductio intellectualis ad ſenſibile.* I never loved fairs, being too weak to bear the crowds and joſtlings of men; yet I have ſometimes walked over great fairs, and entered many ſhops, with little welcome; for I had more of the mind of *Diogenes*, to ſee how many things I had no need of, than to buy. Now having a family, I have another ſecret end, to ſee how many accommodations may aſſiſt frugality. But my mind and chief aim was to practiſe my memory, in recounting all particulars in all places as I ſhould be demanded for trial. And in this kind our experimental inquiſitions have the advantage. When Mr. *Langley* was ſchoolmaſter of *Glouceſter*, I met him at *Kiderminſter*, where, with much affection, he led me along with him into all ſhops of ſuch artificers, as were not in *Glouceſter*: this gave me ſome initiation to attend to artifices and mechanicks.

mechanicks. And what memory can eaſily forget what the ſenſes have entertained? Yet the fancy will aſſiſt the impreſſion of ſenſe, and exalt to a deeper apprehenſion than outward ſenſe. I believe I felt a deeper wound, when I ſaw a man's ſkull trepaned, than he, that ſuffered the ſurgeon's operation. To aſſiſt the practice of memory, I had once deviſed a hundred ſtories, as pertinent to that purpoſe as I could ſuggeſt, and had engaged captain *Taylor*'s brother to furniſh me with 100 comprehenſive pictures, that might introduce, or allure; but his affairs preſently altering, my notes were thrown into a chaos of waſte papers. Another may hereafter do it better. And *omne tulit punctum*, whoever hath built the treaſury of all arts, knowledge and languages, for an entertainment, as in an open ſummer-houſe, to refreſh us in our walks and paſtimes. *Tredeſcant*'s ſhop may be a model.

11. To diſcover how ſome impreſſion is deeper than from ſenſe, I can ſpecify, how conſcience hath rouſed up the memory to do wonders. My youngeſt ſiſter (now living, as I hope, near *Cambridge*, the widow of that judicious *Cradock*, who was chaplain to his late majeſty) had in her very young years ſome blame from us for neglecting her books of devotion: but, as ſoon as her own ſpirit felt the check in deep earneſt, on a ſudden ſhe had all the Bible, and many other devotional books, ſo perfectly by heart, that ſhe was indeed a wonder. In that horror of her conſcience, every word of the ſcripture ſounded louder within her, than all the vaults at *Delphos*. It is beſt to receive the oracles of God with ſuch deep reverence, as if we entertained them for the oracles of God; thouſands of other ways may occur to engage the memory to a perpetual practice, and that does all the wonder. But now I muſt haſten,

III. To the third point of diſtinguiſhing memory; and this is not an eaſy matter, nor for every capacity.

1. FOR who can exactly diſtinguiſh, when the memory is naturally good, and when ſo only by induſtry, habit, practice and art? for we ſee, that the ſhepherd, who excels the doctor, had uſed, truſted, and employed his memory, more than the doctor. And ſome men have naturally ſuch a rational, and well proportioned fancy, as will receive, and lay up in this ſtorehouſe, in better order, and better for command, than others perchance, whoſe brains, or mind, have a firmer retentive faculty. And who will aſſure us, how much ſway the agent intellect, or fancy, doth bear over memory? or how much ſhare they have in the eſſence or ſubſtance of memory? If we attribute divinity to this agent intellect, or to memory, (as ſome of the acuteſt ſchoolwits, both Chriſtian and Mahometan, have done) what ſhall we ſay of the memory of dogs, and other animals, who (if we trace their ſagacity) may ſeem to challenge us for the better memory? I am ſure, I have oftentimes truſted more to my horſe and dog, than to myſelf, for the remembrance of my way. The kindneſs and unkindneſs of millions of perſons, with a remark of every individual favour, they will remember a long day, and put it to the teſt of their noſes, whether this be not the ſame perſon, that did the injury or kindneſs; and I never ſaw them miſtaken in the reſult, though ſometimes they diſlike another the more, for ſome reſemblance or affinity in approach to the enemy. To be brief, I muſt call that a good natural memory, which is apt to reduce, and lay up all things in order, ready for all occaſions; and to deviſe images fit to make a laſting impreſſion.

2. THE practice, that hath been hitherto encouraged, is fit and proper for buſineſs, and for ſcholars, to acquire eaſily and ſpeedily, and to retain firmly and indelibly. And ſince all men have not the ſame capacity, nor the ſame firmneſs of memory, *metiri ſe quemque ſuo modulo ac pede verum eſt*; no man can damnify himſelf by this art, or by his frequent practice upon order and image, or impreſs. But let us keep ſome bounds in all the ſerious perambulations of our minds. He, that hath no true reliſh of harmony, in muſick, verſe or proſe, may well betake to ſome other employment; (for what hath a blind man to do with colours?) but that man, who is not in ſome capacities accommodable to human ſociety, is degraded below the beaſts and dulleſt inanimates. It is a ſad ſoul, who, by this mother and nurſe of all diſciplines, may not be expert in ſome uſeful profeſſion. And this art (as thus far recommended) is ſerviceable in any condition. The natural aptneſs firſt mentioned becomes more apt by theſe practices.

3. THERE is a farther art of memory, or (it may be I ſhall be required to call it) a higher degree in the prompt uſe of the art of memory. For all this makes not an orator ready to repeat his adverſary's unexpected arguments, nor to enable to the performances of *Anthony Ravennas*, mentioned by *Sabellicus*; or of the Corſic youth admired by *Muretus*; or of *Terentius*, *Skenkelius*, and *Morley*, more lately. I anſwer, that theſe few rules regarded, and the memory made vigorous, by morning and evening examinations, and thoſe old inſtructions recorded by *Quintilian* reduced to practice, in thoſe two points of regular place and image, will enable for truer wonders, and more valuable, than thoſe named in the late examples: of which kind of abilities lord *Bacon* ſpeaks contemptibly in his Advancement of Learning, both in Engliſh and Latin, l. 5. c. 5. And how can we juſtify ſo much waſte of time, to the only purpoſe of raiſing wonder? And what a trifle it is, to repeat words, alphabets, and ſyllables, *in infinitum*, if compared to that, which our famous lawyers do daily perform before our eyes, even when they do not ſo much as diſcern, that their memory is aſſiſted with any art, but only by practice? Generally all Mr. *Buſt*'s ſcholars, that were of the higher forms in *Eton*, (and ſo I believe it was in other chief ſchools) could almoſt at a glance of the eye

eye learn about a ſcore of *Virgil*'s verſes, or a larger portion of *Cicero*'s orations. And for the interludes of Chriſtmas, without intermiſſion of our daily exerciſes, many did learn volumes for the ſtage, in very few days. My ſelf, who had then no other ſenſe of art, than in the foregoing clauſe I declared, nor could boaſt of any peculiar verbal memory, did, in a few days, learn every line, that is put in the mouth of *Æneas* by *Virgil*, in all his Æneids; and acted it ſeveral times before Sir *H. Wotton*. And I embrace this occaſion to applaud action, as a peculiar help to enliven and ſtrengthen memory: and hence, from experience, I can anſwer fully, that ſo much of theſe funambulary tricks of memory (as lord *Bacon* calls it) as may be of any commendable uſe, may eaſily, and by theſe two rules, be learned.

In the laſt place I muſt relate, how Mr. *Hartlib*, having received ſuch of my eſſays upon the art of memory, ſent me his whole ſtore of mnemonical books, and, in a large letter, gave account of Mr. *Morley*'s very incredible performances. In following letters, I preſſed him to all particulars concerning *Morley*, as far as he could give me any anſwer; only he told me of a ſcroll of parchment, which he bought in *Duck-lane*, that it was *Morley*'s, but ſo unintelligible to all mortals, that he had caſt it amongſt his waſte papers. For a view of this ſcroll, I ſolicited ſome weeks, or months, before he could be at leiſure to find it out. As ſoon as he ſent it, at firſt caſt of my eye, I ſaw it was a very coſtly and elaborate model; containing between 40 and 50 feet length in parchment, engroſſed in a beautiful hand, ſubdivided and glued into five rolls of differing importance, viewed, examined, and approved, by the teſtimony and ſubſcription of Dr. *Thomas Goad*, a very ſober and acute perſon, and with royal countenance of higheſt applauſe, recommended to all ſchools, as Mr. *Hartlib* farther ſignified. Dr. *Goad*'s teſtimony imported, that he underſtood the accommodableneſs of *Morley*'s contrivances. And Dr. *Goad* was himſelf famous for many literary peculiarities. And, by peruſal, I ſaw how to interpret his contrivances, titles, remarks and defacements, at leaſt, by gueſs, and to mine own ſatisfaction. And now it is time I ſhould acquaint you, how much farther I have advanced. Being encouraged, and frequently preſſed on, by the importunity of Mr. *Brereton*, to explain thoſe rolls, and to proſecute that argument, I determined and proceeded as followeth.

1. I INTEND, God willing, to leave thoſe rolls, and all the mnemonical books, and other accounts of that art (which Mr. *Hartlib* ſent me) in *Greſham* college, for the uſe of the Royal Society.

2. THE books (as I take it) are all out of print, and the beſt of them never were printed for common uſe; but, being publiſhed by the chief maſters of the art, were by characters ſo intricated, that the maſters might not loſe the gain by the common ſale of them; the beſt of them is ſo anonymous, that Mr. *Hartlib* could not tell the author, or the publiſher. I would part in preſent with any of the books to be publiſhed, which by the annexed keys may eaſily be done by any academical corrector. But, for me to make collections, or new methods of the ſame thing; it were but *actum agere*, and the world is too full of ſuch folly. Yet I ſee great cauſe to wiſh, that in all univerſities there were profeſſed and able teachers of the art of memory; as there ought alſo to be ſuch as did well teach the arts of rhetoric, oratory, action, as did *Roſcius* and *Æſop*. What I have ſcribbled in theſe letters, is aloof or apart for the moſt part from what I find in the books of art. And I ſee three or four books of memory are already abroad in Engliſh, perchance with ſmall applauſe, and to little behoof.

3. I HAVE depoſited *Morley*'s rolls for a time in Mr. *Brereton*'s cuſtody, and Mr. *Hartlib*'s accounts of it; to this end, that he may enquire, whether he can find any perſons, that will undertake the explication.

4. I HAVE, in haſty ſcribbles, made offer at ſome explication; and this alſo I have debarred from the view of others, upon the engagement of Mr. *Brereton*'s word, which I know he does highly value. This I leave in his cuſtody, and yet bind from others eyes, that if another interpreter undertakes it, it may be compared, how far in our gueſſes we do agree.

5. HEARING by Mr. *Hartlib*, that *Morley* had a ſecret key, or more portable breviary, for the uſe of his larger contrivances, which was deplored by Mr. *Hartlib*, as the main myſtery, and irreparably loſt, I have exemplified, how thoſe contrivances may be abbreviated into ſmall manuals, and for more eaſy practice.

6. SINCE practice does all the wonder, and is all the difficulty; to eaſe the burden of practice, and to inſinuate the art and habit unawares, I have deviſed a mnemonical character (of which I formerly acquainted the honourable Mr. *Oldenburg*, and other noble friends) by the uſe of which character only, as for cryptography, one may ſoon get a facility in ranging all imaginable formations of letters, ſyllables and words, ſo as the memory, *tanquam uno intuitu aut nutu oculorum*, may, without labour, view and receive them, in whatſoever poſſible form or order, fancy or occaſion may ſuggeſt, alter, or rank them.

7. I EXEMPLIFY, how the uſe of that peculiar cryptography does perform lord *Bacon*'s deſign, touching helps for the intellectual powers; and may, by an immediate tranſition with the ſame, or like operation, ſerve for an univerſal character.

8. I URGE, and ſhew, how by the ſame proceſs the ſpirit is enabled for a promptneſs in the acquiſition of languages: in which operations nevertheleſs any man may decline the tumbling tricks of the mind and memory, reproached by lord *Verulam*, or take them in his way as he pleaſeth.

To

To resume the *pinners rows*, all the operations is a trifle; neither have I any zeal for the character, as cryptographal, or universal; or yet for the mnemonical aid, otherwise than complicately, so as the one may suborn aid to the other, and both may envigorate the activity of the mind to a very useful promptness. Neither should I specify all the uses or powers of it, but in due places: for if I should open my utmost aim, no man will look upon it as feasible, but guess it to be *obscurum per obscurius*, and the help to be the greater burden. And so it will be indeed, if the faculties of the mind be not raised, strengthened, and habituated to it, by a very gentle and orderly process of degrees.

From *Yeovill*, Oct. 2, 1663.

Honourable Sir,

HAVING tired you with long congratulations, and myself also with that and other scribbles on Monday last, I had thoughts of giving you more rest at this time. But on Tuesday morning I drank your health in a dose of essence of balsam, by which I was inspired with strength to undergo your commands for mnemonicals: and when you have seen what is here drawn, and what lies in other hands waiting for a fewer hours of your leisure, I hope you will rather say, I have done too much and superabundantly, than too little and defectively. This is in my heart my own judgment upon the matter.

BUT I cannot devise, how you should peruse my scribbles, for I have neither strength nor leisure either to compose or to transcribe; and since I reviewed my hasty draught, I find so defective expressions, as are uncapable of any other help than your pardon. If this were of so much worth, I would intreat, that the amanuenses would prepare it fitter for your eye or ear before you afflict yourself about it; and then if you should think fit to commute these sheets for some writings, which are now in the hand of my honoured friend Mr. *Evelyn*, these letters and those writings will mutually assist for the explication of each other to you both. And I humbly desire, that neither may be much spread abroad, till they have received the last hand, and the season be ripe and fit: and besides (in these) you will find some domestical stories, though to honest purpose. I resign all to your prudence and conduct.

BUT you may interrogate, why and how I can give such full applause (as in the beginning of those sheets I do) to *Quintilian*, and others of the ancients; and yet offer for the publick more of these writings, either those I have in my custody, or mine own. To this I may answer, that libraries had long ago been empty, if that rule had been obliging, and in force; and I doubt we shall never leave off the rank humour of adding even to the oracles of God, till the crescent sword makes us more humble, and more reasonable. But my better answer is, that modern masters in the modern expressions do best agree with the modern times. And also I consider, that there was more care and pretence to the art of memory in former days (as appears by the remarks, ornaments, rubricks in manuscript, and by mnemonical cases fitted for arts) but there is much more of the art itself (than we seem to be aware of) in use in these days, as appears by our progress in all kinds of literature. For though he takes no notice of it, yet every linguist, before he can be perfect in many languages, gets in mind such topicks, as are most proper for the acquisition of languages, by which he does afterwards get more of like kind with such facility, that he advanceth with more ease and speed; and in a serious pursuit of other deeper knowledge (upon the by, and with imperceptible diversion) gets more languages daily.

HOWEVER, there is great force in this, *Qui monet ut facias, &c.* For every man, that reads a book himself, finds himself in some degree apt to turn to the page, where he found novelty and excellency, or disgust, and some (by a small ray of their spirit) will turn with the finger to the place, *tanquam aliud agendo*, whilst their more serious thoughts are otherwise employed. But, if upon advertisement, they fix and accustom the memory, to take the first impression of the title, chapters, sections, method, and paragraphs, and peculiar remarks of pages, by this precaution and habit, they may find their memory much more vivid and firm.

BUT to prevent in you, and Mr. *Evelyn*, and other friends, such great expectations, as do soil my spirit, and clouds my endeavours, I do often inculcate, how slight the means is. For example, it may seem incredible, or ridiculous, to engage the memory in a prompt use of one hundred and six thousand distinct places for alphabets, syllables, and words; but in practice it will be but two easy operations, which a young factor will suddenly catch up in an hour or two, being assisted by a common slight of the easiest part of arithmetick, the characters being reduced (by coloured lines of partition) to a brief view of one page in 4to. For twenty times twenty makes four hundred: and (in the same manner of operation) four hundred times four hundred makes a hundred and sixty thousand. So like it is to the making and rowing of pins: he, that can make and row one paper, finds no other work or difficulty for as many characters as he pleaseth. And twenty letters may suffice for an alphabet. Or if, for curiosity, he would practice upon *Morley*'s alphabet, which (to take in the sounds of all the languages) he made thirty, by multiplying thirty times thirty, it comes to the same manner of operation.

SIR, *Comenius*, to expedite pedagogy and didactics, wrote a large folio, which he sent me, and hath since added many more volumes: but I thought it better to adhere to my old rules, than to begin with this folio.

I must

I muſt not commit the like error; if a very few rules, and a ſheet or two exemplified, does not ſerve this turn, I ſhall have nothing to ſay. For the world is already oppreſſed with didactical books. It may be you have heard of one *Hercules*, who of late years in ſome parts of *Germany* taught all ſorts of people, men, clowns, and plough-boys, all the learned and devout languages, in few weeks, by practiſing their memory upon a roll, which he turned by ſcrews upon a table, for which he was arraigned as a magician. If I undertook pedantry, it ſhould be my ambition to prefer ſuch brevity before huge volumes. Example is the beſt teacher; and performance a ſufficient proof and demonſtration, as you have thoroughly taught us in your excellent philoſophy.

SIR, I cannot be very well pleaſed with any of theſe firſt draughts, being haſty work, (and that man muſt be very fantaſtical, who gives not ſome precedence to his ſecond thoughts and riper judgment, before his firſt conceits.) But I am ſo much unſatisfied and diſpleaſed with the third ſheet on the top remarked 3, that if in the whole there be any thing worthy a review, I muſt humbly crave the favour for the return of that ſheet for a chaſtiſement. I hope to give a clearer diſtinction both of natural memory from artificial, and of the art, which is the treaſury of all arts and ſciences from that, which pretends to the wonder. Let me put a note of reduplication upon that, which you do well know: you know ſome, that are ſo perfect in many languages, that they would bluſh to be told of any phraſe, idiom, or almoſt of any authentical word (in any of thoſe languages) to them unknown; the ſame perſons to be in a like degree prompt in all hiſtory and geography, and many other arts, ſciences, and voluminous writings, as are ſome, that have the truſt of great libraries; no expreſſion poetical, or rhetorical, no notion ſeems new or ſtrange to them: I ſay of ſuch memories, which muſt have more of art, induſtry, and practice, than of nature, and yet much alſo of an inquiſitive reaſon, of an impreſſive conceit, and of a ſerene and firm mind; that they are highly to be preferred before thoſe quick returns of memory, which are ſo much admired. For what is it to tire all the company with repetitions of words and ſentences (if it ſhould hold out for ſome hours, days, or weeks) in compariſon of this art, which heaps up, digeſts, and firmly retains whole libraries? In my poor deſigns, I have offered aids of both kinds, but chiefly to the firſt, and collaterally to the ſecond, as far as any man ſhall pleaſe to concern himſelf in it.

BUT, Sir, all this is but a kind of pedantry, and very much below your affairs. God willing, in my next Eſſays, I ſhall endeavour to ſerve you in your more noble and publick engagements. For though no man can make leſs luſtrous proof of it, yet I aſſume the confidence to aver it, that no man living can more deeply and more ſincerely honour you, than

Honourable Sir,
your moſt obliged ſervant,
JOHN BEAL.

Oct. 17, 1663.

Honourable Sir,

I AM now under your commands for animadverſions: but I muſt firſt interrogate. Can your commands juſtify any ſuch attempt? Or will you bid a man demoliſh temples, and deface ſhrines and monuments? To ſay truth, you may ſafely bid envy try her teeth upon ſuch marbles and diamonds. For they came from the heart of the beſt rock; the ſubſtance is all divine, and the foundation divinity itſelf: and he, that ſhall aſſault a perſon for vindicating God's glorious attributes, and the intereſt of mankind, (and with ſo much luſtre and ſolidity) he muſt be guilty of theomachy, and renounce humanity.

SIR, the deepeſt of theologues ſay, that we want the ſame hand, and the very ſame method for the reſtoration of theology; and we cannot ſpare your labours for philoſophy, till our ſafe paſſage for heaven be ſecured. And ſurely we had never ſo far divided, and daſhed againſt each other upon pretences of purer Chriſtianity, or of holy truth, if we had adhered conſtantly to that theology, which is operative, practical, and experimental, according to the ſafe and liquid rule of ſhewing our faith by our works. Now by our lofty flight in logical or rather ſophiſtical terms, and ſchool-notions, we have loſt the foundation, and cannot agree, where to find the old plain and Chriſtian faith, which was heretofore always pregnant of good manners. Our king *James* had the applauſe of learned *Caſaubon*, and other judicious reformers for this ſound ſentence, *Pauca illa ſunt, quæ abſolute neceſſaria ſunt ad ſalutem, et fere ex æquo omnibus probantur, qui ſe Chriſtianos dici poſtulant.* We proteſtants do ſay the holy ſcriptures are full and clear; the Romaniſts (notwithſtanding all councils, ſynods, and ſchool-decrees) give us comfort in our implicit faith, and blind obedience. And as well the prophets of old, *Micah* vi. 6, &c. as the apoſtles, *Heb.* viii. 8. have abbreviated for us in very fair and legible characters, which are alſo engraven in us: yet like *Jacob*'s ſons we fall out on the way, till by this breach we do at laſt loſe our way in ſad earneſt. Sir, you are by divine endowments conſecrated a chief in that prieſthood, which is bound to offer ſacrifices to heal theſe tranſgreſſions. And thoſe great diſcoveries, which God in late ages hath made, not only by great effuſions of beams and light of art and nature, but alſo of that holy light of the grace of reconciliation, may give us many grounds of good hope, that God makes haſte to finiſh ſome great work in a more glorious diſplay of ſo much of his luſtre, as is fit for this world. In which notion I indulge

I indulge no more, than was modestly undertaken by *Bodine* some years ago in Meth Hist. c. 7. *Confutatio eorum, qui quatuor Monarchias aureaque sæcula statuunt*, where he shews, that it is we and our posterity, that are of the golden age.

BUT you expect I should descend to particulars, and I must remember, that I am under the authority of your commands, which puts me to the distress of suggesting, how calumny may frame some argument against you.

FIRST then, page 59. though you speak very warily and timorously of the immense perfection, and therein equality of the divine attributes, and our φιλαντία hath a very just check, I can move in behalf of some tender or curious spirits, that you would vouchsafe to secure that paragraph with a marginal note, as a double express, that you acknowledge God's mercy to be his great and most obliging attribute, not only as our nearest concernment in the great mystery of the gospel, but as extended in chief over all God's works, which were created all very good, but by our transgression were rendered under a curse. For you may justly urge, that as our revolts and transgressions were the sad occasion of the emergencies and supereminences of the attribute of mercy; so by our redemption and restoration, we are singularly bound to offer the sacrifices, which are due to God by the claim of all his other attributes, and particularly for his framing, creating, and governing the world, and all parts of it in such perfect harmony. For the works of creation are not eclipsed and darkened, but illustrated by the restoration, *&c.* In this caution, you may decline some endless disputes, which sharp men do daily raise, how the attributes are distinguished, which are essential, and wherein the prerogative, *&c.* In which the greatest wits may sooner lose themselves, than clear all points to others; and a wise man said too truly, that the Jewish superstition at the name of God was less faulty than our presumption upon the nature and attributes of God.

SECONDLY, *ad pag.* 62. It is best, that you do not (since you need not) engage yourself expressly against the interpretation of *Socinus*. And your margin may add, that however the interpretation of *Socinus* may seem specious and coherent to his principles, yet the other sense is more catholickly received, and very proper for the apostolical inference, that the *Gentiles* might see so much of God in the large volumes of Creation and Frame of the World, as might oblige them to more unblameable conversation; and the sin of idolatry there reprehended, verse 23, as the leading transgression, was not peculiar to that age, but was the sin of the old world. And it is not contrary to the remarks of *Socinus*, that the same scriptures should sometimes have a depth and latitude comprehensively reflecting both upon the creation and the gospel.

SIR, I must not trouble you with all the reasons of these overtures, but I find it safer (and fitter for the dispatch of these Essays) to call for experimental theology, than to engage in any heats against *Socinus*. For, though he never had the credit to raise a national church, as *Luther* and *Calvin* have done, yet all parties (as well Romanists as our English hierarchy, or others, the deepest of them) do all confess him to be the acutest, the smoothest, and yet the most dangerous of their adversaries: and as a mere virtuoso he hath raised in all ingenuous persons, that read him, a greater admiration, than either of those leaders, or than *Erasmus*, who was indeed greater than both. And *H. Grotius* and other his strongest adversaries have so often rendered up their cudgels to him, that we may fear his growth to a great name in the next age, and especially by the weakness of most of his adversaties, who do commonly undertake him before they have wit enough to understand him. The Romanists do think, that all other their adversaries are at their retreat, and fading flowers, as *Balzac* called them. And we all confess, that no man ever disputed better against Jews, Mahometans, and Romanists, nor better defended the authority of scriptures. And though he challengeth all mortals at the single rapier of holy scriptures, yet no man enters the lists against him, but with some advantage of cloak and rapier, fire and thunder on his side. And I fear he makes too full proof by visible examples, that our native metaphysicks will not convince all human nature of the Godhead (for all are not so deeply reasonable) without the help of divine revelation, or some parental tradition, which hath a reverend and obliging force, or right to awaken all human regards. But I doubt also, that his mind is not in this argument fully opened by himself, or understood by others: for such as write his life do deplore the loss of his plea against atheists, which was by himself esteemed the most elaborate of his works, and his master piece. There we might have seen what he esteemed the fittest arguments against such as had no belief of any revelation, as divinely authentical.

SIR, In this I commend your prudence, that you keep the garb that is proper for a person of honour, and leave us choleric men of the lower region to answer to challenges, and to fight in duels. And by this emptiness you will see, that if I could have darted any objections against you, I should not have spared you. And this I dare doom, that whoever prosecutes this task, gets no more credit by it than *Milton* got by his Iconoclastes. And therefore this is all you must expect from me for animadversions. Of wild notes and promiscuous experiments, I am like to send you a great deal more than enough, of which the first exemplar may be medical, the rest more extravagant, at random over the whole mass of the creation.

Honourable Sir,

your most obliged servant,

J. BEAL.

Honourable

Yeovell, Nov. 2, 1663.

Honourable Sir,

I SEEM for a while to owe you a trouble once a fortnight, of which kind the annexed is a parcel.

BUT you may juſtly aſk me, what I mean by this? and whether any thing can be more trivial, or more vulgar than this? or whether any phyſician, or ſurgeon, cannot diſcover much better, and nobler things than theſe?

To all which I anſwer, that when I have explained my aim, I ſhall not be aſhamed to ſay, that the more vulgar the things are, the better and more uſeful they may be to the generality of people: and the vulgarity of theſe generalities, do not exclude, but introduce the more received experiments of profeſſed ſurgeons and phyſicians: and, above all things, I would decline the affectation of telling wonders and rarities; for it is a temptation to ſtep beyond the juſt proportion of truth, and can ſignify no more than *penes authore fit fides*. To diſcover the bottom of my thoughts, I muſt recollect to your memory, the Beverovician induſtry, which compiled a volume of letters or addreſſes from the learned of thoſe days, to determine this queſtion, whether medical art, or other care, could add to the length of a man's days; which related then chiefly to the hot queſtions then on foot concerning predeſtination. All this volume brought forth nothing but daſhes of great wits. But, honourable Sir, if you, or any other perſon by your appointment, would engage and receive the addreſſes of honeſt and intelligent perſons, in the way of their experiments, ſelecting and expunging, as you ſaw needful, to avoid impertinencies and repetitions; (to which freedom, I would not only allow from my heart, but entreat your ſpunge) this might ſoon ariſe to a far more profitable diſcourſe, than the cavils about predeſtination; though that be called theology, this a mere regimen of health.

SIR, I owe you another kind of thanks, for the ſleep medicine; but firſt I would be diſcharged of this poor mite, of which kind I ſent you two ſheets a fortnight ago, herewith two more ſheets, and I think one ſheet more will exhauſt my ſmall ſtock of vulgarities. And theſe bearing the title of experiments, muſt bear ſome ſhape of his addreſs, who engageth his fidelity. The meſſenger makes me abrupt, but always,

Honourable Sir,

your moſt faithful ſervant,

J. BEALE.

Experiments moſt part medical, or chirurgical.

1. ABOUT thirty years ago, *Thomas Day* (an honeſt apothecary of *Cambridge*) aſſured me, that a patient then came to Mr. *Eade*, practitioner then in phyſick there, and told him, that his blood was white. To try the truth, Mr. *Eade*, or *Thomas Day*, opened a vein in his arm, and the blood, as it ran from the vein, had a pallid reddiſhneſs; but on the floor, and in the diſh, was as white as milk. Mr. *Ead* gueſſed, by that, and other circumſtances, that if he had not then uſed remedies, he had proved a leper.

2. SIR *R. P.* was there my pupil, and had moſt horrid fits of hypochondriacal, and almoſt epileptical paſſions, holding him many hours together; his ſenſes alienated, his mouth ſpeechleſs, and a ſtrange murmur in his bowels, which ſome thought to ſignify obſeſſion. Mr. *Eade* propoſed a cupping-glaſs, and ſcarification, on the hindpart, or over it, of the outſide of his thigh. Dr. *Gliſſon*, and all other phyſicians, deſpiſed, and, indeed, derided that propoſal. I ſpent a good ſtock of money in the way of Dr. *Gliſſon*, and others, with no viſible benefit; for the fits encreaſed in violence and durance: at laſt, in a fit, I tried the cupping-glaſs, and found the benefit immediately, and, by taking off the glaſs, the raging fit returned. After ſome proofs in this kind, the place was ſcarified, and a drawing plaiſter applied. And thus, by carrying a glaſs in my pocket, to apply it as oft as the fit took him, the malady was in few weeks cured.

3. MR. *Thomas Mountague*, (now ſchoolmaſter of *Eton*) when about twenty-one or twenty-two years old, being then ſtudious, (yet of a very active body, and very ſober, and almoſt beyond example of ſpare diet) was taken with an extreme gout in his great toe. Dr. *Nic*, of *Cambridge*, directed, he ſhould open a vein in his toe, by which he was cured totally, as he told me ten years after. Quere.

4. WHEN I was a child, I flead frogs in ſport, to ſee what ſhift they would make when flead. By miſtake, as I practiſed on a toad, I found his throat ſwelled, and the duſky ſpots; and thereupon did caſt him out of my hands: I was not bitten, but ſoon after both my hands and handwriſts were covered with a ſcab; I could not then gueſs what elſe might be the cauſe: I was cured by contuſed plantain leaves, or the oil of it.

5. (AT *Eton* I threw many frogs into the *Thames*, to ſee how far they could ſwim. Some did reach to cloate-leaves there growing upon the ſhallow water, and were there ſaved; others were drowned, as we could well obſerve. Yet I have ſeen other frogs, in other places, live under water, and engender there ſo, as to ſtick together faſtened, as dogs when lined to bitches, ſo as not ſuddenly to part at a blow with a ſtaff.)

6. ABOUT the beginning of theſe civil wars, I was overwhelmed in melancholy and grief, to ſee the publick confuſions and ruins, (my neareſt alliances, and deareſt friends, being engaged, and many loſt on both ſides.) This broke out into the blind piles, ſtoppage of my ſtomach, hypochondriacal torments, jaundices: but nothing did more moleſt me, than

than a tetter, which did ſeize on the back of my hand, ſometimes both hands, ſometimes both handwriſts; alſo far upon my arms, and ſeeming to have devoured the epidermis. I ſubmitted punctually to the advice of many intimate and friendly doctors, for inward and outward applications. I changed air and diet, from *Herefordſhire* (my native country) to *Shropſhire*, and back again to *Herefordſhire*. Notwithſtanding all cleanſings and care, the tetter reproached me and my phyſicians, more than ſeven years. In all which time, this ugly tetter was a dial to tell me what food, drink, air, diet or exerciſe, was more kind than other to me; and what medicine, inward or outward, had moſt effect: of which I will here give a brief account of three.

A GOOD gentlewoman promiſed me all things from the oil of wheat. Thus it was drawn. The blackſmith heats his anvil red hot, drops the wheat on, which burns to coal, and the moiſture wiped off is the oil as black as ink. At firſt touch of this oil, I found it burn like a fire coal; but I would be *Scævola*, and laid it all over the back of my right hand; and immediately my torments were as great as thoſe of *Scævola*. It did put me in mind to ſuſpect the liquor of wheat to be more outragious, than that of Jucca, yet Mars might have a ſtroke in the injury. The ſwelling haſtned up my arm, and ſhoulder, the kernels under my arm pits, and my breaſt became very ſore, ſwelled, and inflamed, till it grew to an outragious fever. A ſkilful doctor came ſpeedily, and opened a vein, and by other lenitives, under God, cured me. At the beginning of a tetter this oil may be applied, and will burn out the tetter, and leave a firemark behind. But when the tetter is ſpread, and the humour reſorts, and abounds, and the epidermicks deeply pierced, this medicine is too violent.

8. To omit my trial of pigeon-dung, verjuice, vitriols, mercuries, and thouſands of others. My ſecond remark is, of a healing ſpring, very famous for curing many frets, ulcers, impoſtumes, and had lately done a greater cure upon a poor man's rotted legs, than our phyſicians or ſurgeons could do. This water I tried often, and by warming it in my mouth (by which in the morning it was mingled with faſting ſpittle) I did let it fall warm upon the tetter. It would in a moment viſibly cloſe up the raw fleſh, gathering a thin ſkin over it, as ſpeedily as milk gathers a ſkin upon the fire. And as the ſkin did ſpread all over the tetter, a moiſture would aſcend in round drops through large pores, which being wiped off, and more water poured on, at the ſecond or third time, the pores were alſo healed up. And this courſe I took as often as I went to other tables, to hide the ulcer from giving offence. But this was falſe daubery, and within a day or two I was conſtrained to make ſatisfaction.

9. THIS ſeemed to note, that the cure muſt begin within doors; and ſome from great experience extolled betony, ſome fumiterry, for the purgers of blood or brain from melancholy, ſome elder, as the beſt calmer of hot inflammations, and angry humours. I tried all, and with long conſtancy, but without ſucceſs. What cured me, I cannot confidently affirm; but an intelligent gentleman did ſo highly extol ſanicle, with ſo many proofs of his own, and other mens experience, that by the infuſion of it in drink, it would heal all ulcers within and without, that I uſed it, and found the tetter much abated; and caſually reading *in horto ſanitatis*, that the gum of plumtree, diſſolved in vinegar, would heal tetters, I tried it, and found this benefit, that it would cover the ſore, as with a glaſs, ſo that I could wear a glove. Soon after it came alſo in my mind to drain out the moiſture with vine-leaves, a day or two, and then to apply the gum, and with the uſe of infaced ſanicle in the ſame time I was cured. Upon abuſe of diet I have had ſome red ſpots, giving me, many times ſince, warning to be careful. And in want of vine-leaves I had (but with ſome inflammation) a like benefit from raiſins cut and ſpread over the ſore.

10. BUT every year or ſecond year ſince, I am in ſummer viſited with ſome hot inflammation, which begins in one or both my legs, about the ſmall. And water-gruel, in which the buds, inward rind, or ſome part of elder, is decocted, is my beſt remedy.

11. IN theſe and other maladies I have tried the operations of many vegetables in pottages, and in drink, which being a little warmed would draw forth the ſpirits of the vegetables. But for cordials can prefer no leaf before balm (which is alſo highly recommended by doctor *Smith* of *Shrewſbury*) nor any bloſſom before gilliflowers and cowſlips. And for lenitives, and longevity, I prefer elder. I wiſh ſome trial were made in a cup of balm-ale, how agreeable it would be to the perſon who finds an offence at honey. Becauſe balm hath been always eſteemed the chief of honey-flowers, beſt beloved and moſt friendly to bees.

12. DR. *Sheafe* (now arch-deacon of *Wells*) had a wound in his heel, by an arrow. For which (being my chamber-fellow at *Eton*) he ſuffered (and I in my heart) all the horrors of ſurgery, for more than a year. At laſt there was no hope but his leg muſt be cut off. A good woman of *Windſor* deſired leave to make one trial of her ſalve. This ſalve ſo fermented the wound, that it wrought out ſome yarn of the ſtocking, which the forked arrow carried thither. And ſoon after all was healed. I ſaw the fleſh ſo often eaten away, to no other purpoſe but to ſearch the bottom, and to his horrid torture, that it gave me a better eſteem of a good ſalve, than of a famous ſurgeon; for he had the advice and handling of the beſt ſurgeons that were then of note.

13. THAT the fleſh of ſome perſons is much more apt to heal, than of others, I well know. And do thence alſo conceive, that inward applications may conduce far towards the healing of an outward wound. As burſtneſs or rupture is healed by the powder

of

of conſounds; and diſlocations in the head and bones by oſteocolla.

14. WHEN I was a child, I noted, that the clawings and deep bitings of a parrot (which did it in love and fondneſs) were ſuddenly healed, truly to my great wonder; but a ferret, in a high rage, and ſwelling about the head, like a ſerpent, bit the very end of my finger, which preſently wrought upon my body, as if it had been the biting of a ſerpent; which begat in me a ſore wound, and long ſickneſs.

15. IN turning the key, the middle joint of my middle finger raſed on a nail in the lock. It did ſcarce bleed, and was of no depth, yet it ſwelled up my arm, till it laid me in a violent burning fever above a fortnight. Whether the ruſt of the nail, or the ill temper of my body, was more obnoxious, I cannot ſay. But a ſmall ſpark may fire a tinder-box.

19. A LADY of my acquaintance did frequently cure her great pains of her teeth by tying a leaf of water-pepper, or arſe-ſmart, about her little finger, till it raiſed a bliſter there; which ſhe healed with a leaf of wood-bind; if that were not to be had, ale-hoof, or other good medicine for burning, healed it. The leaf ſhould be tied between the firſt and ſecond joint of the finger.

17. WHEN a ſharp defluxion hath endangered the ſight of the eye, I have ſeen it oftentimes ſuddenly diverted by raiſing a bliſter in the pit of the neck behind, and drawing off the moiſture that way.

18. A VINE-LEAF, or a leaf of a tender young colewort have (both of them) a ſtrong faculty of drawing; and I have ſeen many great cures of divers kinds done by their ſeaſonable applications.

19. OFT-TIMES, when I have felt my vitals in danger of ſome great diſeaſe breeding within me, I have rubbed off the ſkin on the back of my hands, hand-wriſts, or ſmall of my legs, I have diſcuſſed or drawn off the more horrid malady, freed my ſpirits, and then, after I have drawn off ſome tart moiſture, I have ſafely healed the raſed and fretted part again.

20. A GENTLEWOMAN (a near friend of mine) had a very great and dangerous wen on the ſide of her neck, which with haſty growth deformed her, and diſcouraged her phyſicians and ſurgeons, who applied for many months divers medicines of beſt account. I ſent to Mr. *Hartlib* for advice, and my good friend Dr. *F. Cl.* directed, that ſhe ſhould, for ſome time, hold and preſs hard on the wen the hand of a dead man, who died ſome violent death. She obſerved it punctually, and ſhe ſaid, the coldneſs of the hand cooled her heart, and the wen preſently withered, and ſhrunk ſo ſmall, that it is not viſible, nor much bigger than a nut kernel.

21. WILLIAM earl of *Northampton*, grandfather to this preſent earl, chid his cook for his ſcabby hands, as he called it; for his hands were all covered with warts, very great and ugly. The cook anſwered, that he could get nothing, that would drive away his warts. The earl bade him rub them with a dead man's hand, and he would warrant the cure. Soon after the earl died ſuddenly. And then the cook, remembering his lord's words, whilſt he watched the corps, ſtroked all his warts with the dead hand, and ſoon found his lord's warrant and word to be very good. This I received from my brother *T. B.* who was perſonally privy to the truth in all points.

22. WE find and feel, that colds, coughs, rheums, fevers, colicks, palſies, and other dangerous and mortal diſeaſes, are begotten by the violence of damps, winds, or other confuſing operations entering at the hand-wriſts, pit of the neck, codpiece, ſoles of the feet, head, *&c.* And theſe diſeaſes are ſometimes drawn off by fomentations and applications to theſe parts.

23. MR. *Harriſon* (the ſchool-maſter of *Eton*) told me, that when the great plague was in *London*, in a tavern he fell down mortally ſick, and thinking it was the plague, he took as much as a walnut of Venice-treacle, and ſweating on it, recovered. A fortnight or month after, he returns to the ſame tavern; the people all wonder to ſee him alive, and tell him, that when he fell ill, there was one in the houſe dead of the plague, which fell ill in the ſame manner as he did. This was no good news to Mr. *Harriſon*; and before he parted, he fell again, as formerly; and, uſing the treacle, recovered again; but within a month fell into a violent and long laſting fever, which (as his phyſicians told him) he might have prevented, if, after the former fits, he had breathed a vein and purged.

24. DR. *Wedderburne* gave me this medical counſel (as we returned together into *England*) that I ſhould not be ſick before I was ſick, noting the puling ſpirits of ſome, and generally of ſcholars, who do always fancy themſelves to be ſick, or ſickly, and by fancy and frequent medicines do make themſelves ſick indeed. And I was not much guilty of it. For I never took vomit yet, nor ever took a purge, or opened a vein, till I fell into a burning fever in *Orleans*, by advice of Dr. *Du Cheſne*, being then thirty three years old. But Sir *H. Wotton* ſaid, it was proverbially noted to be the Engliſhman's folly, that he is the laſt, that betakes to his couch, and the firſt, that riſeth up. And our covetous clowns do commonly caſt their lives away, to ſave charges: they will not be perſuaded to ſend for the phyſician, till it be too late. Yet we commonly find, that after the third or fourth day's rage of ſickneſs, the phyſician is put to an after-game, and ſeldom recovers ground by his ſlow methods and Galenick or more preſumptuous compoſitions.

25. As ſome fleſh is more apt to heal than other, ſo are ſome bodies more pliant or more compliable to medicine. And though I cannot commend judge *Rumſey*'s Provang for any but drunkards, gluttons, and ſuch monſters; yet if one ſhould ſurcharge or offend his ſtomach (which no virtuous perſon will often do) it is a felicity, and a kind of exercise of the

the body, to have a facility in discharging the stomach by vomit, which may provoke worse diseases. And the like of purgation by stool, urine, sweat, perspiration, exercise, *&c.*

26. AFTER long fasting, a moderate proportion of food hath surcharged my stomach, more than twice as much at an ordinary meal, and so is wine or strong drink very heady in a fasting stomach, or great thirst.

27. WHEN physicians tell me, I must open a vein, or enter into a course of physick, then I fall to elder pottage in the morning, and a spare diet, and find this my surest physick.

28. FROM my childhood I have a corn on the inside of my little toe, which torments me and cripples me more than some are tormented with their gout. It is soft, and hath a black eye, and the touch of the shoe or of any artist's hand, that cuts it, yea, the unavoidable compression of the next toe, gives me a deeper torment than any other incision. In all sharp weather of heats, frosts or long rain, it is my almanack. I tried so many remedies, that I lost all hope and belief, and feared some cancer or gangreen from it. About fifteen months ago, I bound to it a leaf of elder morning and evening for a month. This hath altered the nature of it, and restored me to my feet and legs better than ever I had from my childhood, notwithstanding that the black eye remains, and must be cut sometimes, *&c. &c.*

Experiments medicinal, chirurgical, &c. *Nov.* 2, 1663.

ABOUT twenty seven years ago a gentleman of quality, in the prime and beauty of his youth, had a most afflicting ulcer on the back, and all about his hand, which for many years was obstinate against all applications and medicines, and disgraced him in all companies, (he being then in good lustre amongst the gentry and in the English court) and it was thought to be a tetter: as I sat with him in private conference, he fell to his usual rubbing; and the rage of the ulcer constrained him to break up the skin with his teeth in the very middle of his palm; and then examining the orifice, he told me, he discovered a bright jewel there. We examined it, and found it a crystal as big as the nail of a man's hand; which being taken out, he was soon healed, and then could remember how he broke a Venice glass with his hand on a table, so long ago as his hand had been maimed; but it was a far distant part of his hand, that struck the glass, but a piece being sunk through the epidermis might easily, by the motion of joints and sinews, remove the place. And he, that notes the anatomical mechanics of the hand, will discern what mischief a jewel would do in that place. Mr. *Butler* of *Cambridge* got much credit by his witty search into such circumstantial accidents; and I have oft-times seen a chirurgeon do more good with his wit and hand, than with his plaister. And he, that hath read *Voetus de Lamiis & de præstigiis*, will find strange removals within the epidermis.

A CHIRURGEON of my acquaintance finding himself at loss about the cure of an ulcer near the knee, by diligent search found a small pin there. Another time being in the same case about an impostume under the short ribs, by a bold search found a pin there also. They conceived the pin to come thither through the stomach, being swallowed by chance.

SIR *R. P.* falling down a narrow stairs bruised his back and breast, and immediately swelled inwardly, that his breath was stopped. I caused a vein in his arm to be opened, and presently he recovered breath, and was afterwards cured by fit medicines. The help of phlebotomy in falls, bruises, and contusions, and in deep percussions of the air, which beget violent fevers, pleurisies, *&c.* is well known, but not so commonly or vulgarly published, but that I have known many lives lost by the ignorance or wilful neglect of it; and as many lives lost by unseasonable phlebotomy. But these extremities deserve a publick advertisement.

I RODE in the company of a fat big man, that was very drunk. On a sudden he fell from his horse flat on his back a heavy fall, and immediately expired. I leaped off my horse, and more by art than by strength I drew up the forepart of his body, head, and stomach, to lean forwards on my body. After a long pause as I shook him upon my back, I felt him begin to draw breath, which he drew with a very long stroke, and loud noise through his nostrils, as some do snore in their sleep. With long patience I brought him home to his own house alive, leaving mine own road and business. I could not persuade him to the opening of a vein, (some country people are very averse to it) but by wrapping him in a warm sheep skin, taken speedily from a live sheep, he recovered in few days. I have oft-times noted, that if a person falls on his head when he is drunk, he is much more apt to expire, loseth his senses, and dies away as some do in their vomit, if not carefully attended.

AN old man cut a deep clift in his foot between his instep and his toes, by the glance of his ax, and lay expiring by the waste of his blood. As soon as I saw his case, I caught up his foot, and joining both sides of the wound together with my hands, I so held it, till the blood turned and stayed, and the wound was in time healed. Some lives I have saved by closing the orifice or covering it, after I had read it in my lord of St. *Alban*'s. And some lives I came too late to save, which were lost by the want of this advertisement.

A REAPER in this neighbourhood struck his reap-hook in that part of his leg, which is here called the pope's eye. No man could devise how to stop the effusion of blood: a chirurgeon dips lint in vitriol, and so stops it suddenly, but the wound festers, and the man dies soon after.

ABOUT three years before Sir *H. Wotton* died, there ascended into his nostrils some hypochrondriacal

pochrondriacal vapours, which he and his physicians conceived to arise from his spleen, and much care they had to cure his spleen; but the vapours were in his own nose so offensive, that he thought them much worse and more odious than any carrion, and that they gave the like offence to all others; for which cause for some weeks he admitted no person but *Nic Oudart* and *Will. Knat* to come into the room. After he was satisfied of his mistake, and that no offensive smell came from him, he went all abroad for advice and cure. Then I heard the judgments of all famous physicians concerning spleen, melancholy, *&c.* and had the first notice, how the scorbutick had a large yet secret dominion, and sent more to the grave than all other maladies; and ever since it hath so appeared by my computation, and now it is my own lot.

MY lady *Philips* tells me (oft-times repeating it) that when her husband Sir *Robert Philips* was sent to the *Tower*, the scorbute took away all her teeth (this was about forty years ago); yet she still survives (in the conflict with that disease) in a healthy condition, with rosy cheeks, having been for many years only a water-drinker, and driven thereto to allay the heat, which then boiled in her stomach. If water gives health and longevity, why do we take so much pains, and send so far for so many sorts of drinks?

I CONFESS, that the scorbute did justly punish me for defaults in the best philosophy. My inward discomforts begot the disease. But why should a man yield to any such discomforts, as long as he can keep faith alive, and hope of a receptacle in heaven? If the heart were cheerful and fixed on God's goodness and mercy, the simple diet of the long living age (water and wholesom grain) would be our best medicines and preservatives, and this may raise a resolution rather to embrace poverty, than to fear it.

I FED some years at the best sauced table (as fame spoke it) in *England*, and made a sudden change to a collegiate diet; and such like alteration I have more than thrice made, not by fits, but by habitude for some years in either kind, yet with no alteration of my health, but rather for the better at the jejune diet; and for five years, or thereabout, I drank mere wine or mingled with water, the rest of my life I drank a middle sort of beer. But what is this, if compared with their change of diet, who travel in long voyages by sea, or adventure upon new plantations unprovided of their usual diet and lodgings? Such is the extensiveness of human capacity for the short tenure of our days, to the measure, which hath been common these four thousand years, or near it. It is but a virtue of forty hours patience, to reduce the most luxurious palate to be satisfied and delighted in the coarsest rural fare; and that begets the firmest strength, and most constant health. But to pass from one extremity to the other by gentle degrees, is the safest motion; and a rural employment fits the stomach for rural fare. And then a man tastes the truth and sweetness of *Horace* in his Epodon:

Beatus ille
——*Dapes inemptas apparet.*

IN my childhood I had the measles, which (as I did then and do now guess) I caught, as I passed through a gatehouse, where in an inward chamber a servant lay sick of the measles. For I seemed to smell a noisom smell, as if it had been from a boar's-stye (for that smell continued in my nostrils for a week together, and so long it was before the symptoms appeared) loathing all food, and offended at my own breath. I was then much addicted to running, leaping, and such athletic exercises. The only medicine in those days for that disease, and for the small pox in all those countries, was a small handful of the reddle, with which here they reddle sheep, drank up in our ordinary beer. I tried it both for measles and small pox, and saw it used by many others, of which not one miscarried; which makes me say, that either the small pox of latter ages is more malignant, or the medicines more dangerous.

THE measles I had in a country village, and the next summer, in *Worcestershire* I caught the small-pox, and I thought, I smelt the same offensive smell as before in an apothecary's shop; and, returning to the shop to enquire the matter, I was there informed, that a woman came then into the shop, who attended one, that was sick of the small pox. If I had not my wound before, this answer might help fancy to beget it. As soon as we suspect the infection, we drink of this reddle in a draught of beer, fasting before and after. My brain was distempered; for a day or two I thought myself all the while tossed in the air by the clouds, which were as winnowing sheets, forcing me above ground, as chaff flies by the wind, and I uttered grave lectures of morality, being then about twelve years old. After two days, I could rise out of my bed, and, by foolish guides, was immediately put on horseback, and carried about twenty miles, the red pustles rising all the way as I rode, and a very giddy and weary journey I found it. Great care was taken, that I did not increase heat, nor take cold after I alighted from my horse. And that I conceive, should be the chief care, and, perchance, all the medicine in those diseases, in which the blood is in a tumult. And this reddle I should not despise in pestilential infections, at least to cleanse the body of man, as it cleanseth swine. And this I join to honourable Mr. *Boyle*'s Observations, Usefulness of Experiments, part 2. c. 3. pag. 132.

COUNTRY folk have many sluttish medicines, which serve their turn, and savour to them better than the apothecary's shop. For a bruise, ach, tumour, imposthume, or cancered breasts, cow's dung, best when the cows feed in their kindest pastures, and taken hot as it comes from the body of a cow, and fryed with bear grease: for a stitch in the side,

as

as they call a pleuriſy, the juice of horſe-dung, as that comes hot from the body of a horſe, preſſed and drunk in their ordinary beer; that of a ſtone-horſe, feeding high upon provender, being preferred. Pigs-dung, or rather boar's-dung, to ſtop the blood at the noſe. For ſore eyes, the white of hen-dung; for ſore throats, album græcum, *&c. &c.* their own urine, *&c.*

WHEN the peſtilence raged in *London*, (about thirty-five years ago) I was amongſt them for ſome weeks, and took much care to prevent, that I might not ſmell that boariſh ſmell, which ſeemed ſo nauſeous, when I took the infection of the meaſles and ſmall-pox; to which purpoſe, I did contuſe rue in my noſtrils, and eat rue and ſage dipped in vinegar, with a morſel of bread and butter in the morning.

WHEN I am afflicted with deep ſorrow, or have eaten freely of pork, or any hog's fleſh, the foreſaid unpleaſant vapour returns into my noſtrils, or my left noſtril is ſo ſtopped by the thickneſs of the vapour, that I cannot breathe through it but with difficulty.

I WAS about fifty years old, before I made trial, or much believed the great power of elixirs, Paracelſian laudanum, or other richeſt medicaments. Now I have tried ſeveral of them, both upon myſelf, and upon many others; and will give a brief account in one or two examples.

MR. *H.* at ſeveral times ſent me three ſmall vials of elixir proprietatis Helmont. the laſt vial far more excellent than the two former; two or three drops of the laſt was more effectual than thrice as much of the other: to myſelf it was cordial, chearing, and reſtorative. I never failed to recover immediately from fits of the mother, hypochondriacal and convulſive fits. An old woman walking abroad early in the morning was ſmitten, as they call it, *è cœlo tacta*; there was no viſible blaſt upon any part of her body, but down ſhe fell, and the pangs of death were upon her, her pulſes ceaſing, and her breath almoſt ſtopped. In a ſpoonful of ſack, I forced down a few drops, and, in the time of a ſhort prayer, ſhe recovered, called for her clothes, and ſhe ſeemed to give us the guiſe of the reſurrection.

ANOTHER woman (aged above eighty) had kept her bed (unable to ſit up) a week, and lay hopeleſs. When I entered her chamber, thoſe that attended her ſaid, that her feet, legs, and thighs, were dead already ſome hours ago, and her breath departing; but almoſt as ſoon as ſhe received the doſe of elixir, ſhe ſpake with a ſtrong voice, and cheerfully; and, within an hour or two, called for her clothes, roſe up, and recovered, and lived about two years after.

AN apothecary's wife of this town, by many diſcontentments, fell into ſwooning and hyſterical fits. The apothecary exerted all his Galenical art in vain for ſome weeks. With one doſe of this elixir, ſhe recovered for a month, and, after a relapſe, was recovered with one more doſe, and ſo hath continued theſe two years.

THE laudanum, which I uſed, was Helmontian, and drawn, as I gueſs, by the ſame hand, which drew the elixir, Dr. *C.* To ſtop violent defluxions, and to appeaſe tumultuous ſpirits, and to give ſleep, two or three drops of it in beer have raiſed more of my wonder than the elixir did: and I have ſpent three or four vials, never failing of my expectation, but indeed ſurpriſed with the iſſue far beyond my expectation.

I HAVE tried a few ounces of ſpiritus cornu cervi, and found it a rare reſtorative.

BUT lately taking each morning three or four drops of eſſence of balſam in a ſpoonful of ſack, I find it very effectual to ſtop or eaſe a conſumptive cough, and to ſtrengthen nature.

ABOUT eight weeks ago, I had a virulent ulcer in the overpart of my noſtril, under the corner of my left eye; it had there continued above a month, increaſing the pain: going to bed, I took a pill of eight or nine grains of *Richard Matthews*, who juſtly and honeſtly (as his unelegant book ſhews) calls himſelf the unlearned alchymiſt: within an hour I found it work ſtrongly upon my noſtril, opening that paſſage, which is wont to be ſtopped by melancholy vapours, and diſtending it wider than ever I felt it before, and the griſsles ſeemed to make a creaking noiſe all the while: my ſtomach had a deep pain, and, I conceive, the doſe was too much by two or three grains; ſome gentle ſweat I had, and a kind ſtool on the morrow morning: and that very day the ulcer in my noſtril was healed.

BUT another ulcer of the like malignant kind was in the ſame noſtril near the end of my noſe; this was not healed: I took another pill of the ſame weight, and with like operation the ulcer abated, but was not quite cured. I took a third pill, and it was throughly cured. Now I ſeem to diſcern, that theſe ulcers proceeded from a ſcorbutical malignity: and ſurely this unlearned man hath found a medicine, that doth aſſiſt nature almoſt univerſally againſt any malady, and very proper, when the diſeaſe is radicate, or complicate with ſeveral diſaffections, that cannot bear a known name, or is of one kind, or of one nature.

I SAW a child of ſix years old ſo ſwelled about her head and face, that ſhe had no reſemblance of the countenance, which ſhe had two hours before: my mother gueſſed what the matter might be, and forced her to vomit, and with it there came up a ſpider, ſo contuſed and broken, that we ſaw little more than the legs. After vomiting, the child took ſalad oil, and was ſuddenly well again.

I HAVE often debated why ſome medicines might not operate as ſtrongly and ſpeedily for health, as ſome poiſons do for death and deſtruction; and, in my ſmall experience, the chymiſt alone ſeems able to manage the queſtion, and by their aid I have ſeen ſuch ſudden and unexpected recoveries, as may be compared with the diſpatch of ſtrong poiſon.

JOHN CARY, a ſurgeon of this town, had mingled in one vial, for his chirurgical uſe, about four drams of ſublimate, with alum and lime; a woman drank it up, and was very ſick and ſwelled (or ſhe fancied ſo) immediately. This noble earl of Marlborough came by chance thither, and finding her caſe, poured his box of tobacco into a porringer of water, ſtirred it, and ſtrained it as ſoon as the water was lukewarm; ſhe drank it, and vomited, and was well.

Yeovill, Nov. 9, 1663.

Honourable SIR,

YOU cannot bear words, but require deeds. *Nefas verba tibi dare, rem præſtare oportet.* But what offering ſhall I bring? My poor ſtorehouſe hath nothing worthy of your altar; yet they were accepted, who brought goats hairs and badgers ſkins for the tabernacle. This is my caſe. About fifteen years of theſe late bad times I have been a poor farmer. And my hereditary intereſt was upon the mountains of *Seir*, amongſt Edomites (Old Britains and Kymbrians.) Here, as concerned, I converſed with *Cato*, *Varro*, *Columella*, *Palladius*, *Creſcentius*, *Collet*, *Paliſius*, and ſuch as I could get of French, Spaniſh, and Italian ruſticks, *Googes*, *Hereſbachius*, *Marlbanrynning*, *Tuſſer*, Sir *H. Plat*, and *G. Plats*; and as far as Mr. *Hartlib*'s correſpondence would help my information. I tried all things, new and old, by the event, what might be done for improvement of Engliſh paſture, by Engliſh or foreign ſeed, or art, water, or aſhes, clover, ſaint foin. I tried the ways of finding ſprings, and conducting them; of healing bogs, or dragging uliginous land; I tried divers ſorts of grain; I examined the uſe of marl; how far and by what ways earth or ſoil might be altered or improved; divers compoſts; how vegetables and animals might be improved or employed for human uſe; how the wildeſt may be trained to be moſt accommodable. I enquired how far aſſes and mules might be fit for *England*, *Scotland*, *&c. &c.*

AND hence I here ſend you a wild ſheet of ſheep and goats, where you will read, that, in old account, ſheep were the ſoundeſt of cattle, goats never ſound; and if we regard the old rules (of which you find ſalt in uſe for ſheep) our flocks will be ſafe, and our herds of goats a peculiar riches in the land of miſery and barrenneſs. Of bogs, ſprings, marl, paſture, *&c.* I intend in order.

BUT what help from theſe ruſtical affairs for man's dominions? Very little I confeſs from my hand in this rude way. For I have no leiſure to poliſh, or to finiſh: but if I had a reſidence in *Greſham*, I ſhould rejoice to be a collector and compiler of others fuller informations. Now I can only adviſe, that you caſt a ſlight glance upon theſe, to taſte whether any line may be fit for your palate (for that is the beſt preferment it can have) and then ſpeedily to rid your mind of it, by putting it into the hands of ſome perſon, who undertakes theſe agreſtic affairs. Yet, if I did affect high language, and to make great promiſes, I would tell you, that by theſe clowniſh advertiſements, we can give man dominion over the winds, air, water, and lands. We can raiſe cool winds, in the extremeſt ſummer heats; and conduct them for the beſt of human uſes. We can diſſolve the frozen winds of rigorous winter. At no charge, we can ſearch the bowels of the earth, and by our ſprings diſcover all her treaſures, mineral, metalline, coal, *&c.* more by one man's art and experience, than by the labour of thouſands of pioneers, with ſpades or pickaxes, *&c. &c.*

AND let me ſay to you, that if you give theſe things in charge amongſt your acquaintance, that each man in his way may add to the ſearch of others, then you do fully proſecute the Verulamian deſign; then our labour is joined and collegiate, and not always running in the narrowneſs of ſingle endeavours. And what had *Cæſar*, *Alexander*, or *Solomon* done, the firſt in war, or the laſt in peace, if they had not employed more hands than their own?

SIR, eaſe your own hands the more, that you may the better overſee the main work. And for us, that are in ſtreſs of buſineſs and diſtance, it is well, if we be hewers of wood and drawers of water.

I PRAY, that mine may not tempt you to further trouble, or divertiſement, than ſometimes to diſtil from you a ſhort line of directions, how I may in my beſt capacity ſerve your commands. Theſe and the annexed I have not time to review.

Honourable Sir,

your moſt obliged ſervant,

J. BEAL.

Incloſed in the preceding.

Honourable Sir,

THE annexed are only a continuation of the former argument of medicine and ſheep. And this letter muſt be only a duplicate of my laſt boldneſs and importunity. You can better endure ſuch rudeneſs, whilſt it doth heartily proſecute philoſophical deſigns, than compliments, which import nothing but affections and opinion. I urge then again, that you know many hundreds, who can produce more experiments than I can, and of a far more noble nature. And your countenance, or beckoning of your finger, will ſet them all on work. In few weeks I can fill up a quire of ſuch goats hair, as you find. As ſoon as your collector hath culled out from many contributors, as much as will fill up a quire in the preſs, this being printed in quarto; ſo that we, that labour in the work, and all others, may view and review it; by our correſpondents, and further experience, we

we ſhall be pregnant for more of the ſame, or like kind, and perchance (by oppoſitions) much improved. And thus it will grow, like a ſnow-ball, by rolling. And this is like collegiate work. The quarto will in ſhort time be many volumes, which any man may buy by parcel, or in groſs, at his pleaſure; and join, or divide, in volumes, as he liſteth.

I TOOK no care of choice, becauſe I refer that as another's buſineſs, and (as I ſaid before) he that brings matter commits no great fault, if he brings rather too much, than too little; and it is better to be too plain, than too curious. And this will diſcourage no hand, that is laid to the work, when every one can do better.

FOR method, I declined it, and oft-times broke it of purpoſe, becauſe change is ſweeter than a continued ſeries of the ſame, or like; and *præter expectationem* more pleaſant than *chorda qui ſemper oberrat eadem*; and thus alſo theſe are topicks for the practice of memory, which is one of my engagements; and if in the end of the experiment there be a *vide* for further reference, this will ſtring them to a fixed method, or note them for various uſes, as far as they deſerve.

THE main point will be in this, that you chuſe a fit collector, who reſides within your reach, that he may receive your frequent directions and caſtigations. And then we ſhall all expect the countenance of your preface. But becauſe it is not reaſonable, that your honour and credit ſhould be concerned in other men's reports of their experiments, I ſhould yield, that our parcels ſhould bear a letter for a remark of his name, who would poiſon ſuch a noble enterpriſe with an untruth. And in the mean time, you may require further ſearch or evidence in any particular, as you ſee cauſe. For example, I thought a cupping-glaſs an eaſy remedy for ſuch horrid epileptical agonies, as ſeemed to all ſpectators diabolical. I made the proof oft-times upon Sir *R. P.* that is (in the ear) Sir *Robert Pye* of the Equerry. We are indeed of neareſt affinity, but for private reaſons I hold no correſpondence with him. Another may enquire of him the place and the matter, and ſee the mark on the place. I conceive it proceeded from a check, that was then put upon his luſt, when the body was pampered with high diet, and other provocations or temptations. And it may ſhew the way of evaporating thoſe tumultuous winds and ſpirits, which are oft-times deplored, as incurable. And I leave to yourſelf the larger inferences.

I HAVE ſometimes interlaced ſmall parcels of hiſtory, that all might paſs like a tale, that is told without much affectation, and yet improve for ſome benefit: and thus it may anſwer to lord *Bacon*'s title, *Hiſtoria, &c.* There is naturally ſomething of more ſmoothneſs and ſweetneſs in ſtory, than in argument. The firſt carries the liquid evidence of things done, and paſt, and therefore paſt diſpute. The other may have nails or talons for the battle, but muſt not anticipate victory and triumph.

SIR, do not you now aſk me, whether you have not other buſineſs more than enough, or whether you need ſuch a ſimple taſk-maſter? I can truly anſwer, that this I had offered for under-work at your ſervice, if in reaſon or modeſty I could have thought one note worthy of your enterpriſe. If you can raiſe any line to ſuch advancement, it is beyond and above my ambition: and yet I do ſtill keep hope, that in ſome following diſcourſes, I may ſerve you in ſome ſmall meaſure. And do not you obſerve the moſt curious artificers lay aſide that, which ſerves not for their maſterpiece, and yet not caſt it away? This frugality is all my ſuit.

BUT yet I muſt increaſe my boldneſs, and intrude upon your own proper taſk. I have ſometimes treated with Mr. *Oldenburg* of the conduct, by which the froth of falſe literature, and ſpawn of the printing-preſs, may be enforced to give way to true light, and ſound information. The term is almoſt paſt, and yet I find not all the effects of my poor advice. Is not the united and conſtant activity of the Royal Society able to communicate the moſt ſeaſonable information of what is abroad? How few members, or how eaſily one member, by few correſpondents, may give intelligence to all the inns of courts, ſee their ſtationers fully furniſhed with a fit ſtore for the buyers? So in the Exchanges, *Weſtminſter-hall*, and all places of conſiderable reſort. The like from *Paul*'s to the univerſities, and all over *England*. And back again the like activity from all ſtationers in the ſkirts of *England* to the metropolis. Here a poor man can awaken *Briſtol*, *Bath*, *Wells*, *Dorcheſter*, and more on the other ſide of *Severn*. This diligence revived every term, and every fair, and in all acts and commencements of our univerſities, will continually increaſe in force. If we call it modeſty, to deſpiſe theſe condeſcentions, we muſt alſo call it modeſty, to renounce our main work. I think I ſee you eaſily, and without any ſtrain of violence, or the leaſt appearance of ambition, give influence to both the univerſities. And then, though *Greſham* hath no ſettled revenues, yet the colleges of under-workmen have fair revenues. And I think it lawful to interrogate, why all our beſt Engliſh preſſes are not already employed upon old, and freſh treaties of nobleſt uſe? Some to revive, compare, and advance *Pancirollus* by later diſcoveries. And as I have moved already for Medicine and Georgics (where I do yet want the reprinting of *Creſcentius*, of which I have ſeen a better copy in the library of *Hereford*, than the common impreſſion, and others) ſo I ſolicit the like hiſtorical collection in all our affairs of art and nature, mathematical, *&c.* I think our credit might extend for the reprinting of theſe Latin authors in the foreign preſſes of the Low-Countries, *Paris*, *&c.* and to take up the Engliſh, at leaſt the academical preſſes, beſides. Theſe high adventures we muſt ſolicit with conſtant activity, and reſolution, to ſtop the current ſtream of impertinent babble, or we ſhall be carried down the ſtream.

SIR,

SIR, when you firſt ſaw me at *Eton*, I was reputed a ſchoolman (though I had then read throughly much more of lord *Bacon*, than is yet printed, having ſeen in manuſcript all his embrio's, his *gradus rerum & gradus verborum*; and the prefaces, and joints, and anacephalæoſis to all his judgments, as lord chancellor; which raiſed me a little above a mere ſchoolman) yet Sir *H. Wotton*, would often pleaſe himſelf in laſhing the ſchoolmen upon my back; and would often declare it as a ſerious prediction, that in this age their reputation ſhould yield to more uſeful philoſophy. (And in his *Reliquiæ* you may find ſome letters, whereof two or three were to my ſelf, and more of the like I have in my poſſeſſion, in which he had our reliſhes, but with more addiction to curioſities) ſo long ago I had my encouragements for this boldneſs; and now the ſeaſon is in full maturity, and you have charged in the van, and we cannot do leſs than to wiſh you good ſpeed.

Honourable Sir,

your moſt faithful ſervant,

J. B.

THE ſheet of goats ſhould follow the fourth of ſheep, as introduced in the laſt clauſe of the fourth.

I TOOK little care to tranſcribe *Columella* exactly, my book being a very falſe print, falſe in moſt periods. And the four old Roman Georgical writers being long ago out of print, excellent matter and authentical Latin, they deſerve an academical diligence for the beſt impreſſion, for which the edition of *Stephanus*, which I gueſs to be the beſt, will give good aid.

SIR, in the paper of coted ſheep, there is an exemplar to a clauſe at the diſcourſe.

Sheep, how to prevent their rot.

THEY yield us the wholſomeſt fleſh, and warmeſt raiment. The ſtaple commodity for trade and manufactures. They feed on our thinneſt paſtures and fallows; and enforce our weakeſt lands to afford us bread and hearty drink. And of ſmall cattle would bring the ſpeedieſt and greateſt gain, if we could be ſafe from the unlucky years of rot; and this we might much more often eſcape, if the owners were not commonly guilty of covetouſneſs, or the ſhepherds of negligence. For hard uſage in the winter, and want of old and dry hay in the months, which are moſt deſtructive to their livers, is the general cauſe of their deſtruction.

Gabriel Plats aſſures us with confidence, taken from the experience of ſeventy four years by himſelf and his predeceſſors (himſelf an eye-witneſs, and diligently obſerving it for twenty four years; and his predeceſſors booking their experience of fifty years) that the only infectious months, that beget the great rot, are May and June, when exceſſive moiſtures befal thoſe months: it is no very great charge to be provided of ſome ſtore of old and dry hay for the time of great moiſtures and over forward graſs in theſe months. And by my own experience for fourteen years at leaſt, in the moſt rotten vales, by a more liberal allowance of hay in thoſe months, I have ſaved my ſmall flocks of the ſheep, which bear the firſt wooll, and are moſt ſubject to the rot, when, for want of ſuch relief, all the ſheep in the neighbourhood round about us very generally died of the rot. And the plenty of moiſture in thoſe months doth always promiſe great ſtore of hay to repleniſh the racks.

THAT fine graſs, which is raiſed by thoſe moiſtures, with the help of hay and dry food, does oft-times fatten the ſheep on a ſudden, and then when the fleece is taken off, it is no loſs, but much gain to put off the fatteſt ware to the ſhambles, as *Tuſſer* in his merry rhimes directeth in general, and particularly for hogs or ſwine, which may more properly be applied for ſheep;

Whatever thing fat is a gain, if it fall,
Thou vent'reſt the thing, and the fatneſs withal.
The fatter the better to ſell or to kill,
But not to continue, make proof, if you will.

As men by a ſudden change from a rank diet to a ſlender fare, fall into the dropſy, ſo will other animals, and ſheep ſooneſt of any.

G. Plats gives it for an infallible ſymptom, that when bees fail, and their hives feel light, a great rot of ſheep is to be expected; which gives a very ſeaſonable warning to bleed the ſheep under the eye, or in the mouth, as oft as they ſee occaſion in the end of ſummer, or in autumn, or to accuſtom them, that are ſuſpected, to lick ſalt in the troughs, or to take ſome brine with ſome dry food, as they may eaſily be trained to it by gentle degrees, or to force down a doſe of ſalt in their throats, as is directed.

IT is by *G. Plats* affirmed, and I find it generally received, that the ſalt marſhes do much help the ſheep; and ſuch as dwell more remote from ſalt marſhes may do their flocks much good, if they can exchange the ſoil, eſpecially for ſounder and drier grounds. And (as I take it) there is ſome good in changing your paſture for a ſhort time, though it be to a worſe ground, if the ſhepherd's care be to bleed the ſheep, that cannot obtain the butcher's purſe and knife.

MY man, that preſerved my flock in a very rank ſoil, was very frequent in opening a vein under the eye, or in the mouth, as ſoon as he perceived a ſheep to droop; and by uſing to look on the veins and red parts about the eye, he could diſcern when a ſheep did want bleeding.

Gabriel Plats takes care to diſtinguiſh what hay is kindeſt for ſheep, and prefers the hardeſt and drieſt before the ſucculent clover, or (as he calls it) the ſilken hay, which is fitteſt for cows and calves. I have often enquired

quired and examined, whether there be not ſome vegetables moſt peculiarly proper for this malady in ſheep, and ſcurvy graſs is moſt proper to relieve the ſcorbutical, *&c.* And a grave ancient miniſter at a great meeting did aſſure us, upon his own experience for many years, that knot-graſs, that had been waſhed twice or thrice, as it grew by the ſea-water, was an effectual remedy. But where ſhall ſuch ſtore of that graſs be found for them, that have great flocks, and far from the ſea? I have ſeen ſome mowing grounds bear ſtore of a yellow ſmall bloſſomed tre-foil, which is very friendly to enliven and ſtrengthen ſheep; when it was green on the ground a fortnight before mowing time. I tried cows and oxen, and they refuſed it by itſelf, and horſes, whilſt they had common graſs, left it; but ſheep did eat it more cheerfully.

I HAVE noted mowing grounds to make ſome change of their graſs, as the years proved moiſt or droughty; and then moſt eſpecially, when the drought or moiſture hath continued two or three ſprings together: (the drought begetting hawk-weed, hard heads, and white bodies, the moiſture increaſing clovers) as I ſhould think by this vale in graſs we may be directed what hay is kindeſt for ſheep. And in that innumerable variety of graſs of all ſorts, we cannot make ſuch choice as if we dealt by retail. We can only take that, which ſeems moſt likely; and other cattle receive no hurt from hay, if it be fine enough: but the cow is weakened by hay, that hath ſtore of cat's tails; and our ſmall ſheep, which bear the fineſt wooll (the ewes at leaſt when they bear lambs) do require the fineſt hay, and ſucculent.

I DO not ſay, that the turf is always altered by drought or moiſture. For I have ſometimes ſeen an unprofitable graſs (as namely peacock's bent) ſo abundantly and pertinaciouſly adhere to a ſoil, that it could not be altered by the fat floods, which every winter were brought over it, till the turf was quite pared off, freſh earth brought in the place, and ſowed with the beſt of Engliſh hay-duſt.

GROUNDS newly laid for paſture are noted to infect ſheep, and I have obſerved ſuch new laid grounds for the firſt and ſecond year to bring forth ſtore of the knot-graſs. But this cannot contradict the former praiſe of ſalted knot-graſs, nor can demonſtrate that knot-graſs is hurtful to ſheep. Poſſibly they may like it ſo well, and find it ſo friendly, that to bite it too near the root, they lick up too much of the ſoil. And if ſheep come to paſture, that was lately flooded, or hath much looſe ſoil on the graſs, they are ſoon tainted.

THOUGH *G. Plats* aſſures upon his hereditary and particular experience of ſeventy four years, that neither the immoderate moiſture of July, Auguſt, and September, nor thoſe kells, which like cob-webs do ſometimes cover the grounds, do beget the rot in ſheep; yet do I much commend ſome careful ſhepherds, who do never ſuffer their ſheep to graze upon the grounds in the mornings, when they do firſt go forth to paſture, nor after rain, before they have been gently driven over their grounds, that their feet may break thoſe kells, and beat off the dews, and overmuch moiſture from the graſs. For that frequent and gentle motion is a ſeaſonable and healthful exerciſe for the cattle, and overmuch moiſture cannot be healthful for ſheep. And the ſheep are a comfort and help to each other, if they accuſtom to gather together in flocks in the time of great rain, and at the time, which may be ſpared from feeding in clammy weather.

IF no hay can be had in thoſe infectious months of over-moiſt May and June, there muſt be ſome eſpecial care to keep the ſheep (during thoſe moiſtures) in the higheſt, drieſt, and ſoundeſt grounds; which may by a little uſe be eaſily diſtinguiſhed from the infectious grounds by the verdure of that ſweet graſs, which tainteth the ſheep; which is not one peculiar herb, as ſome deſcribe it like purſlane, nor as others ſuſpect it to be ſpearwort, though poſſibly ſome emergent plant may be a remark of an infectious paſture.

THERE are many ſalt or brackiſh ſprings in *England*, beſides the Weeches, and more may daily be diſcovered, and much brine may be raiſed by many houſe-keepers. The ſalt water may be boiled and ſcummed, and the brine may be mingled, as I ſaid before, with oats, peaſe, or beans, or enforced in the doſe. Of which ſee *Columella* recited in the end of the following paper.

The government and choice of ſheep extracted out of Columella, *and compared with our modern cuſtoms and experience in* England.

Colum. lib. 7. c. 2. Poſt majores quadrupedes ovilli pecoris ſecunda ratio eſt, quæ prima ſit, ſi ad utilitatis magnitudinem referas.—Tum quod corporibus noſtris liberiora præbet velamina, tum etiam quod caſei lactiſque abundantia non ſolum agreſtes ſaturat, ſed etiam elegantium menſas jucundis & numeroſis dapibus exornat.—As in ſome parts of *Italy*, ſo alſo in ſome parts of *England*, they have a hardy fair ſheep, which with ſome help of a paſture (which may be too thin for the graſing of other cattle) do yield a great relief of milk, which makes a white ſhining butter, ſomewhat like lard, and fit for the hardy labourer; but being mixed with cow's milk, or of itſelf, amends cheeſe: for cheeſe is the better for that ranknes. *Tuſſer* gives us the ſafe rule, and the juſt proportion.

At *Philip* and *Jacob* away with thy lambs,
That thinkeſt to have any milk of their dams; *May's Husbandry.*
At Lammas leave milking for fear of a thing,
Left *requiem æternam* in winter they ſing.
To milk and to fold them is much to require,
Except ye have paſture to fill their deſire.
Yet many by milking, ſuch heed they do take,
Not hurting their bodies, much profit do make.
Five ewes to a cow make proof by a ſcore,
Shall double thy dairy, elſe truſt me no more.

Yet many a good houſewife, that knoweth the ſkill,
Have mixt and unmixt at their pleaſure and will.

THIS is no ſmall gain for a ſcore of ſheep to be as good as four cows, where cow-paſture is ſcarce; ſince the plough cannot go merrily, where this white meat is wanting.

Id pecus, quamvis molliſſimum ſit, valetudinis tutiſſimæ eſt, miniméque peſtilentiæ. In hot countries other cattle die more frequently of the peſtilence than ſheep; and in *England* we have ſeen the plague in horſes, and the murrain in other cattle, much more dangerous than the rot in ſheep, which may be cured, or at leaſt prevented, by ſuch help and diligence as is directed.

Verum tamen eligendum eſt ad naturam loci.—Pinguis & campeſtris ſitus proceras oves tolerat; gracilis & collinus quadratas: ſilveſtris & montoſas exiguas: pratis planiſque novalibus tectum pecus commodiſſimè paſcitur.—This *tectum pecus* anſwers to our ſmall ſheep of *Lemſter's-oar* and *Hereforddſhire*, which bears the fineſt wooll, and do require all ſummer and winter the ſhelter of warm cotes or houſes. And he alſo diſtinguiſheth them by their countries, *Mileſias, Calabras, Appulas, earumque optimas Tarentinas*, which are the ſame, which before he called *tectum pecus*; ſo we find a difference in the ſheep of *Hereforddſhire, Shropſhire, Cotſall, Somerſet, Dorſetſhire*, &c.

HE commends the white as capable of any colour, yet allows *pullum & fuſcum, quos præbet in Italia Pollentia—Nec minus Aſia rutilos. Sed & alias varietates in hoc pecoris genere docuit uſus exprimere.* And here he commends his uncle *Columella*, for joining ſeveral kinds for novel varieties; and this I have ſeen often tried by putting *Cotſall* rams to our *tectum genus*; but except the invention be better, we muſt not boaſt of the ſucceſs.

Ex albo ſæpe fuſcus editur partus, ex Erythræo vel pullo nunquam generatur albus. It ſeems *Jacob*'s luck will always hold, that the black, dark-coloured, pied, or dappled ſheep, will predominate, if any ſpotted males be admitted. Whence he joins with *Virgil*, to examine the very mouth of the male and to ſee that no part of the tongue or palate be ſpotted.

Virgil. *Nigra ſubeſt udo tantum cui lingua palato*
Rejice—ne maculis infuſcat vellera pullis.—

FOR horned or not horned, he prefers the horned as beſt defended in cold climates; not horned, where no fear of hard tempeſts. *Itaque ſi plerumque eſt atrocior hyems, hoc genus (i. e. ampliſſimis cornibus) eligemus: ſi clementior, mutulum probabimus marem.* In *Hereforddſhire* the ewes are ſeldom horned; here, in *Somerſetſhire*, the whole flock is horned; which, to our country, would ſeem ſtrange and hurtful.

HE noteth the horned to be more apt to fight, and directeth the ſhepherd to knock nails in a board, and therewith knocking their foreheads, they may be tamed. *Ea res ferum prohibet à rixa, cum ſtimulatum ſuo ictu ipſum ſe ſauciat.* I knew a ſhepherd had his thigh broken, and have heard of others, that were ſlain by fighting rams. To prevent ſuch miſchiefs, I recited *Columella*'s invention. And he addeth from *Epicharmus, pugnacem arietem mitigari terebra ſecundum auriculas foratis cornibus, qua curvantur in flexu.*

Ejus quadrupedis ætas ad progenerandum optima eſt trima, nec tamen inhabilis uſque ad annos octo. Fœmina poſt bimatum maritari debet; juveniſque habetur quinquennies; fatiſcit poſt annum ſeptimum. He inſtructeth the buyer to open the wooll, and examine, whether grey be not mingled with the white.—*Variam & canam comam improbabis, quod ſit incerti coloris.* And we ſay, the beſt time to buy them is at two years, and not to meddle with ſuch as are paſt three: the one is not yet ripe for profit, the other is already paſt it.

Eleges bimam vaſti corporis, cervice prolixa, prolixi velli, nec aſperi, lanoſi & ampli uberi; nam vitandus eſt glaber & exiguus. True, this is the beſt choice for *Cotſall-downs*, and the champian commons of *Warwickſhire*; but in *Hereforddſhire* we muſt be content with ſmall ſheep with glabious faces, and little or no wooll on their legs or bellies.

FOR cotes or houſes he directs: *Illa etiam tuendis humilia facere ſtabula, ſed in longitudinem potius quam in latitudinem porrecta, ut ſimul hieme calida ſint, nec anguſtiæ fœtus oblidant.* This we approve, that for ſuch as muſt be houſed, the houſes ſhould be warm, but not too cloſe; and that ewes with young, and weak ſheep, be ſevered by partitions from ſuch as are ſtronger.

Ea poni debent contra medium diem. Namque id pecus, quamvis ex omnibus animalibus veſtitiſſimum, frigoris tamen impatientiſſimum eſt, nec minus æſtivi vaporis. This ſhews, that for our ſheep of fineſt wooll, we ſhould take more care in theſe points, than commonly we do.

Deturque opera, ne quis humor ſubſiſtet, ut ſemper quam aridiſſimis filicibus vel culmis ſtabula conſtrata ſint, quo purius & mollius incubent fœta. Herein alſo we are too negligent, moſt of us not cleanſing the cotes, or removing the litter, more than twice in the year; but only overlaying freſh litter: yet, as I take it, *Hereſbachius* directeth, that the floor be ſloping, (ſo it is in ſtables for horſes) that the urine may paſs away before it ſpoils their feet, or fleeces. But to the uſe of fern, ſome of our ſhepherds do ſay, that fern rots ſheep, and ſpoils the dung. And we ſhall be at a loſs, if the urine be not received in litter for compoſt.

Sint quala munditſima, ne qua earum valetudo, quæ præcipue cuſtodienda eſt, infectetur uligine. It ſeems, that cleanlineſs, as well as other good winter relief, makes ſheep the hardier to reſiſt the infection in ſpring and ſummer. We uſe a ſort of double cratches, that the ſheep may feed on both ſides, and not leap up on the top of the hay, to foul it with their feet, dung and urine.

THAT thiſtles, burs, and thorny buſhes, are bad gueſts in ſheep-paſture, he confirms, by the authority of *Virgil*; and that a few

sheep well fed on sound grounds, are more profitable than larger flocks ill provided. *Nam vel exiguus numerus, cum pabulo satiatur, plus domino reddit, quam maximus grex cum senserit penuriam. Sequeris autem novalia, non solum herbida, sed quæ plerumque vidua sunt spinis, utamurque sæpius authoritate divini carminis*

Si tibi lanitium curæ est, primum aspera sylva,
Lappæque, tribulique absint.——

Quoniam ea res, ut ait idem, scabras oves reddit cum "tonsis illotus adhæsit sudor, & hirsutis "secuerunt corpora vepres." Cum etiam quotidie minuitur lana, quæ quanto prolixior in pecore concrescit, tanto magis obnoxia est rubis. This bushy ground then is proper for goats.

THAT the ancients advised the use of salt, and change of pasture, and to avoid uliginous moist lands, and to choose the fallows for preservation of sheep, we may find (and all this together in one period) in *Columella, lib. 7. c. 3. Jucundissimas herbas esse, quæ aratro proscissa arois nascantur: deinde quæ pratis uligine carentibus palustres sylvestresque minime idoneas haberi, nec tamen ulla sunt tam blanda pabula, aut etiam pascua, quorum gratia non exolescat usu continuo, nisi pecudum fastidio pastor occurrerit, præbito sale, quod velut ad pabuli condimentum per æstatem canalibus ligneis impositum cum è pastu redierint oves lambunt, atque eo sapore cupidinem bibendi pascendique concipiunt.*

Of sheep: the rules of the old writers of Italy *compared with the modern customs of* England.

COLUMELLA makes the question, whether the female should be admitted to the ram in spring or autumn, and gives his judgment for the vernal time; that the weather sheep may gather strength before winter. *Inter authores fere constat, primum esse admissuræ tempus vernum parilibus, si sit ovis matura: sin vero fœta, circa Julium mensem. Prius tamen haud dubie probabilius, ut messem vindemia fructum deinde. Viaticum fœtura pecoris excipiat, et totius autumni pabulo satiatus agnus ante mœstitiam frigorum, atque hiemis jejunium confirmetur. Nam melior est autumnalis verno, sicut ait verissimè Celsus, quia magis ad rem pertinet, ut ante æstivum quam hibernum solstitium convalescat, soluſque ex omnibus animalibus bruma commode nascitur.* And we prefer the winter lamb, that is yeaned near Candlemas, as by winter best hardned to resist the taint of the summer.

THEY had a curious rule of tying the one or other cod of the ram, according as they desired the lambs should be either male or female; but he rejects it as a troublesom curiosity. *Ut admissarii dexter vel sinister vinculo testiculus obligetur, in magnis gregibus operosum est.* I have not tried the truth of this rule, but he voucheth *Aristotle* for another like curiosity to the same effect. *Aristoteles, vir calidissimus rerum naturæ, præcipit admissuræ tempore siccis diebus halitus septentrionales, ut contra ventum gregem pascamus, ut eum spectans admittatur pecus; at si fœminæ generandæ sunt austrinos flatus captare, ut eadem ratione matrices ineantur.* This I must leave as I find it, being by me untried.

WHERE we expect from the ewes milk for the dairy, it is best to turn off the lambs to the butcher. *Villicus enim teneros agnos, dum adhuc herbæ sunt expertes, lanio tradit, quoniam et parvo sumptu devehuntur, et iis summotis fructus lactis ex matribus non minor percipitur.*

HE prefers our own breed of sheep better than change from remoter places. *Summitti tamen etiam in vicinia urbis quandoque oportebit; nam vernaculum pecus peregrino longe est utilius. Neque committi debet, ut totus grex effœtus senectute dominum destituat; cum præsertim boni pastoris vel prima cura sit, annis omnibus in demontuarum vitiosarumque ovium totidem vel etiam plura capita substituere, quoniam sæpe frigorum atque hyemis sævitia pastorem decipit, et eas oves interimit, quas ille tempore autumni ratus esse tolerabiles, non summoverat.*

THE ancient and modern agree, that neither the race of the very old nor of young ewes are fit for breed:

AND that ewes do oft-times want the art of Midwifery. *Neque enim aliter hoc animal, quam muliebris sexus enittitur, sæpiusque etiam quantum est omnis rationis ignarum laborat, in partu.*

THE nursing art is curiously taught. To cast away some of the first milk, and to hold up the lamb to the ewe's udder, pressing the milk into the lamb's mouth, *&c. Agnus autem, cum est editus, erigi debet, atque uberibus admoveri, tum etiam ejus diductum os pressis humectare papillis, ut condiscat maternum trahere alimentum: sed priusquam hoc fiat, exiguum emulgendum est, quod pastores colostram vocant: ea nisi aliquatenus emittitur, nocet agno.*

FOR two days after birth the ewe and lamb should be enclosed together, that the ewe may know her lamb, and the lamb her mother. *Biduo, quo natus est agnus, cum matre clauditur, ut et ea partum suum foveat, et ille matrem agnoscere condiscat.*

HE requires a dark and close pen for the lamb, lest by too much wanton play they take hurt. *Mox deinde, quamdiu non lascivit, obscuro et calido septo custodiatur: posteà luxuriantem virgea cum comparibus aurea claudi oportebit, ne velut pueri nimia exultatione macescat.* I have oft-times wondered to see the fairest and most sportful lambs on a sudden to fall away, wither, and die. The old shepherds would persuade me, they were bewitched; and indeed in old fame young pigs and tender lambs are aptest to receive mischief from the envious eye, *Nescio quis teneros oculus mihi facinat agnos.* But I always suspected this overmuch liberty of sporting to be for the most part the witchcraft.

THE weak lamb should be severed from the strongest, lest in sport they receive hurt. *Cavendum est, ut tenerior separetur a validioribus, quia robustus angit imbecillum.* We want this care also.

HE saith it is enough for the lambs to suck twice a day. In the morning early before the ewes go abroad; and in the evening when the ewes come full home. *Satisque est*

mane

mane priuſquam grex procedat in paſcua, deinde etiam crepuſculo redeuntibus ſaturis ovibus, admiſcere agnos, qui, cum firmi eſſe cœperint, paſcendi ſunt intra ſtabula cytiſo vel medica, tum etiam furfuribus, aut, ſi permittat annona, farina ordei, vel ervi. Of this we take too little care. Cytiſe and medic we have not, and we ſpare the charges of ground malt, or barley meal. But ſome ſhepherds provide ſtore of miſſeltoe, and ſmooth leaves of holly, for the ewes, and the fineſt graſs for the lambs, and bran, and, as I ſhould think, ſome flour of peaſe, oats, and fitches ſhould not be too coſtly. And ſome admit the lambs to ſuck thrice a day, in the morning, at noon, and evening. And as ſoon as the lambs have fit ſtrength they go in the paſture with the ewes, (but not ſo early) to learn to feed. *Ubi convaluerit, circa meridiem pratis aut novalibus villæ contiguis matres admovendæ ſunt, et à ſepto emittendi agni, ut condiſcant foris paſci.*

FOR food in this time of milk for lambs, he adds the leaves or ſmall branches of elm, and aſh, or hay of the latter mowing, and barley, peaſe, and beans, if not too coſtly. *Aluntur commodiſſimè repoſitis ulmeis, vel ex fraxino frondibus, vel autumnali fæno, quod cordum vocatur: nam id mollius, et ob hoc jucundius quam maturum: cytiſo quoque et ſativa vitea pulcherrime paſcuntur: neceſſariæ tamen, ubi cæteræ defecerint, etiam ex leguminibus paleæ, nam per ſe ordeum et freſſa cum ſuis valvulis faba, vel cicercula ſumptuoſior eſt.*

COLUMELLA with *Virgil*'s authority directs the time of feeding and of watering the flocks—*Luciferi primo cum ſidere*—From our *Ogleby* it is thus our own ſtyle.

At the firſt dawn in cold grounds let them feed,
Whilſt day is young, and pearled is the mead,
When dew to cattle dear on ſoft graſs lies,
And the fourth hour heat muſters from the ſkies;
And amongſt ſtubs the murmuring graſhopper ſings;
Command thy flocks then to the lakes or ſprings,
Or let them taſte ſweet ſtreams in pipes convey'd.

FIRST this is beyond our ordinary diligence in this colder climate. Secondly in this account the morning is more friendly to ſheep, than we do commonly eſteem it—*Et ros in tenera pecori gratiſſimus herba eſt*; and *Gabriel Plats* aſſureth, that it is the rank graſs, and not the dews, that does the hurt; yet he taketh ſo little care for the watring of ſheep, that he ſaith, they may live altogether without it, and care not to drink except they ſee water. But for ewes, that give milk, it is in all reaſon fit, and may deſerve *Virgil*'s item.

At cui lactis amor cytiſum, lotoſque frequentes
Ipſe manu ſalſaſque ferat præſepibus herbas,
Hinc et amant fluvios magis, et magis ubera tendunt,
Et ſalis occultum referunt in lacte ſaporem.

BUT this in *Virgil* is rather meant of the goats, than of ſheep, but may well belong to both; for in thoſe old days, as well as in theſe, ſalt had the reputation to preſerve the health of ſheep. And I conceive *Markham*'s directions in that point may be conſiderable. He tells us, that where the ſea-water hath waſhed the marſhes, the ſun dries it into a reddiſh ſalt (by him called ſal alderſe, or ſome ſuch name) which is peculiar for the recovery of ſheep. May not this ſalt be eaſily gathered on the ſea-coaſts, and at eaſy rates?

BUT for watering in the evening we have the ſame double authority,

Solis ad occaſum, cum frigidus aera veſper
Temperat, et ſaltus reficit jam roſcida luna.

COLUMELLA's caution in hotter countries may advertiſe us in very hot ſeaſons; *ſed obſervandum eſt ſidus æſtatis per emerſum caniculæ, ut ante meridiem grex in occidentem ſpectans agatur, et in eam partem progrediatur, poſt meridiem in orientem. Siquidem plurimum refert, ut paſcentium capita ſint obverſa ſoli, qui plerumque nocet animalibus oriente prædicto ſidere.* It is better to be ſo curious, than be too negligent.

FOR warm lodging and fodder in winter we may join with *Columella*, as far as our frugality will permit, and can eaſily obſerve the reſt: *Quare etiam frigidis humidiſque temporibus anni ſemel tantum ei poteſtas aquæ eſt facienda.*

No fierce driving. *Tum qui ſequitur gregem circumſpectus ac vigilans magna clementia moderetur, idemque duci propior quam domino.*

HE gives not the ſhepherd leave to lie down, but to ſhew his face for a comfort to thoſe melancholic cattle. *Neque ab his aut longe recedat, nec aut recubet, aut conſidat. Nam niſi procedat, ſtare debet, quoniam grex quidem cuſtodis officium, ſublimem celſiſſimamque oculorum ſpeculam deſiderat, ut neque tardiores et gravidas, dum cunctantur, neque agiles et fœtas, dum procurrunt, ſeparari à cæteris ſinat, ne fur aut beſtia hallucinantem paſtorem decipiat.* And we add, that ſinging, whiſtling, piping, and other muſick is phyſick againſt their natural melancholy, and for us men alſo, if in the lays of old *Tityrus*.

COLUMELLA preſcribes many old and excellent and curious medicines for the peculiar diſeaſes of ſheep, Lib. VII. c. 5. But every ſhepherd ſhould be always provided againſt the common diſeaſes: of rankneſs of blood, which makes them drop down, and die immediately; againſt the ſcab, begotten by hard winter and poverty. For which the uſe of tobacco and ſufficient dry food and ſhelter exceeds all old receipts; and againſt ſores and wounds eaſily healed with tar; and againſt giddineſs and weakneſs of the liver begetting the rot, againſt which juniper berries have a peculiar commendation, and may be added to the former preſcriptions againſt the rot. The worms and diſeaſes in the feet may by art be cut out, and healed with tar, alum, and liquor. The fever by letting blood between the claws in the feet, or under the eyes, or ears. Why ſhould we ſpare the blood of a ſheep (the moſt general and moſt effectual remedy)

remedy) when our care of ſheep is not for their long lives, but for their fat, fleſh, ſkin, and fleece?

Of coted ſheep.

De Ovibus Tectis, Colum. l. vii. *c.* 4.

NEITHER here nor in my former, do I take theſe words, *Of coted ſheep*, to be the genuine and proper tranſlation of *Columella*'s title, *de ovibus tectis*; but I uſe the word only by way of alluſion, becauſe, as their ſheep in *Italy*, which bore the fineſt wooll, wore coats or covering garments, to defend them from heat of ſummer, and the cold of winter, and for the improvement of wooll, ſo, in *England*, our ſheep, which bear the fineſt wooll, have cotes or houſes for their defence all nights, winter and ſummer, and in the ſaddeſt days of winter. Of the ſheep, which bear the coarſe fleeces, we take not that care in moſt places of *England*.

THAT theſe *oves tectæ* had ſome covering beſides their own fleeces, may appear by theſe words of *Columella*, l. 7. c. 4. *Liberis autem campis, & omni ſurculo ruboque vacantibus ovem Græcam paſcere meminerimus, ne & lana carpatur, & tegumen.* And more clearly in the foregoing chapter, *Quanto lana prolixior in pecore concreſcit, tanto magis obnoxia eſt rubis, quibus velut hamis inuncata, a paſcentium tergoribus avellitur; molle vero pecus etiam velamen, quo protegitur, amittit, atque id non parvo ſumptu reparatur.*

FROM whence I deem it worthy our enquiry, whether we in *England* may not make a conſiderable improvement of our wooll, if we covered our ſheep, and took the other aids for the fineneſs and growth of wooll, which we ſee preſcribed by the old writers; and poſſibly ſome new aid we may find, which excels their aids. And again, we may enquire, whether it might not be available (in theſe times of general commerce by the benefit of navigation) to furniſh thoſe Engliſh counties, which yield the fineſt wooll, with thoſe kind of ſheep, which were clothed. Or at leaſt (as *Columella*'s uncle did, l. vii. c. 2.) to get rams of this fineſt kind. For to the Italians it was not then the native ſheep, but (as *Columella* ſays) *Græcum pecus, quod plerique Tarentinum vocant.* And we ſee how the ſilk-worm hath travelled from the Eaſt through *Perſia* and *Italy*, both weſtward and northward, even to our cold and watery climate, if we ſo pleaſed.

AND ſurely it would be ſome conſiderable reward for a ſhepherd's diligence, if he could make his ſheep bear ſilk, and keep them ſafe alſo; and I make no doubt, but we may have ſuch ſilk from our ſheep, as may paſs for the ſilk of the old teſtament, ſuch as was uſed for the tabernacle in the Levitical rites. For (as judicious interpreters do acquaint us) the ſilk ſo often mentioned in the old teſtament, as pertaining to the tabernacle, or to the temple for Levitical rites, was not the ſilk of the worm, which was an unclean inſectile, and therefore unholy; but was ſome fine cotton, or fine wooll, as it is expreſly called by the author of the epiſtle to the Hebrews, c. ix. v. 19. "with water and ſcarlet wooll, ἐρίῳ "κοκκίνῳ." For ſome wooll contends for fineneſs with ſome cottons, and ſome hair contends with furs or wooll for fineneſs, and ſome furs, ſome wooll, and ſome cottons do approach as near to the ſilk of the great Virginian ſilk-worms, as that ſilk approacheth to the ſilk of *Naples*, *Perſia*, and *Armenia*. We ſee how mohair and Turky-ſtuffs bear the gloſs of ſilk in ſome dies; and ſome calicoes and taffanies, and new ſtuffs, make us doubtful, whether they are of ſilk, or cotton, or whence the materials. And the furs not only of bevers, but of rabbits, and of many vermin, but chiefly of the black fox, do claim a precedence before ſome ſilk. The beaver is fit not only for hats, but for gloves and other garments, eſpecially looſe garments. How far other down of fowls, and of vegetables, and feathers, may by art be brought into uſe, who can foreſee? But now we have gone a wooll-gathering.

THAT we may weigh what Engliſh countries were fitteſt to try the ways of improving wooll to a ſilken fineneſs, I can only give account of *Herefordſhire* wooll, and chiefly there of the wooll of *Lemſter's-oar*, and *Urchinfield*, by which all that pretend to fineſt wooll may compare their own. That which deſerves properly the name of *Lemſter's-oar*, is ſold commonly about thirty ſhillings, ſometimes thirty two ſhillings the ſtone, which weighs twelve pound of ſixteen ounces to the pound: the beſt of *Urchinfield* not frequently above twenty ſix ſhillings the ſtone. The common wooll of other parts of *Herefordſhire*, about twenty ſhillings the ſtone. And the wooll, that fails there of that rate, we call coarſe wooll, or Welſh wool. Though yearly the price may alter ſomewhat, yet this for many late years hath been the proportion: and being our ſtaple commodity, we may the ſafer fix a rate, but I have not the ſkill to proportion it with the rates of wooll in other countries, which had been a clearer guide in this queſtion.

I KNOW, that wooll and ſilk do altogether differ in kind; but wooll is a curled fur, or curled ſilk; and herein I ſend a lock, which I did cut from a negroe's head, to ſhew how like it is to our black ſheeps wooll in *Herefordſhire*.

THUS our fine woolled ſheep, though they be natives, and Engliſh, not of the Greek kind, yet they require ſome of the ſame tender care; but not ſo much curioſity. Whence I infer, that it may be of ſome avail to make known to our beſt and moſt curious huſbands in *England* the great diligence and induſtry, which Italians uſed to preſerve ſheep, which bore the fineſt wooll.

COLUMELLA's firſt words are a kind of diſcouragement, *Græcum pecus, niſi cum domini præſentia eſt, vix expedit haberi; ſiquidem & curam & cibum majorem deſiderat. Nam cum ſit univerſum genus lanigerum cæteris pecudibus mollius*

mollius tum ex omnibus Tarentinum est mollissimum, quod nullam domini aut magistrorum inertiam sustinet, multoque minus avaritiam; nec æstus nec frigoris patiens. But for this we have a satisfying answer, that *England* is full of wealthy farmers; and in the countries, which bear finest wooll, generally all farmers and masters do over-look their own flocks, or both their shepherds and flocks; and many do live at a higher rate, than to measure all things by profit. Some expence and diligence is sacrificed to elegancy and curiosity, with this inscription; *viderit utilitas.*

Raro foris, plerumque domi alitur, & est cibi avidissimum, cui si detrahitur fraude villici, clades sequitur gregem. There is little danger of this amongst us, but the contrary. For our farmers do hold by another tenure, than their slaves and villains. Our farmers are the true owners of the flock; and such as have the special charge of the sheep, are more apt to rob their master's barns for too much and too costly grain, than to defraud the sheep.

FOR their allowance in food, I may save the labour of translating it, for I doubt I shall find few disciples. *Singula capita per hyemem recte pascuntur ad præsepiatribus ordei, vel fressæ cum suis valvulis fabæ, aut cicerculæ quatuor sextariis, ita ut & aridam frondem præbeat, aut siccam vel viridem medicam cytisumve, tum etiam cordi fæni septena pondo, aut leguminum paleas affatim.*

THEY must not think of fatting lambs of this race for the butcher, nor of milk for the dairy; and when any lamb is weaned or sold, or miscarries, the ewe may join to help to give milk to some other lambs, which thereby sucks of both. *Minimus agnis vendundis in hac pecude, nec ullus lactis reditus haberi potest: nam & qui summoveri debent, paucissimos post dies quam editi sunt, immaturi fere mactantur; orbæque natis suis matres alienæ soboli præbent ubera: quippe singuli agni binis nutricibus summittuntur, nec quicquam subtrahi submissis expedit, quo saturior lactis agnus celeriter confirmetur, & parta nutrici consociata minus laboret in educatione fœtus sui: quam ob causam diligenti cura servandum est, ut & suis quotidie matribus, & alienis non amantibus agni subsumentur.* We are not often wanting in any of these points.

HE adviseth to rear, or breed up more males for these, than for coarser flocks, with this peculiar reason, because the rams are gelt for weathers, and sent to the slaughter-house, about two years old, and their fleeces sold at highest price, as bearing the finest wooll. *Plures autem in ejusmodi gregibus, quam in hirtis masculos enutrire oportet; nam prius quam fœminas inire possint mares castrati, cum bimatum expleverint, enecantur; & pelles eorum propter pulchritudinem lanæ majore pretio quam alia vellera mercantibus traduntur.* And thus we prefer weathers, both for the flesh, and for the fleece.

BUT now follows a cluster of curiosities; how to make the fleece grow finer, and also more abundantly. *Nam sæpius detergenda, & refrigeranda est; sæpius ejus lana diducenda, vinoque & oleo insuccanda: nonnunquam etiam tota est eluenda, si diei permittit apricitas: idque ter anno fieri sat est; stabula vero frequenter everrenda, & purganda, humorque omnis urinæ divertendus est, qui commodissimè siccatur perforatis tabulis, quibus ovilia consternuntur, ut grex supercubet, nec tantum cæno at stercore, sed exitiosis quoque serpentibus tecta liberentur.* This puts me in mind of the diligence, which some of our gentry do use for their cocks, hawks, dogs and horses. He requires the like care for these silken sheep, that they be often rubbed, and refreshed, and (their wooll being divided) dressed with wine, and oil soaked in, sometimes washed (which should be done thrice in the year) the stable or cotes kept very clean; the urine always drained away at holes in the planks underneath; no dung left there, nor harbour for serpents.

YEA, and their houses oft-times perfumed also to expel serpents, as he directs in the stile and joint authority of *Virgil.*

Disce & odoratam stabulis incendere cedrum,
Galbaneoque agitare graves nidore chelydros:
Sæpe sub immotis præsepibus aut mala tactu
Vipera delituit, cœlumque exterrita fugit,
Aut tecto assuetus coluber.

INSTEAD of the smoke of cedar, we in *England* may use juniper, which in some barren lands superabounds; or, in want of that, *Col.* recommends burnt hair, or burnt horn.

HE prescribes a medicament, wherewith to anoint new shorn sheep for increase of wooll, and the fineness of it. The decoction of lupines, with the lees of wine and dregs of oil, and after four days to plunge them in sea-water, or (if that cannot be had) in rain-water, in which brine is decocted. *Hoc modo curatum pecus anno scabrum fieri non posse Celsus affirmat; nec dubium est, quin etiam ob eam rem lana quoque mollior ac prolixior renascatur.* This also may here be altered for our lees of ale, and such liquor as the kitchin affordeth; and instead of lupines, which is not common with us, why not a decoction of beans, or some other grain?

AFTER all this care for the softest sheep, and finest wooll, I must vouch *Virgil*'s authority, that the stinking goat yields as much of the sweet gain, as any sheep, and then *dulcis odor lucri.*

Hæc quoque non cura nobis leviore tuenda,
Nec minor usus erit, quamvis Milesia magno
Vellera mutentur, Tyrios incocta rubores.
Densior hinc soboles, hinc largi copia lactis:
Quam magis exhausto spumaverit ubere mulctra,
Læta magis pressis spumabunt flumina mammis:
Nec minus interea barbas, incanaque menta, &c.

WE see, that reddle makes the wooll grow finer, and reddle being cheap with us, many do reddle the sheep all over, and repeat it often.

Of Goats.

To a very skilful farmer I deplored his sad condition, that his lands were all under the curse of thorns, briers, and brambles, barren clifts, and rocky hills; not a shred of cow-pasture

paſture, and the fields ſo light, ſtony, and ſandy, as to refuſe or burn out the heart of wheat, peaſe, *&c.* He anſwered, that (beſides the unknown treaſures, which he hoped lay under that diſheartening turf) he found a relief from it beyond the belief of beholders. For his light and ſandy land bore turnips, potatoes, and other bulbous roots, as well for food, as for ornament; for odoriferous vegetables, and beauties, that this light land was kinder than the ſtrongeſt land in the vale. That his wife or his boy could with eaſe turn up the ground with a hand-plough, or pare off the turf of one piece of ground to redouble the ſtrength of another. That his furzy ground (being torn up) would yield fuel to repay the workmen, and ſome kinds of corn for ſome years, and afterwards (being ſown with the ſeed of the largeſt French furze) would ſuddenly become a wood, as rich as any coppice-wood, and the proverb ſecures for the moſt parts of *England*, that an acre of coppice-wood is as good as an acre of wheat land, if not much better.

To this I replied, But where is the ox-paſture to maintain the plough? or where the cow paſture, to yield milk, butter, and cheeſe? Where is the timber?

FOR timber, he pointed to groves of free holly (ſo they call holly, that hath no prickles, but one at the point) and this (ſaith he) is ſtout and tough timber. Every leaf is a hearty and juicy food for the cattle. It challengeth the bays, and all other verdant beauties of the garden, by affronting the froſt and ſnow of winter, with her fiery cluſters. If the ground be a while ſevered from the teeth of cattle, we can raiſe theſe groves faſter, and frame it into ſtronger fences and hedges, than of any other ſhrub. And now for cow-paſture (ſaith he) here is richer paſture, and richer ware, than that vale does yield, pointing at a ragged, buſhy, rocky hill, where a herd of goats graſed.

I WISHED, that there were a ſevere law for the exterminating of thoſe beaſts of poiſonous breath and teeth from all parts of the land, where a quickſet-hedge could grow. To this wiſh, he conſented heartily, but ſaid in good earneſt, that to him they ſeemed a richer cattle than cows. For cows required flowry clover by the river banks all the ſummer, warm houſes, good fodder, and coſtly attendance all winter. Whereas goats thrive beſt in a buſhy ground, that would unfleece the ſheep, and yield no graſs for larger cattle, and the winter cold they can bear with little charge of relief or attendance. And better they deſerve a park pale, than the nobleman's deer, or coney. But are then moſt profitable, when a poor boy may keep them in herds on the rocks, mountains, and wild or waſte lands, for the relief of the neighbouring poor. And many ſuch waſte lands there are in *England*, *Wales*, and *Scotland*. From whence by theſe herds more Chriſtians may be cheriſhed to ſerve God, and (as we ſay in *England*) the king may increaſe the number of his ſubjects. And it is the main point of agriculture, that we ſort every ſoil to the beſt benefit; and he is the beſt republican, who deviſeth ſuſtenance for the multitude, and raiſeth the moſt profit from the worſt land.

OF old, indeed, Romans, in their wealthy *Italy*, had ſuch eſteem of the profit of theſe herds, that *Varro* tells us of a Roman knight, who, in his days was allured (by the ſweet gain, which he found by a ſmall herd) to advance to a thouſand in the herd, lib. ii. c. 3. *Is (viz. Gaberius Eques Romanus) cum in ſuburbano mille jugerum haberet, & a caprario quodam, qui adduxit capellas ad urbem decem, ſibi indies ſingulos denarios ſingulos dare audiſſet, coegit mille caprarum, ſperans ſe capturum de prædio indies ſingulos denarium mille.* What this denarius would value of our money, we ſhall not eaſily gueſs. For though our monetary criticks do render it ſeven-pence halfpeny, yet who can ſay, how near that may amount to one, two, or three ſhillings, if he conſiders how much a penny or ſhilling of Engliſh money hath altered in three hundred years, and the like of foreign alterations?

AND although *Gaberius* had no good ſucceſs in his exceſſive covetouſneſs, yet we ſee, how much the poor may be (and yet many more might be) relieved with their ſmall herds, which would be a ſmall taſk for ſuch as do want employment; and he, that keeps thoſe herds from wandering, or doing annoyance, may uſe his knitting pins (which alone ſuſtains moſt of the people (male and female) men, women, and children, in *Parſhowe*, a town in *Worceſterſhire*, and may addict to many other manufactures. However, this ſhall encourage me to ſelect from the old Roman huſbandmen a few rules of directions, concerning them. And this is their firſt praiſe, that a few and ſimple directions will be ſufficient.

VARRO, by his own choice, prefers a male goat for every ten females. *Alii ad denas capras ſingulos parant hircos, ut ego: alii etiam ad* xv. *ut Menas: nonnulli etiam ad viginti.*

FOR a herd, he adviſeth to confine towards the number of fifty, or, as he ſaith, *in Sallentinis, & in Caſinati ad centenas paſcunt.* I conceive the greater number of them cannot be ſo dangerous, or ſo inclinable to infections in *England*, as in thoſe hot countries, where they are never free from a fever. *Capras ſanas ſanus nemo promittit, nunquam enim ſine febre ſunt.* I know many herds, and the pooreſt do adventure for them, and I never heard them complain of their loſs by fevers, or contagion. *Quid dicam de earum ſanitate, quæ nunquam ſunt ſanæ? niſi tamen illud unum, quædam ſcripta habere magiſtros pecoris, quibus remediis utuntur ad morbos quoſdam earum, ac vulneratum corpus (quod uſu venit iis ſæpe) quod inter ſe cornibus pugnant, atque in ſpinoſis locis paſcuntur.* However the rule is good, that we rather get many herds, than great herds, which are apt to beget the peſtilence. *Itaque greges plures potius faciunt, quam magnos, quod in magnis cito exiſtat peſtilentia ibidem.*

DR. *Moffet*, a rare and excellent phyſician, comparing the ſeveral milks, ſays, that for ſome aſſes milk is beſt, for others cows milk, for

for ſome goats milk, becauſe the one cleanſeth, the other looſens, and the third ſtrengthens more than the reſt. Goats milk is better for weak ſtomachs, becauſe they feed on boughs more than graſs. Sheeps milk is thicker, ſweeter and more nouriſhing, yet leſs agreeable to the ſtomach, becauſe it is fatter. Hence I collect, that ſheeps milk being fatter than cows milk, and goats milk finer, they may well be contempered together. And twenty ewes and ten ſhe goats would be a good ſuſtenance, and make a dairy for a cottager, or poor farmer. And ſome ſuch mixture ſeems requiſite, ſince goat's of itſelf is apt to beget the louſy diſeaſe, as Dr. *Moffet* exemplifies in the ſad example of the lady *Penruddock*, p. 125.

MOFFET prefers the fleſh of black and red kids before the white, and the kid to be of eaſy digeſtion, of excellent nouriſhment, and reſtorative after great ſickneſs; better roaſted, than ſod; and hinder parts better than foreparts, and beſt under ſix weeks age. A gelded goat is next to the kid, but ſhould be baited, or hunted, then blooded, and when dead, the fleſh muſt be beaten in the ſkin, after the French manner of beating a cow, (ſaith *Moffet* more eſpecially of the old he goat and ſhe goat) and then ſeaſoned with ſalt and pepper, and baked, it makes a luſty kind of baſtard veniſon for the hard labourer.

VAR. l. ii. c. 11. finds good uſe for goats hair for navies, for warlike engines, for veſſels. *Capra pilos miniſtrat ad uſum nauticem, ad bellica tormenta, & ad fabrilia vaſa.* We in our days have amplified the uſe of worſe hair for hats and other garments, as alſo for bed coverlets.

COLUMELLA, Lib. VII. c. 6. confirms the former, by recommending them to ſhrubby, buſhy, and thorny wild grounds. *Nam nec rubos averſatur, nec vepribus offenditur, & arbuſculis, frutetiſque maxime gaudet; ea ſunt arbutus atque alaternus cytiſuſque agreſtis, nec minus ilignei querneique frutices, qui in altitudinem non proſiliunt.* Becauſe this wilderneſs is ſo kind for goats, it is not amiſs to advertiſe of the ancient diligence, which planted cytiſus; and it is now more eaſy by our hand plough to tear up ſome furrows, and ſow them with hips, haws, ripe holly berries, acorns, aſhkeys, and bramble berries, and to ſave them from cattle, till they are got up a little. To encreaſe their milk, *ſuper lactis abundantiam ſamera, vel cytiſus, vel hedera præbenda, vel etiam cacumina lentiſci, aliæque tenues frondes ſunt objiciendæ.*

THE ſkins of kids and goats do grow every day more precious, as we do grow in our ſkill of dreſſing them, and colouring them.

COLL. l. vii. c. 7. gives this general rule for medical, that as ſoon as one falls down of the peſtilence, or murrain, all ſhould be blooded. Nor they ſuffered to feed all day, but reſtrained four hours of mid-day.

IF other diſeaſe invade them, *ſi alius languor infeſtat, pabulo medicantur arundinis, & albæ ſpinæ radicibus, quas cum ferreis pilis diligenter contuderimus, admiſcemus aquam pluvialem, ſolamque parandam pecori præbemus.*

FOR the dropſy, *ſub armo pellis leviter inciſa perniciosum tranſmittat humorem; tum factum vulnus pice liquida curetur, ibid.*

IF the female be troubled with the bearing or after-birth, a draught of good ale, cyder, or wine, will do good, *defruti ſextarius, vel cum id defuerit, boni vini tantundem faucibus infundatur, & naturalia cerato liquido repleantur, ibid.*

IF nothing elſe will, the butcher's knife cures all their diſeaſes, and is then beſt in ſeaſon, when the fleſh, fat, and ſkin are ſaved.

VAR. l. ii. c. 3. *Capræ a carpendo nominatæ. Horum enim dentes inimici ſationis, quas etiam aſtrologi ita receperunt in cœlum, ut extra limbum 12 ſignorum excluſerint.* And ſo ſhould we exclude them from all woods, groves, or hedges, that are worthy our care. For as well holy prophets, as heathen poets do juſtly reſemble them to devils, as proper for the vale of miſery, and land accurſed.

Experiments moſt part medical or chirurgical, Nov. 9, 1663.

ABOUT ſeven years ago, as I ſat at dinner, and drank in a ſilver tankard, I felt ſomewhat like a flie's rough claws faſtned in the paſſage of my throat. Suddenly I caught away the tankard, and ſtrained my breath with my utmoſt ſtrength and ſpeed, and therewith did blow out a great ſpider, which ran on the table before the eyes of all that ſat there. This was in a well ordered family of careful and cleanly people; yet this fell out like an advertiſement to prefer clear glaſſes, before goblets of gold or plates of ſilver. And health and life is concerned in ſuch circumſtantial deliverances, as much as in medicine, or chirurgery. And I think this land and climate does not breed ſtronger or quicker poiſon in any vegetable, animal, ſerpent, or inſectile, than in the ſpider, though I have heard of ſome men, that can eat and digeſt ſpiders; and I have ſeen young turkeys eat them for an antidote, and particularly when ſtrawberries, (either in kind, or in quantity, as cauſing a ſurfeit) was their poiſon, and had killed many, that had not eaten ſpiders. But I muſt never record this deliverance without the ſacrifice of my heart in praiſes to the ſupreme Lord and governor of the world, whoſe influence gives life, motion, and activity to every creature, and very peculiarly to ſuch, as acknowledge his ſuperintendance, abſolute dominion, and inexhauſtible goodneſs; to ſuch moſt eſpecially in the hour of need.

A GENTLEMAN of great parts obſerved to me the preſentneſs of ſpirit, and rationable conduct, that ſome have more than others in ſurpriſing diſtreſſes. He ſaw a man thrown off a great horſe, his head falling under the horſe's forefeet, and the hooff pitching upon one of his eyes. The man's hand was ready to defend his face (which is a natural motion) and perceiving the horſe's hoof coming juſt in his eye, with a vigorous thruſt of his hand, he

he turned the hoof aſide, and ſo ſaved his face. I have ſeen very many eſcapes by quick and unexpected activity; and many ſore miſchances by notorious dulneſs, and negligence. I ſaw a proper youth (his legs ſliding from under him in a ſhelving deſcent at the head of a pond) ſuffer himſelf to be tumbled headlong into the pond in very great danger. An old man ſtood by me, and both of us with much wonder noted, that he made no renitence with hand, or foot, or other part of his body. For which ſtupidity the old man gave him afterwards ſuch impreſſive reprehenſions, as might add laſting metal to his ſpirit. And I ſaw a goodly perſon, of very great fame for his valour and ſtrength, caught by his foot in the ſtirrup at a latchet-pin in a park gate (all made very ſtrong) and the horſe in a gird of ſpeed ſo diſtended, that we all expected he ſhould be torn to pieces. It was his mere negligence to be thus involved; and he had no other remedy, but by a quick activity to caſt himſelf behind the ſaddle, and off the horſe. And (as I noted before of vomiting) there are more points of activity do belong to man's ſafety, and credit, than thoſe, which conſiſt in leaping, running, and fencing, *&c.* And the promptneſs of ſpirit is for general uſes better than a dexterity in athletick exerciſes. But above all it is ſafeſt to make our frequent and conſtant refuge to the altar of God, who makes his angels miniſtring ſpirits for our good. And this is the catholick and univerſal medicine.

IT is not civil language in theſe days to ſay, that the maniacal, lunatic, epileptical, ecſtatic, or convulſive, are poſſeſſed with devils, or unclean ſpirits; yet judicious *Mede* hath proved the holy ſcriptures ſometimes to uſe that language indifferently, as *termini convertibiles*; and ſome very learned perſons of late are engaged to make all theſe ſymptoms merely natural, others ſtrain all their operations to be ſupernatural, divine, and forſooth prophetical. But of this we may take good notice, that in all ages of the remoteſt antiquity (not only amongſt God's people, Abrahamites, Iſraelites, Jews, and Chriſtians, but alſo among Egyptians, Aſſyrians, Greeks, Romans, Barbarians, and Savages) in the application of medicine the moſt famous phyſicians did moſt ſolemnly invocate the great name of Jehovah, not only for the cure of theſe peculiar maladies, but generally of other diſeaſes. Of which cuſtom ſomething is collected by *Grotius* in *Matthæum*, Cap. XII. ver. 26. *A dæmonibus ad morbos quoque mos tranſiit.—Ejuſmodi ergo exorciſmi eventum ſæpe ſuum habuerunt, non quod vis ulla in ſyllabarum pronunciatione ſita eſſet, ſed quod verus Deus illis potiſſimum nominibus noſci appellarique vellet, atque ideo vim ſuam tum demum exſereret, cum apertiſſima locutione conſtaret ipſum, non aliquem gentilium Deorum, eſſe invocatum.* This he takes to be our Saviour's argument there, and that the true God would bear witneſs to his own name (when he was acknowledged the God of *Abraham*, *Iſaac*, and *Jacob*) all over the world. And that the true God will more truly and effectually hear our prayers to aſſiſt the health of mankind, than ſuch idols, devils, and unknown genii, as were worſhipped by ſavages, we may juſtly confide. Of exorciſms I muſt not interpoſe any judgment of mine own, but I refer the intelligent to the argument, as it is handled by the learned and judicious Dr. *Field on the Church*, where the judgment and practice of the primitive church is recited with the joint teſtimony of all the holy Fathers of beſt ages. And ſomewhat we may find amongſt our Canons and Conſtitutions eccleſiaſtical, Engliſh 72. (where in old prints I have read the word exorciſe, in later prints exerciſe) in concurrence with the proteſtant churches, which follow the Auguſtane confeſſion. And *Grotius* tells us in *Mar.* xvi. v. 17. that old miracles are not in theſe days exterminated, if our faith were not firſt exterminated. *Sed nos, cujus rei culpa eſt in noſtrâ ignaviâ aut diffidentiâ, id ſolemus in Deum rejicere; ſunt autem* ἀμετομέλαλα τῶ Θεῶ δῶρα. But to forbear the high language of exorciſms, and of miracles, is it to the credit of proteſtants, if Jews, Mahomedans, and Romaniſts, do refer more to the efficacy of faith and prayers in deſperate diſeaſes, than they, the reformers, do ordinarily? Do not acute diſeaſes oftimes lye in ſuch diſguiſes, as may need more of divine than of human conduct, more of the happineſs than of the art or force of the phyſician, chirurgeon, or application: and we ſee, how the critical ſtate may alter in a moment; and that may now be an antidote, which, within an hour before or after, might be furious poiſon. And we have many inſtances, which do import, that in our days, ſome have the gift of healing, though perchance not in the ſame vigour as in the apoſtolical age. *Reſponderi poteſt, non quidem tam frequentia et conſpicua eſſe, quam olim fuere dona ſanationum: attamen Deum nunc quoque piis, quorum ſaluti id expedire judicat, ſæpe morbos auferre, aut mitigare:* ſaith *Grot. in Annot. ad Caſſand. De unctione infirmorum.* And is it not more of mercy and charity, to offer ſomewhat of the good Samaritan's oil (as St. *James* directeth, ch. v. 14.) and at leaſt to ſolicit εὐθανασίαν, than to fly the field, and to forſake the patient in his greateſt exigence, as it is the manner of ſome phyſicians, leſt they ſhould loſe the reputation of doing more than they can do, or ought to be done in this vale of mortality.

A GENTLEWOMAN of rare beauty loſt all her fair roſes and complexion by conſumptive coughs, rheums, and green-ſickneſſes. For remedy ſhe followed the famous phyſicians of *London*, and thereabout, ſome years in vain. I perſuaded her to take, as hot as ſhe could well drink it every morning, a full draught of the decoction of centaury boiled in beer or ale, and to walk after it: ſhe did it heartily for a fortnight or more, recovered her roſes, was married, hath children, and continues in health theſe fourteen years ſince, this being her only medicine at the firſt, and in all relapſes.

THE blood is purged, and melancholy abated by a like infuſion of fumiterræ, either warm or cold, as ſoon as the plant appears in ſpring. The head freed from vapours by wild betony; and ſage-ale is proper for the aged, when ſubject to rheumatick defluxions from the brain. Balm ale a cordial; and the like I could experimentally affirm of ſeveral vegetables very effectual againſt long radicated maladies, by a conſtant uſe of them infuſed in our ordinary drink. And a palate hardened to bear the hop and tobacco may as eaſily endure any other horrid guſt, of which kind I account centaury the moſt intolerable: in compariſon of which, wormwood is pleaſant, and by uſe becomes more agreeable than the hop or olive, as appears by the teſtimony and practice of many of the gentry in *Hereford*, and *Herefordſhire*, who do generally prefer the wormwood beer of *Trehern* the girdler, before other beſt ale or beer, although their palates are much accuſtomed to a very pleaſant winy cyder. Of theſe vegetables I ſaid as much before, but in this I chiefly intended this note, that in the late times of war and heavy payments, many, whoſe livers by grief and diſcontent became very weak and tainted, and many ſcorbutically affected, were healed and recovered by the uſe of this wormwood beer. And it is ſomewhat conſiderable to find ſuch ſtore of medicine, as may heal the epidemical diſeaſes for all the town and country, without charge upon phyſicians and apothecaries, if they can forgive this fault. And, if we had a medicine, that would heal a rot in ſheep, what is it worth if it be ſo coſtly, or ſo ſcarce, that it may not or cannot be applied to the infected flock?

I HAVE known more than one excellent phyſician, who conceived, that moſt of our worſt maladies had ſomewhat of ſcorbutical malignity, and did frequently apply ſomething anti-ſcorbutical. For their ſakes, that are of this opinion, or for them rather that are afflicted with this malady, this experiment I offer, as thoroughly and often tried, that when all other medicines of current note failed to cure the ſcurvy, a draught now and then of the juice of oiſters taken out of the ſhells, after they were ſtewed, and a cup of wine after it, ſpeeded the cure. This took up my wonder, becauſe I found oiſters irritate the malady; but the fleſh of the viper rebateth the poiſon of the viper. Such as are afraid of chalybeat medicines, vitriol, and *Matthews*'s univerſal pill, or do loath the ſcurvy-graſs, may perchance find their palate pleaſed at this news, and allow themſelves the variety, and ſauce of the juice of oranges added to it.

HOLY thiſtle decocted in clear poſſet-drink was heretofore much uſed at the beginnings of agues, fevers, unknown diſeaſes, and eſpecially if there be any ſuſpicion of poiſon or infection; and *Alexis* of *Piedmont* ſo highly extols it, as if it were an univerſal medicine. It inclines to a gentle ſweat, or perſpiration, and purgeth by urine, anſwering to the ſignature (as generally thiſtles do) as if the prickets opened all the pores to emit the obnoxious humour; and this in my experience I have ever found to be the friendlieſt way of evacuation (as before I noted in *Matthews*'s pills.) And again about five years ago, the holy thiſtle recovered the former reputation, when agues and fevers were epidemical and obſtinate, and of more than ordinary malignity. By this and other like changeable valuations of medicines, it ſeems, that we follow the faſhion, as well for choice of medicines, as for ſhape of hats and breeches.

I COULD not gueſs, why ground-ivy (called in old Engliſh tudmore) ſhould now be called ale-hoof. But I hear it ſerves ſome ale-wives to out-run the exciſe-peeper in clarifying their new ale, as ſoon as it is brewed, in one night, and ſettles diſturbed drink, and gives no offenſive reliſh to hinder the ſale; and then it is one of the general friends of nature, which evacuateth (by urine) rheums, poiſon, and vapours, that offend the head, ears, and eyes, *&c.* And however the hop carries the bell at this time, yet the friendſhip of burnet, angelica, and of lilies of the vale, is beſt known in white and Rheniſh wine, *&c.* And it is needful an ingredient ſhould be generally friendly, before it be entertained epidemically in our daily diet.

WHEN I was an *Eton* ſcholar, I fell very ſick. Our ſchoolmaſter Mr. *Buſt* ſent Dr. *Hector* to me; he tells me, I muſt be let blood, and take a vomit: I deſired gentler handling, for that I had never tried either of thoſe remedies. The doctor draws out his money, and tells me I muſt have a double fee for teaching him his art; but (ſaith he) the ſchoolmaſter ſent me to give you phyſick, and not to receive your inſtructions. But I held my reſolution to adventure upon an unknown malady, rather than upon two ſuch violent remedies. Within three days it appeared a tertian ague, which by regular diet, gentle ſweats, and ſome patience in reſiſting the fits, with walking in the time of the viſit, was ſubdued within three weeks. And as long as we have ſtrength to make any ſuch reſiſtance, I ſhould prefer that method in agues before any violent repercuſſions, though it were by the famous *febrifuga* called Jeſuit's bark: but in the concernment of agues, I account him happy, that can with moſt eaſe, and thoroughly diſcharge his ſtomach.

AT *Orleans* in *France* I fell extreme ſick in a high burning fever, which ſurely was peſtilential, and ſo our phyſician told us; and three of us Engliſh fell ſick together in one houſe, as infecting one another. Monſieur *Du Cheſney* was our phyſician, and indeed ſhewed us the office of a ſkilful, careful, and honeſt phyſician. He viſited all of us, as we fell ſick in order, twice or thrice every day; ſaw the vein opened, or gently breathed (a little at a time) and no oftner than needful. He aſked each of us, whether we ever loſt blood before; and we anſwering no, he cheared us with ſome confidence under God's mercy of our recovery. By which received rule, it ſeems good not to be prodigal of blood without

out urgent cauſe. He overlooked our diet, allowing nothing but French barley broth, and ptiſan during the effervescence of the fever. Was always preſent when any potion was given. Took great care for our reſt and quietneſs by the ſilence of the houſe, and all attendants; forbad viſits. After all his care, he would receive but a ſmall ſum. For myſelf, I could not faſten on him any reward. He accepted of ſome poor trifling ſcribbles, as if they had been a reward. And the like kindneſs I have received from Dr. *Smith* of *Shrewſbury*, and from Dr. *Harford* of *Hereford*. Yet from my heart I can plead in the behalf of ſuch careful, honeſt, and ſkilful phyſicians, that no honour, nor reward, that this world can yield, is a full and ſufficient reward for them. A good magiſtrate gives life to the people, and they by God's bleſſing preſerve the life of magiſtrate, and people. But never was there any ſuch cruel and mercileſs tyrant on earth, as is an unſkifull or diſhoneſt phyſician, or chirurgeon. To conſume our ſubſtance, and to fill their own purſes, they tear our fleſh, corrode our bones, and torture us in all our parts and vitals for days, weeks, and months together, even whilſt we fly to them for aid, and whilſt they ſmile in our faces with all ſweet promiſes of affectionate care. But it ſo fell out in heaven; a collapſed angel is a devil.

ABOUT the end of February, above twenty years ago, as I was riding from *Cambridge* towards the weſt, I fell into ſuch deep and dirty ways in *Wiltſhire*, that I and my horſe were quite tired. With much ado I got to an inn, and to bed I haſtned, where the fever tormented me all night, increaſed all day, and thus for two nights and two days, worſe and worſe. I ſent for the miniſter, and prepared to take leave of this world, for I had no hope to ſurvive, till a phyſician could come thither, if I ſhould ſend for one. And I had no other thoughts, but to end my pain with the end of my days. Some good people of the houſe boiled a handful of currants, of violet and ſtrawberry leaves, each a handful, in a quart of running water, boiling it to a pint, ſtrained it, and adding ſome good quantity of ſugar-candy, gave it me to drink hot. I drank it at a draught, and fell into a ſweat after, and ſoon found my head eaſed, and other kind operations of nature. Two days after I took a gliſter, and ſo by ſoft degrees (after a fortnight's weakneſs) I recovered.

I HAVE always found, that beef is too ſtrong and rank for my ſtudious kind of life; (of pork and bacon I complained before, and it is more offenſive.) At *Eton* college we had no beef but only on Mondays at dinner, yet that filled my noſtrils with rank vapours for two days after: at *King's-College* in *Cambridge* we had beef frequently, and that continued ſome puſtles under the corners of my noſtrils, or about my mouth, or chin. Some others, though very temperate, had more enflamed faces from the ſame cauſe, as I conceive; and took much phyſick, ſtill ſuſpecting ſome heats or inflammations of their livers: and thus ſometimes we deſtroy ourſelves by medical enforcements, and by ſtraining at impoſſibilities. For if our ſpirits be vehemently fervid in ſtudies, reading, writing, compoſitions, hot arguments and meditations, it is hardly poſſible, that they ſhould aſſiſt digeſtion, as in ruſtics and day-labourers. We diet cocks for the pit, and horſes for the race; and the old Romans beſtowed aſcetical diet, and oils on their fencing ſlaves for the ſtage. Our ſerious ſtudies do better deſerve that care.

IT was reputed of old a point of paſſive valour (an eminent virtue) to ſuffer chirurgery, as occaſion required, ſtoutly. *Epaminondas* and *Marius* were famous for it; and *Jack Ellis*, the cook of *King's-College*, diſdained to be bound, whilſt his leg and knee were ſawed off. But I have heard of a lady, that ſuffered a long tormenting death, rather than the chirurgeons ſhould ſearch her wound, (and ſhe hath ſome praiſe for her reſolved modeſty) and that the truly noble Sir *Philip Sidney* refuſed chirurgery with this ſentence, *Non tanti eſt in hac arena vivere*. And death is ſometimes as welcome as ſweet ſleep to a weary traveller; *Quale ſopor feſſis in gramine*. The return to life by ſome enforcements brings the horror of pain, as the witty lord *Montagne* deſcribes it by his own experience.

I KNEW a gentlewoman of great underſtanding, and very devout, not in much talk and ſingular notions, but in fervent and perpetual prayers and deeds of charity. She lived to a great age, and practiſed medicine and chirurgery to all the neighbourhood, above ſixty years. I never heard her blamed by phyſician, chirurgeon, or patient. For ſhe would always refer the rich (in fit caſes) to the profeſſed artiſt; and was ſo noble, that ſhe rejected all kinds of gratuities. Her conſtant ſucceſsfulneſs begot my belief, that ſhe had an extraordinary gift of healing. And ſurely the late counteſs of *Kent*, and ſome princes and perſons of honour and quality now living, do deſerve from us mortals our beſt laſting monumens, and will receive from God everlaſting rewards for their bounty, charity and care in this kind. For their gifts are better than gold (as our Saviour and his apoſtles, and ſome old prophets, by their obliging examples do ſhew) and then ſuch charity will ſurely obtain the greater reward. And it is God's goodneſs to encourage theſe worthies to prevent the cruelties of lucrative and diſhoneſt practitioners.

The conduct of fame, or communication for the advancement of learning, arts, trade, and accommodations of all ſorts, &c.

Yeovill, Nov. 21, 1663.

Honourable Sir,

IN my laſt I did ſolicit the conduct of literary and accommodable communications. Now I intend to produce an example of the effects

effects and benefits, that may be expected from it. Sir *H. Wotton* would ſometimes ſend out all his train of attendants, to try, how far we could raiſe ſuch rumours as he directed; and what return we could make of current news, provoking our emulation to prove our wits and capacities by our ſucceſs, allotting our particular walks, ordering what fame we ſhould correct, and giving us the form and ſtile (in ſome variety) of our reports and of our enquiries. We could ſoon find out the chief newſmongers and receivers in *Weſtminſter-hall*, the *Exchanges*, famed ordinaries, taverns, carriers-inns, ſtationers, and concerned relations in courts, inns of courts, ſhops of trade (the barbers and baladry not neglected.)

I THEN ſaw, how few men could regulate and create fame, and the dangerous influence of fame, if not regulated to honeſt deſigns. Of itſelf, it flies and gives ſtrength or weakneſs to government, as it were by chance. Being guided, it ſerves to noble ends. He ſaid, it was great *Cecil*'s main engine (far and near) in the moſt publick concernments.

I INFER, how proper this care may ſometimes be for our purpoſe of obliging accommodations, and in the way of literature. Let me offer an inſtance upon my laſt argument of wooll, which I ſent to you by carrier on Monday laſt, and by this time hath over-filled your hand, as I fear.

ABOUT eight years ago there was a wager laid by the clothiers of *Worceſter*, that they would make richer and finer cloth of *Hereforeſhire* wooll, than could be made of Spaniſh wooll. What the wager was, or who won, or who the adverſaries, I do not know. But an honeſt clothier told me, that the Worceſter clothiers joined purſes, art, and rural aid for the victory; and beſtowed ten pounds on ribbands to bind up their cloth; which may ſignify, that they ſpared not coſt and care to win the prize. I wiſh better ſpeed to theſe kinds of emulation (both in our own country, and towards foreigners) than to any cock-fight.

AND ſuch honourable families, as wear the richeſt cloth, may eaſily continue this emulation: for advancing the wooll I have put in my mite in the forementioned diſcourſe, both from the old, and new aids; and that will encourage the improvement of drapery; and that again the dyer's art. And he, that would bear on his back the teſtimony of his good ſucceſs, or happy choice, muſt buy the uncoloured cloth in one place, and the beſt dye in another, where either is more excellent.

I REMEMBER, when I was a young ſcholar in *Worceſter*, I noted the clothiers generally to remark what gentry wore cloth; and them they reputed patriots and Engliſhmen: which ſeemed to exclude the ſilken gentry from that eſtimation. I do not join in their opinion; for the king's cuſtoms being advanced, and commerce encouraged, by the ſilken courtiers, it is another luſtre to the nation: yet the coldneſs and moiſture of our climate, at leaſt winter's rage, and the old formalities of honour and quality in our peers, and princes, judges, and all lawyers, citizens, and heretofore of our academicans, agree with our ſtaple intereſt in ſheep, and wooll. And yearly to beſpeak ſome of the beſt cloth, that *Worceſter*, or other clothing towns can make, begetteth fame, emulation, art and induſtry. And then a treatiſe of any helpful directions, becomes acceptable and ſpreading. And this will excuſe the vanity of coſtly garments in the ſight of God, and good men. And this is more than a ſhort blaſt of fame. This is exemplary, and like our Saviour's ſermon of humility, when enlivened with the fit emblem of a child placed in the midſt of company. This will encourage ſome to take care for the fineſt wooll, ſome for the moſt perfect drapery, ſome for the dyer's ſkill; and will (by competition) ſolicit manufacture; in which we did once excel, but do now yield to other foreign nations.

I WOULD yet particulariſe, that we have ſtore of horſes from *Barbary*, Spaniſh genets, courſers of *Naples*, Flemiſh mares: and why none of thoſe covered ſheep, tranſported from *Greece*, *Sicily*, or other parts of *Italy* or *Spain*, and wherever this fineſt wooll is to be found? What more eaſily tranſported than rams, whoſe ſoundeſt food may be carried with them, and whoſe beſt medicine is the ſea-water? And a few rams may alter a flock of ſheep. I have heard of rams bought by wealthy perſons to enlarge their ſheep, of four pounds, yea of ten pounds price; but I have not yet heard of any very high price, or any extraordinary care for to purchaſe the rams of fineſt wooll. Hence, in behalf of trade in general, and of our ruſtical intereſt, and alſo of our ſtaple commodity, which is of no ſmall concernment to *England*, I would humbly propoſe two enquiries to the Royal Society: 1. Whence, or how, might we get rams of the fineſt wooll in the world? 2. By what application might the wooll be moſt effectually improved in fineneſs? In my ſlight papers, I recited out of *Col. l. 7. c. 4.* a mixture of decoction of lupines, with old wine, and lees of oil, wherewith their bodies ſhould be anointed, as ſoon as ſheared; and after three days plunged in ſea-water, or bathed in brine (and in *Hereforeſhire* we ſay, reddle mingled with liquor, and the ſheep twice or thrice in the year therewith anointed) *ob eam rem lana quoque mollior, atque prolixior renaſcatur.* But, to the main point, what kind of liquor, whether gooſe-greaſe, which beſt helps the ſpinners; or badgers-greaſe, which beſt helps the dyer, but begets moths, if not by ſome way of antidote perfectly waſhed; or whether train-oil, or whether any other mixture of the green of hemlock, or white hellebore (both in ſome caſes recommended for ſheep by *Columella*) whether of theſe, or what elſe more effectual, I refer to better enquiry.

AND further I would humbly move, that in all our undertakings in the Royal Society, we ſhould do the like. Each member, in his proper capacity, ſhould, at certain times, propoſe, how any art, ſcience, trade, or manufacture,

facture, might be improved, reſtored, or revived: what old books are fit to be reprinted, what new to be extracted, or advanced: what means to engage the fitteſt preſſes. Some things I know we ſhould manage in ſecret; ſome on the houſe-top: and ſometimes the dial is viſible, when the ſpring is covered and caſed. And thus (with your favour) as a few chief perſons preſcribe the faſhion to the court, and the court to the gentry and kingdom, which is the viſible dial; ſo, by a like countenance of unexpenſive commands to the chief towns of trade, the Engliſh manufacture may be encouraged, and yet the deſign ſcarcely diſcerned. And the honeſty of ſuch a deſign, which brings work and relief to ſo many poor, will heal the tranſgreſſion of luxury, and convert our coſtly raiments into a publick bleſſing. And herein alſo we may act our parts in purifying the ſtreams of literature, and in diſtributing light of the beſt value.

SIR, to explain and confirm all this in a concluding word: if others would endeavour for mathematics, ſome for ruſtical affairs (and that had been my element, if I had been my own man) ſome for artifices, and ſo in all other things, as you have been pleaſed to contribute towards chemiſtry, medicine, and the other great and ſecret works of nature, we ſhould ſoon accompliſh beyond the Verulamian vote, and do things worthy of the Royal Society. But I perſevere in overcharging you with too many troubles.

Honourable Sir,
your moſt humble, and
moſt affectionate ſervant,
BEAL.

SIR, that of late my pen hath cumbered you with many repetitions, I could excuſe it by my ſpeed and buſineſs, which allows me no ſecond thoughts, nor copies, nor ſo much as an engagement of my memory; but I may ſay, that the beſt of poets and orators, and the moſt inſpired oracles, do condeſcend to ſuch inculcations. And my lord *Bacon*, in his few works, hath given us the ſame precedent oft-times. This I hope you will pardon in buſineſſes, which require importunity.

THESE with my humble ſervice, and entreating the conveyance of the annexed alſo.

Yeovill, Dec. 14, 1663.

Honourable Sir,

NO man did ever ſo much moleſt you with the vileſt trifles, as if I made it my ſtudy to find out what are the moſt vulgar matters. In very truth I do ſo. And yet I do boaſt theſe trifles ſo highly, as if they were the moſt proper and the moſt expedient ballaſt for the invincible ſhip of the Royal Society, that ſuch owls as cannot behold the day-light of your microſcopical, magnetical, chemical, and mathematical diſcoveries, may taſte the benefit of your condeſcenſions in georgical and ruſtical affairs.

AND I have a zeal, that no man's pen may rob the Royal Society of this glory. And I hear, that many perſons of eminent honour amongſt you have afforded your countenances in it; the honourable *Charles Howard*, yourſelf, Mr. *Evelyn*, and many others, have vouchſafed your regards to it. And in the annexed waſte ſheet, for gardens, which ſays nothing but *hoc age*, you find it the greateſt improvement of land, the fulleſt reward of huſbandry, the ſpeedieſt return, the ſafeguard againſt dearth, the cleanſer of noiſom towns, and the healer of infectious air. Hence the tables of princes (by an anniverſary, or monthly ſupply) may be ſtored with infinite varieties of delicacies; and hence the poor man's hunger is at cheapeſt rate ſupplied; the artificer's and huſbandman's labour ſtrengthened; and the yeoman's powdered beef and ruſty bacon ſweetened and relieved with healthful ſauces, hard-headed cabbages, and roots, that give more vigour than beef itſelf. Would you try how the fruit of your noble accommodations ſhould appear, the very next ſpring and ſummer, you ſee, it is no more, but at ſeveral of your meetings to propoſe, where the beſt ſeeds of all kinds may be acquired; what kinds newly diſcovered, and fit to be recovered; old and new, delicate and healthful. You are ſo many illuſtrious and ſplendid perſons, as are able to give law and mode, faſhion and reputation, to ſuch diet and raiment, as ſhall be moſt for the publick behoof. Our nobility was wont to applaud the Italians, as the beſt exemplars of elegancy: may we not with good pretences to ſobriety, reduce our carnivorous tables to their patterns of ſalads; or at leaſt to the French *quelques choſes?* And I hope my noble friend Mr. *Evelyn*, whilſt he reads, *Col. lib.* x. *Hortorum quoque te cultus Sylvine docebo*, will catch up ſuch a full inſpiration, as will enforce him upon the argument, and not allow him to diſdain the gods of *Egypt*, onions and chebbolds, and leeks, the princely ſtandard of *Wales*; and *(ne quid præfiſcine ſit dictum)* that he begin with a ſacrifice to the hunger of the common people, before he offers his elyſium at the altar of princes.

AND that would give life and eternity to ſuch a diſcourſe, or book, if ſome day or ſeaſon were anniverſarily deſigned for that peculiar argument, which every year will become freſh by introduction of more foreigners. And to beſpeak the beſt ſeeds, and to appoint where they may be had upon ſure truſt, makes this negotiation abſolute and perfect. We have here gardiners, that pay an hundred pounds yearly to workmen; if they ſhould fail of true and right ſeed, it would undo them. Hence they are conſtrained to truſt their own ſeed, though their ground requires change, and moſt plants (if the ſeed be not renewed) do degenerate; of ſo much concernment is ſafe and truſty recommends.

IN the other animal ſheet, I proſecute the benefit of communication, and in few heads, without

without choice do exemplify, how much the publick might be obliged, if ſome perſon, that hath fuller information, than I can have, and that hath leiſure to review the ancient, ſhall fit the foreign and old aids, for our preſent occaſions. If the witty thrift of every Engliſh county were known, and practiſed in every county, *England* would have another face, much more wealth than now it hath. And it is hard to determine, whether the old aids reſtored would not equal all, that can be learned from the foreign parts of the world at this day known.

LET me entreat your patience, that I may fill this paper with an old ſtory. That learned *Roman*, who began the firſt period of his ruſtical diſcourſe with this account of his age. *Annus nonus octogeſimus admonet me, ut ſarcinas colligam ante quam proficiſcar e vita*; he recommends the dance of *Orpheus*, which you find mentioned in the end of the ſheet of poultry. And again lib. iii. c. 17. *De piſcinis*, exemplifies the like obedience of fiſh in fiſh-ponds and lakes, which may be in the ſame grove. *Quos ſacrificanti tibi, Varro, ad tibicinem Græcum veniſſe dicebas, &c.* Here we have *Orpheus in Sylvis, inter Delphinas Arion.* By the experience I made in my childhood, I know, how eaſy it is to get an abſolute command over beaſts, birds, and fiſhes; to keep them at what diſtance we pleaſe, or to draw them to any degree of familiarity. I tried it then upon bulls, boars, keen maſtiff-dogs, ferrets, carps, and other inhabitants of water and land for uſe, and for ſportful entertainment. The kindneſs of a lamprey (which is a kind of water ſerpent) was of old famous.

WHEN my brother *T. B.* was ranger of *Wakefield-lodge*, one ſpring there came up from his large fiſh-ponds a hoſt of black frogs, or toads, newly ſtripped out of their tadpole ſkins. They covered all the ground for two furlongs diſtance, and entered into his gardens, and all the rooms of the houſe like the plague of *Egypt*. I perſuaded my brother to buy good ſtore of ducks, and get ſtore of wild ducks eggs hatched for thoſe ponds. He did ſo, and preſerved his gardens, and deſtroyed all theſe ſkippers and crawlers, and was never after moleſted with ſuch an ugly viſit, having improved his ſtock of ducks into a pleaſant and profitable duckoy. Here he had bitterns, herns, moor-cocks, fowls of all ſorts, not quite wild, becauſe he permitted none to moleſt them with gun or other open violence, and almoſt at call by ſome kindneſs of frequent relief. And you ſee, the old learned *Varro* was not aſhamed to patroniſe this kind of ruſticity. And my tale is well ended, if it procures another collector of better advertiſements; and that the Royal Society do allow an anniverſary ſeaſon for rural accommodations, and freſh communications. And poſſibly this point of philoſophy, and *Ariſtotle*'s tractates of animals, plants, *&c.* is as conſiderable as his Organon, Phyſicks and Metaphyſicks, which take up all the ſtudies of our academies. And may not this wild kind of aviary appertain to my honoured Mr. *Evelyn*'s ſylva, as the apiary belongs to the culinary garden? But with all this tedioufneſs I muſt end abruptly, only adding, that if the Royal Society ſhould think fit to allow a ſeaſon for ruſtical reviews, I conceive the fitteſt time would be in autumn, or ſpring, or both.

Honourable Sir,

your moſt affectionate ſervant,

J. B.

Yeovill, Jan. 11, 1663.

Honourable Sir,

I SUSPENDED the acknowledgment of your laſt obliging favours, till I could give ſome account of the iſſue of mine own eſſay. With the mixture of water I filled the cane with quickſilver on Wedneſday laſt, and did not reverſe it, nor veſſel it, till late on Saturday. And then (by a miſchance in the reverſing) I was conſtrained to repleniſh a foot length in the cane, which I did very careleſly at two or three haſty pourings, yet then it reſted near thirty inches, and on Sunday morning compleated thirty inches. But then there was a miſling of ſmall rain in the morning, and thick clouds all the afternoon. And it mounted an eighth or ninth higher, after the rain, than in the time of rain; and ſo this morning it ſunk an eighth or ninth in the very time when hard rain fell. By which it ſeems, that the clouds, before the rain fell, lay heavier on the air, and compreſſed it more, than when they were diſſolving, and the air intermingled with the falling rain. But I do, as novices are wont to do, and haſten to a reſult, before the conſtancy of the experiment be confirmed.

I AM very glad, you met with that ſtrange phænomenon, that ſuch a ponderous ſubſtance as mercury, in ſuch quantity, ſhould refuſe to deſcend without the compreſſion of a bubble of air, and yield to ſuch a ſmall motion. I may ſuggeſt to you many enquiries; of which there occurs to my mind at preſent *Gilbert*'s apprehenſion, "that a ponderous body, if elevated above the terreſtrial "magnetiſm, would have leſs propenſion to "deſcend. And whether, beſides the want "of compulſion from the bubble, and the obſtruction of air, and terreſtrial ſteams in "the orifice, the mercury and all groſs bodies "have not inviſible claws, or ſuch ſtrong "ſteams in the next approach to their bodies, "as may faſten in the circumjacent pores of "the glaſs; and ſince mercury hath no very "briſk tumult of parts, whether each particle "may not ſomewhat (though weakly) adhere to other." We ſee ſmall drops of mercury will adhere on the outſide of the glaſs. And leaf gold will adhere by innumerable particles, and fly up and down in the air, as if it ſought for ſome neighbouring body, which

which if it meets, it will offer at ſome hold; and the branches of vines, Roman beans, and hops, will ſo feelingly ſearch out for ſupportance, as if they had animal perception; theſe for any dry ſtick; and goards and pumpions for a pot of water. As if their effluvia correſponded, and gave notice, where their auxiliaries quartered. But will not water or mercury more eaſily deſcend out of a narrow cane on plain ground, than on a pharos? Or has the cane, and materials of the pharos a more ſtrongly approaching magnetiſm, than will yield to the predominancy of plain ground?

SIR, you have tempted me to this boldneſs; for novices, when they begin to taſte ſomething in philoſophy, cannot govern their appetites. I am not altogether ignorant of my ignorance, but can diſcern, how eaſily I may raiſe queſtions and propoſals upon falſe grounds; yet I pray you allow me a little to wander, as *in itinere ecſtatico*.

LAST autumn I ſaw (near a great buſh of roſes) many very ſmall ſpiders, and they ſeemed to fly in the air, yet had no wings. I had formerly repreſented to Mr. *Pell* the ſpider's mechanical riddle, as it is explicated, and in effigy illuſtrated by *Blancanus* in *Ariſt.* Loc. Math. pag. 212. *Araneorum induſtriæ*. But here to my eye the ſpiders viſibly exceeded the conceit and draught of *Blancanus* very much. For theſe ſpiders did ſwim and glide in the air, up and down, as fiſhes do in the water, as eaſily and as ſwiftly up as down. Truly, a nimble youth might more eaſily catch the flying butterflies, than theſe. When my hand ſtruck at them, they fled upwards over my head, ſwifter than ſome flies; and in this ſwift eſcape they ſpringed upwards in guirds, as larks do, and ſeemed to take the ground of their leap from the web, which they did caſt out of their mouths to their feet. And when they ſaw themſelves out of my reach, they would ſometimes fix in the air, as a kite does. And then I thought on a fat bulky fellow, that without motion of hand or foot (by mere extenſion of thoſe ſinews, which are in the main bulk of his body) ſwims and floats on the waters in the Bath. A ſpider is one of the beſt mechaniſts amongſt our viſibles; and every animal activity puts me in mind, what air, fire, and other inanimates may do. And in that phænomenon I think as well of the ſpring of mercury, as of air; and all things, as well as ſpiders, ſeem to have webs, and claws, though of ſeveral kinds.

SIR, will you now ſuffer me in this wild voyage to aſk, "whether you have at *Greſham* "tubes of tin, or white iron, of thirty one "foot length, to which are firmly ſoldered "ſtrong glaſs canes of four or five foot length? "one fixed, and remarked to the only uſe of "comparing (by ſome tinged water, or other "liquor, that would eſcape freezing) the "gravity of the air with the humours of the "Torricellian mercury." For, beſides that (as I gueſs) the degrees of change may at ſome ſtair-caſe, or balcony, be made more viſible; poſſibly it may ſometimes diſagree with the peculiar humours of mercury. Another like tube to examine what kind of liquors will aſcend higheſt, what apparent difference in waters, healing and poiſoning ulcers; in waters, that bear ſoap for the laundreſs, and ſuch as refuſe it; in waters, which corrupt the colour of beef and other meat in boiling, and make them inſipid, and in others of better fame and ſalubrity, ſuch as aſſiſt the brewer, and ſuch as rob him; ſuch as ſerve the dyer for this or that colour; to view by the ſteams, as well as by weight, coherence, and conſiſtence, ſuch waters, as are brought freſhly reeking from tepid fountains. Have you capacious glaſſes and exact ſcales fitted to weigh the common air uncompreſſed at ſeaſons, which perplex the Torricellian device; and to weigh all liquors? Alſo ſmall glaſs canes of divers ſizes, to try the diverſity of all waters and liquors, in the ſeveral degrees of their fluidity. By theſe and ſuch like aids, which will occur to yourſelf more abundantly, we may find more of the differences and qualities of waters and liquors (and poſſibly ſometimes of air and winds) than are diſcoverable by the thermometer, Torricellian mercury, or the pneumatic glaſs; and knowledge of water and ſubterraneous veins, by which they are conveyed, may to vulgar hands be more popular, and have more obliging utilities, than of air. As whether water by bottelling (and coverture in ſprings or ſand) gets more or leſs fluidity, or conſiſtence, weight, or levity; what by boiling, *&c.* We ſay, that ſprings iſſuing from mineral veins do give in ſhort time a reddiſh tincture to the oaken leaf. Some ſprings are known to have ſuch conduct, and by comparing the properties of ſuch waters, they may learn to gueſs at the ſubterraneous veins. We have here (within a ſlight ſhoot) two very fluent and ſalubrious ſprings, differing in many qualities very much from each other; and both as much from a ſpring, which is in my garden, which gratifies the brewer, and corrupts all fleſh, that is watered or boiled in it; and (hard by) a ſearching unfreezing water, which tingeth all ſtones with the colour of ruſty iron, and is therefore called *Ruſty-well*. Not far off, an excellent eye-water. By Mr. *Oldenburg*, in my laſt, I gave notice of a water at my couſin *Robert Seymore*'s at *Hampford* in *Dorſetſhire*, which (to mine own, and generally to other guſts) improves malt to a third of quantity. If this may be found true, and the like in many other places, it may oblige brewers, and good houſewives. Poſſibly you may deem it worthy your ſteward's enquiry, and may direct him to examine probable cauſes. The gentleman is of eaſy acceſs, and hoſpitable. I have under hand an experimental ſearch in general after the cauſes, or nourices of ſprings, which I intend you by the next; and then for ſoil and compoſt, with a ſpecial eye to your commands, "touching the more ca-"tholick ways of acquiring our dominion by "advancement of huſbandry," if God permit and enable.

WHEN

WHEN we have found ways to diſcriminate the obvious properties of water, then we may further expatiate upon many ſtrange qualities of it in all parts of the earth; and may find better healers, than the pool of *Betheſda*, and greater wonders. But I am almoſt by experiments convinced, that if the poor would take knowledge, and accept of that ſtore of help, which God doth in very many places offer them, they might thence partake of a greater kindneſs, than the phyſician, ſurgeon, or apothecary will afford them, when they have ſpent all their ſubſtance.

Publica morborum requies, commune medentum
Auxilium, præſens numen, inempta ſalus.
ſaith *Claudian* of his *Aponus*.

SIR, having thus far trifled about curioſities of weights and meaſure, I wiſh the virtuoſi of *Italy*, *France*, and *Germany*, by amicable correſpondence, would agree with us for ſome academical ſtandard. For it ſeems to me as improper, that we ſhould uſe domeſtic meaſures, in addreſſes to foreigners, as to write in ſecretary or chancery hand. And I would propoſe, that ſince *Rome* was the laſt miſtreſs (of *Europe* at leaſt) we ſhould in literary communications uſe the *Roman* foot and meaſure, ſo exactly examined by *John Greaves*; or (at firſt) offer the debatement, who could give a more probable light to the ancient meaſures and weights; and it might be a fortune to an ingenious artificer to furniſh us, in box and braſs, with ſuch meaſures exactly ſubdivided. By a ſmall remark they might ſerve alſo to our vulgar *Engliſh* uſe, but the Roman is leſs. And when I read in *Greaves*, what ticklish ſcales he carried about him in his travels, I may juſtly aſk, how well you are provided in *Greſham*.

SIR, I have been buſy to fill up my paper, but make too much waſte of your time, and am always,

Honourable Sir,

your moſt obliged ſervant,

J. BEAL.

Of ſprings, fountains, lakes, waters, &c. Their originals, Jan. 18, 1663.

OUR ſchool philoſophers do take ſome pains in their philoſophical manner, to diſpute out the original of ſprings. Some ſay, they are engendered in the concavities of the earth, by condenſing air into water. I doubt we ſhould complain of thirſt, if we had no other ſprings. Others pretend to holy evidence, that all rivers come from the ſea, as the main fountain head. To ſalve this we may confeſs, that ſuch rivers, though they come not by ſprings immediately from the ſea, yet they may come thence immediately, by the vapours drawn (the greateſt part) thence, which are afterwards poured down in ſhowers and rain, dews, and miſts.

A VERY intelligent and induſtrious friend of mine, who dwells on the ſide of *Mendipp-hills*, hath made ſuch careful ſearch into the cauſe of ſprings, as by particulars inclines him to believe, that moſt ſprings are begotten by the falling rains, and ſnow diſſolved. For he obſerves in the parts about his habitation, *viz. Mendipp-hills*, *Wells*, *Bath*, &c. which are a fair proſpect for this enquiry, as followeth.

THAT there are certain porous and ſpungy places, which there the people do call *ſwallows*, which devour all the rain, which by rain or otherwiſe is brought from thoſe vaſt hills thither, He notes ſuch ſwallows, as do devour vaſt quantities of rain in the wetteſt ſummers, autumns, winters, and ſprings.

AND that theſe ſwallows and gulfs are oftneſt ſeen on hills and mountains, which are rocky, and where ſhowers are moſt frequent, and ſnow moſt abounding; and where the confluence of rain water ſliding from the tops of the hills is greateſt.

THAT the largeſt of our ſprings are found in the ſides or near the foot of thoſe hills; whereas (ſaith he) in our marſhes, and great levels, it is hard to find a ſpring, the land of thoſe lower grounds being more cloſe, or clay, or mud, ſuch as is ſome way or other leſs penetrable. He noteth a place on the top of *Mendipp-hills*, called *Rough* pits, now famous by Mr. *Buſhell*'s late act of parliament, where the old wrought mines of many fathoms deep ſtand full to the brim after great rains, containing a little ſea, or great lakes of waters. From the foot of one ſide of theſe hills ariſe thoſe noble ſprings, denominating the place an Amnery, and the adjoining city Wells.

HE addeth, that many other ſprings ariſing on the ſides of ſeveral of thoſe *Mendipp-hills* do depend on the ſucceſs of the ſeaſon, growing dry by the heat of ſummer, and flowing again with the floods of winter.

HE noteth ſome ſprings, which are yearly exhauſted in May or June; ſome, that hold out longer as the ſtock of water is greater.

THAT he knows a ſpring, which for twenty or thirty years conſtantly grew dry by Midſummer; yet the ſame ſpring in an extraordinary wet ſummer ran freſh the whole year round.

THAT the ſame ſpring hath been dried up in May, yet the ſame ſummer, after much rain, it guſhed out again before St. *James*'s tide.

THAT he knew another ſpring yielding a plentiful rivulet of excellent waters, which held out ſome moiſt years, but failed in ordinary ſummers.

THAT into the mouth of this ſpring, when empty, he did let in a neighbouring current, which entered in at the ſame place, where the former waters iſſued, and were there devoured for twenty four hours together: that longer time he could not well allow for the experiment, without injury to thoſe, which did partake of the benefit of the current.

HE addeth, that in *Wiltſhire* bourns, he noted pure cryſtalline ſtreams running in gravelly

velly channels between the green banks, where not a drop was to be ſeen in ſummer time; that after a dry autumn, and the like winter ſucceeding, no water was there to be found the whole year.

THAT ſome ſprings, which in forty years and more have not failed, in extreme dry ſummers have failed, as the living have ſeen for one proof, and have heard the like of former days.

HE inſiſteth on the reaſon rendered, why the river cleareth was dried up, 1 *Kings* xvii. 7. "becauſe there had been no rain in the "land." And the Pſalmiſt recounts it to the praiſe of God's wiſdom and goodneſs, that he ſendeth the ſprings into the vallies, which run amongſt the hills, and watereth the hills from his chambers.

THUS far he, a perſon of unqueſtionable credit in what he offers upon his own obſervation. Chiefly I remark two of his notes,

FIRST, that he noteth rain and ſnow to fall more frequently and abundantly on hills.

SECONDLY, that the ſurface and land is in ſome places, and frequently about hills, more bibulous than in the vales, where clay abounds.

FOR the firſt of theſe, I have ſo often met with rain upon *Mendipp-hills*, that I aſked this gentleman, whether he ever ſaw a fair day, or clear ſun, in his neighbourhood. And in *Hereforddſhire*, we do generally ſee a white cap of ſnow upon *Malverne-hills*, which are eaſtward, and moſt aſſuredly upon the black mountain, which is weſtward from us, above a fortnight before we have ſnow in our lower ground: and the like I obſerved on the Auvernian, Alpine, and Pyrenæan mountains: and all along our road, between *Lyons* and *Geneva*, I could ſee thick miſts ariſing from the hills, or deſcending on the hills, when in our vale we had a ſettled ſerenity.

FOR the ſecond, we all know the ſurface of ſome provinces to be of a ſpungeous and thirſty ſoil, ſuddenly drinking up all the rains which fall; ſo that after many days of great rain, in an hour's ſerenity, the ways will be dried for pleaſant walks. In other clay land, the water ſinks not, but beats the ſurface into dirt, and haſtens to ditches, lakes, ponds and rivers.

IN a thirſty ſoil, a friend ſhewed me a garden he had deſigned, which looked like a deep broad trench, flanking on the ſide of his houſe. I aſked him, how he could hinder, but that it would be a mote, or fiſh-pool, having no fall or deſcent for the water which came thither: he told me, (and the rain fell abundantly then to prove it) that the ground would drink it up as faſt as it could fall from heaven, and from the leads of his large buildings.

I HAVE ſearched for ſprings near the foot of a hill, and on the deſcending ſides, with good ſucceſs; but I never ſaw a good ſpring, which did not iſſue through ſome gravelly vein, or ſtony vein, which ſometimes would be ſo ſoft, as to fall and crumble away at the touch: and wherever I found this crumbly ſtone, the ſpring would gather a quick ſtream, within a foot or two under it. And thus *Blith* notes in his Obſervations on bogs in *Warwickſhire* and *Leiceſterſhire*, viz. "That "the water, which is ſpued up out of all "bogs, and begetteth the bog, proceedeth "from this interruption of the gravelly con-"duct; and the bog is cured by opening "the ſpring in higher ground; and, that "the ſpring runneth about a foot under the "gravel or ſand."

AND that the earth is in ſome places ſo tubulous, as to ſwallow great rivers, our eyes have been witneſſes; and the noble and induſtrious virtuoſo, Mr. *Greaves*, in his Diſcourſe of Pyramids, pag. 101, 102, collects, "That the earth is ſo tubulous, as to give "ſecret commerce, and free paſſage, be-"tween the Euxine, Caſpian, and Mediter-"ranean ſeas."

AND as the ſurface of ſome ſoil and mountains are bibulous, ſo we may well gueſs, that the channels of rivers, and the bottom of the ſeas, are in many places voraginous, and do ſend waters through channels and iſſues, even to the tops of our mountains, as it may fall out, without any real aſcent, by the diſtance in the horizon.

As why may not the famous ſource, not far from *Orleans* in *France*, as well derive from ſome gravelly or ſtony veins, that are in the channel of the *Loire*, as from the fall of rains on the neighbouring mountains or plains? And poſſibly there is a circulation of waters in this terreſtrial globe, as of blood in animals.

WE ſee, that as fiſh do live in the waters, (ſalt and freſh) ſo do many animals live in the earth, or under ground; not only worms and ſerpents, toads, frogs and effs, but an innumerable hoſt of creepers, whereof ſome are ſo ſwift, and ſome ſo beautiful, their heads trimmed with ſuch rich attire, and their ſkins painted with ſo many laces, ſtuds and guiſes of divers kinds, ſhining very bright as the microſcope, ſhews them, as if they were adorned for ſome light there: of theſe I have found cluſters a foot deep in the earth, having ſtore of feet, and hard bodies half an inch long, driving ſpeedily through the earth every way, and the attire of their heads ſeemed to make room for their breathing. If the earth be ſo pervious for animals, it may alſo give way to dews and moiſture.

BUT the original of ſprings is not ſo much worth our enquiry, as the art and ſkill in opening, finding, and diſcovering them: and he, that diſcovereth a good ſpring, obligeth poſterity; for waters, which do much hurt under ground, do oft-times much good above ground.

BLITH, in his Cure of Bogs, which are many times deſtructive to travellers and cattle, and the worſt waſte of lands, aſſures, upon his experience, "That every bog hath "moſt certainly a living ſpring in it. That "if poſſibly we could light on the head of "that ſpring, or meet it higher, than the "place of the bog, and give it a clear paſ-"ſage, the nether bogs will all vaniſh: that

"wherever

" wherever the ſpring is drained to the bottom, the bog is cured; but ſhould be drained one foot deeper than the bottom of the ſpring. That in boggy land the ſpring lyeth deeper than in ordinary ruſhy land. That the ſpring is ſometimes within two foot of the natural ground, uſually three or four feet deep; ſome ſix, eight or nine feet deep." And for thoſe countries, he deſcribes the ſeveral lays of earth thus: " Firſt he finds a black earth two or three feet thick, then to a white earth like lime, and then to a gravel or ſand, in which is the ſpring."

THESE colours of earth are not for all countries a fixed rule; the beſt help may be from the boring inſtrument, by which they ſearch for marle, coal and ſtone: and a ſoft ſtone or gravelly vein (as I noted before) ſeldom fails of a clear ſpring; and many circumſtances of hills, ſoil, gally or uliginous grounds, may direct our ſearch for a ſpring; and where one is found, it may direct our trial for more, till they be brought to a conſiderable head, or profitable ſtream.

MY foreſaid *Mendip* friend complains, " That although his neighbours in the marſhes and lower grounds have oft times too much water; yet many times they have too little of that which is wholeſom, freſh ſprings being rarely found with them; ſo as they and their beaſts drink out of the ditches: and if a man hath but a hole or a pit to himſelf and his family, this he accounts a peculiar felicity, and this he forms into a reverſed pyramid, with ſteps down into it, as the water ſinketh with the increaſing heat of the year. In every dry year he caſteth out the mud and corruption, and then thinks all is well." Hence he collecteth the ground of their frequent unhealthfulneſs; and others are as ill ſatisfied with their booriſh and inhumane conditions, as too agreeable to their ſordid liquors. If their lazineſs would endure to dig deeper in ſummer-time for true ſprings, and to bring ſtone to wall them, they might have purer waters, more health, and better minds and manners.

HE noteth, " That ſometimes freſh ſprings break out on the very banks of the ſalt ſeas; and freſh fountains iſſuing below the flux of thoſe ſalt waters: that he meaneth not the percolated waters, which are found in the ſand digged on the ſhore, mentioned by lord *Bacon*, experiment firſt, appears by the inſtance of that famous hot well near *Briſtol*, flowing freely from St. *Vincent*'s rock, which hath (ſaith he) the mouth frequently ſtopt with the tide, under which it ſometimes lyes ſmothered ſome fathoms deep."

HE propoſeth, " That many ſtreams of water, which do annoy highways, and moleſt and endanger habitations, may by eaſy labour be diverted into ſuch ſwallowing grounds, or conducted to profitable uſes, to the help of many noble manſions, which want water, and to fit many places for commodious habitations: and truly (ſaith he) a ſtudious and heedful obſerver, by taking notice of the poſition of rocks, and the opening of them (which the miners there call rakes) may ground a good conjecture, which way waters may be beſt directed. It ſeems the neighbours and miners of *Mendip* have a happy gueſs at it."

BUT now the properties of water in ſprings, lakes, and rivers, is more worthy our conſideration; but the qualities are ſo different, and ſo innumerable, that we know not where to begin, nor how to end, if we intended to embark in theſe ſeas.

FIRST, I will note the ruſtical uſe; and I think, there is ſcarce any water ſo hungry, but if it were at fit times conveyed upon very dry and thirſty paſture, it would improve it. Neither have I ſeen any water ſo rich, but it would impoveriſh the paſture, and ſeem to eat it into holes, and beget ruſhes, and moſs too, if it ſtayed long on the paſture. And I have ſeen the ſame water enrich dry grounds by running at ſome allowed times over it, and impoveriſh the lower grounds, where it lay, till the ſpring ſun dried it up.

YET we note, that ſome uliginous water breeds a coarſe graſs, which cattle will not eat for pleaſure, for feeding, or for the dairy: a goat, upon a bald and rocky hill, will yield more and better milk, than a good cow in ſuch paſture.

AND the water, which deſcends, or paſſeth through the land, that bears the beſt limeſtone, or through the rich vale, is pregnant of the clover, which yields milk and honey.

IN cold ruſhy land, a hungry water is found beneath the firſt and ſecond lay of the earth. If the ruſhes be ſhort and ſmall, the water is more jejune.

THEN commonly ſucceedeth a lay of gravel, or ſtony gritty earth, in which this hungry water is.

SOMETIMES this water and gravel is ſo near the turf, or ſward, that the turf and graſs is thereby deprived of ſucculent earth to feed the roots with ſtrength enough for honeyſuckle or other fattening graſs.

BOTH in this caſe, and to cure the forementioned ruſhy land, it is good to order a ſufficient ſtore of trenches to carry away this deceiving water, at leaſt, as often as need requireth; and to ſhred earth thinly on the paſtures.

SOME do affirm, that if the trenches be ſunk a foot or more below the gravel, the water, which lying on the top of the gravel, did impoveriſh the paſture, will in the lower trenches carry a very fertile ſtream. If this be certain, it is an encouragement to ſome improvements, that are not yet in much uſe amongſt us.

WHERE the grounds do lie ſo, as will coſt too much to ſink channels deep enough to carry away this water, in the lowermoſt ground we may ſearch for ſome of the forementioned ſwallows; and that oft-times falls out after two or three ſpade depth under this gravelly ſurface: or it may be improved for fiſhponds, or a watering place for cattle.

To make ſheep-paſture ſafe, it is very neceſſary to draw away this water, which makes the graſs very deſtructive to ſheep.

AND the water, which lyes commonly in the furrows of fields newly turned from arable to paſture, begets a rank graſs very hurtful to ſheep.

IT is ſome ſuch gravelly or ſandy vein as aforeſaid, which carries that uliginous water too near the roots of corn, and weakens it (as the paleneſs of the blades and ſmall return ſhews) for many acres together, in many parts of the richeſt vales. The cure is difficult, and can hardly be done otherwiſe, than by a happy collection of thoſe waters in ſome over-ground, and reſtraining or diverting them from that lay of gravel.

I SAW a field, which in moſt moiſt ſummers, or very wet winters, deceived the huſbandman. I gueſſed, that the waters were detained too near the roots of the corn, and by examining it with a ſpade, I found within a ſpade's depth a ſtiff clay, through which no rain could paſs. In this caſe, it is good in the loweſt ground to make catch-pools, as they call them, which gather the rain waters, and earth with them, to repair the land. And my Mendip friend acquaints me of a witty neighbour, who uſeth an iron inſtrument to ſtrike holes through this clay vein, by which the rain is ſwallowed, and the corn ſaved.

I SHOULD now proceed in recounting the oeconomical, artificial, medical, chirurgical, and various, innumerable, and wonderful qualities of ſeveral kinds of waters. But it is better to inſiſt upon the general properties of obvious waters, to find out the cauſe of their differences; and, by teſt, to diſcover their originals, or the veins, by which they are conducted, which (poſſibly) may be the beſt or moſt frugal way of tapping the iſſues of rocks, hills, and mountains, to find out the ſubterraneous riches.

FOR example, our Mendip friend collecteth, that generally ſprings run in veins not far from the ſurface of the earth, and do rarely pierce ſo deep, as to the copious mineral veins: of all, that fall within his obſervation, he only excepteth Mr. *Buſhel*'s mines and rough pits, which lye wholly in water: that the body of the lower and beſt ſorts of coals do lye wholly drenched in water, which, ſaith he, may perhaps yield ſome ſulphurous qualities, richer coal participating much of ſulphur. By theſe waters, if their peculiar qualities were known, we might examine, whether the Bath waters had not ſome mixture of other more dangerous mineral veins, than our known lead-mines, as *Jordan* ſuſpected.

ALSO in *Mendip* there are ſome caverns of water ſo ſhallow, that in all ſeaſons of the year they can drain them to proceed in their work: others are ſo deep, they cannot drain them, but at peculiar ſeaſons. Here we might try, whether the deeper or the ſhallower were the more ſalubrious for human diet.

OUR well-water, though cleanſed and kept quick by deſcent from a running ſpring, yet refuſeth to diſſolve peaſe for peaſe-porridge; as alſo it corrupteth fleſh in boiling; which the next neighbouring ſprings, which have not that reſt in wells, performeth moſt agreeably.

IN this our ignorance, and want of utenſils, we can better make enquiries, how to diſtinguiſh rain waters newly fallen, from ſuch as have ſtood long, either inſoluted, in clear gravel, pebble, or marble, or in pits and wells, *&c.* than other poſitives. And poſſibly ſomething more of the natures of colours might be found in examining the *Coventry* blue waters, and the *Stroud* ſcarlet waters, *&c.* how diſtinguiſhed.

AT *Wooby vale*, the petrifying waters ſeem to guſh from hard rocks: our ruſty well-water, laſt mentioned, doth in one night give ſtones a reſemblance of ruſt.

I AM yet at a loſs, if in the body of mercury there be not ſome intumeſcence beſides gravity, occaſioned by the outward air, of which I cannot reach the cauſe, but do ſtill wiſh it compared with the natural ſtandard of water. For it calls to my mind two ſtrange notes in Sir *H. Blount's Levant*, near the beginning, pag. 9; firſt, "That at mid-day, "and midnight, the ſtream runs ſlower by "much than at other times." Secondly, "That for ſixty miles the ſtream in the ſame "channel mingles not." May we not find out theſe and many other ſtrange phænomena? But I muſt be abrupt.

Jan. 21, 1663.

Honourable Sir,

IN two or three late packets by Mr. *Oldenburg*'s conveyance, I have moleſted you more with enquiries than with experiments; though pretending to the watery element, than which nothing more vulgar, nor ſcarce any thing leſs underſtood, or more uſeful, or more excellent, ἄριστον γὰρ ὕδωρ. In theſe I preſent a medical ſecret, as it is recommended to me by a perſon of very great wit, and great fame, and long experience in chirurgery, who tells me (and it is evidently true) that he hath by this, as his chief myſtery, theſe eighteen years gotten above 50 *l.* yearly. If it be a ſecret and conſiderable, he hath given me power by your hand to make it my affectionate offering to the Royal Society. But confines it to you and the other ſworn perſons of the council for uſe; and that his myſtery in the nakedneſs of compoſition, and application, be not proſtituted. If it be vulgar, and trivial, you well pleaſe to let me know ſo much, that I may underſtand the meaſure of my obligation. It is no more than this.

TAKE half an ounce of coloquintida (pulling out the ſeeds carefully) boil it in a quart of wine vinegar, till a third part, or thereabout, be conſumed. Strain it, and then boil it up a ſhort wain with a pound of the beſt true ſugar, that is not mingled with alum, *&c.* ſcumming it. In bottles it will hold good

good ſome years. It kills infallibly all manner of worms, and may be ſafely taken in potion, a ſpoonful for a child of two years old; two ſpoonfuls for eight years old; four or five ſpoonfuls for firm age. If a gliſter or vomit faileth to work, this in a ſpoonful or two never faileth, nor forceth the ſtomach, as the vomit doth; and cleanſeth the bowels of all ſorts of worms, wind, *&c.* cureth cold, agues, *&c.* It ſhould be taken faſting, and to faſt two hours after, with care from cold. It is dangerous to drink cold drink within ſome hours after. Drink well warmed with a toaſt may be taken after two or three hours. The gentleman being famous, and of much practice in the chief parts about *London*, *Barkſhire*, *Bucks*, *Wilts*, *Oxford*, and now in the Weſt, aſſures me, that ſeveral kinds of worms beget unknown maladies, and are very generally the deſtruction of young and old, breeding in all parts of the body, in the womb and ſeed veſſels, and are cured by this in a ſyringe, in the eyes, brain, *&c.* of which he promiſeth me the account and application. He ſhewed me ſome ſtrange monſters, which he brought alive from his patients. Here (at Mr. *Phelip Mountague*'s) a woman voided a monſter of twenty one inches long, and full of joints like knot-canes, or horſe-tail graſs. The head ſome of the family had cut off, and caſt away, ſo that we could not ſee it. This they did, becauſe it was ſo ugly, as might raiſe ill fame. Some ſaid it was like a ſerpent. The toſte is much diſguiſed by the vinegar and ſugar, yet ſo horrid, that ſome chew cheeſe, and ſpit it out, ſome other things to remove the diſguſt. Some bodies breed deſtroying worms perpetually: theſe muſt uſe it twice, or more often in a year. How trite ſoever it may ſeem to you, be pleaſed to try a doſe of it upon a pot of garden-worms, and obſerve it with your own eye, with what ſpeed, and in what manner it operates upon the worms. It will invite you to ſhew the experiment to the Royal Society. They may gueſs at the ingredient, but miſtake the mixture, doſe, applications, and effects. He tells me of worms of incredible length found in the bowels; and finds often worms, that do fill up the whole length of the ſmall guts in rabbits. I have deſired a kinſman (my couſin *Phelip*'s ſon) to attend the ſlaughter-houſe of butchers to ſee, whether worms may not be found in the bowels of tainted ſheep; for they and rabbits are ſubject to the ſame ſeaſons of the rot.

I HAVE read in phyſicians old and new, that human bodies have produced ſome varieties of the ſubterraneous matters, vegetables, and animals. And our liquids are a pregnant mother almoſt of all things. My old lady *Phelips* is a conſtant water-drinker, and it hath preſerved her (as ſhe conceives) from a reſort of ſeverous heats in her ſtomach, and from the ſcorbutic, which ſeized upon her about forty years ago, when her huſband Sir *Robert Phelips* was committed to the *Tower*. She is pleaſed to try the diverſities of many waters (which I name to her) by the taſte of her palate. Some years ago I ſent to Mr. *Brereton* a ſhining ſand, that ſeemed like ore of tin or ſilver, full of ſuch thin ſparkles. The refiners made nothing of it. But the water cleared the eyes, healed ſcabs and itch, diſpatched ſun-burning and freckles, and gave ladies a luſtre as quick as any of their new pigments. By this vein of ſilver-ſand, I was directed to open many permanent ſprings thereabout. And in my garden I had a black poiſonous moat, which infected all the houſe in hot weather, and bred toads and efts, which deſtroyed my garden. I digged a trench, and found a fall to convey away thoſe foul waters, and then found a weak ſpring, which by ſinking it two foot deeper, diſcovered that vein, and continued a very briſk and wholeſom ſpring of the foreſaid qualities. By which I concluded it beſt to avoid the depth of fountains, or wideneſs of moats, by which the water might contract putrefaction by reſt. And in thoſe beautifying fountains, I allowed but a ſhallow and narrow compaſs for the reception of ſpring-water.

MY friend of *Mendip* tells me of a black incruſtated ſubſtance, which he found in *Mendip-hills*, bedecked very delightfully with artificial branches of the exact form of ferns, which they there ſay is an infallible diſcoverer of a coal-mine; and that there are the like forms of bay branches. And that Mr. *Buſhel* (to whom he gave this reſemblance of fern) ſhewed him the like reſemblance of roſemary ſprigs, which he found in the veins of ſilver. The ſtones of ſerpentine figures, which I preſented by Mr. *Oldenburg*, are in the very ſame ſhape of two colours, thoſe of *Keinſham* near *Mendip* are reddiſh, as I hear the ſtones are there: theſe about *Hambden-hill* are yellow, as the *Hambden* ſtone is. Monſieur *Petit*, a medical practioner voucheth his own frequent experience, that their powder in drink is a moſt imcomparable antidote and preſent remedy againſt poiſon. I am ſlow in my faith. Here are of the ſame in divers other ſtrange ſhapes, ſcalops, rams-horns, and as the marks of feet of beaſts and birds, as if imprinted in breeding there. This I ſee, and of this I can further aſſure you, that both here, and at *Keinſham*, ſome ſtones have been cleft, containing about ſixty of theſe ſerpentine ſhapes, ſome bigger and ſome leſſer, as in caſes. And one is ſent me moſt curiouſly drawn, but (as all the reſt) without a head. The materials very hard and weighty, and in all appearances reſembling metal between a ferruginous and copper colour. It ſeems a kind of marcaſite. This I had from *Keinſham* near *Mendip*.

SIR, I ſhall conclude this with a very ſtrange ſtory tranſcribed verbatim from the ſame gentleman, a perſon of undubitable credit. I ſhall impart a paſſage near me, from whence you may extract ſome profitable concluſions in philoſophy. My neighbour's ſpaniel worrying a ſheep, they fell both together into an old mine, and faſted there a full fortnight. At length the owner of the ſheep directed to the place, drew out his beaſt alive; but the dog

dog looking with glowing eyes in the dark pit, and not meriting the diſpleaſed man's courteſy, was left there alone for a full week longer, and at laſt being relieved, lives to put you upon the ſearch of this ſecret. This was a pit, where the air was ſerene, neither too much, nor too little. But in mines, where there is a quick ſucceſſion of air, the ſtomach is craving. The dog lay cloſe to his prey, yet faſted. Thus he, March 12, 1662. by which date I gueſs it was in that winter, or near that time.

Honourable Sir,

your moſt obliged ſervant,

J. BEAL.

Yeovill, April 25, 1664.

Honourable Sir,

I RECEIVED, by our dear friend Mr. *Oldenburg*'s conveyance, the Hiſtory of Colours from your noble and bountiful hand. I muſt keep conſtant to your order of forbearing the juſt applauſe due to you. And therefore I will rather complain, that in this you have inflamed our deſires, and expectations to ſee the deſign completed by the ſame happy hand, at leaſt for the remaining ſimple colours, yellow, red, and blue. For if you reſt here, I do not think any diſcreet man dares attempt to go on. And in my opinion, you have not only broken the ice, but have abſolved the main and hardeſt work already. For, in mine own narrow thoughts, I was moſt of all plunged at the cauſes, and difference of whiteneſs and blackneſs. All that I can ſay to this excellent work I have ſignified already to Mr. *Oldenburg*; and it importeth nothing but votes for the like ſucceſs in the reſt.

IN the firſt place, I wiſh there were prepared to your hand (by ſome judicious and induſtrious perſon, who throughly taſtes theſe your pleaſing diſcoveries) an acute, full and pertinent collection of God's paintings (ſo I may juſtly call it) on flowers, and fruits, and other things in nature, with the adjunct alterations in taſte, medicine, or other qualities. For ſome flowers admit of ſome variety, others of more or leſs. Some flowers, and many ſorts of fruit do change complexion, as they advance in maturity. Of which ſome judgment is given by my lord *Bacon*, and contraverted by Mr. *Auſten*. I have ſeen a very ſmall and almoſt inviſible touch of red, or purple, as the ſun and heat encreaſed, in one day ſpread all over a tulip, which in the morning appeared white. And I have ſeen thoſe you call blue-bottles take the ſame beauty in other colours, white, pink-colour, ſcarlet. And I can name but one garden, where I found this weed in this variety. But this I cannot wiſh, without hopes of your notes, method, and illuſtrations upon it.

MY ſecond wiſh is, that you would take up a whole chapter in the uſe of your microſcope, or rather of three or four more and leſs magnifying glaſſes. For though my eyes were never good, and are now much decayed, and my beſt magnifying glaſs be not worthy of *Reeves*'s promiſes; yet by mine, and ſome other leſſer microſcopes compared together, I ſeem to receive many hints, and much aid towards the diſcovery of the original of colours, at leaſt in many particulars. In mine I can, with my bad eyes, find the different conſiſtence, cloſeneſs or looſeneſs of contextures, which cauſeth the ſame colours in ſome bodies to be more lanquid and duſkiſh, in others more briſk and vivid, in others more emphatical. I can ſee ſome of thoſe ſimple colours compound, ſome duſky, thick, and dark bodies tranſparent, *&c.* For example, I have not ſeen more changeable variety in any flower, than in the leaves of one ſort of ſage, as chamletted with whites, greens, reds, tawnies, purples, yet all in a duſky hue; and the gloſſes will ſhew the porous and ſpungeous windings, which mortify the rays from a briſk reflection. Here in the great glaſs a very perfect vermilion had very little true redneſs, but only a ruddineſs, as of thick goreblood, and ſome ſparkling corpuſcles, whoſe ſtrait and direct ray ſeemed to give the bright redneſs on the way. So in greens, and other colours, I find them leſs perfect in the glaſs, but compounded of ſhining ſparkles from other parts of the ſame leaf. And every perfect painter knows, that his picture would lie flat on the table, and be worthy to lie in the dirt, if it were not taught by the artifice of ſhadows to come off roundly. A very dark grey ſand is here all cryſtal and tranſparent. Some other ſand, of no alluring colour, is rubies, emeralds, every jewel, not one ſand of dull hue. I pounded the black ſhining ſand, and it was full of ſtarry eyes. I filed off ſome ore I had out of a tin mine, which ſeemed to the naked eye very luſtrous, but the very ſmall duſt denied in my glaſs to be luſtrous or tranſparent. Here I ſee ſome reaſons of the differing briſkneſs of colours in metals, glaſs, horn, ſilk, woollen, linen, flowers, *&c.* and much that may confirm your main engagement.

SIR, I will adventure to betray the folly of a third wiſh, which may ſeem very phantaſtical, but it had this occaſion or temptation. Mr. *Oldenburg* beſtowed on me a hydroſtatic, which being fitted to a horn, that gave no more room than was neceſſary to let the inſtrument ſink, I could thereby, and apparently to mine own defective eye, diſtinguiſh the ſeveral weights of ſpring waters in the tenth or fifteenth part of a pint, more palpably, than I could diſtinguiſh the whole pint of the ſame waters in the beſt copper ſcales, that this town affords. Hence I aſked, how far this inſtrument may be improved? and whether poſſibly it may not diſcover ſome of the liquids, which you mention, after colour to be lighter, or heavier, than either ingredient was. If ſo, it might be a kind of argument of

cloſer

cloſer or looſer contexture of parts; and thence ſhew (for ought I know) which ſort of colours require the cloſer contexture. If I tried in white wine, and red, or claret, in the juice of white and red raſberries, or white and red currants of the ſame age and degree of ferment refined, I cannot here make ſo exactly the ſame inference, becauſe in that way the very individuals are laid in the ſcales. In wines, and cyder, and perry, and all thoſe liquors of currants, raſberries, and in plumbs, ſtrawberries and cherries, as I apprehend, the red do bind the ſtomach, and tickle it with a more ſalubrious provocation of appetite, and help of digeſtion, than the white. What this will infer for colours I muſt rather expect from you, than offer the ſacrifice of mine own ignorance. Thus I conceive, that the ſtatics may bring in collateral aid to many diſcoveries of heat, and fire, fermentation, cloſeneſs of parts, and many other matters, if not alſo of colours.

BUT with this looſe diſcourſe I have ill requited you for your great favour. Yet if I could make better returns, they ſhould not be wanting.

Honourable Sir,

I muſt ever remain

your moſt humble and

moſt obliged ſervant,

JOHN BEAL.

May 27, 1665.

SIR,

IT was Thurſday laſt that I received your noble favour by the conveyance of our worthy friend Mr. *Oldenburg*. I am not worthy to offer you any account of it, and leaſt of all, being now in the prime of the enjoyment. This argument of cold I had only *in votis* about eight years ago, and ſo I wrote to Mr. *Hartlib*. But I had no hope then to live to ſee the beſt of chemiſts ſummon all the curious, to have a due regard to ice, and ſnow, and freezing. I had at the ſame time a like deſire for a conſiderable micrography. And I know, to whom we are indebted for that performance alſo. In truth I am in many other matters of greateſt weight prevented; and am ſurpriſed with illuſtrations far above the maturity (I ſhould ſay the rawneſs) of my wiſhes. And you have done much to teach us all, how to rectify and to amplify our aims, wiſhes, and enquiries.

I AM full of deſires to prove my ſelf no unthankful perſon, having received ſo many great favours from you; and every ſmall river returns to the ocean, as the ſovereign of all ſprings. I can only offer effete endeavours. I have often been ſolicitous, how I might tender to you one line, that might be ſerviceable to your dear engagement for the empire of mankind. That which herewith I ſend you, is my laſt thoughts, but ſo raſhly drawn, and in ſuch an unlegible hand, that I cannot deviſe, how you ſhould find a reader, or one, that can have the patience to ſever the few grains from the maſs of droſſy ore. If I ſhould keep them for a review, the whole would be forfeited under the ſpunge, as hath befallen me in other eſſays of more affections than judgment. Neither have I hope of leiſure for ſecond thoughts. You will here allow rather the warmth of a ſolicitation, than require the rigour of experiments. Yet I had not been ſo forward in this, if I had not in my ſelf in my childhood, about five or ſix years before I came to *Eton* ſchool, found more of truth in what I here propoſe, than I hold fit to affirm now, or to expreſs. I aſſure you, I did abide oft-times under water with much wonder at mine own eaſe, and delight in it; and ſo long, that in my preſent underſtanding, and with ſuch memory, as I have of it, I cannot think it poſſible, that I ſhould or could abide half ſo long without breathing above water. And this I take to be a conſiderable query, whether the Americans and other naked people, which are bred to ſeek their food in the ſeas, and to take much of their habitation there, are not able to dive longer than they can hold their breath above water; chiefly whether their children are not more apt to ſwim, or to endure diving at the firſt eſſay, much better than we that are clothed, and dry fed.

SIR, I think you may find yourſelf there recited in a parentheſis, that takes in more than I intended, or agrees with ſtrict truth; but I thought it fit to paſs in the number of other known faults, becauſe it falls into your merciful hands.

BUT I defraud you of that, which you can hardly ſpare, your precious time.

I PRAY for the right honourable vicounteſs *Ranelagh*, and for all your excellent relations.

Moſt Honoured Sir,

your moſt obliged ſervant,

J. BEAL.

Yeovill, Sept. 7, 1665.

SIR,

I WISH theſe may find you in *Eton* college, and well ſettled there. But I am alſo to acquaint you, that by poſt, on Monday laſt, I ſent to Mr. *Oldenburg* two conſiderable accounts of Mr. *Gratrix*'s healing.

THE one is in the hand of Mr. *Thomas Wall*, a miniſter (independent) who, it ſeems, took a journey from hence thither, with ſpecial purpoſe to be throughly informed of the whole truth. He noteth many peculiars, which deſerve and require at leaſt a double teſtimony, eſpecially that of the healer's hand twice ſtruck dead, and black as a coal, upon his unbelief, and as often healed by the touch of his other hand. If this can have no other witneſſes but Mr. *Gratrix* and his wife, yet then

then the conſtancy and agreement of their teſtimonies are fit to be recorded.

THE other account is from *Lionel Beacher*, ſometime mayor of *Biddiford*, who could take no ſatisfaction, but from his own eyes and ears. This is ſaid to be in Mr. *Worſley*'s hand, and it is very like his hand. I received both from Dr. *Sydenham*, who preſents his humbleſt ſervice to you. He promiſeth to overwhelm us with clear evidences of ſuch wonders, as would be incredible, if not ſo well confirmed. And I have ſeen many other good teſtimonials of like wonder.

SIR, if you ſhall pleaſe to examine theſe accounts, perchance you will perceive many things worthy the ſagacity of your own further enquiries and directions; and your acquaintance in *Youghall*, *Liſmore*, *&c.* may give you large opportunities to add to the ſearch and evidence of a buſineſs, which deſerves to be ſpeedily publiſhed, as far as is poſſible, and with fulneſs and exactneſs. It is a convincing evidence of the powerful name of our Lord *Jeſus*, in a ſeaſon, that needed ſome evidence, that all revelations were not fanatical.

BUT I ſhould refer all to your own better advice, being always,

Honourable Sir,

your moſt obliged and

faithful ſervant,

JOHN BEAL.

October 11, 1665.

SIR,

I MADE as much haſte as I could to return my moſt humble acknowledgments of your laſt favours by the ſame hand, that brought them to me.

BUT now hearing, that you give life to the engagements of the Royal Society by a club in *Oxford*, and that you have opportunities to confer with Mr. *Auſten*, I make bold to propoſe an expedient or two, by which his induſtry and faithfulneſs to experiments may correct and amend old reports, and much improve our vegetables for aliment. Much of this I can give in one reference, *viz.* to *Palladius*, and more particularly his fourteenth book *de inſitione*. Where, though we muſt expect a poetical gloſs, and overſtraining for wonder, and I have ſeen ſome experiments fail of his character; yet I cannot hear of any ſufficient proſecution of the argument by real and careful eſſays, which may at eaſy rate be made in a nurſery, where the neighbour grafts may be permitted to draw from their native ſtock, more or fewer years, for variety of experiment. I hear of many eſſays of Mr. *Finch* in *Herefordſhire* and *Worceſterſhire*; but not of any ſuch largeneſs in his aim. We ſee, that *Palladius* wrote much upon real experience himſelf, being an illuſtrious perſon of large revenues, his lands in *Italy*, *Naples*, and *Sardinia*, *&c.* very differing ſoils, *&c.* More particularly, and of more general uſefulneſs, and at ſome certainty, we may complain, that we have too long and too much neglected the liquor of cherries. For it is beyond belief, what ſtore of cherries one acre of kind land will yield in a fit air, when they eſcape froſts. And by this you may judge of their cheapneſs, that we have often ſeen cherries brought from *Peak* near *Worceſterſhire* to *Hereford* (which is eighteen miles) on horſe-back for two pence per pound, or thereabouts. For ſuch carriage they muſt be gathered more carefully, than for the preſs, and the liquor may yield a far greater value; but I could never obtain a due examination of the ſalubrity of the liquor, or what kind of cherry yielded the beſt and wholeſomeſt liquor, how long they ſhould be in the heap, after they are gathered, before they be preſſed; and the time of the liquor's maturity. I was in covenant with many perſons to proſecute theſe enquiries, and to deviſe commodious preſſes; and ſome applauded their ſucceſs, ſome failed, none took encouragement to continue the experiment, and to advance it to any conſiderable quantity. And it is to be conſidered, that ſome land and air is fitter for cherries, than for other fruit. And perchance, they would do leſs hurt in liquor, than in their kind: otherwiſe I would ſay little for them. I conceive they ſhould be preſt within twenty four hours after they are gathered; yet not immediately; and the liquor ſpeedily encloſed for fermentation. For it ſeems apt to expire.

BUT, Sir, I ſhould not give you this trouble, neither do I intend it otherwiſe than by your recommends with my ſervice to Mr. *Auſten*. I have indeed many other thoughts concerning apples, pears, and cyder fruit, but that work thrives happily, and needs no nice curioſity.

FOR the vegetables Dr. *Sydenham* is a very heretick; he detracts as much from the worth of their knowledge, as they overſpoke it, who gave them a Godhead. And *Hortus Sanitatis* is leſs faulty in over-numbering their virtues, than he in diminiſhing the account. He was much pleaſed with the account I offered of the correſpondence of parts in plants. I had my firſt directions in a brief manuſcript from Mr. *Hartlib*, *de herbis ſine duce cognoſcendis*; which I did put into my lord *Brereton*'s hands, intending it for the publick; and I conceive it worthy to be further ſolicited.

SIR, ſince you have appeared ſo heartily and ſucceſsfully for religion, and have once allowed me the freedom to adviſe you in one point, wherein you will pleaſe to remember, that I did not engage them in a controverſy, but only moved you to decline the engagement; I pray you let me further prevail with you to adventure half a quarter of an hour (it cannot coſt you more time) to read the ſecond chapter of *Socinus*'s *Prælections*. *In quo quæritur, quid ſit in homine naturaliter, quod ad religionem pertinet.* It hath been much in my thoughts above theſe thirty years. And it advertiſed

advertiſed me to dive into the ſpirits of many people to find their bent, notions and grounds. And as to the general, I find it very hard to diſcern, how much or how little of religion we have in the frame of our natures; and to diſtinguiſh that from all kind of revelation, or tradition. And Mr. *Hales* told me often, that he found himſelf utterly at a loſs in that point. And ſo he notes in one of thoſe ſcraps, that are printed.

YET I incline to conceive, that all the world over there is more of revelation and grace, than we can ſtrictly claim from our natural frame, or any lines written in our hearts. And I hope this will acquit me from Pelagianiſm, which the Calvinians do liberally daſh upon all their adverſaries. And for ought I can hear, the Americans in general take more reverend knowledge of ſuperior and divine powers, than ſome that live amongſt us. And I can ſhew you in *England* the full body of ſome towns and countries, very zealous, devout, ready to do, to ſuffer, and to expend freely in the way of their religion, yet within twenty or thirty miles of that place, the whole body of people habitually, and time out of mind, unſenſible, and wholly as unconcerned in all diſcourſes of religion, and apt to take all to be fanatics, that make any pretence to ſeriouſneſs in devotion. Hence I collect, that by cuſtom many people do unconcern themſelves in the holy traditions, which they received from their anceſtors. And yet alſo that all nations very generally, if not univerſally, have ſomewhat of holy tradition; and therefore it is the beſt uſe we can make of our reaſon, if we employ it candidly and heartily to find out ſafe and firm grounds why and how far we ſhould admit of revelation, by what evidence, *&c.* To the words of *Socinus*, *Hoc autem nihil aliud eſt* in arg. 12. of that chapter, I can add the fulneſs of primitive fathers, of beſt authority, which being added to the elegancies of *Cælius Secundus Velcurio*, *de amplitudine regni Dei*, will plead more comfort for good-natured, ſober and honeſt Gentiles, and much more yet for devout Jews and Mahometans, than for our over-growing atheiſtical drolls.

BUT the letter I intended is become a book of blots, and it is time I ſubſcribe,

Moſt honoured Sir,

your moſt obliged ſervant,

J. BEAL.

Nov. 9, 1665.

SIR,

BY the favour of your conveyance, I have received a packet from Mr. *Auſten*, of which I know not how to acknowledge the receipt, but by giving you the trouble of it.

I BELIEVE Mr. *Auſten* hath given you the ſame account, which he does to me; and is very ſolicitous to promote cyder by laws. I hope there is no need of ſuch enforcement. For, I hear that nurſeries of fruit-trees are advanced in every county, and that will alſo prepare, and encourage the preſent, and poſterity. But becauſe nurſeries are ſlow, and the men of this age are impatient for diſpatch, I can propoſe an expedient, that would entertain the curious, and find them an employment in their nurſeries, as hopeful, and as uſeful, and as delightful, as in any kind, either of philoſophy, or of agriculture. I mean the re-examination, and the further proſecution of the noble *Palladius*'s XIVth book, which is *De inſitione*. Of this I made mention in my laſt to Mr. *Auſten*; and now I have doubly recommended it to your own advice. If I had leiſure, I would adventure it in a more publick manner, together with ſome other collections, which I have found in old writers, and compared with modern Eſſays. And I think we may wonder at ourſelves, that we have done ſo little in a field ſo large, upon an argument ſo pleaſant. And I wiſh ſome good printers would take notice, that *Palladius*, and the other three, *Rei Ruſticæ Authores Latini veteres*, will never be out of requeſt, but have this long time been out of print. Dr. *Fell* found it a hard work, and of long time to procure me one of them; and that is in a very faulty edition of *Hier. Comeline*, *Anno* 1595. Mr. *Oldenburg* hath them in the edition of *Robert Steven*. It were no hard work an academical corrector of the preſs, to improve the beſt edition, as by the notes of *Barthius*'s notes in *Columella*, Lib. X. *De cultu hortorum*, *&c.*

AND in my time we were many of us in *Cambridge*, who did freely offer our aſſiſtance to the correctors and printers upon all ſuch occaſions.

BUT, Sir, I muſt crave your pardon for my frequent importunities.

Honourable Sir,

your moſt obliged ſervant,

J. BEAL.

Feb. 6, 1665.

SIR,

I MUST remember, that when firſt you beſtowed your books upon me, you blamed me for not returning my cenſure. If I had need of an apology for ſuch freedom as I here intend, hence I could frame it. But your virtue is more ſolid than to require ſmooth handling; and you cannot exchange that leiſure for a compaſs of ſoft words.

1. THEREFORE to begin rudely with generals, I ſhall tell you that, which you will hardly believe. Perſons of no ordinary capacities do find your three diſcourſes of thermometers and baroſcopes difficult; that aſſiduity upon the argument, with exemplars before your eyes, hath made all things ſo eaſy to you, that you will ſcarce apprehend, how it

it can be intricate to another. Yet I ſee no remedy you can have to clear all, but by recommending the ſale of all ſorts of weather-glaſſes, and baroſcopes to ſome perſons, that are fitteſt, and of beſt truſt, in *London*, *Oxford*, and *Cambridge*. Theſe are the liquid demonſtrations. And ſome inventions may be better communicated in ſpecie, than by books.

2. I ENGAGE for you, that you need not the poet's excuſe, *Brevis eſſe laboro—Obſcurus fio*. For you are as plain and ample as can be. And whatever is of itſelf intricate, it comes often in your way, and is laid down in variety of good expreſſions. But whilſt you take too much care to ſecure our underſtandings, and to help us with much of your patience, ſuch as have not the objects before their eyes, are more apt to languiſh than to feel the life of your arguments. Were the virtuoſi furniſhed with theſe philoſophical utenſils, then you might permit yourſelf in ſome repetitions to come off more roundly, and more briſkly; and well you might adventure to refer this to your judicious tranſlator. I ſhall explain my ſenſe by an exemplar of a twofold aſpect.

A NUMBER of famous lawyers did urge againſt me, that our learned *Selden* wrote the beſt Latin, that ever was uttered. I denied it to be his due praiſe; for in truth he took too much care to be rightly underſtood, and to bound his own ſenſe: and *Ben Johnſon*, when he read *Seneca*, cried oh, that he would truſt my underſtanding! This was in a far differing caſe, for he meant it of giving the ſame ſum over and over in ſeveral coins. Of the latter fault no man can accuſe you; and for the former excuſe, I do truly thank you, but all men will not turn it into your praiſe.

3. MORE particularly the tranſlator may do well to refer in the margin to the ſcheme or figure there intended; or to explicate where the diſcourſe requires ſome change of figure. As I think, p. 33. which ſeems to belong to the firſt or ſecond, and to the fifth figure, though not beforementioned.

4. AND perchance there is ſome miſtake of the printer, pag. 792. l. 8. where *Zucclius* pretends to a good ſealed weather-glaſs, which if true, removes the ſuſpicion of pag. 797. that it was not a ſealed glaſs. And again there, pag. 792. l. 9. it is ſaid to be obſerved three years together, which excludes the anſwer, p. 799.

5. I SHOULD add, that I am almoſt become confident, that one of my thermometers by ſuch inſolation, as may be had in *England* from our ſtone walls, hath loſt ſome inches of liquor. For I cannot find any leak, or expiration, neither doth it waſte at any other time, but under very ſtrong heats: and a ſmall cylinder of water on the ☿ in my baroſcope, and alſo a white liquor, which in the extremity of laſt winter froſts was diſtilled from the ſpirit of wine into the bolt-head of my ſmalleſt ſealed thermometer; theſe two liquors do remain in the uſual ſolar rays of my ſtudy unconſumed. From whence I ſeem to argue, that ſealed thermometers may fitly be graduated for our winter, and for ordinary ſummers; but for better uſes another thermometer may be appendant, that at ſome ſeaſons it may be compared, how far it agrees with the firſt rules of graduations in the winter thermometer. And if your perfect ſcales will ſhew, that a ſealed glaſs may by inſolation loſe weight, then you may adviſe your tranſlator of a ſhort paragraph, pag. 58. l. 14. For that in ſome caſes, the ſeal will not keep the liquor from evaporation. But who can enumerate all the diſcoveries, that may be made by ſealed glaſſes, as well upon earth, and vegetables, as upon air and liquids?

6. I PRAY you ſuffer me to raiſe a queſtion, which is more like to betray my own ignorance, than to inform you. This I would not preſume to do, if I had any ice or ſnow here. It is above thirty years ſince I practiſed the freezing by ſnow and ſalt. Then I ſeemed to apprehend, that a kind of circular motion of that ſnow and ſalt did accelerate and invigorate the freezing. And this laſt, May 6. I tried the like or more gentle but circular motion of the liquor, in which mackarels were boiled and pickled, for the luciferous experiment of ſhining in the dark, which (though the water or pickle was thick and muddy) ſucceeded without fail, upon the motion of the hand in the ſame gentle circular manner, as the dairy maid ſtirreth the milk, to curdle it for cheeſe. When that motion ceaſed, it did not ſhine. But in this experiment there were many other circumſtances requiſite, of which I can give you a fuller account at your command. This ſeemed to our preſent purpoſe, the reſt to belong more generally to fermentation. If this ſhould have any importance towards freezing, your tranſlator may be minded of it, pag. 181. For though you ſignify near the end of pag. 525. that it ſhould be nimbly ſtirred; and again, pag. 593. l. 1. in a briſk motion: and there again, l. 20. in another kind of agitation. And though the circular motion cannot be applied in many of your experiments, yet if you find it true, or any kind of motion more conducing than other, the firſt rejected place, pag. 181. may be fitteſt for the record; and poſſibly this enquiry, and the microſcope, may ſomewhat aſſiſt for the hypotheſis of cold. If it proves impertinent, I hope you will not impart it to any want of my reſpects. For I offer it with diffidence enough.

THUS I have ſearched for cavils from the beginning to the end; and in the laſt waſte page of *Opera nondum edita*, I find my diſcomfort. For there I miſſed *The Continuation of lord* Bacon's *Sylva Sylvarum*, or *promiſcuous Experiments*, mentioned in your *Phyſiological Eſſays*, pag. 14, 15, and 16. This title might preſerve and ſhelter many ſcattered papers of beſt note, and redeem you from the trouble of methods and ambages, and ſupply and rectify the firſt adventurer, our lord *Bacon*; and would ſuggeſt many occaſions to prove, that ſomebody hath at laſt advanced beyond his expectation and votes: and one well choſen experiment

experiment is (in my opinion) worth more than many of the largeſt volumes of old ſtile.

YET this I durſt not ſay, if I did not think it would rather eaſe you, and free you from ſome confuſions, than add to the burthen. I am ſure I am,

SIR,

Your moſt obliged, and

moſt humble ſervant,

J. BEAL.

SIR, you gave us the firſt or fulleſt notice, that the ſmaller glaſs canes do draw water higher above the ambient ſurface, than wider tubes. And the ſame heat, which fits the bolt-head to draw water into the open weather-glaſs, will not ſuffice to expel the ſame water; and the ſmaller weather-glaſs requires the greater encreaſe of heat to expel the liquor. And the gravity of the atmoſphere hath more influence to interrupt the indications of heat and cold in one kind of open tube, than in another. But you give us good reaſon, why we ſhould not expect, that you ſhould here lay down all your own obſervations. The white liquor, which I noted to be diſtilled out of the ſpirit of wine, deeply tinged in the hardeſt froſts, was done in a very ſmall glaſs, that had the faults, which you mention, pag. 41, 42. In the larger thermometers it did not ſucceed, though they were expoſed longer to the ſame froſts. This may accord with lord *Bacon*'s conjecture in experiment 27. M. H.

Of mackarels, and their liquor ſhining in the dark.

ON Thurſday May 5, 1665, freſh mackarels were boiled in water with ſalt and ſweet herbs in the uſual manner; being boiled, they were taken out of the water, and on Friday morning next following, the water being then perfectly cold, the mackarels were put into it for a preſerving pickle. On the morrow being Saturday, more freſh and ſweet mackarels were boiled in like water, and on Saturday morning were put again into the ſame boiled water, being then fully cooled, and both mackarels and water were then put together in the ſame veſſel with the mackarels and water, that were boiled on Thurſday foregoing.

ON Monday evening the butler ſtirring the water to take out ſome of the mackarels, found the water very luminous, and the fiſh ſhining through the water, as adding much to the light, which the water yielded. I could ſee the fiſhes in their juſt proportion, as they lay, emitting rays all over the water; and both fiſhes and water ſpreading rays at ſome ſmall diſtance about the veſſel.

THE water by the mixture of ſalt and herbs in the boiling, was of itſelf thick and blackiſh, or dark; yet being ſtirred, it ſhined, as having ſome inherent light in itſelf, but the fiſhes appeared more luminous and in their own ſhapes, as is above noted.

I NOTE, that the liquor had ſome inherent light in it apart from the rays of the fiſh; for that, wherever the drops of water fell, they ſhined, both on the ground, and on the ſtools. And my children caught drops in their hands, as big as a penny, or two pence, and theſe drops by ſhining ſeemed to me as broad as ſix-pence, or a ſhilling.

THOUGH neither the fiſh, nor the water ſhined, till the water was ſtirred; yet when it was ſtirred, and ſhined, the drops, that fell, continued to ſhine for ſome time, and the children ran about the houſe ſhewing the drops ſhining in the palms of their hands.

THE butler ſtirred up that ſide of the fiſh, that was loweſt, and thence came no rays of light; but thoſe turned fiſhes appeared black in the ſhining water. And the water, after it was fully ſettled, and at reſt, which was about an hour after, neither it nor the fiſhes lying in it did ſhine at all.

ON Thurſday night we repeated the ſame trial on the ſame fiſhes and liquor, and found the ſame effects. The water gave no light till it was ſtirred, but was thick and muddy, as we ſaw by the foregoing day-light, and then by candle-light; but being gently ſtirred by the hand moving round, as the dairy-maid is uſed to gather the milk into curds for cheeſe, the liquor and fiſhes did all ſhine together.

THE fiſh did then ſhine, as well from the inſide, as from the outſide, and chiefly from the throat, where the inciſion was made to take out garbage, and in ſuch places as were broken in the boiling.

I TOOK a piece, that ſhined moſt, and fitted it to my leſſer microſcopes, and alſo to my great microſcope; but I found no light in any of the glaſſes, nor from any drops of the ſhining water, when applied.

ON Wedneſday I examined thoſe broken pieces in my great microſcope in the brighteſt ſun-ſhine. At firſt we could find nothing very remarkable on the ſurface of the fiſh in any poſture. After we wound the object plate a turn or two below the juſt diſtance, both others and myſelf thought we ſaw a very thin ſteam, rather darkiſh, than luminous, ariſing in the glaſs like a very ſmall duſt, and rarely here and there a very ſmall ſparkle in the fiſh. Of theſe ſparkles I am certain; for we numbered them, and agreed in the number, order, and place of the ſteam. I am not very confident, whether it belongs to our eyes, or imaginations, or to ſome duſt in the air, though it was without doors in the garden, ſo ſmall it was, if it was any thing more than a fancy.

THIS piece of fiſh being fitted to the great microſcope by day-light, was re-examined in the dark of that evening, and it yielded no light at all, either to the view of the glaſs, or otherwiſe: finding it dry, I tried, whether by the mixture of ſpittle, or by rubbing, it would ſhine. And ſo it did a very little, not

not in the glaſs, but to the naked eye; and in very ſmall ſparks, ſuch as ſoon vaniſhed. I collected they were the ſame ſparks, which we ſaw in the ſun-ſhine by the microſcope.

THE fiſh were not yet fetid, and I cauſed two to be kept for further trial on Thurſday night. And then they began to be fetid, and I expected more brightneſs, but could find none, either in the water ſtirred, or in the fiſh taken out of the water. I boiled fiſh a fortnight after, and failed of the ſhining. I gueſs, that the mixture of the freſher fiſh and pickle with the former did accelerate and enliven the fermentation for ſhining.

SIR, in the laſt clauſe concerning ſhining mackarels I would note, that I attempted the ſame experiment in the ſame manner in all circumſtances, excepting only, that I did not add another of more recent boiling, as in the former; and I could not obtain any ſhining from the ſecond trial, though I kept ſome of the mackarels till they were very fetid. Every night I tried in vain.

I GUESS at random and ſhot proof, that every frozen body gathers a moiſture in the freezing. This may be tried by encloſing duſt or dried earth in a ſealed glaſs, and then freezing it. If it ſhould convert the encloſed air, or collect the aqueous particles, it is to be added to the other obſervations. If it ſhould add to the weight of the glaſs, it would yet be more ſtrange and remarkable. Thus I fill the ſheet, and am always,

SIR,

your moſt obedient ſervant,

J. B.

Yeovill, March 31, 1666.

SIR,

IN what I repreſented for you by Mr. *Oldenburg*, for the immediate conveyance of the ſuperabounding blood of healthful young people into the veins of the aged and decayed (if ſuch a way could be deviſed) I had ſpecial regard to the vital ſpirits, and congenial heat, which may poſſibly have in ſome reſpects a more indulgent virtue, than mummy, or ſalt of human blood. And the mighty power of imagination may be advanced by the choice of the perſon. This I called Tranſanimation, in alluſion to the Scripture expreſſion, "The life or ſoul is in "the blood," which *Selden* interprets of the warm blood in the living animal, which may be part of the ground of the Noachidal precept, as if by ſuch nouriſhment we might degrade our ſouls, and become ſavage, or gigantine. Others, as well as myſelf, have obſerved a valetudinary ſympathy, and a change (even of features, more than one would expect) after conjugal enjoyments, and then more eſpecially, when the affections are mutual, tender and entire. When the wife is breeding, the huſband is troubled with the tooth-ach, and unweildy; when ſhe is in labour, he feels pangs, and recovers in her delivery. Thus in ſome. I have offered other inſtances. But more to our purpoſe thus: an aged perſon (above eighty) married a young maid: a ſharp wit gave ſentence, that he was a dead man, and dropped into his grave. I anſwered, that it was rather his reſurrection, or reſtoration. My ſentence hath held true; by her he hath two ſons unſuſpected; hath lately within two years broken his leg twice with falls from his horſe, bore it ſtoutly, and is again recovered, healthful, and more cheerful, and of a freſher countenance, than before this marriage.

SIR, this I remark, as oft as I hear of the caſe, and I think it is remarkable. In the ſalacious it may be otherwiſe.

AND as to the baroſcope; if any ſcales could be deviſed ſo exact, as to take the differing weight of air (of any conſiderable and ſtated breadth) at 30, 29, and 28 inches in the baroſcope, we could thence calculate the particular weight of any column, that is found moſt agreeable for any particular man's health, or pleaſure. And till your own accurateneſs ſhall inſtruct us, I dare not confidently affirm, that the aſcent of the mercury does ſtrictly indicate the weight of the air. For mercury is apt to yield to a ſmall degree of heat, and ſeems to boil, before it is tangibly hot. Now if heat ſhould ſwell the mercury, and make it lighter in proportion of bulk, it muſt be ſo much more apt to aſcend higher. And all liquors do alter very much in their weight, as they are warmer or colder. Of this objection I gave notice to Mr. *Oldenburg* ſome months ago.

AND beſides this, the dews amongſt us, when it rains, may (for ought I know) weaken the ſpring of the air, that approacheth the baroſcope, and ſo betray it to give a falſe report of the weight of the whole atmoſphere. For whatſoever hinders or provokes the quick twirlings of thoſe globulous particles, may alter the caſe by a kind of impulſe, or by deadening the force; as it falls out, when the tendereſt ſcales are impelled by a ſtroke of wind, which had leſs weight than the air without it. This may be ſome cauſe of our diſappointments, and put us to a bluſh for the language of our printed obſervations.

I WISH the matter as well tried as might be, by very dampy vapours about the mouth of the baroſcope, or in the cloſet, and then again with charcoal fires, and ſuch pariet works, which do endanger ſuffocation, *&c.*

THE fickleneſs of winds hath alſo given me cauſe to bluſh at my curioſity for half points, *&c.* For my vane is now ſo unſteady, that I can never ſay in what point it is: perchance it is not ſo ambulatory, where the ſpires are far above the neighbouring hills: here the hills are higher.

IN a ſtanch thermometer of 2 feet length, that deſcended not in the hardeſt froſts of theſe two laſt winters below 5 inches; nor aſcended in ſummer (out of the ſun) above 16, I remarked,

Nov. laſt 29, froſt much abated thermometer $6\frac{1}{3}$.

EVENING it leaks, and ſmall rain, thermometer $6\frac{7}{12}$.

Nov. 30, ſnow melts apace before ſun appears, thermometer $7\frac{3}{4}$. This I remarked carefully as a ſtandard, or to be tried in the following winter; ſince which time I have found it freeze quick, when it was above this mark; ſometimes above 8. It was much and often lower in ſome rainy weather, than in ſome froſts.

SIR, may not the hydroſtatic ſettle a ſtandard of heat and cold; as when water is ſo warm as to weigh ſo many ounces per pint? *&c.* For a ſtandard of cold rain at firſt fall, ſo much mercury in a bottle of ſuch capacity, ſo many ounces per pint; but rain fell here, Dec. 19. thermometer $5\frac{1}{4}$; and Dec. 26, thermometer $5\frac{3}{4}$; in ſome froſts lately, near $8\frac{1}{2}$. thermometer in a window, heat may adjuſt it: ſome other poiſe rather than mercury, which ſwells.

IF the little Italian hydroſtatic were remarked, with ſome regard to the round numbers of drams or ounces per pint, it would pleaſe ladies for trials of degrees of heat and cold in liquors, of water, wine, cider, beer, ale, ſtronger or ſmaller, wood-dried or ſtraw-dried malt, *&c.* and ſerve for profounder uſes.

To another, I ſhould have added above, that if any damps or fumes do alter the weight of air much above the indication it gives in the moſt curious baroſcope over the cloſet; it gives us cauſe to ſuſpect, that it does not indicate the true weight of the atmoſphere.

IN a letter to Mr. *Glanvill*, I ſoftened ſome of the expreſſions, which are in the Tranſactions, numb. 9. pag. 155. more carefully, than to Mr. *Oldenburg*, where I did not intend all for the publick. And I ſaid, that the magnet was known for ſome properties, 2000 years before any of the wits in the world applied it to find a new world, and mountains of the royal metal. It will not be for our credit, if we ſhall ſtand long at gaze, and find no uſes of the baroſcope.

BUT I have filled this paper, and troubled you too much.

GOD preſerve your health, and proſper you in all your noble ſtudies, and in all things.

SIR,

your moſt obliged, and

moſt humble ſervant,

JOHN BEAL.

Yeovill, Apr. 18, 1666.

Honourable Sir,

I HAVE ſeen enough to give me the confidence to affirm, that you have already laid the foundation of ſolid philoſophy ſo firm and deep, that it can never be ſhaken. And if it ſhall pleaſe God, of his bounty to mankind, to preſerve your health and ſtrength (which is the prayer of all that have taſted the fruit of your labours) in a very few years you will reform all our univerſities, and ſet many thouſands on work, to complete the ſuperſtructures, with all the innated ornaments, and with their moſt valuable efficacies.

BUT, ſince you are pleaſed ſtrictly to forbid our applauſes, and do allow me to be your critic, I crave your leave, that I may give myſelf a great delight in viewing, how you have methodiſed your unpubliſhed papers.

AFTER you have taught us, with what ſeverity experiments themſelves ſhould be examined and circumſtanced, and what aim we ſhould have for the choice of moſt conſiderable experiments, and have given us an ample ground-work, your exuberance hath flowed in more ſtreams than we can number, but (as if I thought of the river *Nile*) I will conſider them in ſeven channels.

1. I MUST reſign to your private cabinet thoſe arcana, which you reſerve for your legacy to the Royal Society, and, by them, to the worthieſt of poſterity.

2. The ſecond place is due to the remaining part of uſefulneſs, by which you ſtop the mouths of impudent ſcoffers, and of thoſe counterfeit zealots, who are ſo unjuſt as to demand the uſe of every line you write; whereas they might ſee ſuch a ſplendid account already publiſhed, and more promiſed; and for their own darling (which hath troubled ſo many wits ſo many ages) they cannot pretend to any ſhew of uſefulneſs. And, becauſe this work will grow in your hands, as long as you advance in knowledge, I make it my humble vote, that you would publiſh this by parcel, as it grows up; and to put no full period to it, but to leave it always as the devout Jews did their private buildings, unfiniſhed, and for our further expectations.

3. YOUR phyſico-mechanical appendix is moſt nobly introduced, and there alſo you may give us by parcel, as you find leiſure; for here you cannot end, when you ſeem fulleſt: and the ſtatics in general will raiſe a large and moſt inſtructive bulk of philoſophy. And here you lead us to confeſs the firſt mover, who made all things in order, number and weight; poiſeth the mountains, and agitateth all things, *cribro divino*, by his myſtical ſieve, into their proper natures, and ſeveral regions.

4. YOUR farther explication of qualities will teach all the ſchools better language, convert their verbal quarrels into fruitful deeds, and illuſtrate the whole body of general phyſiology. Nothing can be more powerful to remove and extinguiſh *ſcholarum faſcinum*; *& hoc præfiſcine ſit dictum.*

5. WHEN you ſhall give us your diſcourſe of heat and flame, we ſhall acknowledge, that you alone have accounted for all the elements of old fame, and have given us their juſt names and natures; for heat is our firſt viſible mover, the ſun in the center of this world. When we ſee the ſimple dairy-maid gather her cheeſe by the gentle circling of her

her induſtrious hand, and obſerve how by compreſſure, ſaline ferment, and rennet, the cheeſe in time becomes hot, inflaming, and animated; and when we note the ſtatic laws, by which the butter is gathered, and ripened into oil and flame; then we ſhall better diſcern, how the holy dove ſat on the waters to produce our originals; and how we are ſtill cheriſhed under the ſoft wings of indulgent providences, and tender mercies, for our new birth and reſtoration: and by this time (by opening the ſprings of fermentation, gravity and magnetiſm) you will conduct the two rivulets of mechaniſm and chemiſtry into the ocean of theology. We have ſeen you ſtand your ground ſo well upon firmneſs, and ſo ſkilfully divide the waves of fluidity, and ſo happily tranſcend and ſurmount the air, and ſo ſecurely command the æther and fiery boundaries of the world, *flammantia mœnia mundi*, (as of old they called it) that we ſhall not henceforth moleſt ourſelves about the number, or nature of the elements.

6. OF your other diſcourſes of the ſeeds of diſguiſes, of improbable truths, or whatever elſe you find of eaſy diſpatch, and ſeaſonable, you may free yourſelf at pleaſure; but we have the immodeſty to be always calling for more, and to take all your intimations for good and ſure promiſes.

7. THE continuation of lord *Bacon*'s Sylva, or promiſcuous experiments, will be a pandect to receive all your ſcattered papers, and to reduce them into ſuch a diſorderly order, as falls out oft-times to be better than the beſt method, for all uſes, occaſions, and for immortality. Here you may annex to any piece, that is publiſhed, re-examine, enlarge, explicate: here you enter polychreſts, which cannot belong to one head, nor be confined to few heads: here you relieve lord *Bacon*'s *Sylva*, and his *Novum Organum*, which oft-times want your aid. Here you ſhew, how much you have advanced, both beyond my lord *Bacon*'s votes, and beyond *Des Cartes*'s eſſays, or imaginations.

SIR, I have ſtrong reaſons to urge, that as ſoon as they amounted to a century, they deſerved to be abroad. For thus you may empty your deſks often, and be leſs overwhelmed with your own abundance: thus you may enforce our dulneſs to apprehend our work, and the ſooner you will ſee us work under your commands. Sir, I have a hard ſentence for you, that (confining to the philoſophical affair) never was man ſo deeply indebted to God as you are: and in the ſame account, never was the world ſo much in debt to any man, as we are to you. But it is not in our power to diſcharge the debt. Only this muſt be your comfort, that as you have a rich mercy in what you have received, ſo you have grounds to expect a great reward from the ſame bountiful hand, for your admirable and ſucceſsful induſtry. For you have opened the eyes of all that love wiſdom, to behold, that the works of God are good, and have another luſtre than the notions of the Gentiles, or the cavils of malicious men. And the more liberally you ſhall impart your ſtreams, the more briſkly your fountains will overflow. God preſerve you in his beſt favours and mercies.

Honourable Sir,

your moſt obliged ſervant,

J. BEAL.

MY laſt margin of March 31, ſent for you to the poſt-houſe of *Oxford*, repreſents, that heat may be graduated by the hydroſtatick. This I tried, when you firſt communicated the hydroſtatick to me, which was Feb. 27, 1663. If true, it cannot be hid from you; if falſe, I am deluded more than once: and poſſibly we may be ſomewhat diſappointed by the ſwelling and leſs weight of the ☿ in the baroſcope in hot weather. I muſt leave this for better examination, *&c.*

April 28, 1666.

Honourable SIR,

IF you have by this time pardoned my officiouſneſs in ordering your papers, I may now proceed to offer to you ſome very vulgar things, which you will not diſdain, if they may any ways conduce to the diſcovery of the receſſes and labyrinths of nature. This encouraged me to give you an account by Mr. *Oldenburg*, of an experiment, which ſhews what kind of motion, both for figure, and celerity or vigour, gives the beginning, progreſs and advancement of light, or flame; and by the ſame view or rule to gather (as it were) into a method the very principles and proceſſes of fermentation, and of vegetation, and of circulation of blood and ſpirits in animals, and of configurations, colours, and ornaments, and their interruptions, both in concrete bodies, and in fluids, all in a kind of mathematical demonſtration.

YOU were pleaſed to give notice of the profound changes in nature, as they are manifeſted by the dairy-maids gathering of the cheeſe; and yet there is more of art in that than is commonly conſidered. For a ſkilful dairy-maid brings the cheeſe ſooner with her hand, and due timing of it, than an unſkilful maid, though the runnet and other ingredients were all the ſame, and in the ſame proportion. And (beſides the differing heat of the ſeveral hands, which may make ſome difference, and the vigilance and ſkill to drive the circulation in due meaſure, and to cover and put down the curds ariſing about the middle of the veſſel) there is ſomething more, which the wittieſt of them cannot name or deſcribe, or give for rules, which therefore they refer to the luckineſs of the hand. And (to my knowledge) ſome of the beſt ſkilful have at ſome ſeaſons ſo often miſſed of this luckineſs, that they have believingly and confidently attributed this unluckineſs to witchcraft. Of this I ſhall have ſomewhat to ſay another time.

WHEN

WHEN clear liquors are but touched in the middle, or ſides, or wherever, their ſeveral undulations will ſhew the circuits and recourſes of the motion, which may be retarded by thickning the liquors with firmer ſubſtances of divers kinds, more eaſy and more difficult to be diſſolved: or the motion may be diverted, or croſſed, or broken in various guiſes by touches in other places. And this may repreſent the progreſs of nature in all configurations, colours, and ornaments, and ſome reaſons of concurrences, yieldings, and diſappointments.

WORT hath a peculiar tranſplendency, when it is not altered with thunder, noiſe, or violent agitation (which turns it into a thickneſs and acidity;) and the bubbles of wort have a peculiar aptneſs to give all the colours of the rainbow more conſpicuouſly, than the dew of the morning: by putting good balm or yeaſt in the middle, or other parts of a broad veſſel, we may diſcern in what lines it begins to work, and when all figures do ſeem to be blended, by moving and ſtirring it with the hand or bowl, and with laving of it, which drives the circulation from the centre, we ſhall ſee the ſtatic laws obſerved; the foam, bubbles, and lighter parts aſcend; and the heavier parts deſcend; and the viſcouſneſs of the yeaſt holds on this operation for ſome time, and keeps the balance in agitation.

So in kneading of bread, the circulation and time of heaving may be obſerved; and when they gather the dough from the outſides, and work it in the middle of the maſs, the liquor and ferment is driven in the ſame manner into all parts of the maſs, though in liquors the lines of the motion are more viſible.

THE country people call the verdant rings, which appear in the paſtures in the ſpring, fairies dances. I have examined very many of them, and though I found ſome few of them perfectly circular, and many of them inclined to be circular in part, yet I ſaw reaſons and proofs enough to perſuade me, that they all proceeded from the dung of cattle, whoſe ſaline vigour by the vernal dews, and rain, enlarged its circle, as we ſee in the uſual motion of water; but paſſing more eaſily, where the ranknes or ſoftneſs of the ground did more eaſily embrace the ſaline liquor, by more obſtinate ground the circle was ſometimes interrupted, and ſometimes it was conſtrained to draw a ſtreight line. The ſame chamletings and undulations we may obſerve from a like cauſe in the grains of timber, ſhapes of plants and flowers, variegations of ſtones, and ſome minerals. I have taken up on the ſhores, and land, many ſtones, which being cut, ground, or poliſhed, are a very excellent and beautiful kind of hard marble, ſometimes tough, and white marble interwoven; and ſo perfectly anſwering to theſe undulations, that they needed no other interpretation for the cauſe of thoſe ornaments, than the touch of a child's finger in a pool of water. And thus I have ſometimes obſerved the heart only of a large flint to be a marcaſite, ſometimes the ſtone is only covered or cruſted with marcaſite, as heat drives the ferment from the centre to the circumference in viciſſitudes; or as it falls out to be arreſted by cold, or the repugnance, or lazineſs of firmer matter. When I read Sir *K. Digby*'s diſcourſe concerning the vegetation of plants, which I had not heard of till very lately, this thought came into my mind, as in ſome degree helpful to interpret or illuſtrate the cauſes of the peculiar figures, not only of the roots, ſtems, heads and leaves, but alſo of the bloſſoms, fruit, and ſeeds, their colours and other ornaments. And I wiſh, that this acute diſcourſe had been divided into diſtinct paragraphs, and each paragraph by himſelf, or by ſuch as bear ſpecial reſpects to his memory, confirmed by the plaineſt or moſt proper experiments; for which purpoſe your ſeveral diſcourſes of Colours, and other qualities, have furniſhed extraordinary aids. Sir, if thus we began ſoftly, and in vulgar liquids and by obvious examples, we might poſſibly arrive in due time to the configurations of all ſtones, metals, and other ſolids; as by *Euclid*'s firſt elements we are enabled by induſtry and attention, to make a gradual progreſs to his more involved demonſtrations.

I HAD lately a brief Latin manuſcript of *a Method, without a guide, to learn all Plants by their Affinities and Differences*, in their roots, ſtems, branches, blades, ſtature, colour, leaves, bloſſoms, fruits, ſeeds, *&c.* I hope my lord *Brereton* hath it yet in his cuſtody. I wiſh it were made publick, not only for the purpoſe of the author, which was not unconſiderable, but alſo for the collections of theſe infinite varieties into few heads, as moſt appoſite to receive theſe rules of interpretation. And yourſelf have done abundantly to furniſh vacant perſons (of which our univerſities do afford good ſtore) for the application. And poſſibly when we can clear our apprehenſions of the nature of gravity and levity, it may give us ſome ſatisfaction concerning the ſyſtem of the world. And this I intended by the late words *cribrum divinum*. All motions in nature ſeem to follow the courſe of ſome ferment, and to be ſifted by heat and weight, as we ſee in the farmer's riddling ſieve, *&c.*

SIR, I ſhould take heed of making any overture to you concerning the progreſs or figurations in glaciation; for it is above thirty years ſince I have ſeen the experiment, and then we had a belief, that circulation did encreaſe and accelerate the operation of the mixture of ſnow and ſalt. And Mr. *Hook* hath well noted, how glaciation hath given or arreſted ſuch motions, as gave the figures of very many flowers, Microgr. Obſ. 14. But I have filled my paper, and muſt ever remain,

Honourable Sir,

your moſt obliged ſervant,

J. BEAL.

From *Yeovill* in *Somersetshire*, May 7, 66.

Honourable Sir,

THE man, whom you accuse of compliment and poetry, well knows, that you have no leisure for the best strength of his seriousness: and seriously he thinks he hath a better taste of your depths, than can be defined in the most sober prose, or painted in the most luxuriant verse.

BUT, Sir, it is for your health and delight, sometimes to relax the profounder studies, and to take a recreating prospect for the view of our wandrings, even then, when the best of our apprehensions do seem to you no better, than poetry and ceremonies.

So does the philosophical poet advise you,

Suave mari magno, turbantibus æquora ventis,
E terrâ magnum alterius spectare laborem.
Sed nil dulcius est, benè quam munita tenere
Edita doctrinâ sapientum templa serenâ,
Despicere unde queas alios, passimque videre
Errare, atque viam palanteis quærere vitæ.

SIR, after all this preface, I would account for the ground I have to represent, how heat may be graduated by weights. And here I pray you permit me to be so poetical, as to indulge my sweet dream, till a ray of clearer reason and evidence shall awaken me. For some of us have neither heads nor purses to strengthen our discourses with full and proper experiments.

IN Feb. 1663, I noted the float hydrostatic to descend, as the heat of the water encreased, and to ascend in the proportion as it cooled. This I tried lately again, and more than once with like event. Then I guessed, that some peculiar figure of the float, or such more exact hydrostatick, as you have since bestowed on me, would note the degrees of heat more accurately, and perchance then best, when the poise is not of ☿, which may expand, and lose weight (for ought I know) in hot water.

AND although the graduation will not hold to the encrease of weight in all proportions of cold; yet thus we may discover, whether cold doth alleviate before it arrives to glaciation; and thence we may enquire, whether any glaciation doth alleviate to such proportion as may resemble the coincidence of extremes, when *penetrabile frigus adurit*.

AND I see by several of my own thermometers, that the glass-men are by you so well instructed to make the stems in equal proportions, that if we could name some degrees of heat by a certain weight, we might by the proportions of the glass make our discourses intelligible in mentioning, what degrees of cold our greatest frosts do produce.

THEN I thought, that if rain-water, as soon as it fell, might, by a single or double distillation, be brought to the same degree of purity and fluidity in several climates, and at differing seasons, thus the degrees of heat might be ascertained by weight, and the degrees of cold inferred by the equable proportions of a thermometer, that was regularly graduated for heat, *&c. &c.* Here I have not expressed my self fully, but you will apprehend my aims.

IF we can discourse of heat and cold in their several degrees, so as we may signify the same degree intelligibly, though it be by any compass or juncture of evidences; it is more than our forefathers have taught us to do hitherto.

SIR, I have some store of these adventures, but this is in present a sufficient interruption. You will bear with me, if I affirm, that one may find more philosophical demonstrations, and more liquid proofs of the generations and corruptions, and various alterations of very many things, in some vulgar trades, and manufactures, than I could gather out of numerous volumes of several good libraries.

LAST autumn I had leave to spend a whole day in observing the sweet chemistry of a lady, who is most perfect in the art of making marmalades, and conserving fruit in all their approved colours; and she hath taught me to confess the miracles of heat. It is sure the philosopher's stone, that can do and undo all things; and it is not in the power of orator, or poet, with ink and paper, in prose, or in verse, to lay down the process, how to make a good cawdle, posset, or pottage.

AND therefore, Sir, if you shall task me about fermentation, (as you seem to threaten) be pleased first to instruct me what operation there is in nature without fermentation, that I may single out my proper object; and be pleased to teach me the nature of gravity, before I take the balance in hand, to essay the statick laws.

SIR, I am not so much an enemy to posterity, as to expect your returns to such letters as these. Only if you shall please to give me your commands by our good friend Mr. *Oldenburg*, you shall see that I am such a zealous lover of your person and business, that I shall rather betray all mine own weakness, than forget to be very industriously,

Honourable Sir,

your most obedient servant,

J. BEAL.

Yeovill, July 13, 1666.

Honourable Sir,

I KNOW no other shelter from the apprehension of our horrid wars, but only by a more serious diversion to theology and philosophy; that the nearer the horrors do approach us, the more attentively we may indulge these retirements, in which you have liberally conferred on me my best philosophical entertainments. For these I have a grateful sense; but, since I am unable to make any return in the like kind, be pleased to permit me

me once more to trifle upon your methods. Of which I have yet ſomewhat to ſay to you, being encouraged, in that I do not diſcern, that you took any offence, when I ſo lately uſed more boldneſs towards you, than I durſt adventure towards any other perſon, of whatever complexion.

HERE I ſhall deliver my thoughts, in what order your writings, which are already abroad, and thoſe alſo, which are by you intended for the publick, ſhould lie.

AND firſt I muſt conſider, that what you have done, will never be undertaken again in the whole. Something perchance in time may be added to them; and much may be ſuperſtructed on them; and by parcels they will be recited and applied to other methods; to diſcourſes of all ſorts of mixed and compounded bodies; of vegetables; and of animals: but no man, that hath reaſonableneſs, or ſtrength enough to hold up in any credit, or reputation, for half an age, will ever attempt the ſame arguments again. And therefore I do earneſtly ſolicit, that you may ſee them publiſhed in ſuch manner, as may be fitted beſt both for libraries, in which they may be preſerved permanently; and alſo for the moſt expedite manual uſe, in readineſs at all times, and at hand both at home and for companions in our travels.

FOR all which purpoſes (in my opinion) it were very convenient, that all the parcels were abroad in quarto, and rather in thinner tomes, than in thicker; and I humbly offer my reaſons.

1. THAT bulk is not incongruous for libraries, and more men do find it eaſieſt, and handſomeſt for common uſe.

2. SUCH as have defective eyes; and thoſe alſo, who have the beſt, and moſt laſting ſight, being neither pore-blind, nor clear ſighted, for great diſtances, nor able to endure much light, nor yet much darkneſs, cannot with eaſe uſe great folio's; and are therefore conſtrained to cauſe the book-binders to ſubdivide them into thin and light volumes, that their hands may the better ſupport them to ſuch approaches of their eyes, as may afford the juſteſt proportions of light and ſhadows, as beſt agrees with their ſight.

3. IN ſuch thin volumes, and of that moderate bulk (in quarto) every man may ſort them in a method more agreeable to his own humour and concernments.

4. THAT bulk is fitteſt for the cuts, which ſhould not be in folds, which are ſoon worn out, and are ſubject to many miſchances; but ſhould be in pages, as many as are neceſſary.

5. AND we ſhould have the more care of all accommodations, becauſe of the great difference between experimental philoſophy, and that which is looſely notional. For ſuch writings may be only ſkimmed over, as with the glance of the eye, and one reading may ſuffice for all: but theſe do require a frequent and aſſiduous review, and a kind of incubation, as for innumerable applications, for remoter diſcoveries, and for ſeaſonable inventions upon all imaginable occaſions. And certainly, if a mere liſt of experiments were only ſet down in a naked, but full narrative, a ſmall volume might ſuggeſt for ſerious, and long induſtry; ſince, every marginal reference might advertiſe of a freſh method by union, parallel, graduation, limitation, and thouſands of other inferences, whereof ſome might prove of comprehenſive and pregnant importances. And a liſt of experiments well choſen will hold out againſt all times, as firmly, as any of *Euclid*'s propoſitions.

SIR, the marginal remark is to ſignify, how you may make an hundred experiments ſerve for a thouſand uſes, and eſcape all oppoſitions.

AND now the method, which I do ſoftly and tenderly propoſe, is as followeth.

1. USEFULNESS may be firſt, or laſt, or both. It may be firſt, becauſe in all practical tractates, the end ſhould give the firſt encouragements and directions; and herein you have particulariſed, explicated, appropriated and exemplified thoſe fair encouragements, and affectionate directions, which my lord *Bacon* had in a wide and ſpacious generality eſſayed, or conjecturally propoſed. And then the uſefulneſs will hold on a good claim to the laſt place, or as long as, by our progreſs in philoſophy, we may hope to raiſe any accommodable inventions.

2. OF the Phyſiological Eſſays; the introduction, and the two treatiſes of unſucceſsfulneſs, as preliminary to inſtruct the accurateneſs of experimental obſervations and ſpecifics.

3. THE Origin of Forms and Qualities, which, if in quarto, and in ſuch a cloſe print, as the Phyſiological Eſſays, will make no large ſeparation between thoſe eſſays, and the eſſays of Heat and Flame, which ſhould next ſucceed. For theſe Phyſiological Eſſays do fitly preface for much caution, and frequent examination of the ticklish operations of fire.

4. HEAT, which is uſually reputed the firſt of the four primary qualities, and is the briſkeſt agent in all motions of generation, corruption, and alteration; and flame, which carries the reputation of the firſt element, as in motion, and upon the very wing for aſcent, do deſerve to lead the reſt, whether qualities, or elements, as they are called.

5. THERMOMETERS, and cold, with the appendages, do claim to ſucceed heat, and to be put into the ſiniſter balance to counterpoiſe the ſwift motion of heat. This in a ſecond edition ſhould be in quarto, and the additions inſerted in their due places, Dr. *Merret*'s diſcourſe being united for a double teſtimony to ſome particulars.

6. HERE ſhould be fluidity and firmneſs, as making up the four primary qualities of old account, not omitting the main of the preface for the ſolicitation of a good correſpondence between the corpuſcularians and chemiſts, and what elſe you have as appendage to the experiments upon ſalt petre.

7. COLOUR

7. COLOUR and light may lead the qualities more eſpecially attributed to the ſenſes, the ſight being reputed the nobleſt ſenſe, and light a noble nature.

8. HERE whatever elſe you ſhall publiſh of ſubordinate Forms, or of ſecondary Qualities, either according to the order of the ſenſes, or as otherwiſe you find the gradual information (whether manifeſt, or occult) better inſtructive. But I ſhould refer it to your own only judgment to place theſe. For who can better order them, than he, that can ſo fully diſcover their natures? The peripateticks, by their diſagreeing and clouded notions of mixtions, have put themſelves into ſuch confuſions, that it gave *Wendeline* juſt cauſe to ſay, *Quot phyſicorum ſyſtematum ſunt ſcriptores, tot ferè de ordine qualitatum corporis naturalis ſunt ſententiæ.* Some excluding all qualities from the general affections of bodies natural, therein following *Ariſtotle in libris acroamaticis.* Others aſſuming tangibles, viſibles, and audibles, as the common affections of natural bodies; and referring the objects of odour and guſt to the mixture of their four elements, not to the elements themſelves, nor to the celeſtial bodies, ſay they. As far as I can dive into theſe matters, to me you ſeem to have gone through the hardeſt parts already, and to have cleared the way for the reſt. For ſounds do ſucceed colours, and odours ſounds; then taſtes, and laſt of all tangibles. And perchance the difficulties and intricacies of their natures are more or leſs, according to this order; ſounds having a difficulty next to colours and the tangible qualities, which belong to the loweſt, and dulleſt ſenſe of touch (at leaſt the remaining and ſecondary order of them) being not hard to be explicated. For, ſince you have provided us a liquid and ample account of the four chief of tangibles, heat, cold, fluidity, firmneſs, we have hereby a good foundation to be better acquainted with that, which they call hardneſs, or the ſtrength or ſtiffneſs of conſiſtence, and with the contrary ſoftneſs; with lentor or toughneſs, and friability; and then the remaining qualities, denſity, and rarity; craſſitude, and tenuity; aridity, and lubricity; aſperity, and levity, or ſmoothneſs, have in their notions no abſtruſeneſs, their natures apparently conſiſting in the inequalities, location, ſituation, adheſion, firmneſs, or contexture of parts, as they are ſevered united, mixed, or abated more or leſs. But to find the operations, which do beget theſe qualities or poſitions in ſeveral mixtures, and which properly belongs to our practical philoſophy, it will require a portion of your ſtrength and light to guide us in it. And if it ſhall pleaſe you to make ſome entrance in this place, to give us the proper motion and vehicle, which carries and embodies ſounds, odours, and taſtes, we ſhould think it reaſonable, that you refer many of the abſtruſities of theſe to the argument of ſenſation, which ſhould follow after the account of vegetation.

To give my reaſon, why I do here place heat, cold, fluidity, firmneſs, which are reputed tangible qualities, before colour and other objects of the nobler ſenſes, and leave other tangible qualities to be ranged after theſe, I ſhall ſay,

1. I DO herein ſubmit and comply with the expectation of ſuch, as do require an account of their four elements, before qualities. For in theſe tractates, as by you they are handled, thoſe men may find more ſatisfaction concerning their elements, than in all their volumes of notional Philoſophy. And in a due ſeaſon, they will be ſhewed the emptineſs and fruitleſneſs of all former undertakings in philoſophy.

2. HERE was the fitteſt place, and the fulleſt arguments to refute their prejudices, and trifling conceits, concerning ſenſible qualities, which are by demonſtrations of reaſon refuted in your Origin of Forms and Qualities; and in the following tracts more particularly diſcharged, as by manifold demonſtrations of matter of fact.

THIRDLY, and chiefly, we have hereby a more regular opportunity to conſider theſe qualities, according to their true and real natures, and the motions of thoſe particles, by which the ſenſes are affected. And (to ſay it rudely and bluntly) no ſenſe is otherwiſe affected than by touch, as the ſmart of the eye, and the tearing of the ear, as well as the haut gouſt to the noſe and palate, does ſometimes teſtify. Thus much for defence of the method, which I have propoſed for the notion of qualities; but I do more willingly refer it to your own advice.

10. IN the tenth place we ſtand in great want of your explication of gravity. Of which I have not ſeen any hypotheſis, which accounts for all the phænomena, which are obvious. This, if I can obtain leiſure from my importunate engagements in theology, I may chance to repreſent to you more at large, as only to point out where I find the perplexities. To provoke you to this taſk, I will only entreat you to look back upon your works recited, and ſee in what coherence you have given us the firſt view, that ever mankind had of the general body of phyſiology, all publiſhed already, excepting only the account of ſecondary Qualities, which are in your hands. I may add, that we have been diſciplined and accuſtomed to look for the tractate of gravity amongſt the qualities. But I urge it more eſpecially, becauſe it will unite and link together many other of your moſt elaborate works to the forementioned. And perchance it is the very poiſe, which makes the balance dance, or conſtrains the motion in all natural operations. And alſo I conceive it may receive ſome conſiderable aſſiſtance towards the diſcovery of it, from the hydroſtaticks, becauſe the tendency, and agency, as well for motion, as for reſt, (if there be any ſuch thing as reſt in this world) and the co-operation and the reſiſtance of bodies in their ſeveral degrees of gravity, may better be diſcerned in the more viſible fluids, than in the air, which is inviſible. And

And this poiſe or gravity ſeems to me to lead us into many very large enquiries, both relating in general to the whole ſyſtem of the world, and to many productions in mixtures, and perchance may equally pertain to the mechanical, corpuſcularian, and chemical branches of philoſophy; and to your diſcourſe of Magnetiſms.

11. THE eleventh or next place is due to the Hydroſtaticks.

12. THEN your copious phyſico-mechanical Experiments, which do ſeem to perambulate over the moſt ſpacious fields of nature, and to penetrate into her receſſes and labyrinths. And very happily hath the air (which the poets attributed to their proud queen *Juno*, Βοῶπις πότνια Ἥρη) obtained to be the firſt great body, or elementary maſs, that is ſo accurately examined by your incomparable and moſt inquiſitive induſtry.

AND here your adverſaries will have the honour to be commemorated in your ſeveral vindications and appendages.

13. AFTER all your phyſico-mechanicals, I ſhould allot this remoter place to your ſceptical Chemiſt, which others (I believe) would place next to the Origin of Forms: but I have already rendered my reaſons, why thoſe treatiſes ſhould not be disjointed, or interrupted: and furthermore thoſe chemical principles have not been ſo generally received in our publick ſchools and univerſities, nor do carry ſo high eſtimation in current antiquities, as may claim a ſuperior place, than is here allowed them.

14. AND hereunto may be adjoined the Sceptical Naturaliſt, or the Account of the Imperfections of natural Philoſophy, as we yet have it. Although yourſelf will not only ſurvive, but accompliſh the refutation of that diſcourſe.

15. AND then you have a due place for improbable truths.

16. OUR next care would be due to our mother the earth, *tellus mater omnium*, ſaith *Varro*. And here alſo you are beſt able to give us directions to find out the changes, rules, and ferments of the earth for fertility and agriculture. And the treaſures of minerals and medicines, that are locked up, as jewels in the rocks are laid deep in the bowels of the earth; and good directions may be more than a guide on the way for all future diſcoveries. I ſee rags, leather, metals, all things, that are caſt out upon the face of the earth, in time reſolve to earth, and then to invigorate liquids to aſpire into all the flouriſhing beauties of the fields, and gardens. This travail of ſpirits will bring us to the golden branch, which will be a wand to ſecure our walks through the Elyſian groves: and this part of beautiful philoſophy is not neglected, but plentifully cultivated by many hands, and in a fair progreſs towards perfection in time.

AND I have in my late letters mentioned to you a brief manuſcript, which I had from Mr. *Hartlib*, *De cognoſcendis ſine duce herbis*. Probably it may be in your hands, and I wiſh you would take the trouble upon yourſelf to employ ſome well-willer (a vacant academician) to tranſlate it into Engliſh, and then to beſtow it upon the publick, with a preface of your own; and there you might find opportunities, where you pleaſed, to exemplify what you have written of colours and other qualities in that general phyſiology. And this is as the application of the alphabet to reading and learning of words and ſentences. Here, in a little, much (and perchance enough) may be ſoon done. For though old philoſophy wandered far out of the way in notions, yet when they deſcended to particulars, they did not do nothing. Here you can more cloſely diſcriminate ſpirits and juices by their ſeveral indications, and call for the proper uſe of the microſcope to diſcover the contextures proper for ſeveral kinds of vegetation. But this you have done already by Mr. *Hook*, who can never get leave to take off his hand from that work, if ingenious men can prevail with him.

18. AND this leads me to the account of the ſenſible plant given by Dr. *Clark*, and Mr. *Hook*; and from thence by a gradual aſcent from vegetables by Zoophytes to be prepared for.

19. YOUR two Eſſays concerning the concealments and diſguiſes of the Seeds of living Creatures.

20. AND here, if you in that way can teach us to apprehend ſenſation, it will be more obliging than all, that *Ariſtotle* and many modern writers have elaborated, *De animalibus*, or *De piſcibus*, though neither the old induſtry, or the later additions in theſe points be contemptible, but not in their kind admirable.

21. BUT I had rather ſee the Anatomy of Animals by your inſtructions undertaken and publiſhed in effigy with good cuts, than all the outſides alone. Of this I have ſuggeſted ſomething more particularly to Mr. *Oldenburg*, and intended for your ear by his favour and not for a trouble to your eyes: there I do urge reaſons, why this work ſhould be begun upon dogs, and to what ſpecial purpoſes.

SIR, your firſt pardon begot all this confidence; and ſurely you will dive ſo far into my boſom, and heart, as to call it the licence of ſincere reſpects, and affections. Only I can plead, that no part of this is contradictory to the former. But as in the former I conſulted for your own eaſe; ſo here I ſolicit mine own and univerſal accommodations, which ſeem to make up but one trifling motion, that your works may be printed all in quarto, as being a bulk more conducible to preſerve them all entire ſafe, and for frequent uſe to poſterity. Neither does this exclude or diſcourage the fineſt prints for the pocket.

SIR, I do always pray for the beſt of bleſſings to encourage your great example for a ſtronger influence in a diſſolute age, and I preſent my moſt humble ſervice to the excellent viſcounteſs *Ranelagh*, and to her generous daughter.

Sir, your moſt affectionate ſervant,

J. BEAL.

SIR,

Yeovill, July 30, 1666.

SIR,

I HAVE need to hasten these to deprecate for my last unluckiness. For now I apprehend, that I stumbled at the threshold; which was a fit omen for one, that puts his sickle into another's harvest.

SURELY your Sceptical Chemist should immediately follow your first introduction; and take up the place, which the scholars do give to their *tria principia*, which do hold us in thick darkness for a large tract of their initiating volumes. Here in many rich experiments you give a very substantial account of the manifold guises of their first matter (perchance as far as really it can be represented, or pretended) you examine all claims to principles, or elements of a fixed number, and give us a clear view of *Mistion*, both in general, and in leading particulars, and shew us how to search the originals of all materials to the utmost extent of their capacities.

AND perchance to this you will think fit to adjoin your Sceptical Naturalist, which is not yet abroad.

AND then to place the two discourses of Unsuccessfulness, because they warn us of an extraordinary accurateness necessary to distinguish some simples of like resemblances; and of the strictest manner, and measure, and order of operations.

AFTER these difficulties, and obstructions thoroughly by you noted, the Origin of Forms and Qualities will break forth, with a more positive, explicit, and refreshing splendor; and call on the rest to add gradually more rays, as by a continual advancement with fresh examples, and further demonstrations.

SIR, I could not thank you for your statical baroscope in my last, for I had not then seen it. But now I may take the blush upon myself, for that although you had done it long before I did solicit you for it, yet perchance you yielded to the immodesty of my importunity, in publishing it amongst fragments apart.

YET I think I may excuse myself, and defend your condescensions, if in such leading and pregnant inventions, you suffer yourself to be provoked both to scatter them by parcels, and do also conserve them in the main body of your full discourses. For by this time you have only begun philosophy to the world; but you are now concerned to carry the stream, and to overlook what progress others can attempt upon the aids, that you have so amply administered.

THIS oeconomy we may learn from our most clangorous enemies the Jesuits, who (by these arts of dressing for the pocket in fine prints the grossest errors) can cast a mist to blind the eyes of many wise and subtil persons, and obstruct the brightest rays of heavenly truths. In a good cause we should try the success of the same arts.

AND truly I am confident, that by your philosophy you have converted the very Jesuits to make some recompence for the destruction they have so long made of mankind; that by their universal commerce, incessant industry, and bottomless purses, we may receive useful intelligence, and experimental informations from all parts of the world. This comes into my mind, more especially upon the reading of philosophical Transactions, num. 14. p. 249, the fifth paragraph, which begets in me the wish, and hope, that the Jesuits (who are said to have their residence in *China*) would give us the translations of their chief books (old and new) of simples, herbs, plants, stones, of medicine, chemistry, *&c.* For it is like they may signify some other things than ours do, which follow uncertain traditions for the most part. Some of them have obliged us from *America*, and the like, or more they may do from *China*, as your example does guide, instruct, and entice them in considerable citations.

SIR, after all this adventure, I must not be afraid to tell you, that you owe us another clause upon your statical baroscope. For here you escape *Hobbes* and *Linus*, and can excel yourself in calculating the weight, and ascent of the air (and mixtures perchance) at another certainty, than by the other way.

HOWEVER, this is my strange way of begging pardon for my former faults. He must be a dull man, that can forbear it.

SIR, it is almost time, that you should be altogether free from the manacles and fetters of stiff methods, and should take the liberty of the bee, to pick and choose (at your own pleasure) from all the flowers of paradise. And you have already not only formed the cells sufficiently, but you have also filled them. But that is not a work, that is to be perfectly completed in this age or in this world. And therefore, since the whole is unfeasible, you have the more obliged us, by conducting us through the most necessary, the most substantial, and the most useful parts of it; such as afford us the safest delight, and the kindest entertainment. And every man thinks he could wish you more ease, and freedom, if once you had rid your hands of your own papers. But I doubt their wishes would covenant for impossibilities; for ever-flowing streams are not easily emptied; and your additions may not out-run the speed of your amanuenses. But I had rather stop your course, than drive you on, because I wish you firm health, and long days.

AND to invite you to refresh yourself upon your own writings, which may both increase your margins, and preserve you from a worse waste of time upon others wandrings, I must conclude these with a story. *Jul. Scaliger* extols *John Suisset* calculator (as he was denominated) for the sharpest, the profoundest, and the most elaborate writer, that ever the sun beheld. And they say of him, that in the decay of his age, when he would have reviewed his divine works, he fell a weeping excessively, because he was not able to understand what himself had written.

SIR,

SIR, I do not threaten you with this judgment; for you wrote light, and he wrote darkneſs. But if you do not keep your eye frequently upon your own margins, you may live to find the perfections of grey hairs, which do ſometimes ſteal our own labours and inventions out of our memory: and who elſe will put you in mind of this?

SIR, I do heartily pray for you, and the ever honourable viſcounteſs *Renelagh*.

Your moſt humble ſervant,

J. BEAL.

SIR, Mr. *Glanvill* wrote to me, that one Dr. *Harmar* had a good Latin pen, and an eaſy inclination to tranſlate into Latin, that Origin of Forms, *&c.* or Hydroſtaticks, or both; I know no more of the man, or of the maſter. This I was deſired to ſay to you.

Auguſt 10, 1666.

SIR,

LEST you ſhould be deterred by the bulk of the annexed, I may premiſe thus much of recommendations.

THE argument is noble, and both requires and highly deſerves your own advice in the proſecution of it.

THE recited examples are beyond all that I have read or heard of, in any age; yet we have been in a manner eye witneſſes to the truth, conduct, and effectualneſs, ſome the moſt dangerous, others the moſt obliging, all very inſtructive, and no leſs conſiderable. And you are perſonally, or (at leaſt) affectionately concerned to make the application.

I HAD preſented it in a better hand (which had alſo afforded the opportunity of a more chaſtiſed ſtile) if I durſt admit an amanuenſis to ſee my boldneſs, or to pry into the deſigns. And here I make promiſe, that I will give you no more troubles in theſe matters.

Honourable Sir,

your moſt humble ſervant,

J. BEAL.

SIR, if you think fit, Mr. *Oldenburg* can make the whole, or any part more legible.

Incloſed in the preceding.

SIR, Aug. 10, 1666.

I DO not forget, that you have rendered ſufficient reaſons againſt the preſumptuous affectation of methods, and haſty ſyſtems; yet we ſhould alſo take notice of your conceſſions in your Procemial Eſſay, pag. 5. and 6. that there is a uſefulneſs and a ſeaſon for ſyſtems. And certainly, when ſtore of good materials are collected (be it of cement, ſtone, timber, and metals) it will have more uſefulneſs, ornament, and ſtrength, if ſkilfully ordered into a fit building, than in a confuſed heap. Order gives facility, and luſtre to every buſineſs. And this may plead for my laſt officiouſneſs.

BUT now I have, with a like freedom, further to ſhew you, that you have performed the hardeſt taſks in philoſophy, and yet you omit, and perchance neglect to reap for yourſelf, and to ſolicit for others, the main benefit and application: Or (to deliver my thoughts in a reſemblance not altogether improper) you have found out the polar uſes of the loadſtone, and the aſſiſtances it offers for navigation; but you have not applied it to diſcover the other world, and to fetch hither the ſilver of *Potoſi* and the gold of *Peru*. This my boldneſs you will the better bear, if you can have patience to receive my explications; and then I hope I ſhall not moleſt you in this kind any more.

WE do ſometimes look about us, and take a proſpect upon the times paſt, that from thence we may deduce a conjecture at the times to come. When we ſee what events have followed; what the cauſes; what conduct hath failed; and what hath ſucceeded; we may thence take the more likely guidance for the preſent, and may be the better aſſured of the future.

UPON this note, I will firſt call to memory, that when I firſt entered into *Cambridge*, the Ramiſts were in ſuch great eſteem, that we gave very high rates for ſuch of them as began to be out of print; but within three or four years they fell ſo low in credit, that we might buy them at the rate of tainted fiſh, or *Iriſh* beef; ſhops full in *Cambridge*, and cartloads in *Sturbridge* fair, at one penny per pound. This fell out without the ſolicitation of any party or faction, or other concernment, merely by the prevalence of ſolid truth, and reaſonable diſcourſes. This may ſhew us, that ſome truths are of ſuch worth in their native ſplendor, that they have no need of other dowry. And to this (for our preſent comfort) I may farther add, the infinite or vaſt difference of luſtre, which this experimental philoſophy gives in all (and thoſe innumerable) branches of it, much more alluring than all former diſcoveries, which indeed were but notional and fantaſtical.

SOON after, the ſame fate befel Calviniſm, in both our univerſities, and yet that claimed the title of Holy Oracles; the uncontroulable myſtery. It was defended by the flouriſh of invincible chairmen, *Collins*, *Prideaux*; by ſwarms of writers, and diſputants, the noiſe of pulpits, all pretences of zeal, and the juncture of many foreign, and national correſpondencies. Yet in a ſhort time theſe painted oracles were reputed no better than the horrid riddles of Sphynx, or groſſer blaſphemies. And as the Delphian Oracle, at the firſt appearance of our Saviour's Aurora, ſhrunk from his tripodes, and ſtole to the cottages of trivial witches; ſo did this new doctrine deſert the throne and chairs of the univerſities upon the reſtoration of better antiquities;

antiquities; and hide itſelf in the ſmoke and ſmother of plebeian pulpits.

IF you permit me the boldneſs of my reflections upon theſe two changes; even in thoſe my younger days, theſe Ramiſtical dichotomies ſeemed to me like a taylor's ſhears, cutting all our beſt cloth into ſhreds, or rags; and the Calvinian doctors, dancing in the circles of their nimble diſtinctions, were as ridiculous, as the maid-morrian and hobby-horſe in a morrice dance.

AND, though thoſe latter did put a countenance of gravity on it, for a while, and maſked their riddles under a vizor of devotion, yet when they found, that the younger ſtudents (ſuch as were ſcarcely graduated) did by the aid of ſtronger arguments, and by the advantage of true and authentick antiquities, ſo far excel the whiffling doctors in their lectures and diſputations, the elder men grew pale at it, and the elder truth prevailed. I ſaw thoſe old and rotten ſtandards ſo often fallen by the ſharper hatchets of the youngeſt graduates, that it may direct and admoniſh us, not to deſpiſe to furniſh our younger and ſwiftly growing academicians, with the ſtore of your well tried weapons; and I am confident, that thoſe froward and diſingenious medlers, who do reſiſt and reproach the light, would ſoon be convinced, that they fight againſt themſelves, and all their own ſenſes, and do pull out their own eyes, as oft as their tongues do wag againſt your experiments.

SIR, here I would ſoftly inſinuate into your ear, that we are not ripe for theſe ſucceſſes, nor can have juſt ground of expectations, till you ſhall pleaſe to draw forth your experiments and obſervations into hypotheſis, ſuch as they do fairly bear, and unite them as far as they give mutual ſtrength, and light, and aſſiſtance. For though it be good to learn firſt to ſpell well, yet we muſt not leave off there, nor reſt there too long. And I cannot diſcern a reaſon, why you ſhould continue ſo ſhy of advancing to ſome poſitiveneſs, after ſo large a view of ſo many experiments, and ſuch mature experience; and without a ſeries of ſome propoſitions, and ſome ſyſtems, it is impoſſible to carry a ſtrong vogue in our univerſities; who, when they ſee the neceſſity of experimental demonſtrations for their conqueſt (even in language and diſputations) will ſoon and gladly exchange their impertinent volumes, for quadrants, rulers, alembics, and curious ſcales, *&c.* And thus diligent ſtudents might be enabled both to underſtand ſomething aright, and to do ſomething. And thus you draw both the univerſities to your aid.

MY next note will point out the conduct, which never failed either of ſucceſs, or of diſpatch.

I HAVE formerly hinted unto you, how the Roman ſeminaries, and eſpecially the Jeſuits, do infatuate the world, as well by their ſhort manuals, as by their endleſs volumes; yea much more by their breviaries, than by their tomes: by the grandeur of their volumes they overwhelm or amaze them, that have leiſure to dwell in their tents; but by their ſingle ſheets they catch him that runneth by. By theſe they have an opportunity upon every man's moments of leiſure; theſe are the ſhort daggers, which ſtab to death in every corner of darkneſs. The ſhorter and more ſevered they are, the more are they like wedges to cleave the ſimple proteſtant into ſhivers, according to the proverb, *divide & impera.* And every ſingle dart pierceth deeper than a bundle; and thus every man may be ſingled out, and taken in his own humour. And thus the chief artiſts amongſt our ſectaries (for they are ſore wedges alſo) could cleave us with their inviſible darts.

BUT I never ſaw this ſtratagem, or ambuſh, more effectually managed, than by the Socinians, who, when their name was odious to all the world, magiſtrates, and miniſters, and all men armed againſt them, and enraged; when they might ſay, they had neither holes, as foxes have, nor neſts, as birds; neither college, nor glebe, nor revenues, nor ſhelter, but a mere connivance for a time in *Cracow*, and that alſo merely upon a deſign of ſtate, to quell ſome ecſtatic Anti-trinitarians by the Socinian more ſober pretence to ſtricter reaſon. Yet in all theſe diſtreſſes, and exigencies, by the few or ſingle ſheets of their brief manuals, as with poniards, they fell upon all parties, without noiſe, vapour, challenge, or quarrel; they ſingled out the ſtrongeſt and moſt famous Jeſuits, and, as if they had learned the Ovidian verſe, *Medææ Medæa forem*, they charmed the witch, and purſued them, and almoſt undermined them in all their coverts. I can look on them only as a bee faſtened on the noſe of a bear; yet I cannot but eſteem them, as the only viſible agents, that in time may divide the Jeſuits amongſt themſelves; for I ſee, that all the ſubtileſt Jeſuits, that I know, have taken up a doſe of their infuſions, even whilſt they rail openly at them; and I dare affirm, that they do perplex them more than all the Janſeniſts, which have the beſt of the old Roman pretences, ſo many ſwarms, colleges, revenues, and parties, to back them. And we ſee they have laid their hot irons in all parts of *Germany*, got many of the Remonſtrants in the Low Countries into their party, and there have their fair printers, and learned advocates, antiquaries, every thing.

CERTAINLY, I ſaw, how the Socinian ſhreds eſcaped the moſt watchful eye, and the ſevereſt ſearch of the acute arch-biſhop Laud, and did, at the ſame time creep into the pockets and boſoms of his moſt intruſted chaplains, and (every where) of ſuch ſecretaries of ſtate, as had learning. Of this I know more than will be eaſily believed.

TO leave this odious example (and yet we ſhould not diſdain to learn of our ſharpeſt enemies) I can ſhew it with more unblameable luſtre in the ſucceſſes of *Eraſmus*, whom I take to have written the moſt and the beſt, that ever man wrote; yet almoſt all were firſt ſent abroad in very few ſheets, or ſmall enchiridions,

ons, and did infinite good all over the Chriſtian world, to allay the furies of that age, and for the general reſtoration of literature, conſiderable antiquities, and holy truth. To inſiſt on this inſtance more explicitly, and more particularly. If *Varro*, amongſt the Gentiles, and *Origen*, amongſt Chriſtians, wrote more than *Eraſmus* did, yet the remains of *Eraſmus* amounted to ten tomes of large and full folios in a pretty cloſe print, as himſelf collected them, or computed them eleven years before he died; beſides that many of his beſt approved compoſitions were loſt by fraud or negligence, as himſelf then complained; and he ſays himſelf had burnt ſuch of his letters, as he could recover, which were then almoſt two cart loads. *Epiſtolarum tantum ſcripſimus, & hodie ſcribimus, ut oneri ferendo vix duo plauſtra paria ſint futura: ipſe multas caſu nactus exuſſi, nam ſenſi ſervari a compluribus.* But a full tome of his letters have eſcaped, and do remain a monument, not only of the glory due to that man, but alſo of the glory due to the princes and potentates of that late age. For there we find it amply recorded, and ſpecified, how freely, and familiarly, and ingenuouſly, this man of plebeian birth, and of very ſlender fortunes (as himſelf would have it) held for many years, even for almoſt half an age, as it were weekly correſpondence with all the popes, emperors, kings, cardinals, princes, miniſters of ſtate, minions of fortune, and with all the eminently learned, with ſuch unbiaſſed ſincerity, as if he ſcorned all intereſts, and diſdained to glance a ſmiling eye upon ſecular greatneſs.

THIS man with great judgment gave us the choiceſt of Grecian and Roman antiquities, for all the ornaments and uſes of philology, morality, and true theology: reſtored the beſt of the Gentiles, as well as of Chriſtian fathers, to themſelves, recovering them from duſt, worms, and worſe-defacing-ſcribes, into the light of the faireſt impreſſions; and with his ſmart apologies, ſmiling reprehenſions, and healing laſhes, conſtrained all the neſts of lazy monks, as well as the ſwarms of overbuſy ſectaries, to attend to a ſerious reformation, as well of literature and manners, as of faith and notions. We ſee, how ſeverely he inſtituted the lives of princes, diſſuaded their raſh wars, rebuked the inſolence of prelates, detected the hypocriſy of indulgences, fiſh-devotion, and plundering beggary. Laſtly, we ſee, how ſtoutly, on the one hand, he confuted the fopperies of the Roman friers, and, on the other hand ſtrangled the confidences of *Luther* and his followers, his *ſervum arbitrium, effete faith, &c.*

SIR, he deſerves our records, and eulogies for this peculiar remark, that in all his immenſe volumes he did not let fall one line in applauſe, or in defence of thoſe notional phyſico-logics, which are now exterminated by the brightneſs of your experiments. Neither was it poſſible, that he could have done ſo much, and ſo well, if he had ſuffered himſelf to be ſeduced out of his way by that *ignis fatuus.*

AND yet (more to our purpoſe) we may remark, by what expedients he became ſo voluminous, and by what conduct ſo effectual: truly by flying all abroad in ſmall parcels, almoſt in ſingle ſheets. And this was the only poſſible way to write and publiſh ſo much, and yet to live ſo long. Yet his age was not great, and that was interrupted and contracted by the two horrid tormentors, the gout and the ſtone.

SIR, if you caſt your eye upon his own catalogues, either that which he collected at the requeſt of Dr. *Botzheme*, Cal. Feb. 1524; or that which he ſent to *Hector Boetius*, the Scotſman, not long before his death (he died July 11, 1536) you will there ſee, that generally a dozen or a ſcore (ſometimes half a hundred of his printed books) make not ſo much in bulk as ſome one of your elaborate volumes; beſides that his writings are for the moſt part extracts, or ſpun out of the workings of his own ſpirits, or deſcants upon others writings; your's are coſtly, laborious, and ſearching experiments, all of freſh inventions.

HERE you may behold the odd cauſe *Naudæus* had to enroll this voluminous man amongſt them, that have acquired the greateſt ſplendor, and glory, by ſmalleſt enchiridia, and gives him amongſt others the eulogy of *Cornelius Gallus:*

Nec minus eſt nobis per pauca volumina famæ,
Quam quos nulla ſatis bibliotheca capit.

He deſigned and ſent out ſmall parcels, and time and opportunities made them large and many.

THE biggeſt of *Eraſmus*'s volumes are his Adagies, and his Notes on the New Teſtament, and his Paraphraſe, as big as the former; yet theſe did abundantly oblige, and inſtruct, as they were firſt ſpread all abroad in ſmall parcels, the Adagies ſtill encreaſing as faſt as the former editions were ſold off.

ERASMUS perſonates an objection againſt himſelf, and provides you an anſwer, if henceforth you ſhall think fit to embrace his example.

Porro quod quereris exhauriri loculos, quod eundem librum cogaris identidem emere, ita rationem apud te ineas. Finge nunc primum prodiiſſe proverbiorum opus, ac me protinus ab opere vulgato mortem oppetiiſſe. Num futurum eſſet, ut te pœniteret impendii? —Jam & illud mihi finge, me poſt annos aliquot reviviſcere, ſimulque opus idem mecum renaſci melius, ac locupletius, utrum deplorares diſpendium, an ſimul & amico, & amici monumento gratulareris! Jam ſcio quid dicas, redivivo quidem gratularer, at non eſt quod fingis. Utrum igitur tu judicas felicius, a morte reviviſcere, an non mori? Si gratulareris redivivo, multo magis gratulare ſuperſtiti. Poſtremo, ſi poſtrema editio nihil habet novo pretio dignum, liberum eſt non emere; ſi habet, lucrum eſt, non diſpendium. Si prior editio fructum attulit tantilla pecunia dignum, & ſi poſterior idem facit, nimirum auctus es gemino lucro, non mulctatus es damno. Imo quemadmodum ipſi hoc ſemper agimus, dum vivimus, ut nobis ipſis reddamur meliores, ita non prius deſinemus noſtras lucubrationes

nes elimatiores, ac locupletiores reddere, quam deſinemus vivere. This is the laſt part of a juſt and full anſwer.

AND he adds, *Quanquam ipſe jam dudum ingenue faſſus ſum me hic indiligentiorem eſſe, quam par eſt, ſed interim alii meâ ſententiâ gravius peccant, qui cum ſint longe doctiores, ſuperſtitione quadam aut nihil edunt, aut ſero.*

SIR, this great example had the ſucceſs to prevail againſt all the national factions in the Chriſtian world, to rouſe up all the idle friers, and to make way for ingenuous literature and truth. And it is apparent, that all the good, that the Jeſuits have, they had it from *Eraſmus.* By him they retained more truth from the Greek fathers, and their doctrines, than from the later ſchool-men, or from *Auſtin* himſelf, or any of the later Romans, or their many orders: and the wiſeſt and learnedeſt of proteſtants do make the ſame acknowledgments for themſelves. See his *Hyperaſpiſtæ.*

Now I crave leave to open the benefits of this kind of conduct, and the reaſons of the ſucceſs, applied promiſcuouſly to all, that is above ſaid.

1. IT is the ſweeteſt entertainment of life, and both a ſpur and a refreſhment to human induſtry, if we give ſpeedy vent to our freſheſt diſcoveries, which will drive on the pen with a grateful impetuoſity, and it will ſomewhat regratify our ſpirits to ſee the ſpeedy reception amongſt the ingenuous.

2. THAT every piece becomes more perfect, as being examined in ſmall parts; and a diamond is eaſier poliſhed, than a rock.

3. AND thus alſo it is made more perfect by the reſults taken upon all other judgments, and by gradual increaſes: the diamond thus grows more ſolid by the aſſiduous increaſe of diſtillations in ſuch leiſure, as may beſt receive firmeſt induration from the ambient air, or penetrating ſteams.

4. IT is dangerous to health, nor can any mortal long hold out to fill up ſuch large and elaborate volumes, as you have already publiſhed, except he allows himſelf fit intervals, and forbears, till he be carried with the delight and impulſion of his own ſpirit.

5. SUCH due reſts do fill up the ſpirit, and make it more pregnant for the ſublimeſt and moſt excellent inventions.

6. IT is impoſſible, that we ſhould keep our memories firm for our own improvements, if by theſe ſtrong impreſſions, renewals, ruminations, and inculcations, they ſhould not be fortified.

7. THUS we may refreſh our latter days upon our younger delights, which lord *Bacon* recounts amongſt the ſpecial helps to longevity.

8. In all the heaps of miſguiding libraries, you can ſcarce find any other diverſion for your ſpirit, but will be confined to vent, renew, or complete your own. You have only *Des Cartes*, Lord *Bacon*'s good wiſhes, ſome few honeſt chemiſts, and modern diſcoveries in aſtronomy, anatomy, *&c.* What are all theſe, if compared with one St. *Auſtin* for bulk?

9. IF in ſmall volumes, many would lay hold on the opportunities, and could find the leiſure to tranſlate them into the elegancies of the modern languages, yourſelf ſurviving to be the judge and umpire, whether truly and faithfully tranſlated, and to procure their emendations.

10. EVERY man, that plants vines, or olives, takes delight to ſee the yearly growth of his plantations. You have planted groves of olives and vineyards in all climates. Can it diſpleaſe you, to ſee them proſper and flouriſh every where, and ſome of your own fruit gratefully preſented to you from all places, and their liquor in ſeveral ferments? You would ſoon find a conſtant and perpetual recourſe of all rivers to the ocean. The returns would outrun the ſun and moon.

AND this (as I told you at the beginning) is the due application of the loadſtone for *Potoſi* and *Peru.*

HENCE you will conſult, which of your works, that are publiſhed, are fit to be enlarged, which are compleated, and fit to be tranſlated, not only into Latin, but into the chief modern languages (at leaſt of our neighbourhood) French, Italian, German, Spaniſh; which of thoſe under your hand are fitteſt to go abroad in brief tracts, and in what order they ſhould be conſerved in your fuller tomes.

SIR, after this tedious induction, can you permit me to review your works with ſome reflections to this purpoſe?

THE beſt of Roman orators made uſe of one, that was once his ſlave, to criticiſe and to methodiſe his volumes. And *Eraſmus* made it his wiſh, *Optarem mihi tyronem quempiam fidum, qui hoc mihi vita defuncto præſtet, quod ille ſuo Ciceroni.*

SIR, to you I offer it (as he to his maſter) that you may ſee the danger of truſting to another's ordering of your writings; and that you may conſider the neceſſity of uſing your own judgment, whilſt it is in your power.

1. Into the firſt tome I would collect all your devotionals, that are merely ſuch; as Seraphic Love; the Stile of the Holy Scriptures; Occaſional Meditations, *&c.* whatſoever your ſabbatical meditations do produce. But (to ſay truth) your philoſophy, as far as it contemplates the ſyſtem or frame of the world, as the work of God's hand, and with purpoſe to give God the glory, is the office and liturgy of the old ſabbath, and ſhall be of the everlaſting ſabbath; and, agreeable to the ſong of the angels, as ſome of the ancient fathers have called the 104th pſalm. It is our ſhame, that we have ſo many controverſal books, and ſhallow deductions in the proteſtant churches, and ſo few, that are truly and ſolidly framed to compoſe our ſpirits for devotion, and to allay our diſtempers, and to beget in us the love of God, of our neighbours, a peaceable, contented, and quiet mind.

2. For the ſecond tome, your uſefulneſs already publiſhed is complete and full enough, and very fit to antidote philoſophers with the preliminary

preliminary demonſtration, or acknowledgment of the architectonical principle.

3. THE ſecond part of the ſecond ſection of Uſefulneſs, I hope, and believe, will make up a third tome.

4. THE Proœmial Eſſay, the Sceptical Chemiſt, the Sceptical Naturaliſt, the two Eſſays of Unſucceſsfulneſs, and the Diſcourſe of Improbable Truths, do ſeem proper to be annexed for a fourth tome. And of theſe, the Sceptical Naturaliſt, and Improbable Truths, may come abroad in ſeveral parcels apart, as to the purpoſe we have above ſolicited, in ſmall print.

5. THE Origin of Forms, and Qualities, and the Hiſtorical Dialogues concerning Heat and Flame, if you ſhall pleaſe to ſpecify freely out of your own proceſſes and collections, the ſeveral operations of Heat upon ſeveral objects, and in ſeveral degrees, and after ſeveral admiſſions of air, or intervals of time, and with applications of various kinds of menſtruums, will certainly complete a fifth tome.

6. THERMOMETERS, Hiſtory of Cold, Antiperiſtaſis, and other appendages, with the growing additions, will ſoon enlarge a ſixth tome.

7. THE Eſſays of Salt-petre, Fluidity, and Firmneſs, if you ſhall pleaſe to purſue their adjuncts, moiſture, petrification, and other kinds of induration, *&c.* may ſoon grow to a ſeventh tome.

8. HISTORY of Colours and Light will ſurely encreaſe upon your review; and, I believe, all the ingenious do deſire to ſee the reſt of your experiments on that argument, and the reſult of your judgment upon Mr. *Hook*'s Obſervations, 9th, 10th, and 36th Microgr. and applied in ſome particulars to vegetables, that at leaſt we may have ſome better account than of old, concerning the verdure of graſs, and moſt leaves; the various beauties of flowers, and the changes of fruit in the degrees of maturity, and in relation to ſmell, taſte, or other qualities. And truly (as I ſaid above) I cannot conceive, why you ſhould ſcruple to publiſh poſitively your own apprehenſions of the nature and cauſes of light, and all colours, ſimple, compound, and de-compounded: and it is pity, ſince you have gone ſo far in the main work, but that all, that pertains to viſion, ſhould lie together in one body by your choice and collections: this for the eighth tome.

9. YOUR ninth tome may take in whatſoever you ſhall pleaſe to confer more upon us concerning ſubordinate Forms, Sounds, Odors, *&c.* or other deductions from the figure, ſize, texture, motion, reſt, weight, or ſtate, or affections of matter in general, or in peculiar mixtures; and your notes about Occult Qualities. Here you have a fair field to appear abroad in many ſmall parcels; ſome of them taking up but a week, a fortnight, or a month of your time; and you know there are twelve months in a year for your encouragement.

10. THE Spring of the Air, and againſt *Hobbes* and *Hall*, make the tenth tome.

11. HYDROSTATICAL Paradoxes, and the Appendix Phyſico-Mechanical, make the eleventh tome.

12. WHAT directions you ſhall give us concerning mineral earths, compoſts, or impregnating earths, or ſalts; concerning vegetables, ſenſation, nutrition, or other animal faculties, anatomies, how much they may increaſe, I muſt leave it in the hands of God, and to time, and your opportunities. But here again is a threefold field, or rather paradiſe, for your entertainment in every broken month, and for ſmall parcels; and this may call to your remembrance, the diſguiſes of ſeeds, of living creatures, *&c.*

13. THE pandects, or promiſcuous experiments, do ſeem to promiſe a larger bulk than any of the other. And I would earneſtly diſſuade from publiſhing more than a century at a time; for all the reaſons above rendered, and more eſpecially for the immenſe extent of the importance of a ſmall number of theſe collections in the ſeverity of your choice; and they may eaſily overwhelm an ordinary induſtry, and confound memory. When theſe are in your thoughts, I hope you will ſometimes caſt your eye upon lord *Bacon*'s *Novum Organum*, and give him ſome aid for his kindneſs and ſolicitude. By thirty of your experiments, you may lift his head above the waters, and ſave him from the Lethean lake, as the poets call it.

14. THE fourteenth tome waits for your Arcana.

15. AND I may put you in mind to collect and preſerve ſuch of your letters, as do direct, and ſolicit philoſophy; for upon ſuch records they will do the ſame work every where over and over, and in following ages. It is indeed fit to be a poſthume work, but it requires our ſerious care in your life-time, as we ſee by the ſad examples of the great wrong done to excellent perſons, by after handling; as *Scaliger* and lord *Bacon*, amongſt many others, may juſtly complain. Your own amanuenſis, and your own directions, are the beſt conſervatories of theſe; and you may then expunge and enlarge, as you ſee it of publick conducement. But where are Sir *William Petty*'s duplicates?

I MAY now preſs on my particular requeſts.

1. BE pleaſed to correct theſe my faults by directing your amanuenſis to reduce your works into ſuch order, as yourſelf can approve: for upon the frequent view of them, you will find much more of refreſhment and encouragement, in what you have accompliſhed, than cumber of taſks in your way.

2. YOU know them, that can well tranſlate your Sceptical Chemiſt, and ſuch like, into the German tongue; and ſome of your tracts into good French; and there are ſtore, that will clothe them in elegant Italian, and there is much more than men are aware of in it, to have our light and inſtructions in the ornament of our native language.

3. WHILST I write this, I receive your Frigorific Experiment, numb. 15. which puts me

me to the poet's anſwer, *Qui monet, ut facias.* That Experiment, and your Statical Baroſcope of numb. 14, and the Heads for the Natural Hiſtory, numb. 11, do very well deſerve to be enlarged for peculiar treatiſes; for they are leading and pregnant: and though I think we are now ſure and ſafe of a perpetual progreſs in this philoſophy, yet the diſpatch of it is our comfort; and theſe ſhort eſſays do bring a quick return, and awaken our own countrymen, and our univerſities, the more rouſingly, when, by the benefit of tranſlations, the eccho of reputation comes from the moſt famous of foreigners; which is the only remedy againſt envy, whoſe black tooth ſpares none of the living, till they are turned to aſhes. And this I account the moſt pertinent eulogy, that I can raiſe for the reputation of the Royal Society, and chiefly from your laborioufneſs; that you have given an enforcing example, and a ſpirit to the very Jeſuits to oblige mankind; and have found and ſolicited noble enterpriſes, ſuch as may become their innumerable ſociety, their univerſal commerce, and may engage their inexhauſtible treaſures. To find out the true longitude, to correct all maps of topography, to make the world better acquainted with the heavens, ſtars and planets; with all minerals, terreſtrial concretes, ſimples, vegetables, *&c.* The Socinian frets their conſciences (in ſuch as have conſciences) inwardly; and you call them out to ſhew their faith by their works. *Hoc age.* Sir, you know the hand; I wiſh you could read it, and my heart in it.

J. BEAL.

London, Oct. 31, 1666.

Honourable Sir,

I MISS you here, and deplore my unhappineſs in it. But you are better employed; the Uſefulneſs will ſtop the worſt mouths, that the devil can open againſt us; and will be the beſt apology for us of the clergy, better than a hiſtory, which is yet lazy, and much wanting. Mr. *Glanvill* intendeth ſomething theologically in defence of the emergent providences for the ſeaſon of all ages, and of the gifts of God's holy Spirit for inventions to the benefit of the worthy againſt atheiſts and ſcoffers. And he hath a flowry pen, and may do well, if we can ballaſt him from Origenian Platoniſm and extravagant adventures. To which purpoſe I have given him the trouble of much ſcribble, and ſuggeſtions, both hiſtorical and prudential, which he ſeems to accept of, and profeſſeth conformity: but his genius is apt for ſublime adventures. I conceive very great hopes of Mr. *Parker*, but I do always wiſh, that ſuch juvenile felicities could receive a contemperament for their conduct from ſome, that are better ſeaſoned by longer time. This gives the beſt abilities the benefit of a collegiate ſociety.

SIR, I have moleſted you with many cumberſom and unlegible papers; but I had this encouragement, that they were once for all, and perchance ſomewhat your concernment in the ſucceſs of your wonderful and moſt obliging induſtry.

SIR, I have moved Mr. *Oldenburg* to find a way to uſe Sir *Robert Atkins* the recorder of *Briſtol*, and what means elſe he could to frequent the correſpondence with our American plantations, and more particularly with *New England*, amongſt whom there is ſome fear of God, but too notional in the bulk of wavering creeds. They may grow as we do ſhrink. They are the granary, and huſbandmen for all other colonies. They begin for an univerſity, and by the paucity of ſeducing libraries, and the neceſſity of uſeful and accommodable ſupplies, may be at leiſure to be imbued with our ſuggeſtions. And it is fit to put new wine in new veſſels.

SIR, in your Uſefulneſs I beg your thoughts on the baroſcope, with accounts for the food and breath of life, and yet is unintelligible, neither yet can we particulariſe the gravity, till it be ſtated by the help of your excellent balance. By which at leaſt we may have tables to inſtruct us to aſſume poſitively, how high ſuch air of ſuch weight would aſcend. And when the proportions are taken from ſeveral heights, that are certainly known, and exactly meaſured in the time of the ſame ſtate, we may then ſay, how far it does extend, ſuppoſing the ſpring of air to take the ſame meaſure of liberty of the like diſtance. And as for the expanſion, which air may take, when it is of perfect freedom, it cannot more juſtly denominate the place air, than a drop of ſack can denominate a tun of water wine.

BUT, Sir, I ſhould have more care of your buſineſs, than to give you ſo much trouble. I do always pray for the beſt of God's bleſſings upon all your noble endeavours.

SIR,

your ever obliged,

and moſt affectionate

and humble ſervant,

J. BEAL.

Jan. 7, 1666.

Honourable Sir,

THIS hot and droughty ſummer, you obliged us with a ſpecial and preſent remedy againſt exceſſive heat, for our diet, food, and drink, and other cooling refreſhments. And we have hopes, that out of that rich ſtore-houſe in your dialogue of Heat and Flame, or perchance in your Uſefulneſs, you will furniſh us with remedies againſt cold. This ſharp ſeaſon calls to my mind, that I have ſometimes enquired, 1. What things in nature, or by art, or mechanical contrivance, will retain a warming heat longeſt; or

2. a melting or ſcorching heat. 3. What will continue or maintain fire longeſt. 4. What will moſt eaſily take fire. 5. What will beſt reſiſt it, or not yield, or be conſumed by it. 6. What will quench it ſooneſt. 7. What will conſerve it for conveyance of animal or vital ſpirits, or transfuſions in it, *&c.* And how to apply any of the reſults for accommodations of art, or for medical, or oeconomical, or political uſes, or for philoſophical inſtructions.

AND ſome of this philoſophy I have learned from common practices, and vulgar trades, and it is not eaſy to ſurpaſs ſome of their diſcoveries.

1. I HAVE wondered to ſee joiners uſe leaden pots for their glue, but they ſay lead does retain the heat longer than other metals. It is a cloſe metal, and they do not try golden veſſels. For ſometime I had above 100lb. in gold for my uſual bedfellow, and I did not diſcern nor obſerve what good or hurt it did me for heat or cold. *Cary*'s warming ſtone promiſed a warmth for ſix or eight hours. If it performed for two or three hours, it was of great uſe for ſtudents in their ſtudies, where chimnies may be hurtful, pans of charcoal dangerous. A ſervant might renew them for many from one kitchen fire or furnace. They may ſupply the abſence of a warm bedfellow, or help to ſweat, when that is medical. I find by ſad experience, how hurtful bright fires, and eſpecially of ſtone coal, are to the eyes. But ſince men are ſo fooliſh as to make dogs their bedfellows, as is not unfrequent, they are ſoon taught to keep what place or poſture we pleaſe, to warm the belly, ſtomach, back, legs, or feet, as required. And I am ſo well aſſured of the transfuſion of vital ſpirits by what I have often obſerved, how grandmothers tranſplant the freſheſt roſes of their little bedfellows into their own cheeks, that I ſhould prefer a young, ſound, and merry dog before a ſtone or lead. Mr. *Hartlib* told me of ſtoves made cheap about ten years ago. But the ſudden removal from a warm room to a bleak air, or piercing wind, ſhould be forbidden. Who thinks of building a room (for warmth in cold winter, or for coolneſs in ſummer) over a good ſpring, of which we have ſtore in this town, and millions in *England*; and for a long way I note their ſmalleſt ſtreams to run briſk, and to keep all the banks green at ſome diſtance, and unfrozen in our hardeſt froſts. Sir, on Saturday laſt at four in the evening, it was a very quick froſt, ſeldom greater: I tried my ſmoking ſpring-water taken out of a well at 15 foot deep. In a thermometer of 20 inches it aſcended from the 4th to the 9th. I ſent my man to try two excellent ſprings, the one raiſed it to 10, the other wanted that warmth by $\frac{1}{4}$. In few ſummer mornings it aſcended above 11. My parlour is low and cool, and in very hot weather it aſcended not above 12 there. On Friday morning we had oiſters perfectly frozen, firm ice, not perfectly cloſed. I was glad to have the opportunity to obſerve their poſture for reaſons, which hereafter I may acquaint you. Some I ſtewed, the taſte was not altered, or noting corruption. Some I cauſed to be laid on the ground in a room level with my parlour, both the rooms keeping a coolneſs in ſummer. The froſt yeſterday morning was a very little abated, but then and all this ſpace it did freeze hard, and my thermometer kept the remarks of hard froſts; yet in this room the oiſters were all unfrozen, and full of juice, and alive, and we could not diſcern any change from the beſt reliſh. I thank the neighbouring ſpring for this warmth in thoſe rooms. The ſmoke of that ſpring is not there viſible, but I ſuſpect ſome force of it in damps, and an aptneſs to make my paper moiſt, and to beget moldineſs, and thence I fear inſalubrity and putrefaction, which depreciates the accommodation. I ſhould add, that the ſpring, which in old and common fame is held the beſt, did raiſe the thermometer higheſt; and ſo of the reſt. So that common experience in waſhing and oeconomical uſes ſeemed to give ſome ground to fame.

2. To reſtrain a ſtrong fire, the glaſier's melting iron is well deviſed. The taylor's gooſe not unfit, and does him double ſervice.

3. To retain fire unconſumed, Sir *H. Plats* hath obliged the fueller. And my couſin *Speke* here hath bountifully obliged *Ilminſter* and his neighbourhood by a black fat earth lately found in his park. But I never ſaw any parallel to a ſea-weed, which we had in *Cambridge* in the mouth of a barrel of the beſt oiſters. It is like there is ſtore of it. It was ſmaller than peaſe-halm, yet it outlaſted two very great fires of their ſea-coal, burning bright in the midſt of the fire. And by a ſtroke of the tongs it fell into the hearth, jingling like metal. It reſembled red hot iron.

4. THIS enquiry is reſolved by gunpowder, and may do worſe.

5. ASBESTRE of old conſerved the remains of noble bodies in their funeral incineration. Can it be made cheaper, and better applied? We have here very thick and fair cups, which bear the fire very well. I know not, whether China-ware does better.

6. MILK, they ſay, quencheth ſpeedily: poor *London* and all *England* wanted milk from heaven. Seventhly and laſtly, a good big pitcher of the coarſe earthen ware, very well glaſed or leaded, with a ſmall orifice, and well corked, may be ſo ordered, as to carry milk warm from the cow a mile or two. I have too much of this vulgar ſtuff; your ſkill in furnaces and crucibles both promiſe far better things. I hope Mr. *Oldenburg* will ſave you the trouble of reading this.

HONOURABLE Sir, I do always pray for the excellent viſcounteſs *Ranelagh*, her noble daughter, and all yours.

Your moſt humble ſervant,
J. BEAL.

To Mr. Oldenburg.

SIR, I have altered my purpoſe for the ſuperſcription, as in the front, becauſe you alone can read my frozen hand.

Your ſervant, *B.*

Yeovill, Jan. 24, 1666. about 3 evening.

Honourable SIR,

I AM further confirmed, that what I deſired Mr. *Oldenburg* in three letters, each adding to the former, concerning the warming a habitation (or ſome rooms at leaſt) by a ſtream from a tepid ſpring, in the hardeſt froſt, that *England* knows, is conſiderable. For this laſt Wedneſday and Thurſday we have had ſuch tepid or temperate ſpring-like weather, that I ſhould not deſire much warmer of any time, yet in hotteſt or warmeſt time of theſe days, where the ſun had reflections on a wall, my thermometer being alſo free from wind, ſtood at 8½ when at the higheſt. In the coldeſt time of this winter it aſcended ſpeedily from four to ten in good ſpring-water, and perchance it would have aſcended higher, if my man had had the patience to ſtay longer. Then I ſaw a young child dabbling in a bucket of water, and ſtanding in a very bleak and ſharply freezing wind. I bid the child go in to the fire; ſhe anſwered, that the water was warm, and ſhe ſtayed there to keep her hands warm. Thereupon I uſed the thermometer.

1. SOME have ponds in leads on their houſe tops. I gueſs, that a far better uſe may be made of water there, at far leſs charges, if from a tepid fountain it guſhed out there into a ſmall receiver, where without ſtay it were ſwiftly carried for the foreſaid purpoſe.

2. AND if I were not a very ſoft and lazy traveller, I would try what ſprings and waters you have at your Stalbrige, and how far applicable to theſe cogitations.

3. SIR, the laſt affliction, which I gave you, relates in one point to theſe your true thermometers. Many do not know of them, or where to obtain good, and perfect at a certainty. Few are well awakened to apply all the uſes of them. And perchance they may be brought to ſome near approach for a ſtandard, by your experiment of ſal armoniac, or other your aſſiſtances, and an aſſiduous practice in the glaſs-houſe.

4. THEY may have ſome uſe in the tranſfuſion of blood and other liquors, and it will oblige us, if we may be informed, what difference in the heat of blood of ſeveral animals; and of milk guſhing out with the ſame celerity. It will direct you to fit the mixtures of milk, ſpirit of wine, *&c.* And the butchers at eaſy terms may give us the proportion of blood in ſeveral animals, fat and lean, wound and ſick, by weighing them before and after the effuſion, all apart unſeparated.

5. THERE you may try the old fame, whether any or all dead bodies are ſo much more ponderous than the living.

6. POSSIBLY a peacock may grow more weighty ſome days after roaſting, than at firſt by relenting and drawing a mixture. But it is hard to believe, that a peacock will keep unputrified a whole year, (or as ſome have not been aſhamed to deliver) above thirty years, and under ground alſo: ſweet and ſound, as new killed.

St. *Auſtin de civ. Dei.* So *Kiranides* promiſeth.

SUCH animals, as are moſt active, ſtrong, and vigorous, or full of ſpirits, and vivacious, are generally lighteſt in the proportion of their bulk, and (as I take it) have leaſt blood.

7. A CAT is lighter than a whelp or dog of the ſame bigneſs, and ſeemeth to have leſs blood. And Mr. *Hales*, your acquaintance in *Eton*, did attribute as near kindred between a cat and a lion, as between ladies beagles and maſtiffs. You will now ſee, whether blood will diſcover kindreds and affinities in animals at any diſtance.

8. IF my gueſs at weights ſhould hold good, when other preſent indications are fair, and promiſing, we may try a horſe and greyhound by weights, before we part with our money, or adventure for a wager. A very good and well practiſed horſeman did oft-times tell me, that I did hit the right, when I adviſed him to buy a full, ſquat, or well truſſed horſe for the mill, or market, or cart, a ſtrong and firm ſinewed, light, eaſily mounting, and almoſt winged horſe for a ſimple ſaddle, or ſpeed in the race.

BUT I muſt not think of weights, without grief for your matchleſs ſcales. And I wiſh you could give no reſt to artificers, till they furniſhed you in a like kind, whilſt all requiſites are in freſh memory.

9. AND in the ſame breath, I wiſh, that a number of academicians could not put the ſcales out of their hands, till they have given us a judicious hiſtory of light and weighty bodies, I mean the degrees of gravity in ſeveral bodies.

10. SIR, I have advertiſed Mr. *Oldenburg* of ſome books worthy to take up the beſt printing-preſſes, and always to be continued in print, as well for the ſtationer's profit, as to element the younger ſtudents in uſeful knowledge, or to incline their affections for the beſt. I ſhall here mention the moſt perfect and abſoluteſt pieces of antiquity. *Rei Ruſticæ authores Latini veteres, Cato, Varro, Columella, Palladius*, fit to be printed in one of our univerſities, by *Stephens*'s edition. Mr. *Oldenburg* and Mr. *Evelyn* tell me, they have that edition. It is ſo hard to be gotten, that Dr. *Benſon* and Dr. *Fell* were two years inquiſitive to get me one, and then they got none, but that of *Comeline* in *Duck-lane* by mere chance. And this of *Comeline* is ſo falſe, that I cannot often be ſure of their ſenſe. We have an unhappy cauſe, that gives us the opportunity of taking up the preſs, to prevent impertinencies; and thus we may undermine our perverſe accuſers, and make antidotes againſt all the force and witchcraft of their ſeducing principles.

11. THE Royal Society have many acute wedges innumerable, as many as there are implements, utenſils, helps of art, or kinds of arts, and inventions, and the impertinent controverſies are very ſoft and looſe timber. It is no hard work to heal the dog in the manger, or to ſilence the ſnarling. And the ſooner it is done, the ſooner you will be a college,

college, and have reſidents enough to collect and put in order all your noble inſtructions, and whatever comes from abſent members.

12. I READ in the Gazette, that a college in *Seville* in *Spain* muſt yield a hundred perſons yearly, that are ſkilful in the art of navigation. Store of ſuch, in both our univerſities, as teach that art, and all parts of mathematicks, anatomy, chemiſtry, and all your other engagements, would ſoon carry the ſtream there, and deduce a good part of their revenues into the right channels, and then poor ſcholars would bring home to their parents ſome better ſkill, than to prove two eggs to be three.

I HEARD a perſon of honour, and of good underſtanding, highly extol Sir *Nic. Criſpe* for ſome influence in making copperas in *England*. Perchance he conſulted for his own profit, and had not much care for the beſt, or beſt way. But when I read in Philoſophical Tranſactions, num. 15. that you could direct the way of making ſal armoniac, though I underſtood not the importance, yet I thought of this applauſe. And I fear you are guilty of hiding ſome hundreds of arts, which would relieve many families, and oblige all his majeſty's dominions at leaſt, as well in times of war, as of peace. I need not tell you, that he that contributeth any uſeful trade, or artifice, buildeth the faireſt hoſpitals.

SIR, much of this had not moleſted you, if I had not thought it within the power of your commands. I preſume it ought to be ſo, and then it puts you to no more trouble, than that word and countenance. I pray God to bleſs you in all your affairs, and in all your relations.

I AM, Sir, your ever importunate, but ever obedient ſervant,

J. BEAL.

I SHOULD note, that on Wedneſday and Thurſday forementioned (being very bright and fair days) my marbles were drowned, never were they wetter, only on Thurſday morning they began to dry, but as the day grew brighter, the marbles grew moiſter, the ☿ near 30 inches high. At three afternoon ☿ began to deſcend, ſkies darkened, wind aroſe.

ON Friday the rain continued long, ☿ deſcended near an inch. Thermometer aſcended to $9\frac{1}{2}$ near the temper of our ſprings, and ſeeming like ſome cooling rain in ſummer. So when it is ſnow on all the hills about us, it diſſolves in rain before it falls to ground here, and more frequently in lower vales. Hence I am emboldened to enquire, whether by your opening of the upper, or nether ſprings, or both, or by ſteams emitted out of the earth by the ſame or ſome collateral and concomitant cauſe, the freezing cold be not oftentimes expelled and ſubdued. Upon which queſtion I intend in my next to propoſe a way by your own inventions, to take an ephemeris of all the increaſe and decreaſe of ſprings in quantity of courſe, heat, &c. to the minuteſt variations. And this I value above a hiſtory of tides, ſuch as may be eaſily obtained.

Jan. 25, 1666-7.

Honourable Sir,

I TAKE ſo much delight in the experiment of transfuſions, that I find it my duty to congratulate your care, inſpection, and ſucceſſes in it. And, if it be thoroughly proſecuted, it will ſhew us at a certainty all the proper and acquirable force, and operation of blood, in all varieties of changes, and with all ſorts of mixtures for vital functions, for health, ſtrength, courage, activity, appetite, memory, and all mental faculties. If *Lucullus*, and others, who were prodigal of human blood to feed fiſhes, or for the vain glory of unjuſt conqueſts had ſeen this experiment, it is like they would have made havock of their ſlaves, and innocent mortals, for the utmoſt trials; and perchance the Mahometan, if he ſhould now hear of it, would exerciſe the title of his zeal againſt Jews and Chriſtians, to this collateral purpoſe. To prevent which, if our laws would permit it, we might with more innocence, and with ſome degrees of mercy, ſacrifice notorious and dangerous malefactors upon the experiment, whether tamer blood might not amend their minds, and manners. And perchance it may diſcover a way to redeem lunaticks, and madmen, and the epileptical, ſome from the chains of *Bethlehem*, and ſome from the more cruel handlings of chirurgeons and phyſicians. And I think any ingenious man would rather end his days, than ſurvive his reaſon; and rather die once for all, than have frequent epileptical returns; and would rather expire in a bath, by effuſion of blood, as *Lucan* the poet, and other half-favourites of tyrants did, than to ſuffer all the tyranny of uſual chirurgery. And ſomewhat may be done without charges by the kindneſs of our college-bachelors, to diſcover the cauſes and potent remedies againſt the rot in ſheep, and other diſeaſes in ſwine, oxen, &c. We cannot foreſee all the importance, but, certainly, it will amount to a fair volume, a large branch of philoſophy, as inſtructive, as pleaſant, and as wonderful, as ever was publiſhed.

SIR, will you permit me (with ſincere veneration and hearty affections towards you and all true virtuoſi) to harp upon one ſtring, which I had made to grate in your ears many times within theſe twelve years. Thus it is.

ALL mortals have ever been apt to ſtand at gaze, and to admire and applaud the wonder for nine days, and then to enlarge it with falſities; but to let the uſefulneſs die in the womb. We ſee the lazineſs and ſtupidity of all mankind, for two thouſand years at leaſt, in the neglect both of the theory, and of the ineſtimable uſe of the magnet; which teacheth me, both to accuſe human dulneſs, and to attribute ſuch weighty inventions to the immediate inſpiration of God, whoſe providence ordereth

ordereth all diſcoveries for their due times and ſeaſons. And, in theſe days, God hath by your hand ſummoned us to quicken and to enliven the application. This is our duty, and the office of charity.

YET, ſhall I not ſay it, that ſome of your own moſt wonderful diſcoveries do lye dead, or aſleep. Many of your improvements, of the moſt excellent nature, are yet unpractiſed; and we hang up our plough upon a pin, as old *Chaucer* expreſſeth it, as if it were holiday. Your balance of the air lies unſtated, leſs underſtood, and leſs applied, than it deſerves. The freezing of eyes for anatomy, and other organs of ſenſe, unpurſued, or unpubliſhed. And the microſcope had been only a gaze, if Dr. *Wren*, Dr. *Powel*, and Mr. *Hook* had not made the application, and ſtill it may produce a ſecular or anniverſary ſupply for anatomy, and to ſhew the ſurface and intrinſic frame of things within our reach in this globe. The beſt teleſcopes have not examined the cauſe of obſcurity in ſome, and of brightneſs in other of the ſtars of the firſt magnitude, nor the approaches, and remoteſt diſtances of ſtars, and many other viſible evidences pertaining to the ſyſtem of the world, and advancing the glory of the Creator much beyond all former acknowledgments.

SIR, I muſt confeſs, that ſo much is done, and excellently performed, as may claim our higheſt applauſes. But that ear is leſs patient than to allow that diſcourſe. Our preſent taſk is to ſay *hoc age*, as of old in the ſacrifices. And it is my peculiar inclination oft-times to call to your mind, that low things, and much vulgar, are the moſt ſpreading obligations. Unclean rags may make fine paper. And the aſhes of ſtones have lately furniſhed more tables, than all the hoſpitals in the world.

SIR, if you ſay this is a ſufficient apology for ſome lines, which I lately intended for you, with a ſecond and third ſupply in following ſcraps of letters, I ſhall rejoice, that ſuch weakneſſes can proſper in benevolous, and indulgent hands. My ſecond thoughts adviſed me to ſuperſcribe them to Mr. *Oldenburg*, that they may give you no more trouble, than the breviate of his account, or extract. Diſpatch and full communications are the life of the Royal Society, in deſpight of war and *Apollyon*, the grand enemy of all elegant arts, and the deſtroyer of mankind. And if I ſhould not ſometimes preſume upon your patience by ſuch officious offences, I ſhould have leſs need, and you leſs of the habit of granting your pardon to,

SIR,

Your moſt humble, and

ever obliged ſervant,

J. BEAL.

SIR, I do always pray for the beſt of God's bleſſings upon you and the moſt excellent viſcounteſs *Ranelagh*, and all your noble relations.

SIR, I am glad to hear, that you do accuſtom the duke of *York* to afford his countenance to the engagements of the Royal Society, that he may acquire a prompt habitude for hereafter. Perchance it is all the coin the court can ſpare.

January 28, 1666.

Honourable Sir,

I PRAY you ſuffer me (in purſuit of my laſt words) in a rude draught, ſuch as my hand is, which is paſt the uſe of the compaſs, to propoſe a kind of ornament for your two inventions, the baroſcope and thermometer; and, if it ſucceeds, for further purpoſe.

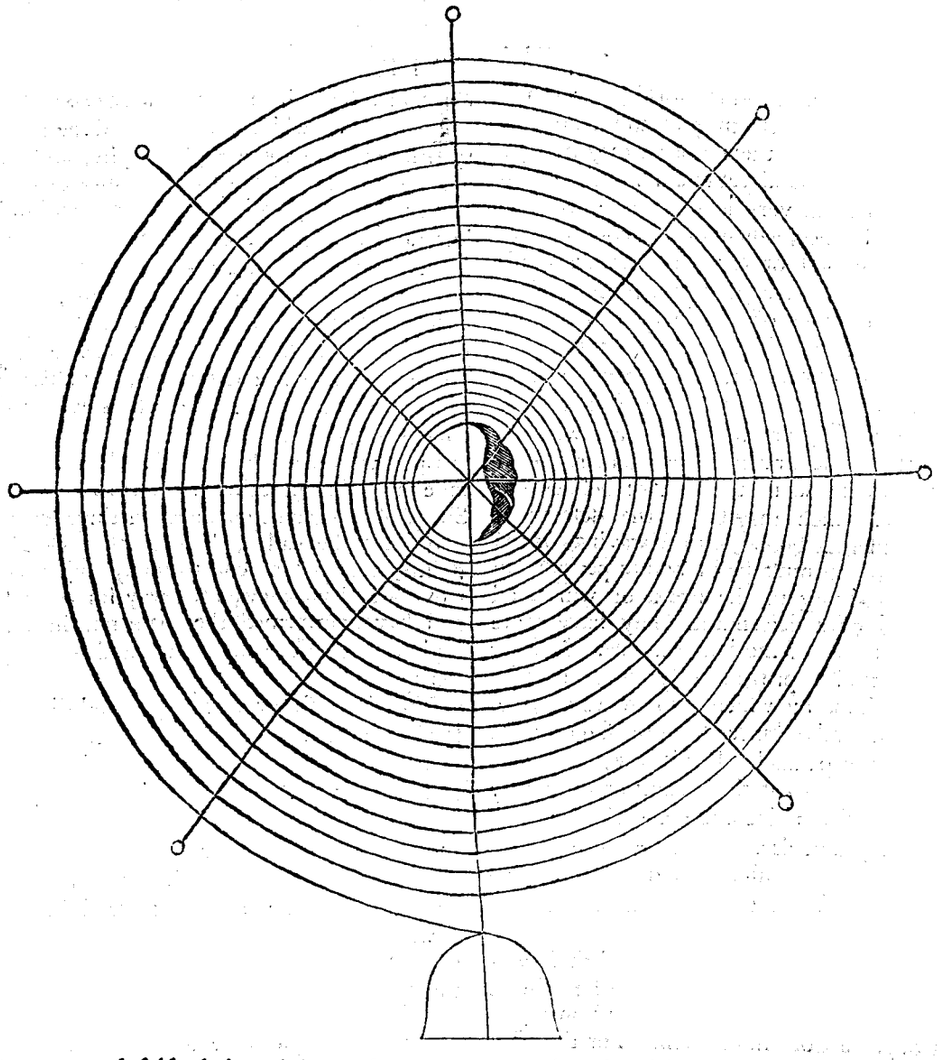
I DO not know, what they can do in the glaſs-houſes; but I have hatbands made of glaſs, ſmaller than the hairs of our heads, and of no great price. Whence I collect, that they can draw the ſtem of a thermometer round to be faſtned on hooks of wire, or wood whipped about with ſilk, or cruel, to ſave them from cracking at every ſmall motion.

IF this can be done upon a frame to the length of forty feet, more or leſs, it may make a baroſcope for lighter liquors, which may take up two or three feet in the changes, and perchance diſcover more fluctuations or trepidation in the air, than a heavier body can do. And to this may be added Dr. *Wren*'s invention for minute variations, mentioned by you in one of Mr. *Oldenburg*'s tracts. But here it is needleſs, and impracticable.

IF the glaſſ-men's ſkill can reach to this; the ſtem being filled in good part, and the bolthead large, and ſo fitted, as an open thermometer, may ſhew to the eye, the reſtleſs changes, and (as I may ſay) the perpetual motion of the air, by variety of heat, cold, weight, even the pulſes of heat. I have a thermometer very inartificially made for nine or ten inches as ſmall as a ſewing thread: when the temper of weather raiſeth the liquor thither, I can never find it at reſt, though I hold my breath, and keep at a good diſtance. If the glaſſ-men cannot perform the utmoſt of my propoſal, yet by this figure they may give a more delicate and nice diſcrimination of degrees of heat, to try, whether ſtrong odours, good or bad, do operate that way. And ſurely they have a motion perpetually, as long as odorous ſubſtance remains. And we want help to diſcover, whether rays reflected from the moon, Jupiter and Venus, have any heat, *&c.*

BUT this figure is proper to ſhew to the eye the indifference of gravid bodies, whether aſcending or deſcending, in ſome caſes. I grant, that the ſame appears in a reverſed thermometer; but here it is repreſented more lively, and more ready at call. In the liquor of one of my thermometers, there fell (in the making) ſome black ſtuff, which ſometimes floats at the top of the liquor, ſometimes deſcends five or ſix inches, or yet more, ſometimes is divided in five parcels, ſometimes in three, frequently in two; but in cold weather is

is always in one, and on the top: yet, in the cool mornings of ſummer, keeps together on the top, when the weather is not near ſo cold (as by the remarks appears) as when it is diſſipated, and deſcend deep in the diſſolving weather, after hard froſts in winter, which proves to me an agitation of the liquor, by the motion of all parts, at the change of weather. The very ſame rules this black ſtuff does obey ever ſince I reverſed the glaſs, which hath been about a year. This may ſeem a double proof, that gravid bodies may as naturally aſcend as deſcend, accordingly as they are circumſtanced by the next ambient. If the bubble, which you mention, could eaſily be fitted for thermometers, the evidence would be to many very acceptable, and give a glimpſe of the ſtate of gravity.



I CANNOT deſpiſe their opinion, who conceive the ſun to have an agency, or ſome influence into the cauſes of the perambulation and rotation (where it is) of the earth and planetary globes. The ruſtics (for their ſport) do cut a reſemblance of a hare, hounds, and huntſman, in cards or paper, which being ſupported, or hung by a peg in a frame *in æquilibrio*, round about the inſide of a lanthorn, will all drive a perpetual round as long as any candle burns in the center of the lanthorn. And in fermentations we do generally ſee a circulation, or ſeveral kinds of boglings, as it were by a mixture of agitations, partly by ſpiral lines, partly by undulations, not mixt otherwiſe than in the motion of ſmoke. And theſe ponderous globes, as they ſwim in the open and wide æther, where there is no real ſurſum or deorſum, but what is relative to our fancy, and where neither air nor æther reſiſts more on any one ſide than on another, may, by the ſolar rays, be whirled about more eaſily, than we are apt to imagine. And perchance theſe globes are not ſo ponderous, as we fancy them to be: we ſee our globe to caſt out her ſails and flags every way in her largeſt and wideſt compaſs; the air, which ſhe emits through all parts of her pulverous or equatic ſurface, hangs in the æther; and the æther and fire, or heat and flame, or other influences of the ſun, do pierce and correſpond ſo deep in the bowels of the earth, that we cannot find the body, that makes reſiſtance againſt them. And perchance this cruſt of the earth, the rocks and metalline ribs, which do faſten this globe in a kind of firmneſs, is of no great thickneſs, or depth, in compariſon of the globe; but may be as the ſhell of an egg, or of an Indian nut; and we do not account an egg-ſhell or the ſhell of a nut ponderous, when the egg is ſucked out, or the kernel taken out. Neither do we yet

 diſcover,

discover, whether the bowels of this or other globes be solid, or replenished with vapours and smoking flames. Neither can I say, whether a ponderousness or levity would best agree with the swiftness of these perambulations. We see children do wind their balls hard, and sometimes about bullets of lead, to make them rebound the better, and such ponderous bodies do take an enforced flight from an exterior impellent swiftness; but yet the lightning, which carries a light body through a thin passage, is swifter.

I SEE little rest in this world; nor can I affirm, that any parts in gold and diamonds are at perfect rest: their motion may be slow and very lazy. And yet again we must deny the motion to be very lazy in a like firm and durable substance, when in hot countries we see the diamond or carbuncle always luminous, and, as it were, in a fiery motion. And in all the motions of parts, which we find in the world, I can discern no constant regard to the Peripatetical center, sursum or deorsum.

NEITHER can I affirm, that a ponderous body, descending or falling from a tower, descends by a line drawn perpendicularly from the circumference to the center: besides the difference, which may be in the descent of most ponderous bodies, by the wavings of the air, and which must be in bodies pervious to air, and yielding to the stroke of winds, all the parts of a descending body have more kinds and lines of motion than one. Neither have we skill to prove or disprove accurately, that the lines, by which two stones may descend at several distances from the same tower, are perfectly parallel. But if they are parallel, then the Peripatetical definition of gravity is false in that point also; and the tendency is not perpendicular. So little can we trust to our eye concerning the question of the motion or fixedness of the earth; and less to old fame.

SIR, I have transgressed, and all these suggestions (for ought I know) may be vain in relation to the thermometer; for I am ignorant of the art of filling them. For the other uses, a few pounds may do more than is yet done; and when a happy hand is well in, he may in time delight to go on.

SIR, here my main drift was at something else: we touch the vein, and attend to the pulse, to discover feverous distempers, and languid faintings. Thus we may examine the veins and pulses of this globe, at their issues, springs, or fountains: whether in their fullness or faintings, in their heat or cold, saltness, or any bituminous, or other mineral affections, they correspond with any solar, or lunary motion, or operation, *&c.* If the spring be so stened, that it hath no outlet, but at one only orifice; and to the orifice a pipe devised of several small partitions, one higher than another, the lowest partition carrying the water out farthest, for better distinction to the eye; this would shew, whether the increase were mornings or evenings, noon or night, spring or autumn. Whether in frosts or dissolvings, whether fullest or freest from the salt, or mineral, *&c.* By such ways we might chance to find more than we do yet know how to enquire.

SIR, if you can pardon the excesses of respects and affections, you will pardon this troublesom officiousness in

your most humble servant,

J. BEAL.

Octob. 30, 1667.

SIR,

THERE is abundance of polemical writings, which have obtained the mighty titles of theology and philosophy, and yet are no way conducing to the glory of God, or to the peace or other benefits of mankind; but do much rather beget the frets of our spirits, raise our emulations and insolences, waste our lives and the precious time, which is designed and consecrated to the noblest purposes. And, till these spiders cobwebs be swept out of our schools and temples, our oblations cannot be clean, our holy chalices will be in danger of poison.

BUT who dares be the *Hercules* to undertake this bold and toilsom enterprize! Truly, Sir, these your antipolemical writings (as they may justly be called, because they clear all points, and put an end to many endless controversies) have shewed the way for theology, and have performed the main task in philosophy, most effectually for us, and for all posterity.

You have for ever expunged and dismissed the first matter, old elements, and new and old principles, in your divine Sceptical Chemist: and here in your last Discourses of Forms and Qualities, you have extricated many labyrinths, and extirpated the very roots and fibres of substantial forms, and of all disguised and deluding qualities: you have most solidly laid down the firmness of terrestrials; you have opened the fluidity of liquids, you have measured the weight, and examined all the motions, operations, and smallest particles of air; and fire itself (which I may call the knight errant of antiquity) is brought down to offer obeisance at your command. Sir, you will pardon a poetical allusion, which is no invention of mine, but as old, and as significant as any Heathen history. For seriously, you have not suffered the cramps of cold to arrest us in our dulness; nor the velocity of heat, light, or flame to escape us. In all which, you have freed the ingenuous from the thraldom of quarrelsom impertinencies, and have purchased their leisure to search out the particulars and excellencies of all nature's bountiful and voluminous dispensatory.

But, Sir, my own personal obligations are very peculiar and extraordinary. I can only sigh, and wish, that I could prove my self by some demonstration, so fully as I am in my heart,

SIR,

your most humble, and
most affectionate servant,

J. BEAL.

Honourable

Yeovill, Oct. 12, 1670.

Honourable Sir,

SOME weeks are past, since I received from your noble hand a very great favour; such as will oblige all the learned; all that can taste the lawful and religious delight, which should result from beholding the curious and wonderful frame of this our visible world. It will be my true, but insufficient excuse, if I say, that it gave me such agreeable entertainment, that I could not easily take myself off, to render my thankful acknowledgments, till I had four times perused the whole, allowing myself due rests and seasonable intervals; and weighing every period, as it were in several lights; that what was at one time my pomeridian diversion, was at my next view examined in the morning serenity: and this I did with a watchful eye to the malice, that is so busy abroad.

AND now, as far as I have made search into libraries, I must pronounce it, and I think I dare undertake it, that these and your former writings are the fullest and clearest interpretation of the divine workmanship, that ever yet shined in the publick light. And I am very confident, that they will remain for ever, in despite of all the oppositions, that malice, envy, and bold ignorance can make against them. The trifling objections, which depend upon metaphysical notions, will vanish, merely by extricating their terms, which are as changeable, as the moon; or as the French, I should say, the English mode.

BUT, Sir, you will rather hear what I have to offer or propose upon any of your arguments. Whilst a person, whom for many years I have known to be creditable, was reading to me the fifth page of your Cosmical Suspicions, he stopped at the first period, which mentions pestilential steams; and, before he knew what more was in that discourse, he told me as followeth; "That he knew a good "old woman, aged near eighty, now deceas-"ed, who said often, in his hearing, that she "could know, if the plague were within thirty "miles of her, by a pain she had in three "plague sores, which sores she had in her "younger days, before she was married." He forgot to ask, and could not now guess, what her particular aim was in mentioning thirty miles distance; but her abode was at ten miles distance from *Gloucester*, ten from *Worcester*, in the mid-way; twelve from *Hereford*, above thirty from *Shrewsbury*; and by her age she might well remember the plague in all those places, several times, and in many other places within the foresaid distance.

FOR a diversion, not far out of the way, I shall further acquaint you, that when I was a young scholar at *Eton*, the town was infected, the scholars fled away, my father was deceased, my mother at great distance, my other relations in court, and I had no address to any: the house in which I abode was surrounded with the plague, on both sides at the next doors: the nature and fame of the disease begot in me a great horror: in this distress, I had an impressing dream, consisting of very many particulars: I told all to the family, and within three days we found every circumstance true, though very strange, and seeming casual. I foretold who were sent for me, what coloured horses, and very sore accidents, which fell on them in the way. From that time to this, I have regarded some dreams in myself, and others, not without advantage, by the premonitions. I remarked all that I read on that argument, and other preceptions, omens, &c. in philosophy, and in histories, sacred and profane. I find these hints observed of old, and with religion, by all nations, Greek, Roman, holy, barbarous; and I cannot see cause, why they should in later ages be rejected out of the schools of philosophy, or of religion. *Aristotle* hath his lecture upon dreams, and *Cæsalpinus*, and many others, refer all the mystery to emanations: etherial intelligents would make all much more easy and more agreeable to the holy scriptures, old and new, and to ecclesiastical history. *Mede*, in his profound researches, found the interpretation of dreams to be the best key to unlock the mysteries of prophecies. Another like hint I shall offer. Our famous schoolmaster of *Eton*, Mr. *Busby*, spake seldom in the schools: I think I remember all that he spake, whilst I was there. At the prophetic verse of *Orodes* in *Virgil*, he gave a check for silence, and then bade us all remark it, that dying men do commonly prophesy. I have had many occasions to inculcate and really confirm that early advertisement. *Naudæus in Bibliog. Polit.* pag. 70. thus: *Cum opinio sit non futilis quidem illa, aut ridicula, sed omnium fermè gentium consensu firmata —— moribundos vaticinari* ——. But he expresseth it far better with his reasons, and then adds, *Quemadmodum fecisse dicuntur Patroclus ab Homero, Orodes a Virgilio, & Possidonius a Cicerone, &c. &c. Casaubon* hath much to this purpose, Enthus. especially c. ii. p. 59, 60, second edit.

I CONCEIVE the astrology of the wise and sober in the East was not fimbriated with the trifles genethliacal, but attended to new and extraordinary apparitions, and waited for many concomitant hints towards the interpretation, and chiefly by dreams, which were then more considerable, when skilfully distinguished from vulgar, and the secret art religiously solicited by collegiate studies of them, whose profession it was to be *somniorum & prodigiorum interpretes*; for instructions to princes, and for publick utility. *Abraham* hath in oldest monuments a great name for the syderal arts; and he and his descendants made good use of the interpretation of dreams: and our primitive Christians assure us, that our Saviour's star was a comet; yet whatever other hints the wisemen had, they had good directions by dreams. Some comets were *blandi*, some *horribiles*; and in the first ages, when all disciplines were traditive by experience (without books and babbling) and perhaps frequently from God and his angels, our longevous parents had a long time to register, and compare the phænomena

phænomena with the events. If comets were in the firſt ages ſo frequent, as they have been of late, one of thoſe long-lived men might have obſerved at leaſt an hundred and fifty, which number makes a great noiſe for a phyſiological evidence: two or three of our vulgar chronologers being joined together, do number ſixty comets within three hundred years: a diligent cometographer by further enquiry may find out many more in the ſame compaſs of time; and theſe, if they had kept equal diſtance, had been twenty in every century of years, one in every five, and that's no great rarity. But blackneſs or darkneſs within the diſk of the ſun (and without any known eclipſe, and for ſeveral days together, or at leaſt for a longer ſtay than eclipſes can allow) this is a greater rarity; and yet in hiſtory it will occur once in every four or five hundred years. And ſuch portentous ſigns in heaven might juſtly be the blameleſs ſubject of old aſtrology; which, if it had been in *Daniel*'s days (though then perhaps much adulterated) diabolical, or merely ſuperſtitious, *Daniel* ſurely would not have been advocate for the lives, nor the provoſt over the colleges of ſuch aſtrologers. And it is the ſtile of the ſcriptures to threaten judgments by the ſigns of darkneſs in the ſun. This unhiſtorical interpreters turn over to domeſday, which might be the main aim of the prophetical aſpect, but it had always a more literal importance. We may in time hear more of this from the monuments of the Eaſt, when they ſhall be better known to us. Whatever the way, or the manner, or the means of it be, we are ſure, that we have a perception at great diſtance, and otherwiſe than by our known ſenſes; and ſometimes a ſecret anticipation of things future, which cannot be without correſpondence with ſome cauſative, whether aereal, more refinedly ethereal, intelligent, or aſtral; whether by any one or other; or all of theſe expedients, we are ſure of the great and ſtrange effects: and when we ſee, how quickly the ſun-beams do paſs to the borders of this vertex, we may well imagine, that our ſpirits may hold an intercourſe at like diſtance, with equal diſpatch, in mental and ſpiritual affairs.

AND I doubt we are more ſure of the truth, than of the cauſes of the returns in the ſeveral kinds of agues; of the reſort of humours to green wound the third or fourth day; of divers periodical diſeaſes, more than have been hitherto named; of critical days, and of climacterical broodings; I ſay broodings, becauſe I apprehend it, and have deduced it from manifold obſervations, that thoſe years are tender, and by miſconduct fatal; but by ſalubrious applications may revive, and repleniſh the furnaces, and fuel of vital flame; and may redintegrate and corroborate the web of our complexions, and conſtitutions.

SIR, I have many other appendant (and perhaps better and deeper) thoughts, but I have need to beg pardon for this prolixity. And it is time I ſhould conſider, that I ought to prefer the gift you ſent me above a rich medal from ſome great monarch, both for the perſonal reſpects I owe you, and for the intrinſic value. Princes there have been in all ages, and generally they are amongſt all nations; but you are the firſt, and only faithful interpreter of nature, that we have ſeen, or ever heard of: and your diſcoveries of qualities are the golden keys, which unlock the divine cabinets; or I ſhould call them the luminous jewels, which give luſtre to all the parts of our mundane architecture. I beſeech God to reſtore and preſerve your health; and to crown you with the richeſt of his graces and mercies. And I humbly preſent my devoted ſervice to your moſt excellent ſiſter, the right honourable viſcounteſs *Ranelagh*, and her moſt virtuous, and honorable daughters.

SIR,

your ever obliged,

moſt affectionate, and

moſt humble ſervant,

J. BEAL.

Sept. 2, 1671.

Honourable Sir,

I AM obliged in a very extraordinary manner for the honour you have done me, in the favour I received from your noble hand, by the conveyance of our worthy friend Mr. *Oldenburg*. I have now twice read the book over with attention and affection; being all along comforted with ſtrong hopes, that it will revive the Royal Society, to reaſſume their firſt vigour, in defiance of proletary diſcouragements; and ſet many generous perſons at work, to counterpoiſe the emulation, and to ſatisfy the greateſt expectation of foreigners.

DR. *Bathurſt* being our Dean of *Wells*, and now there, I tranſcribed to him out of the fourth tract of the Goods of Mankind, *&c.* Sect. 2. pag. 10. your wiſh, that a catalogue of inventions loſt were extracted out of *Pancirollus* and *Salmuth*, made publick, *&c.* I added, that it were confronted with another catalogue of inventions and accommodations deviſed within theſe two or three hundred years; which is no great ſtride in antiquities; and yet would offer a ſtrange delight, and both would ſuggeſt and prompt inventions for future accommodations, for garments, diet, drinks, all things. Not a row of pins, little clean linen, no ſilken raiments, nor Engliſh beer, within one age, or near it; the trifles would not be thought trifles, if we were now put to ſhift for them. Other places I recited to this purpoſe, that ſuch as have an influence in the univerſities, ſhould inflame metalline ſpirits to bear up the Engliſh reputation againſt foreign inſolence; though perhaps ſome of theſe matters would be beſt performed by ſome generous Greſhamiſts, who may have more aid from the

the great trade and commerce of our chief empory.

I DID not accuse, but I did tenderly enquire, whether it were true, as is reported, that disloyal and seditious pamphlets were authorised in the famous universities; and that staunch and reverend heads there were become patrons to a sacrilegious *Herostratus*, and openly courted him with theatrical instalment. If all were false, I should be the more innocent; if true, *&c. &c.*

To this, and much more, which did sometimes look like satyr, our reverend dean returned me a very civil and obliging answer, that the last clause was a misinformation, nothing like it, but rather the contrary: that the chief, and even the generality, do abhor the *Blosius*; and that, when he comes to *Oxford*, more do accompany him in the coffee-houses, to laugh at him, and to scorn his folly and impudence, than to applaud his madness: and that a little time may produce better things. This reply from such a sagacious person did please me so well, that I thought it fit to be transcribed to you.

BUT I ought not to interrupt you with double pages, whilst you are so active to oblige all mankind, the present and future; and to redeem our nation from a great blot. And I can only pray for you, and all your right honourable alliances, subscribing,

Honourable Sir,

your ever obliged and

most faithful servant,

JOHN BEAL.

Yeovill, Nov. 13, 1671.

SIR,

I SEE, by your favour of 10th instant, that you bore with patience, and much more respects than I can deserve or expect, the trouble, which I lately gave you. My reflections did not aim only at your tract of gems, nor yet to your other collections, margined *loco citato*, nor only to Mr. *Hook*'s promise, but to the design of *Steno*, as far as he hath expressed it, and farther; since (in my opinion) to explicate the generation of materials, found in the great mass of the earth, some consideration should be had of terrestrial rotation; all kinds of motion having so much efficiency in the forms and figures of things generated: of which we might expect some further discoveries, if such as are much practised in the deepest mines were judicious philosophers. Sir *William Strode* was to me, as you say he was to you, somewhat unintelligible; but towards me I could apparently discern, that he affected to be intricate; and to amuse me with wonders; as if he had a mind I should take him to be a conjurer: therefore I solicited Mr. *O.* to try, whether his copartner in the mines, Dr. *Cotton*, could explicate his reports in clearer stile.

SIR *William Strode* is now, or lately was, in *London*, busied in a law-suit: if he should visit you, you may have an opportunity to try; whether *Steno*'s prodrome can invite him to apply his observations more distinctly; and to mind him in my name (if you think fit) of two points. 1. He told me, that in mines for some months the fire burns downwards; by which language he means, that it eats or burns the hearth or ground, where it is kindled, deeper than at other times. This he refers to the solstices, but added, that the change was not punctually every year at the same time of the months. If the change and difference, as he assured, be considerable, perhaps it may hint some other subterraneous motion, or operation, than I am yet aware of. 2. Sir *William* told me of a liquor, which falling from the roof of a mine, did one part immediately petrify, and another part coagulated into the form of milk or cream, very white; a third part ran off in limpid and pure water. Such notes, if true, may be significant to them, that understand more than I do; especially, if all circumstances relating to the roof, place, and fall, be related: how long this liquor runs, or rests, upon stone, *&c.* The former (of fire) was very imperfectly described to me, and merely described for my astonishment.

SIR, I shall violate the laws of good manners, and presume to fill my sheet (though with trifles) when I adventure to interrupt you.

WHEN I was an *Eton* scholar, I broke many great flints, only to observe the several figures interwoven in the mixed veins. In one of many, I found in the very center a marchasite, not separated, nor that could be divided from the flint; since that, I found on the earth elsewhere a flint-stone, seeming like touch, but harder than the best touch. This was only covered on both the flat sides, with knobs or studs, as big as a pepper-corn cut in half, but with the ornament of angles, six or more, of a more golden or fulvous colour, than ever I saw any other marchasite: perhaps, some cause, more than mere chance, may be rendered, why the marchasite was on the surface of the one, in the center of the other. As my man was digging deep in my garden, he found a heap of white flints, or white pebbles, almost transparent, one of them, somewhat bigger than a two-penny white loaf, was bowed, as if crushed, so as the outside seemed to be broken through the middle of the stone on the one side; the cleft whereof was filled with as bright and fair stones as any *Bristol* diamonds, that I have seen: it seemed to represent, how gems may be gotten in hotter countries, or colder, by the contusions or ruptures of rocks; as I can crush cherry-trees and plumb-trees to yield gums in their seasons: but of this I gave notice heretofore. Lately, the blueish stones, cast out of a blueish marl-pit, being broken, had in the middle many varieties of figures and colours; many of them a white and faintly shining stone, broader than the palms of my hands every way, and doubly as thick as a crown piece of silver;

silver; my man, by breaking many, learned the skill to choose (aright) those stones, which had the white stone; he could discern a peculiar tumour, or swelling, about the middle of those stones; upon the flatter stones he lost his labour.

ALAS, what trifles are these, in comparison of what may be remarked by them, that dwell under ground! Yet these may be referred to some lines in *Steno*'s Prod. pag. 51. English, where I note, vapours driven out of stones, &c.

SIR, I shall now only add, that Dr. *Bury*, Mr. *Buckland*, Mr. *Gulson*, and I, with as many as we confer with, are all in an obstinate heresy against Mr. *Hook*'s published judgment, concerning the scalops, cockles, and Heliacal stones; which we have seen with our eyes, half generated, and *in transitu* towards generation, and with the breath of our mouths, readily redissolvable to their aquatic and terrestrial principles. We cannot find in our neighbouring seas any stones or shell fishes, resembling any of our Heliacal stones; but I fancy, that if the soil, where these Heliacal stones are generated, were covered with sea water, and *sub æstu maris*, (which alternative recourse may be essential to their animation) they would then be enlivened, and amount unto periwinkles (which they do nearest resemble) their flatness to be turbinated. I cannot disbelieve all the histories, that I have read of great and monstrous animals generated in lands, overwhelmed by the seas, after the seas are drawn off, especially in hot countries. And we see, that scalops, cockles, and periwinkles, are generated in peculiar places of the seas, not every where; periwinkles in our shores. It is short logic to infer, that all such are fishes petrified, because some are brought amongst us by floods, and here petrified; or to deny the imperfect generation on earth, because we see the films, and other resemblances of marine productions. The Romans, *pro piscinis*, took care (at vast expences) for the sea tides, as necessary for the more agreeable diet of their choicest fishes: they may as wisely be considerable for generation, without affront to our argument or sentiment.

BUT, Sir, I have now transgressed enough, to have need of much pardon; and God knows, who can read, what I have written in the dark, through leathern lamp barnacles.

Honourable Sir,

your most humble, and
most affectionate servant,
JOHN BEALE.

BY the late posts I have troubled my lady viscountess *Ranelagh* with hasty scribbles. I present my most humble service to her ladyship, &c.

I HEAR, that excellent marble is digged in a quarry near *Plymouth*.

Nov. 27, 1671.

SIR,

ONCE more I adventure, (because St. *Andrew*'s tide is close at hand) briefly to propose, whether it may not be convenient at this next meeting, when the resort may be greater than ordinary, to nominate two committees of such, as are thought fittest, and are willing to correspond constantly, the one committee towards one of our universities, the other towards the other. To encourage some chief, whom you deem worthy of that trust, to collect into a club or society such as have a heart and capacities for the advancement of learning; to agree upon some place of meeting monthly (softly and slowly, rather than too thick and hasty at first) there to communicate what they please of their own, and what they receive from others.

THESE committees may sometimes oblige by an overplus, which may be spared from your repository for theirs; sometimes by concernments for their Bodleian, sometimes for their printing presses. Every month may afford fresh and welcome arguments. The beginning hath a friendly and becoming aspect: and if it prospers to a considerable number, and to carry good credit, you may in season derive unto them some of the power, which by the later additionals to your charter you may lawfully grant. This alone will prevent, that they cannot sever from you, or make collisions against you, or be independent, or be reputed other than subordinate. There you may have your candidates, prepared and essayed for your approbation: there are the colleges, revenues, faculties, many opportunities, and leisure. There in time you may have store of astronomers, and other sons of art, to assist you in foreign correspondencies; especially, when by these committees they shall at all times be advised, how they may be furnished with the best aids, and instruments for all ingenious arts.

SIR, you have already published very costly and elaborate volumes, very agreeable and proper for the universities, to redeem them from the slavery, and perverseness of the mind, reason, and all intellectuals; and from impertinent wars about chimeras. By God's blessings upon this conduct, you may soon see the fruit of it, the advance of your labours, as well, and perhaps much more at home, than is yet among foreigners. By this the Stubbian malignity will soon be confounded, and extirpated.

AT my request, a young Oxonian prepared me a list of fit, capable, and hopeful persons, addicted to the design of the Royal Society, and willing to entertain correspondencies, and to assist in them. They seemed to me by their qualifications, and number, very considerable; some in every college, and in every hall. Only in one college, there was but one named; but it is excused, that his list was much too short, and that he wanted time to complete it, and for some reasons he would not be seen to advise with others for fuller information. There are excellent professors, some lecturers, and very many students of useful arts amongst them. And in time they may have their meetings in some of their publick schools, after fit lectures; and the wings of

the Stubbians are already broken, and their reputation withers, as Dr. *Bathurst* told me. And it will be some ease and encouragements to such bookish men, as I am, when we know, where to offer to farther examination such suggestions, as we collect from the ancient in our readings; and to spread what may be approved, as proper for modern advancements.

SIR, I see in the last Philosophical Transactions, num. 76. p. 2282. that Mr. *Lister* is somewhat warm on our side; and though I rest not on his argument, which are also the same here for us, *viz.* that Heliacal stones, which Mr. *Buckland* sent from *Cansham*, are red, as the quarry is there; those, which Dr. *Bury* and Mr. *Gulson* sent out of a blueish marl pit, are blueish and marly: those, which I gathered on *Hambden-hill*, are yellowish, as the quarry is there; and one, which I had out of a marl pit here, is greyish, another a ferruginous marchasite. Yet, if they differ not only in the colour, but in many lines and circumstances of the figure also, and no such resemblances can be found in any seas, or on any shores, this may add some weight to other arguments. The chief of which are to me these: 1. That we find them frequently *in fieri*, unfinished and mingled with other stones some way or other, bearing the quinary, remark noted by *Casaubon*, Credul. part I. p. 122, *&c.* and other peculiar shapes, for which they are here called thunderstones. 2. Mr. *Buckland* found some of those cased one in another from very large to very small, to the number of seventy, as I remember. 3. My credit to various history, and to the authentick narrative of the *Genesis*, or creation, as I am taught to understand it. I hope Mr. *Lister* will be desired to send his exemplars, that they may be compared with those, which I sent up; and that he be advised to enquire and notify, what difference of shape and figure from each rock. For the colour must follow the nature of the soil, where they are petrified. When Mr. *Hook*, to convince me, shewed me the very film adhering to the inside of cockles; I answered, that I should yet be more confirmed in my sentiment, if he had shewed me some of the flesh, even the vitals. But I wondered most, when I was charged of affront to holy text, when I insisted upon the express, *Gen.* i. 24. "Let the "earth bring forth the living creature after "his kind, *&c.*" In the creation I conceive there was more dispatch, than contradiction or opposition to the rules and laws of generation. Yet perhaps I was in my younger days affected with the authority of Mr. *Hales* of *Eton*, who, when he shewed Mr. *Muffet* on insects, told me very positively, but with a smile, that insects were the new product of every year. And now I know better than he could, that there is as much of divine art and architecture in making an insect, as a whale or elephant.

BUT I fear I have tired my lady viscountess *Ranelagh* with many other wild matters, and with a touch upon this last point of philosophy concerning Spiders, Caterpillars, aerial Cobwebs; beseeching your favour to present my most humble service to her. I may for shame make haste to subscribe,

Honourable Sir,

your most affectionate, and

most humble servant,

J. BEAL.

Yeovill, Oct. 26, 1672.

Honourable Sir,

I SHALL a little interrupt you to discourse of your *Stalbridge*, and your nursery there. For I hear you have that way also a large charity for the publick good of *England*. I have sent for your nursery man, that I may speak with him, when he can spare a few hours, being myself unable to travel so far. When you have occasion to write to *Stalbridge*, be pleased to add a line to incline him to accept of my advice; and to confer with Mr. *Henry Star*, a nursery man of this town, and with *Marmaduke Coates*, a quaker, the chief nursery man in this county, a neighbour well known, and much used by my cousin *Speke*, and by him furnished with good store of the right redstreakes, which my man brought from my lord *Scudamore*'s own orchard this last spring. I have many things to say for your man's advertisement.

AND because I have seen your fair and large walls, I recommend to you, and for your man, the Sieur *le Gendre*'s manner of ordering fruit trees, printed for *Humphrey Mosely* at *Prince's Arms*, *Pauls*, 1660, written with the greatest judgment, that ever I saw any, after about fifty years experience, and a full knowledge of all the best gardens in *France*, translated (as I guess by the stile) by Mr. *Evelyn*. It is of less bulk than the French Gardiner, translated by Mr. *Evelyn*. Both these tracts are excellent, but this lesser is close to the main art, for wall fruit; and his large preface will inspire a gardner, that hath wit enough to understand him. If you please to mind your man of pear-stocks in your nurseries, and of a trench or two for a nursery of quinces, mulberries, and vines, I will give him directions, and sometime shew you weighty and urgent reasons of concernment for publick good, and also for curiosity and profit.

BUT my art is chiefly to increase a rich winy liquor, and to spread the best fruit for that purpose, as largely over our corn-fields, as the vines are spread in *France*, not to countenance tipling, but that we may not be always so wastefully tributaries to *France*, but enrich our vales to have a sure staple commodity, as our downs now have; and fit for an island addicted and concerned for navigation.

I AM told, that in our late war with *Holland*, anno 1665, the French began to interdict trade with *England*, till an accomplice shewed their king, that by trade we were pensioners to *France*, merely for their wines, to

to the value of ſome millions of money yearly. About the ſame time, Mr. *Fortrey*, a gentleman of our king's privy chamber, computes from the Cuſtom-houſe (*et multa cadunt inter calices, &c.*) that beſides all commodities, we export for *France*, the overplus of our expences for their wines amounted to 1600000l. ſterling yearly: and that this Mr. *Fortrey* publiſhed in his treatiſe of the Engliſh Intereſt and Improvement. I have not ſeen this tract, but I recite it out of Mr. *Roger Coke*'s Treatiſe of Trade, and (to my knowledge) this book was very welcome to ſome of the privy-council. Leſt I ſhould be miſled by falſe printed figures, I examined *Coke*, and found it, p. 3. and again repeated, p. 61. edit. 1. and pag. 39. he adds, that by trading for French wines, in the perilous months of September, October, November, December, we loſe more ſhipping, and more ſeamen, than by all our other trade. And Mr. *Fortrey* calculates, that we loſe in the whole of all our trade with *Spain* for Spaniſh wines 195000 *l.* clearly, which I am ſince informed to be much an undervalue. Thus we are at charges enough to have the French to invade us, and to conquer us, as Saxons, Danes, and Normans have done. Some ſay, that our cyder will ſoon become a drug; I anſwer, that French wine will become odious before the beſt cyder, ſuch as we can already raiſe, will become a drug. Neither did French wine become a drug, when vines did overſpread *France*. I can produce good records, when there were no vines in *France*, nor on the *Rhine*, nor in all *Germany*. Now they are their chief wealth.

AND for further encouragement, I take my wife's word, that ſhe, with others of my family, drank redſtreak at my lord *Scudamore*'s houſe this ſummer, of eleven years old, ſo rich, ſtrong, briſk, and pleaſant, that they took it to be old Spaniſh, or Greek wine, and they came few days ſhort of drinking cyder of ſixteen or ſeventeen years old; richer, as appears in that it was ſpent for the beſt, at my lord's wooing entertainments. And it is eight years ſince my lord's father promiſed me cyder of three, four, and eight years old, the older the better: and my lord's grandfather (at whoſe houſe my wife drank the abovementioned) was a better guardian of rich liquors than my lord's father.

BUT I have found a liquor of pears, richer, and as long laſting for many years trial, as the redſtreak: of this I intend our nurſery men, as moſt proper to be planted alternatively with apples.

I HAVE not yet heard, how the Turgovian pear thrives in *England*. Be pleaſed to review what Mr. *Evelyn* ſaith of it, in *Pomona*, pag. 13. edit. 2. If they thrive, Mr. *Evelyn* is apt (at that motion) freely and generouſly to furniſh you with a few graffs for *Stalbridge*. And thus far I have made bold to trouble you. I preſent my humble ſervice to the right honourable viſcounteſs *Ranelagh*, and her honourable daughters.

Sir, your moſt humble ſervant, J. BEAL.

SIR, if you pleaſe to engage the Royal Society at the anniverſary ſolemnity of St. *Andrew*'s, to continue their care for the propagation of the beſt cyder fruit, in large encloſures of thirty, forty, or more acres, at forty or at leaſt thirty two foot diſtance, that the plough or ſpade may keep the land in hearty tillage; I dare promiſe, that the trees will come on fairer in five years, than in ten without tillage; and bear more fruit, and more frequently abound; and Mr. *Reed* will join teſtimony in this point: naturally good ground is beſt for nurſeries, ſaith *Le Gendre*, upon good reaſons and experience. Not wormy grounds for pear kernels, ſaith *Marmaduke Coates*. The borland and linten pear is beſt for ſtrong perry, *&c. &c.*

Yeovill, March 3, 1672.

Honourable SIR,

I HAVE requeſted my ſtationer *Brome* to ſend you, together with this tract, a ſeaſonable Diſcourſe, ſhewing the Neceſſity of maintaining the eſtabliſhed Religion in oppoſition to Popery. Not as a tract made by myſelf, but very agreeable to my ſenſe; inſomuch, that if I were rich, I would put one in every hand in the two houſes of parliament; and perhaps you will not deem it unſeaſonable.

SIR, many years are paſt, ſince I had the confidence to tell my lord *Brereton*, and others of quality, that (if I did not abhor the wickedneſs) I could myſelf ſmooth and oil the *Roman* pretences, ſufficiently to impoſe upon the main body of a people far more ſagacious than I can find the Engliſh, or any other people in the world to be. For doctrine, I ſhould have good helps from *Picherell*, *Grotius*, *Modrevius*, and a hundred more, ſome aſſiſting in one point, ſome in another; and for diſcipline our own *Hooker*, *Brerewood*, *Hammond*, &c. our very rubrick, canons, and conſtitutions, would furniſh ample grounds; and then I could trick and dreſs up all, to ſhew more liberty than any proteſtants do, or dare afford; and for this laſt, Sir *Edwyn Sandys* in his *Europæ Speculum* (but with an honeſt aim) hath given me ſplendid arguments.

Now at page 6. of this diſcourſe, the oil is quite beaten out of my hand, and all my poiſonous compliments are quite put out of countenance; and by the club law of arguments of intereſt *ad hominem* we are here taught to feel the concernment for the king and people, nobility and gentry, huſbandman and tradeſman, lawyer, and all *England*, to keep off the Pope, with a long pike, at five hundred miles diſtance, if poſſible. To me *England* ſeems weak and haraſſed, out of breath, and out of heart; the proteſtants in all places ſinking apace; the Romaniſts in thouſand guiſes intruding, undermining, inſolent, and already triumphant; and whence is our remedy, when our public ſins cry aloud for publick judgments? In this caſe I would part with cloak and gown, with all accoutre-

 ments,

ments, ceremonies, and formalities, any thing, to preserve the substance.

HONOURABLE Sir, I present my humble service to the right honourable viscount *Ranelagh*, and to all the honourable family, ever remaining,

your most humble and
most obliged servant,
J. BEAL.

Yeovill, Dec. 31, 1673.

Honourable Sir,

I HAVE too long delayed to acknowledge the honour and many great favours, which I have lately received from your noble hands; and particularly your last published volume of Cold, Hydroscopes, *&c.* Truly I have been very sick some weeks before, and since I received your excellent book. And, though it gave me most pleasing treatments, whilst it was read to me, yet I did long to be my own reader of it to myself, before I would adventure to say any thing of it to you. And now I must complain against myself, that there is no regard to be had to my sentiment, or sentence concerning any of your writings. For as soon as any of them appeared, I thought always within myself, that you were at the very bottom, and that nothing could be said more on the same matter; yet all the following books have in order surprised me with fresh, and (as I think) deeper additionals. Your first tracts of air were to me as miracles; yet all that followed begot still my greater wonder. I was strangely amused at the laziness of *aurum fulminans* to take fire and flame at the cessation of air; and more, at your performances in rendering fire and flame ponderable. I thought you had said enough and finished for the corpuscularians in your large and various accounts of particular effluviums; yet your last of Cold, of the peculiarity of Air, as to moisture, and the effects of it, and of Hygroscopes, do seem more largely to discover the depth, or to extricate nature, or to direct the great methods for detecting her force, and to apply it for infinite uses. It is strange indeed, that cold, which seems to be the cramp of all things, almost a mere cessation, should raise an expansive force, as if *aurum fulminans* were fired; and that liquids, in the rage of their conflicts, should beat themselves mutually into a benumming congelation. Doubtless your motions concerning Hydroscopes will open a fair portal to a main body of deep, useful, and pleasant philosophy. Sir, you cannot suspect me of ingratitude for any of these favours and discoveries, whilst you allow me to be a man of common sense, and of ordinary reason. And truly I am, honourable Sir,

Your ever obliged and
most humble servant,
JOHN BEAL.

I BESEECH you to present my most humble service to the right honourable my lady viscountess *Ranelagh*, and to her honourable daughters.

I SHALL add a line or two on the back of this.

SIR, I named Mr. *Carew Reynol's True English Interest* to Mr. *Oldenburg* by the last post. I can say nothing to his politicals. But enough may be safely done, to make good his great words in the title page. And several great are done very effectually to the same purpose, under his majesty's countenance, and by the happy conduct of the Royal Society. And much more may in good time be done by the same prosperous conduct, and constant perseverance, and without any blameable digression from the advance in other points of useful knowledge; as myself can instance for the linen trade, mulberries for the silk trade, vineyards, *&c.* And infinitely much more yourself do best know, and especially in relation to the great trade of *England*. I fear the greatest obstructions from the gallants of *Covent Garden*, by their debaucheries, and apishness. I intend a few lines more to Mr. *Oldenburg*, concerning some particulars suggested by Mr. *Reynol*.

From *Yeovill*, Nov. 29, 1676.

SIR,

I THINK I am as deeply sensible of your manifold and great favours, as a man can be. I am sure your excellent writings do give me all the satisfaction, that my own heart can desire; and much more than so; for (to confess the truth) they give me abundant satisfaction in very many deep and weighty matters, which I had not the capacity to desire, or to enquire, or to think of. And yet, by my continual indisposition and unluckiness, I am altogether unable to make any shew of gratefulness, for you are not a person to be complimented with abundance of soft words; and I can make no oblation of substantial importance.

SIR, instead of returning you those many thanks, which I am resolved for ever to owe you, I must fall on begging, first, that you will pardon a few wild sheets, bearing the title of Nurseries, and my name, but (in truth) they are not mine; for they came so hastily from my over-running pen, and slipped away out of my power so suddenly, that they never had one minute of my second thoughts; neither had they blasted my name abroad, if Mr. *Oldenburg*'s persuasions had not prevailed with me more than my own judgment and the sense of my own reputation.

SECONDLY, as bad as the pamphlet is, I beg your honour's countenance, both towards the Royal Society, and towards *Ireland*, not for the pamphlet, but for the business, to renew and revive their solicitations every way towards the publick. Our scribbles are but trifles, in comparison of examples and action in

in fit and eminent places; and there is a conduct (as you and many right honourable perſons of your family do well know) which perform more in a year, than huge volumes in half an age; and (to inſtance in the ſmalleſt things, under the roſe) I dare ſay, that *Anthony Lawrence* can do more for propagation of orchards in five years, than Mr. *Auſten* hath done in fifty two years, as he numbers them. Yea, I can prove and ſhew, that he hath done ſo before our eyes very lately, only by tranſporting many thouſands of grafts of apples and pears of the beſt cyder fruit out of *Herefordſhire* and *Worceſterſhire*, into *Somerſetſhire*, *Dorſetſhire*, *Devonſhire*, and *Cornwall*; and by ſending grafts to *London*, and by riding up and down to give inſtructions and encouragements.

SIR, it is more for the reputation of the Royal Society to appear hearty and active in theſe matters, than to let them drive themſelves on, as doubtleſs they will do in time, though but ſlowly, without you. If there were but one or two ſubſtantial nurſeries well begun (as is here directed) in *Oxford*, *Cambridge*, *York*; and in *Ireland*, in *Dublin*, *Cork*, *Limerick*, *Waterford*, *Youghall*, *Galloway* and *Kilkenny*, we ſhould then ſee, what would be done in five years.

SIR, I have under my hand a tract, for which I intend more ſolemnly to addreſs to your honour for countenance: mean while I am haſting to the preſs a fourth Hortulane Letter, addreſſed to Mr. *Oldenburg*, of which the following page will give you the argument; and theſe four are but preliminaries and prodromes to that, which I have already drawn.

SIR,

Your moſt humble ſervant,

J. BEAL.

I HUMBLY crave the favour to preſent my moſt humble ſervice to the right honourable my lady viſcounteſs *Ranelagh*, beſeeching my lady's pardon, favour, and countenance in the ſame affair. I hear, that many worthy perſons in *Ireland* are as forward for garden orchards, as we are. Amongſt them, Mr. *Greatrix*, the healer, is more famous for nurſeries, orchards and cyder.

SIR, when this letter was written, I thought a third letter, which I ſent to *London*, had been printed; which was the cauſe, that the letter next mentioned was by me called the fourth Hortulane Letter. I hope I ſhall yet recover the third.

The cheap and eaſy diſpatch for raiſing, preſerving, and cheriſhing rich nurſeries, and young orchards, and for renewing old and decayed orchards, with more expreſs confirmations of ſome conſiderables intimated in the foregoing Hortulane Letters; this being the fourth Hortulane Letter to Henry Oldenburg, *Eſq; from* J. Beal. *In four chapters.*

CHAP. I. Shewing how ſome by triflings do retard the planting of nurſeries and orchards, and defending the old plain way for ſure diſpatch.

CHAP. II. Shewing ſome plain, ſpeedy, and eaſy ways, how to guard nurſeries, orchards, and gardens from worms, birds, mice, and other noxious vermin; how to prevent or correct bad winds, blaſts, hurtful thunders and lightenings; to purify infectious air; to heal unwholeſom waters; and detecting trifling, ſuperſtitious, and ineffectual pretences, inſtead of true remedies.

CHAP. III. Shewing the moſt expedite and cheap ways of putting forward a young orchard for ſpeedy growth, beauty, and fertility; and how to renew and revive an old, decayed, moſſy, cancerous, and fruitleſs orchard; to be (on a ſudden) freſh, beautiful, and fruitful; at very ſmall charges, or trouble, or with preſent profit, and full reward, whilſt it is doing.

CHAP. IV. Defending more expreſsly the facility of ſetling and maintaining hortulane correſpondencies between theſe triple kingdoms and the Engliſh colonies in America, for exchanging all ſorts of ſeeds, ſets, or plants, together with their proper ſoils yearly.

THIS tract is much larger, than all the other hortulane letters joined together.

For Mr. John Houghton.

Yeovill, Feb. 1, 1680.

Worthy Mr. HOUGHTON,

I INTREAT your patience to hear, how I am rarely ſurpriſed with ſuch noble kindneſſes, that I know not how to prove myſelf an honeſt or thankful man. By our carrier laſt week, I received Mr. *Boyle*'s Aerial Noctiluca, richly embelliſhed with gold and other ornaments, the carrier alſo paid; but not a line or word in the encloſed ſheet, to ſignify to whom I might return my thanks; but I have good reaſon to believe, that it was ſent me by Mr. *Boyle*'s order, for that he obliged me with his many other volumes in like manner richly garniſhed. Therefore I pray you preſent my moſt humble ſervice to Mr. *Boyle*, and let this haſty paper ſay to him, that I cannot but admire the extraordinary ſagacity of the author, and his ſucceſsful induſtry in thoſe reſearches; but I am ſorry, that he was not furniſhed with the beſt preparation of the Bolonian ſtone, and of *Balduin*'s phoſphorus, and of *Kraff*'s two luminaries to ſave him ſome of his pains, and for his further progreſs. We have for ever loſt many rare diſcoveries by the reſervedneſs and mortality of the authors; and theſe Mr. *Boyle*'s ſucceſſes gives us great hope, that in time we may obtain luminaries of great uſe for the general benefit of all mankind. For it appears, that ſome materials may be found compoſed of ſome cold, and more ſparingly ſelf-conſuming ſubſtances. And that, albeit the ſo frequent co-exiſtence of flame and light do beget

get some prejudice against the attempt; yet is it not so much, as that we ought to despair of finding within the region of possibilities, permanent or long lasting luminaries. Rotten wood, and the tree in *Jamaica*, mentioned by Dr. *Trapham* (of which I hope Mr. *Boyle* hath a fuller account) do afford long lasting luminaries: and snow, which seems outwardly of a cold complexion, hath some degree of luminousness, enough to dazzle our eyes: but snow hath some intrinsic or circumstantial heat, as appears by the vegetables cherished and impregnated under it. And Mr. *Boyle* hath given us the demonstration, how whites do resist solar beams, and blacks imbibe them; and Mr. *Newton*'s account of whiteness hath evaded the objections of all his adversaries.

IN a very hot summer day, we were eating lobsters at supper, which were very pleasant and sweet to all that sat at the table; but whilst we were sitting (within half an hour after we had eaten the lobsters) we saw the insides of the shells shining vividly from the corner of a cupboard, to which they were removed. And Sir *H. Wotton* told me, that after a clap of thunder, cart-loads of shell-fishes, which they were driving into the town (of *Venice* as I take it) were forthwith driven out, they being well assured, that none would buy them after thunder: but thunder suddenly taints some of our drinks, especially sweet wort, before the yeast or barm is put to it. Whatever becomes of this note, there may be something found uniformly proceeding from luciferous bodies; and of necessity every effect must be proportionate to its cause. If *A* be proportionate to *B*, it cannot be so to *C* also, *qua* differing from *B*: but in this hasty scribble, I wander above my own understanding; and therefore it is time I should beg your pardon, and subscribe

Your much obliged,

and very humble servant,

J. BEAL.

To Mr. Boyle.

Yeovill, Feb. 16, 1680.

Honourable SIR,

I WAS so strangely transported, when I received your Aerial Noctiluca, that I could scarcely believe mine own eyes, that you should condescend so low; yet I had good reason to believe, that it was sent me by your express order: for that you have obliged me formerly in like manner with all your volumes; which veracity and sincerity bind me to acknowledge to be all along the profoundest discoveries of art and nature, that ever appeared in the world.

SIR, I was tempted to send you, by Mr. *Houghton*, an hasty and wild rhapsody of little or no sense; I must confess I sent it before I had seen more than a very few pages of your book, being interrupted by my function, and visits of my chief alliances: and now I must hasten my recantation; for we could not spare you one line or hint, that is in your book. You have explained the terms and the business so accurately, and you have so methodically step by step ascended far higher than I could expect, or imagine; and if you have failed of other men's expedients, though that might cost you the more trouble, yet it is more to be esteemed by us, for the variety: and now you have done that, which may purchase all other discoveries by fair exchange.

SIR, I cannot allow your scruple in favour of mankind. Mr. *Hartlib* told me long since, how largely, and how often, your bounty hindred *Kuffler* from vending his destroying artifice; yet I never heard what hurt or good it hath done, since he made sale of it. All antiquaries agree in it, that our wars have been less destructive, since our thundering artillery, than in former ages: the holy scriptures bear full witnesses to it; and little *Benjamin* lost more in one day, than all our great monarchs and potentates have done in the main battalia of three years war. For it was but like the hunting of a hare, or of a fox by a wood's side: and I have been told, that they have reported the loss of more men in their skirmishes, than they have there in battle array. I know not what the French bombs were; but the sooner they forced a surrender, the more lives were saved on both sides. And if brave *Brandenburg* could have forced *Stetin* to have surrendred by any terrifying artillery with speed, many lives on both sides, which were lost by the long siege, might have been saved. If *England* should be in distress, I should pray for such terrifying engines, as would soon rout all our enemies: and I wish we had such against the Moors and Algerines. Therefore I pray do not suffer your best inventions of defence or offence to die in your hands, but preserve them for our own day of need. I do conceive, that as the late inventions of printing and navigation were great blessings to *Christendom*, for the propagation of the gospel in our latter days, so was also the thundering artillery. And as far as I can understand the prophet *Daniel*, ch. ii. chap. vii. and *Revel.* ch. xvii. the greatest work does yet remain, and perhaps may be near at hand; that as those three great expedients have been above three hundred years preparing for the battle of the lamb, so God only knows, how many thousand years may yet remain for the world to enjoy the conquest of the lamb.

OF which I have much to say some other time, for my right honourable lady viscountess *Ranelagh*, to whom I beg leave to present my humble service. I pray for you all as my bounden duty.

I AM persuaded, that the microscope, as it is now wonderfully improved by Mr. *Hook* and Mr. *Leeuwenhoeck*, and as they are now made by *Cox* and *Mellin*, were by divine providence ordained to accompany your luminous discoveries; and that all their important uses will not be found out in many years. Not that I dare think it fit, that you should be troubled with it; but it is a great damage to the

the publick and to the commonwealth of philoſophy, if you ſhould not have a full college of the beſt ingenious to govern and employ them by your inſtructions; which is all that reaſonable men can expect from you, your hands being ſo full of the nobleſt arguments. I can name at leaſt thirty one admirable volumes, which you have already publiſhed, taking in what I find in Philoſophical Tranſactions, num. 31. and num. 32. and again, num. 62. and num. 63. and num. 132. and elſewhere. And the volumes, which you have publiſhed, do mention about twenty four noble arguments now under your hand, which are impatiently deſired by all, that have hearts for ſolid philoſophy: and I hope, that your Sylva of promiſcuous experiments will be your eaſieſt work, becauſe thoſe you may caſt in at broken hours how you pleaſe; and afterward enlarge them for various importances, far beyond the bulk by marginal references. For we are covetous to be ſecured of all your profound obſervations, and painful labours. Moſt of your publiſhed volumes are alſo rendred in Latin, and ſome of them are enlarged in latter impreſſions.

SIR, upon the by, and partly as belonging to your diſcourſe of Light, I am able to aſſure you, that ſuch darkneſs, as ſeems to moſt men like Egyptian darkneſs, is clear light to ſome animals, and to ſome very few men and women: this I found out, by trying for helps for mine own decayed ſight, and ſince by the experience of ſome few others. Some of my particulars will ſeem very incredible; but I ſhall ſay no more than what I can fully prove. To put a ſtop to this tedioufneſs, I muſt abruptly ſubſcribe,

SIR,

your ever obliged,

moſt affectionate, and

moſt obedient ſervant,

J. BEAL.

POSTSCRIPT.

SIR, I intreat your patience for two advertiſements: firſt our *London* merchants have been always famous for generoſity: they could be now induced to take into their company ſome ingenious virtuoſi to interpret your beſt philoſophy, and to ſhew the uſe of your philoſophical utenſils. I hope they would prove good barter, and then employ our curious operators: but this ſhould be done with all convenient diſpatch, to prevent, that the French, Italians, and Jeſuits themſelves, do not pre-occupate our glory, and turn our beſt artillery againſt ourſelves. If the *Engliſh* pre-occupate, the interpreters may find opportunities to inform the great monarchs, Mahometans, and infidels, that the Jeſuits are interlopers in all trades and traffick by ſea and land; and do infuſe principles for the tripple crown of *Rome* againſt the intereſt of all other monarchs. The monarchs of the *Eaſt*, of *Japan*, and *China*, would not diſdain ſome of your inſtruments. Monſieur *Bernier* tells us, that the great Omrams in the courts of the great Mogul did highly eſteem his new philoſophy, which I think could be no other than that of *Gaſſendus*; which ſince his time is mightily improved, and thus, by God's bleſſing, the light of art and of nature may uſher in the light of grace for the laſt and univerſal propagation of the goſpel; as *Auguſtus* by ſettling peace all over the Roman uſhered in our Lord, the prince of peace, in the firſt propagation of the goſpel. That was begun by blood and ſufferings; this may be more proſperous by the conqueſt of the holy lamb.

SECONDLY, if the miniſters of *New England* can be intreated to print monthly bills of births, male and female, marriages, and burials, male and female, within fifteen miles of *Boſton* and *New Cambridge*, and then once a year to ſend in the like bills from all their colonies, and the iſlands about them; this I conceive would be acceptable to the king, and to all that can make the beſt uſe of Sir *W. Petty*'s notes on the bills of mortality. Sir, this is not to taſk you, but a word from your mouth may probably engage *H. Wood*, or ſome worthy perſon, to preſs it on effectually.

THEY are ſaid to be great breeders, and have lately had ſweeping diſeaſes, beſides their loſs in their late wars: and there are amongſt them learned men to give us a map of *New England*, and their iſlands, as they are now ſettled in peace and plenty; noting in the margin their townſhips, and churches, with other fit circumſtances, taking in *Longland* amongſt their other iſlands. All this may be reaſonably expected from their printing preſs, by the communications of *Boſton* and *Cambridge*.

March 2, 1680.

In Noctilucam viri ampliſſimi ſummique philoſophi, R. B.

EPIGRAMMA.

ÆMULUS en! noſtri ſurgit Britannicus heros;
Noſtraque partitur munera, Phœbus ait.
Non jam de cœlo poſcent ſibi lumina noctes;
I nunc per nemora, & fige, Diana, feras.
O vivat, vigeat longævus, plurima ut ultra
Proferat in lucem ſplendida ſcripta, precor.
Hunc modo parca favens multos conſervet in annos,
Altior humanâ ſorte feretur homo.

HEN. LAVOR, *raptim*.

SIR, this is from our quaker, a man exquiſitely learned in all the arts and ſciences, that are yet known amongſt us; a profound admirer of all your volumes; very reſerved, and of few words; ſo that this is merely enforced from his great reſpects, and ſtrong affections. He gave me epigrams upon ſome of

of your other volumes, which I ſent to Mr. *Oldenburg*, as I received them, in his own hand; ſo that I have no copy.

SIR, you do not allow any ſuch introduction in the front of your other volumes; but I wiſh you would refer it to Mr. *Warr*'s diſcretion, if your *Noctiluca* ſhould come abroad in Latin, to prefix this modeſt epigram for the reader's ſake; *et boni ominis gratiâ*. A fit epigram is an acceptable preparative for the guſt of moſt readers. This is plain and honeſt, and you can indulge affectionate ſimplicity. Excuſe me, Sir, I ſhould be glad to ſee your picture in a curious cut; and the moſt proper epigram, that the beſt wits can make, in the front of every of your volumes, in Latin for your Latin, in Engliſh for your Engliſh. A picture prompts the reader to fancy, that he ſees and hears the author ſpeaking, enlivens his attention, and confirms his memory by the moſt natural impreſſion. I hope you will pardon this over-officiouſneſs, which is not intended to afflict your modeſty, but for the benefit of the readers.

SIR, at the end of my laſt to you, where I wiſh for a map of *New-England*, noting in the margin their towns, churches, and other fit circumſtances; I ſhould have added the natural peculiarities of the place. Yourſelf hath given excellent inſtructions for thoſe purpoſes, in Phil. Tranſ. vol. I. numb. 11. Dr. *Plott*, in his Natural Hiſtory of *Oxfordſhire*, hath done the beſt in it, that I have yet ſeen. And Mr. *Oldenburg*'s Breviate on the ſame, numb. 135, would give good light to *New-Cambridge*. And his preface to vol. XI. ſolicits the ſame; but when he comes to the main point, at the end of that preface, there are ſo many falſe prints and diſlocations, that the ſenſe is paſt recovery. I hope they have all the Phil. Tranſ. in their *Cambridge*. Dr. *Merret*'s Pinax may do them much good. There is an excellent account of the depth of the ſoil from *Barbados*, numb. 117, pag. 399. and a wonderful account from *Bermudas*, numb. 30. pag. 565. I wiſh you had the like from the reſt of the Caribbee iſles, and from *Jamaica*. If *New-England* would now begin it, probably the Engliſh would follow that example in all parts of that large continent, and in the iſlands about it. I have taken ſome pains to find what hath been done in it in other parts of our old world, and have much more to offer for *New-England*: but I have tranſgreſſed already beyond the bounds of a civil addreſs. Sir, I pray for you, and all your noble relations.

SIR,
your ever obliged, and
moſt obedient ſervant,
J. BEALE.

SIR, for ſafety of conveyance, I ſhall duplicate the ſuperſcribed directions.

Yeovill, June 26, 1682.

Honourable Sir,

I HAVE no language to expreſs, how ſenſible I am of my deep obligations for your many great favours; and you have no leiſure for impertinencies. I ſhall only offer to you, at preſent, what I conceive to be of great importance for the publick; and to obtain a free paſſage both for true theology, and for ſound philoſophy.

SIR, all true hearted Engliſhmen, and all good men amongſt us, are aggrieved to ſee the ſwarms and prevalence of Hobbians and Stubbians, atheiſts and ſcoffers, theatrical buffoons, blaſphemers, and the burleſque and traveſtry, which explode all religion, graces and virtues, and moſt of all thoſe heroical virtues, which are the ſtrength and honour of our nation. I dare ſay, theſe have done more real damages and diſhonour to the king, and to our nation, than all the diſſenters in their ſeveral guiſes have been hitherto able to do. And they ſeem to me more dangerous, than all our bloody wars with foreigners, the great plague, and the firing of *London*. Neither can I hear, that God's wonderful mercies upon one of the worſt have been effectual to reclaim the other knights, or the blaſphemous balcony.

FOR a remedy, I have lately tranſacted with one of my beſt friends in ſeveral letters; he deſponds, and ſays, *Conclamatum eſt*, for any thing, that is ſerious, to be heard among the gallants; that it renders a man but ridiculous, to ſpeak there under the rate of dam'me for a preface; and he cannot be a ſtranger to the mode of court, *Exeat aulâ, qui velit eſſe pius*.

SIR, I pray give me leave to abbreviate my arguments to you. We ſee, that God hath in great mercy raiſed a very powerful and commendable clergy amongſt us; at leaſt an hundred excellent ſermons in *London* every ſolemn day; ſome thouſands preached and printed, with other excellent treatiſes of divinity, ſince his majeſty's bleſſed reſtoration. I will name no more, but as our near concernment, Dr. *Tillotſon*'s ſermon at *Whitehall*, on the 2d of *Pet.* iii. 3, where he ſhews, how atheiſm came from *Italy* into *France*, and is now moſt rampant in *England*; and ſhews, how God may forbear his puniſhments in this world for perſonal tranſgreſſions, but is concerned ſometimes to puniſh whole nations for national tranſgreſſions. To this I add Dr. *Parker*'s late Demonſtration, ſhewing how inconſiſtent groſs immoralities are with true Chriſtianity. This book I wiſh were mentioned with juſt applauſe in the Weekly Memorials, that the kingdom may know, that the Royal Society do heartily eſpouſe true and ſolid virtues together with ſerious Chriſtianity. And it would be for the honour of the church of *England*, if their cenſures were as vigorous againſt blaſphemies and rank immoralities, as ſome are for mere formalities; as I ſo lately diſcourſed by the ſeſſions of *Devonſhire*, printed and drawn by baronet *Semour*. The more we are obliged to adventure with boldneſs and reſolution, to encourage the city to advance in arts and ſciences. And we have good grounds to hope, that in a ſhort time, by God's bleſſing, they may be the moſt famous and proſperous empory, that we know of; being

being aſſiſted with both our univerſities, which now do heartily concur with them. And it is a good omen, that God hath given them his lively oracles above any other empory; for this, if well received, (as I hope it is by the main body of the city) ſecures them of the bleſſing. And they have already a great number of excellent teachers and writers, and diſciples, of all parts of mathematicks, eſpecially for navigation: and his majeſty hath the firſt honour for endowing a college to teach the art of navigation, which is the great concernment of this inſulary monarchy. Mr. *Moxon*'s charts and mechanicals, and Mr. *Seller*'s furniture for navigation, may be an excellent entertainment for intelligent citizens: and Phil. Tranſ. numb. 24, will ſhew them, how long they have been inſtructed with ſuch aids for navigation, as other parts of the world are not aware of: and yourſelf, in the ſecond tome of Uſefulneſs, have twice told them what you know of the ſkill of ſome urinators. And it is more than ten years ſince his majeſty's urinator, Mr. *Curtis*, publiſhed in the Gazette, how he had practiſed, and was furniſhed with inſtruments divers, and ſhipping, to recover permanent goods, which are loſt by ſhipwreck; which minds me how eaſy it were, and advantageous for our merchants, in all their voyages, to be furniſhed with ſuch urinators; and with the engine, which claws up all the natural and caſual treaſuries of the ſeas, mentioned in Hiſt. R. S. pag. 220, & 248, ſo long ago: and the citizens are by this time able to diſcern, whether they are more obliged to the buffoon, who made it his only buſineſs to vilify virtues and inventions, or to thoſe illuſtrious perſons, who have taken ſo much pains (and at ſo much of their coſt and charges) to increaſe profitable arts and inventions, for the great benefit of the city. I think, no empory hath ſo many, that are expert in the ſeveral kinds of ſhort hands; this requires ſome time and pains to be ſo prompt at it as they are. To perſons of that docibility, the real character may be eaſily taught in a few days, at leaſt to be their own maſters in the practice; and the ſooner, if a ſhort model were printed for an introduction. And the characters, which are vulgarly known for arithmetick, chemiſtry, aſtronomy, and all parts of mathematicks, would ſoon paſs current, with a mixture of Dr. *Wilkins*'s real character for all European Chriſtendom. Many more excellent arts I could add of great worth, which myſelf could teach in few hours, and have practiſed in my younger days. And the citizens, as many of them as can make uſe of a Gazette, may ſoon gain a benefit to themſelves (citizens for their diverſions, gentlemen and virtuous ladies) by reading the beſt books of philoſophy; the Phil. Tranſ. Phil. Coll. and Weekly Memorials, which in their minute half ſheets, by their pleaſing variety, may bore a hole through the thicket of Stubbians. To convince the ſcoffers of their contempt of knowledge, by theſe Phil. Coll. and Memorials, if it ſhall pleaſe God to continue them, we are in a ſure way of furniſhing the city, and all *England*, with the moſt uſeful and moſt wonderful knowledge, that the learned world can afford. The account of *China*, in the Memorials, makes me wiſh, that we had a conſtant correſpondence with them, and they freed from the inhuman Tartars: Mr. *Mallenge*'s microſcope would ſhew them, that the Engliſh have as many eyes as themſelves; and, perhaps, they may aſſiſt us, to improve the teleſcope: and I am perſuaded, that ſhortly it will be much improved, for wonderful diſcoveries in the planets.

O THAT Dr. *Spratt* could be perſuaded to go on with the Hiſtory of the Royal Society! The argument is become much more pleaſant, more hopeful, and the ſeaſon to revive it is perfectly ripe; and no man, that hath the wit to underſtand the excellency of his writings, will adventure to follow him. In pag. 413, 414, *&c.* he hath ſaid enough to reclaim the ſcoffers, if they had been reaſonable animals.

SIR, I wiſh, that Mr. *Erſkine*, and our other Scottiſh virtuoſi, would find out a fit perſon in *Edinburgh* to publiſh half a ſheet weekly, extracted out of the beſt of ours; or as they ſhall be better inſtructed upon the place for the advancement of *Scotland*. My lord of *Perth* will countenance it to his utmoſt, as I am told from a ſure hand. I have caſt in my ſymbol in Phil. Tranſ. numb. 116. pag. 357, and more is for their purpoſe, numb. 124, pag. 583; to which I can add much very peculiar for *Scotland*. It were our happineſs, if we could find them good work at home, rather than that they ſhould be the forlorn hope, or lead the van in all foreign wars, never to return. They are the beſt recruits in the world, frugal, and hardy, fit to recover a good ſhare of the fiſhery upon their own coaſts; or to aſſiſt us in any rough ſervice by ſea or land, and for our napery; and to ſtore our American colonies; which to them would be a paradiſe, in compariſon of their own country. Whites are ſtewards as ſoon as they arrive: but we have moſt need of them for *Newfoundland*, a large and rich territory; and, by right, his majeſty's iſland, but a part of it lately uſurped by the French.

THE like, I ſay, for half a ſheet weekly in *Dublin*, for all *Ireland*; and I do preſume to name Mr. *Conyers*, as fit for the purpoſe, and Sir *James Shaen*, and Sir *William Petty*, who never fails to exceed all expectation; and many excellent perſons of your honourable relations can give life to this buſineſs.

FOR *Boſton*, in *New-England*, where they cannot want fit perſons, nor fit opportunities to diſperſe their prints all over our American colonies, I wiſh they would publiſh a ſheet monthly.

BY theſe expedients (as ſlight as they ſeem) I dare engage, that you would ſoon have thouſands of votaries, and, perhaps, many conſiderable aſſiſtants to affront the atheiſtical ſcoffers: and this is to vere about, in the ſailors phraſe.

SIR,

SIR, I have much more to ſay, but I muſt beg your pardon for this intolerable burthen, which (by the iniquity of the times) we are conſtrained to bear, and to afflict our beſt friends with a ſhare of it.

SIR, I pray for you, and for all your noble relations, particularly my great and conſtant friend, my lady viſcounteſs *Ranelagh*'s, and all her's, and am,

SIR,

your ever obliged, moſt

affectionate, humble ſervant,

J. B.

O WHAT a goodly ſight it was to ſee our grandees in the open theatre laugh and grin at the rupture of their own ſolemnly ſubſcribed parole! to prefer a moſt ſlanderous fable with an adulterous maſquerade, which barbarians and ſavages would abhor, in ſuch gibberiſh, as their lacqueys derided, before the ſerious intereſts of all mankind! Gentlemen of honour for Crim Tartars court, grand buffoons! what can the Abhorrers ſay for this? *Eadem fides utrinque.* A nation bewitched, and *Shadwell* the Dramatiſt for the Lancaſhire witches, fitter indeed than for the virtuoſi. I have a Latin iambick for the laureat atheiſts, that may ſave eſquire *Ketch* the labour: it is as ſharp as *in iben*; but where are their contributions? all drowned in the ſame parole? yet it is as good as ſome of their bonds.

P. S. SIR, I wiſh, that ſome of theſe lines in the margin, remark 1, 2, 3, *&c.* were worthy to be entered, *ab incognito*, in the Memorials, where there are good hints for the city, or for the kingdom, and they ſhould be briefly mentioned in the firſt advertiſement of the Gazette. This done three or four times, would make the Memorials paſs as far as the Gazettes, and be more welcome, effectual, and everlaſting. I pray pardon this trifling. The right management of fame is a powerful myſtery, as lord *Bacon* ſhews, in his Fragment of fame. I was once expert at it, by Sir *H. Wotton*'s inſtructions, and it is my main deſign, as the beſt ſtrength of this addreſs; which with better help and good conduct, all the wheels being put into motion, may turn the ſtream, and do much good to many good people, and confound the proudeſt of God's daring enemies, *Deo adjuvante.* God bleſs the promoters.

THE TITLE.

Friendly advices and encouragement for the advancement of London, *and this whole monarchy, in true piety, the nobleſt arts, the beſt culture, and in all the branches of ſound and uſeful knowledge.*

Yeovill, July. 1, 1682.

Honourable Sir,

I HASTEN theſe, to correct a notorious fault in a long letter, which I ſent for you hence June 26th, and to make ſome conſiderable additions, and to beſeech you, if any of my lines be thought fit for the Memorials, to divide them in ſome fit joint, that they may not take up too much room in any one tract of the memorials.

SIR, my great fault was, that I did not do right to Dr. *Tillotſon*; having not ſeen his book ſince it was firſt publiſhed. Having his books now in my hand, I deſire it may run thus———I ſhall only name, as our near concernment, the reverend Dr. *Tillotſon*, dean of *Canterbury*, the firſt vol. fourth edit. printed for Mr. *Gellibrand* 1680-81, where he ſhews, 1. The unreaſonableneſs of atheiſm, and ſcoffing at religion. 2. And recommends religion to men, from the great and manifold advantages, which it brings both to publick ſociety, and to particular perſons. 3. He repreſents the excellencies more particularly of the Chriſtian religion. 4. He perſuades men to the practice of this holy religion. On 2 *Peter* iii. 3. p. 99, in the moſt powerful language, and the moſt moving arguments, he ſaith enough to reclaim atheiſts and ſcoffers, if they were not more ſenſeleſs, and more unreaſonable, than brutes, or ſtocks and ſtones. And on *Prov.* iv. 34. p. 131. he ſhews, that it is the uſual courſe of God's providence, to recompenſe religious and virtuous nations with temporal bleſſings, and proſperity; and, on the other hand, that God many times ſuffers the moſt grievous ſins of particular perſons to go unpuniſhed in this world; but that the general and crying ſins of a nation cannot hope to eſcape publick judgments, unleſs they be prevented by a general repentance. And p. 145. he ſhews, that this atheiſtical humour among Chriſtians was the ſpawn of the groſs ſuperſtitions, and corrupt manners of the Romiſh church and court: that in the laſt age atheiſm travelled over the Alps, and infected *France*: and now of late it hath croſſed the ſeas, and invaded our nation; and it hath prevailed to amazement: that he doth not think, that there are any people in the world, that are generally more indiſpoſed to it, and can worſe brook it; ſerioufneſs and zeal in religion being almoſt the natural temper of the *Engliſh*. So that nothing is to me (ſaith he) matter of greater wonder, than that in a grave and ſober nation, prophaneneſs ſhould ever come to gain ſo much ground, and the beſt and wiſeſt religion in the world to be made the ſcorn of fools———I ſpeak it knowingly (ſaith he) a man can hardly paſs the ſtreets without having his ears grated and pierced with ſuch horrid and blaſphemous oaths, and curſes, as are enough, if we were guilty of no other ſin, to ſink a nation. And this not only from the tribe, that wear liveries, but from thoſe that go before them, and ſhould give better example.

To this I add the reverend Dr. *Parker*, arch-deacon of *Canterbury*'s Demonſtration of the divine authority of the law of nature, and of the Chriſtian Religion: in two parts. Printed for Mr. *Royſton* and Mr. *Chiſwell*, 1681. I do not think there was a fitter treatiſe written

ten ſince the apoſtle's age, for our nation, in our circumſtances; ſince pride and prodigality, luxury, and all exceſſes do abound amongſt us, to the utmoſt peril of the city, and of this whole monarchy, as Mr. *Mun* the merchant, like a wiſe and pious Chriſtian, hath demonſtrated fully in his third and nineteenth chapter, highly approved by the wiſeſt of our ſtateſmen, and therefore licenſed in *Whitehall*. Sir, I will ſay no more of doctor *Parker*'s book, becauſe it will take up too much room in the Memorials, to give a full account of it, though in a breviate.

BUT ſince the author of the Memorials ſeems well inclined to give quick touches in behalf of religion, I wiſh, that the *Voice of the Nation* were re-printed in ſmall, that he may give notice in one of his Memorials, of that weighty and invincible argument, that the atheiſm and debaucheries of this nation, above all nations, that ever we heard of, is the moſt likely expedient to introduce popery among us. And I doubt not, but I could ſend a pregnant hint againſt our national debauchery for every Memorial, as long as it ſhall pleaſe God to preſerve my life, who am now entering the 80th year of my age. Sir, I muſt now omit the additions, which I intended as abovementioned. And I pray for you, and for all your noble relations, which have always been my great and ſureſt friends,

SIR,

your ever obliged

and moſt humble ſervant,

J. BEAL.

POSTSCRIPT.

SIR, what I wrote of Dr. *Sprat*, *Scotland*, *Ireland*, and *New-England*, I humbly conceive fitter to be done by the Royal Society, than to be entered into the Memorials; and I have ſomething conſiderable to add concerning the beſt culture, to make good the title at the bottom of my laſt. And I hope by your favour I may paſs incognito, as I have done often by my deceaſed friend, Mr. *Oldenburg*'s favour, in his Philoſophical Tranſactions. And if my letters are too heavy for you, I pray you eaſe yourſelf by referring them, with my humble ſervice, to Mr. *Warr* the elder, that he may ſuggeſt to you what he thinks proper, when he finds you at beſt leiſure.

Yeovill, July 8, 1682.

[I pray firſt ſee my poſtcript in the laſt clauſe of the encloſed paper.]

Honourable Sir,

I SHOULD be now aſhamed to give you this third trouble, ſo ſoon after my laſt of *July* firſt, if I had not met newly with an ugly buſineſs, for which the Royal Society is nearly concerned. For ſome will bid them ſweep clean before their own doors; *medice cura teipſum*; they will ſay the virtuoſi do now publickly declare againſt all the fundamental virtues, and commend prodigality, pride, vanity and luxury, to be for the good of the nation.

SIR, this you may ſee in Mr. *Houghton*'s collection of letters for huſbandry and trade, number 5. pag. 52. line 15. and in the laſt line of that number.

I WROTE to him with as much affection as I could expreſs, and with the beſt arguments of reaſon and divinity, that I could ſuggeſt, to retract it, as a damnable ſentence, contrary to all the hiſtories that I have ſeen, and eſpecially the whole tenor of the holy ſcriptures; and I referred him to Mr. *Mun*'s third and nineteenth chap. where he demonſtrates the contrary, like a religious and wiſe man. Mr. *Houghton*, number 6, p. 59, 60, 61, 62, goes on higher than before, and writes to me, that he had read both theſe chapters, and could find matter enough there, in which he contradicted himſelf, and juſtified Mr. *Houghton*'s ſentiment, *&c.*

SIR, if we take notice of his name, quality, or tracts, we ſhall ſpread the blot wider, but for a perfect cure of it, this I humbly propoſe. When I have ſaid what I have ſaid for doctor *Parker*'s Demonſtration, I will raiſe an anſwer to Mr. *Houghton*'s objection thus —— If it be objected, what will become of our Eaſt-Indian and Turky trade, and other commerce, which I think is almoſt univerſal, if we be ſo ſtrict and ſevere for ſober and Chriſtian virtues; and do not allow of exceſſes in proportion to the largeneſs of our commerce, that we may ſpend the ſtores; which are brought home: to this I will anſwer, firſt, with Mr. *Mun*'s demonſtrations; the moſt judicious (I think) that ever wrote for the foreign trade of *England*. Secondly, I will anſwer with the fulneſs of theological demonſtrations, ſhewing how ſuch exceſſes in pride and luxury (according to the proportions of the increaſing and abounding commerce) have been the ruin and precipitancy of all the greateſt empories, and of all the monarchies, that have ever yet been, and that it ſhall ever be ſo; God having ſo often and expreſly declared it in his word revealed, and in his terrible deeds executed in the face of all the world.

AND firſt I will begin with Mr. *Mun*'s demonſtration, as a ſure remedy to prevent it, and worth millions yearly to *London* and this monarchy, if duly regarded. Chap. 3. pag. 22. A ſtaple or magazine (ſaith he) for foreign corn, indico, ſpices, raw-ſilk, cotton, wooll, or any other commodities whatſoever to be imported, will increaſe ſhipping, trade, treaſure, and the king's cuſtoms, by exporting them again, where need ſhall require, *&c.* Much more there to the ſame purpoſe; and in the ſame chapter, pag. 15, we ſhould ſoberly refrain from exceſſive conſumption of foreign wares, in our diet and raiment, with ſuch often change of faſhions, as is uſed —

which

which vices at this present are more notorious amongst us, than in former ages, *&c.* Again, chap. 19. pag. 155, 156, 157, 158, 159, and generally throughout that chapter, and in the aforementioned chapter, he charges the English to be the most prodigious wasters and consumers in the world, to have far outgone the Hollander in the swinish vice of drunkenness; to pull the pot from their nose, to the great hurt and dishonour of this famous nation: and much more there, than I must repeat. This discourse was addressed to the earl of *Southampton*, lord high treasurer, after the author's death, and highly approved by the wisest of our statesmen; as partly appears, in that it was licensed at *Whitehall*, March 24, 1663. by the principal secretary of state. If those, which were best able to judge of these matters of state, had discerned them, certainly they would not have licensed such false principles, which could have hindered trade or commerce; and how much have our excesses, luxury, and debaucheries abounded, since this treatise hath been written or published! I say nothing to hinder the ancient hospitality of the city, nor the decency of their apparel, nor the great variety of liquors or drinks, partly hinted in the Weekly Memorials, number 21, pag. 115, 116. But that our excesses in any kind should go so much beyond the excesses of *Rome*, *Madrid*, *Amsterdam*, or any empire, that we can hear of. This brings us back to the just reproach of surpassing the effects of the Romish superstition and fopperies, in the worst and most dangerous vices, which a reverend person said before were in former days the spawn of the Romish fopperies.

SECONDLY, for the demonstration by God's holy word, and deeds, that such excesses are the sure fore-runners of the ruin and precipitancy of the greatest cities and monarchies in the world, from the beginning until this day, I will only refer to a sermon preached to the house of commons, Nov. 13, 1678, by the reverend Dr. *Stillingfleet*. That excellent sermon is wholly engaged in those proofs, especially from pag. 17, second edition.

SIR, I am so large, with a great desire to make this business clear and sure; and I wish again, that the *Voice of the Nation* may be re-printed again in small, such store of them, that some of them may be stitched to the memorials, and dispersed throughout the kingdom, only mentioned (according to the purport of it) in the memorials.

SIR, I have many more remarkables of quite another nature, which seem to me of such importance, that they do lie heavy upon my spirit, and constrain me to stir every stone, and to trouble my best friends to make them pass current.

AND by my infirmities I am constrained to dictate extempore, and do want a friend to assist me. I intreat, that *Whitehall* may not be mentioned in any of my lines, nor any word, that seems to reflect upon the place, nor the word gallants; I confine my expressions to Hobbians and Stubbians, atheists, scoffers, blasphemers. Where I say of doctor *Tillotson*, that he said enough to reclaim all the scoffers, which are not more senseless, it should be thus; which are not as senseless and as unreasonable, as brutes, or stocks and stones. There are other errata.

SIR, I shall be loth to trouble you again in this kind, but if you please to appoint your servant to direct me, how I may address it safely; perhaps I may draw up in half a sheet the right managery of fame, as I was instructed by Sir *H. Wotton*, and have by frequent trials found it more stupendously effectual, than myself could have imagined. If *London* had a great fault, and had no ears to hear (as I had prepared all the great resorts of the city) by veering about, first to remotest cities, having God and a good cause on my side; I could make the check come thundering into the city, that they should all take it to be *vox Dei, non hominis*; and make the eccho continue as long as I please, or revive it when I please, without any the least danger to myself, or any others.

SIR, I beseech you, give my most humble service to the right honourable viscountess *Ranelagh*, and yourself to accept of the sincere devotion of

your most obliged

and most humble servant,

J. BEAL.

WE see, that God hath been gracious and bountiful to us, above many other nations, in preserving and blessing us with peace and plenty, with a universal commerce, and with a great advancement in useful arts and sciences, in manufactures, mechanicals, and all sorts of good culture (of which I have much to say hereafter:) and now we should be notoriously ingrateful, if we should abuse God's graces, mercies, and bounty, with pride, luxury, and wantonness, whereas we are the more bounden to give God the glory by our true humbleness and suitable industry. And this is a good lesson, and Mr. *Mun*'s book a most excellent book, as well for *Dublin*, as for *London*; that they may not strive, which shall exceed the other in pride and vanity; which (if it be not prevented) threatens a sudden ruin to us all.

WE may get nobler employment, than to glory in gay clothes, to enslave ourselves to French fashions, and to pay monthly pensions to French taylors; to obey the precepts of *Heliogabalus*.

Eat, drink, and play, whilst thou art here,
For death invites to no good chear.

And to imitate *Tricongium*, who had his name for drinking three gallons of wine at one draught, *supernaculum*, as good fellows call it.

BUT thrice happy *Scotland*, which was never infamous, or blamed for extravagant apparel, and effeminate toys. Their thistle, a wild one (for it is no artichoke, which is a civil thistle) with the old motto, *Nemo me impune*

impune laceſſit, hath been long ſince ſo conſiderable, as to oblige the Engliſh roſes and the French lilies, and hath been conſtantly, and is, to this day, for truſt and valour, guardian to the French king in all his glory. As poor as he is, he is able to purchaſe both the Indies, when he pleaſeth, by the royal fiſhery, which attends on their coaſts, and all their iſlands; and to ſecure *Newfound-land* and the Bank (the marvel of the ſea) to the intereſt of this monarchy; and to recover queen *Elizabeth*'s whale-fiſhing in *Greenland*, and to enlarge our preſent whale-fiſhing in *New-England*, *Bermudas*, *&c.* See Phil. Tranſ. numb. 8. pag. 132. and fuller numb. 40. p. 793. and to aſſure his majeſty of enlarging his dominions in the new and old world, both by ſea and land. Thus far, and in many other reſpects, the plain and hardy breeding of *Scotland* is to be preferred before all the preſent delicacies, pride, and exceſſes of *London* and *Dublin*. The genial poet, *Horace*, ſhews how our nobility and gentry ought to be bred.

Carm. lib. 3. *ode* 2.

Anguſtam, amice, pauperiem pati.

and in a good part of the next following ode 3. Theſe ſhould be tranſcribed, as they are elegantly tranſlated; and *Columella in præfat. omnis enim (ſicut M. Varro)* for thirty lines worthy to be Engliſhed, ſhews, how the Romans, by their ſoft and theatrical breeding, were degenerated, as if he had ſeen how our gentry paſs from the bawdy plays to bawdy houſes, neglecting all good culture, and their ancient hardineſs. And *Gratius Cyneg.* pag. 17. tells us in elegant verſe,

Nec luxus alios avidæque impendia vitæ,
Noſcant; hæc magno redit indulgentia damno, &c.

about twenty more verſes, ſhewing, how luxury has been the ruin of all monarchies. To this may be annexed Mr. *Waſe*'s accurate tranſlation. Laſtly, Pſalm 1. againſt ſcoffers, and pſalm 14, againſt atheiſts, in Dr. *Woodford*'s paraphraſe, will perfect the old proofs. *Dan. Scargill*, fellow of C. C. Coll. in *Camb.* being ejected out of the univerſity, for profeſſing himſelf an Hobbiſt, made his recantation in theſe words; that this Hobbiſm, or atheiſm, is the accurſed root of all that abounding wickedneſs, perjury, ſacrilege, debauchery and uncleanneſs, in this preſent age. pag. 6. in Great St. *Mary*'s, July 25, 1669. This recantation may eaſily be printed in half a ſheet; and then being fairly mentioned in the Memorials, the ſtationer will be ſufficiently repaid, and all the kingdom take notice of the record. We have need to apply all our engines to ſtop, or turn out of *England* this polluted ſtream of iniquity; *Deo propitio, & adjutore noſtro.*

THE young ſtudents of *Oxford* were, by God's wonderful mercy, delivered from the ſame, or worſe temptations, as they were inceſſantly aſſaulted by great wits, of great titles. Now, by God's mercy, both univerſities are raiſed to be juſtly eſteemed the mirror, and wonder of the world, for ſound religion, and for all the moſt excellent arts and ſciences.

THE Memorials do now fill up the whole ſheet, as at firſt; and they ſeem to me to grow better and better, and willing to repreſent religious impreſſions to the beſt advantage.

Sir Robert Moray *to Mr.* Robert Boyle.

October 7, 1661.

My Noble Friend,

THE bearer delivered me yours of 2. in your ſiſter my lady *Ranelagh*'s preſence, where I could neither handſomly read it, nor queſtion him concerning you. I mean to know all he can tell me, when I give him this, and furniſh him what to ſay, when you queſtion him concerning your friends here; only one thing I ſhall ſay for us all, if you did but wiſh us to be with you, as ſtrongly as we wiſh you to be with us, I am ſomewhat diſpoſed to be of the opinion you would draw *Greſham* college to *Oxford*. But I could find in my heart to quarrel with you upon the publick account, of your reſolute depriving us too long of your company, if I had not a ſingular indulgence for you. Therefore I will rather entice you hither, than force you. The king hath been moſt graciouſly pleaſed to grant the deſires in our petition, and you ſhould not be away from the finiſhing what you helped to contrive and promote. We could allow thoſe at *Oxford* any thing with leſs envy, than the fruition of thoſe perſons, whoſe preſence with us can only turn the ſcales on our ſide: but if juſtice alone prevail not to make you haſte to us, let your affection to the promoting of our buſineſs work: and if kindneſs may be allowed any place in the account, remember there is nobody at *Oxford*, nor perhaps any where elſe, hath ſo ſincere and intimate an affection for you, as,

My noble friend,

your faithfuleſt humble ſervant,

R. MORAY.

THE friends you remembered in particular, return your kindneſs heartily. You ſhould not mind of ſo cutting misfortunes, as being out of the way, when you were to ſee me. I know you are not to be charged with forgetfulneſs, and I dare truſt your diſcretion, without ſcruple. Our main buſineſs ſticks ſtill where it did.

To Sir Robert Moray.

Whitehall, July 15, 1672.

TILL now I could not anſwer yours. That which you wrote to Mr. *Aſhurſt* was

was readily answered after it was presented, which was after a second attempt, he having been in the country when the first was made: and yesterday I made out fifty, and delivered it to our friend, from whom I expect a letter to put within this. He knows not yet of any help I had to make out the matter; but that may be help another time. It will now be Friday next before he part. I have this day talked with him pretty fully of all matters, and easily prevailed with him, that you and lord *Brereton*, and he and I, and another friend, may confer of the whole business. I took rise from his shewing me your letter, and the importance of the matter. Therefore I do by all means desire you may take journey the very next day after this comes to your hands, which I hope shall be by to morrow at night; for I could gladly have you here on Wednesday, if possible, that we may have the more time to consider and talk of things. I did not think fit to tell our friend I had writ to you, though I think you meant my letter, when you told him you had heard of his leaving us; though I will own it to him, when I see him next. We have no manner of news more than is in the Gazette, that I know of, worth writing. Haste hither, and let me know when you arrive. Adieu.

Letters from Dr. John Wallis *to Mr.* Robert Boyle.

Oxon. Dec. 30, 1661.

SIR,

THIS, I suppose, may be at you time enough to wish you a happy new-year; and many more to ensue. It brings with it a part of that in print, which you had before an account of in writing (for it was thought fit by friends that it should also appear in this dress.) You might have had the whole ere this, had the press been as much at leisure, and as diligent (or rather not so much at leisure, but as diligent) as I could wish.

I AM now upon another work; as hard almost as to make Mr. *Hobbes* understand a demonstration. It is to teach a person dumb and deaf to speak, and to understand a language. Of which if he could do either, the other would be more easy; but knowing neither, makes both the harder. And though the former may be thought the more difficult, the latter may perhaps require as much of time. For, if a considerable time be requisite for him, that can speak one, to learn a second language; much more for him, that knows none, nor hath so much as the advantage of speech.

YOU may think perhaps, that it is not a piece of mathematicks, to teach either speech, or language; as Mr. *Hobbes*, that the attendants of Jupiter were not found out by algebra. But, though I am in this fully of his opinion, yet I must in that except to yours, at least thus far, that I find it therein no small advantage to have been versed in mathematicks.

I WAS the more willing to attempt it, because the person was represented as very ingenious and apprehensive (and at least so much of a mathematician, as to limn very well, being taught it by some of the best masters in *London*.) And I was the more confident, that the defect was not in the organs of speech, (though possibly not so pliable as in a child, to the forming of unacquainted sounds) not only upon the common presumption, that the defect of speech in deaf persons is but an accidental consequent of their want of hearing: but also because he could once speak (though so long since, that he does not remember it) till that about five years of age, having by accident lost his hearing, he thereupon lost his speech also: not at once, but gradually; that is, he was about half a year in losing it.

HE had, before he came, learned to write, I mean, as an English scrivener writes Greek; of which he knows neither the sound, nor sense; and thereby hath saved me so much labour as the teaching him an alphabet. But hears either so little, or not at all, that I cannot, as I hoped, make any advantage of it. He cannot from the back-side of my house, (which is a little more than a stone's cast, and no obstacle between) hear St. *Mary*'s great bell ring; nor, in *Christ Church* choir, hear the organs. Close at his ear he can hear a sound, but not a voice, (unless I should rather say he feels it:) I mean, he discerns a noise, but not the articulation; and of a smart sound, rather than a loud. When, a coach at night rushing close by the window, I perceived he discerned it; asking whether he heard it, he signified, no, but he felt it, by the shaking of the ground.

HE hath now been with me a fortnight, and somewhat more. In which time, as to the language, he hath already learned many words, and somewhat of the Syntax. And, as to speech, hath pronounced all the sounds of our language (even those of *L* and *R*; and those of *th* in *thy* and *thigh*, which the French and others complain of as most difficult, and can hardly attain unto) which secures me, that the organs of speech are not indisposed to the forming of articulate sounds. And at some of these he is very ready, though he cannot at pleasure command them all.

IF you ask, what my conjecture is as to the issue, or what I do design in it; I must confess, that as to the matter of speech, though I doubt not but he may come to speak any thing, yet I do not expect, that he shall make the like advantage of it as those, that hear. Because that, neither hearing himself nor others, he will be subject to forget or mistake in forming sounds; and not to correct those mistakes, because he hears them not. For as one, who knows very well how to write, and hath a good command of his hand, yet if he want either sight or light, will hardly write well; the like must be expected in a deaf man's speaking; for, as then, the eye guides the hand, so here, the ear the tongue.

But

But, as to the language, I know not but that he may, by writing, both expreſs his own, and underſtand the conceptions of others, as well as other men; and ſo converſe with men, as we do with the ancients, or perſons diſtant, which is no ſmall advantage in human affairs: and may very much ſupply the defect of ſpeech.

You may pleaſe to acquaint Sir *Robert Moray* with this adventure, (who is himſelf ſo much a virtuoſo, that he is the more inquiſitive what others are doing; and will not allow me to be unimployed:) but whether he will infer, that I am buſy, or, was much at leiſure, I cannot tell. Nor that I further treſpaſs on your preſent affairs, than to ſay, that I am,

Your honour's

affectionate and very humble ſervant,

JOHN WALLIS.

Oxon, May 6, 1662.

SIR,

YOU will excuſe me for not returning you my thanks for yours (ſo full of civility and reſpect) when you underſtand, that I had nothing elſe to ſend with it, that might be worth giving you that trouble: and yet pardon this at preſent, which waits on you with this only addition, that I have thoughts of waiting on you myſelf next week. At which time I may poſſibly preſent you with ſomewhat as acceptable as the laſt, but in another kind. For I ſhall bring with me (I ſuppoſe) a perſon on whom I have made an attempt lately of teaching him to ſpeak, though he cannot hear; wherein your curioſity may poſſibly make you deſirous of underſtanding what progreſs I have made. Which being of ſuch a nature, as not to be ſo ſatisfactory in a repreſentation to the eye as to the ear, I ſhall forbear the narrative, and refer it till you may receive a perſonal account thereof from himſelf, and from,

SIR,

your very humble ſervant,

JOHN WALLIS.

Oxon, March 27, 1663.

SIR,

THE encloſed is in obedience to your commands laid upon me, when I waited on you at *London*. If it be too large, you may extract out of it as ſhort a one as you pleaſe; and if it may ſeem in ought too ſhort, there is ſcope of enlarging it as far as you ſhall think fit. The deſign is ſo ordered as to obviate the inconveniences, and to reſerve as much of convenience as well may be. The other command, which I received in order to Dr. *Pocock*, I have endeavoured to obſerve ſo far as was in me. I acquainted him with your deſire; but he tells me, that to give account of all the longitudes and latitudes in *Abulfeda*, is, in a manner, to tranſcribe the whole book; for it contains little elſe but the longitude and latitude of places, with ſome very brief deſcriptions of them in two or three lines, and not digeſted into diſtinct tables, but to be collected out of the text. But he tells me, that Mr. *Clark* is deſigning ſomewhat out of him and other geographers compared; which perhaps may better ſatisfy the deſire of the gentleman, than a bare account of *Abulfeda* alone. I hoped to have given a ſpeedier account of both, had not ſomewhat elſe ſo often interpoſed. Your goodneſs, I truſt, will excuſe the delay, and accept the endeavours of,

SIR,

your honour's very humble ſervant,

JOHN WALLIS.

SINCE I had written thus much, Mr. *Hyde* (the under-library-keeper) tells me, that if you pleaſe, he will collect out of *Abulfeda* the longitudes and latitudes, and tranſmit to you (I ſuppoſe he will expect ſome gratuity for his pains.) He hath lately, for the biſhop of *Exeter*, tranſcribed out of *Uleg Beig* the longitude and latitude of all the fixed ſtars, according to his obſervations. If you think it *tanti*, and give me ſuch order, I will deſire him to undertake it.

Oxon, Sept. 10, 1663.

SIR,

I HAVE with very great content and ſatisfaction gone through that book of yours, wherein you have ſo very charitably obliged mankind. You will eaſily believe, though I ſhould not tell it you, that in ſo ſhort a time it were not poſſible for me to conſider ſo much variety of good matter, ſuitably to the worth of it. Which though it be true, yet doth not ariſe from want of reſpect to it, but from mine impotence and utter inability to paſs a particular judgment of chemical proceſſes, being ſo nothing of a chemiſt myſelf. And therefore, the animadverſions, which you invite me to make, you may be ſecure, will not concern any thing of that kind. The papers encloſed come ſo rudely, becauſe I could not judge what is in them to be worth writing twice, which I fear you will have reaſon to think not worth reading once. And if after (or before) you have once read them, you will pleaſe to let them help make a fire under one of your learned furnaces, it will be a greater honour than they deſerve. For by that means, they may give ſome light to ſome of your works.

BUT your mention of ſome ſpecificks you have for diſtempers in *genere nervoſo*, minds me of what I thought to have diſcourſed with you, but neglected, when I had the opportunity

portunity concerning ſome very odd and dangerous ſymptoms in a relation of mine (my brother's wife) ſo good a perſon, and ſo uſeful, that her life and health are very well worth the preſerving. In order to which I have tranſcribed the account of her caſe, as her phyſician (a good chemiſt, and ſucceſsful practitioner, the ſame I mention in the encloſed papers) did upon my requeſt draw it up to ſend to Dr. *Willis*; together with what afterwards I did myſelf obſerve. If you have any arcanum, which you judge proper in the caſe, by communicating the medicine (though you keep your ſecret) you will not only do a great work of charity to her, and in her to many more, and very much oblige,

SIR,

Your honour's very humble ſervant,

JOHN WALLIS.

Incloſed in the preceding.

25° Julii, 1663.

UXOR Dom. Wallis Aſhfordienſis, Cant. habitus mediocris, temperamenti melanophlegmatici, quadrageſimum agens annum, victu euchymo ut plurimum utens, ab incunabulis plerumque valetudinaria exiſtens, rariſſimè cum morbo ullo acuto (exceptis variolis) tentata, ſemperque pro ſcorbutica ſuſpecta; poſt varia et innotata ſymptomata leviora, quæ annis præteritis quandoque paſſa fuit, ſub autumni ſuperioris initio, dolore lateris dextri, pleuritico haud multum diſſimili, prehenſa eſt: cui, phlebotomiâ præſidiiſque aliis levibus, pacato, paulatim ſucceſſit dolor acutiſſimus, mordicans et pungens, ſub mucronatâ cartilagine, quandoque ad umbilicum fere, quandoque ad coſtas nothas dextras, quandoque ad ilia dextra ſe porrigens; unâ vel alterâ poſt paſtum horâ delapſâ, ægrotam invadens: quem gradatim ſupervenit oris ventriculi (poſt ſumptum cibum, ut antea) ſuperioris morſus acerbiſſimus, animi fere deliquium ſecum trahens, per circuitus revertens, cum reſpiratione frequenti, et fere interceptâ, oſcitatione, ructatione, vellicatione, et ſæpiſſimè totius quaſi ventriculi convulſione; nunquam illam jejunum invadens, neque poſt ſumptum panem neque frumentacea edulia inhauſta; ſed tantummodo quum victitaſſet carnes fere quaſcunque: unde per totam hyemem, frumentaceo et triticeo victu, vinoque generoſo, contenta remanſit; ſæpiſſime etiam per menſem ampliuſve temporis, tali regimine, immunis evaſit, ſolitis fungens muneribus domeſticis, placideque noctes trahens, ſatiſque hilariter inter vicinos ſe gerens; paroxyſmis prædictis (quando invaſere) magis magiſque ſenſim minuentibus. Vere ingrediente, omnia mitiora factâ, prædictis ſymptomatibus in totum fere evanefcentibus. Ingruente æſtate, corporis illius ſtatus non procul à naturali et eucratico videbatur, eduliiſque quibuſcunque ut placuit veſcens, ſineque moleſtia ferens. Attamen ſub menſis præteriti calce ſubito poſt paſtum paroxyſmo præteritis diſſimili correpta eſt; cum dolore hypochondrii dextri, tum gravativo tum pungitivo, cum frequentiſſimâ reſpiratione, et metu ſuffocationis, febriculam ſecum habente, cum urinis coloratis, anxietate inſueta, ſubitaneoque virium lapſu, ut vix loqui vel ſe de loco in locum movere potuit, loquelâ interim gemitibus inſolitis interrupta, et ſummotam, in ultimum vitæ diſcrimen adſtantibus redacta videbatur, ita ut per plures dies in cubiculo vel lecto ſe continebat, unoque eodemque ſtatu per quinque vel ſex dies permanſit, uſitato interim victu utens uti placebat; ſine appetitus dejectione, ventriculi retentricis vel expultricis vitio, vel coctricis imbecillitate; videbatur autem coctio depravata, ſicque ſe habebant facultates ſtomachi per totum morbi decurſum. Hoc inſuper notandum, quod medicamenta purgantia nunquam ferre poſſit. Nunc temporis, omnia leviora ſunt facta, cibos (uti arrident) capit, ſine ullorum prædictorum ſymptomatum inſultu, vitamque trahit (quam antea) beatiorem, ſine dolore vel triſtitia. Hæc ſunt præcipua, quæ in noſtrâ ægrotâ ſe produnt.

THIS is verbatim the account, which I had from her phyſician (her brother) who had diligently watched her, as you may diſcern by the ſo particular account he gives. Upon diſcourſe with him, he tells me, he had ſometime thought the cauſe of thoſe ſtrange ſymptoms to have been in the coats of the ſtomach (becauſe digeſtion in the ſtomach, and other faculties there, ſeemed not to be much impedited;) ſince that it was rather in the ferment of the ſtomach, but from whence injected (from the pancreas, or whence elſe) was dubious. Her head not moleſted with fumes or aches, nor is ſhe wont to be feveriſh, or otherwiſe (ſave as is related) diſcompoſed. Her ſtomach he complains of as troubled with viſcous matter, or ſuch, as that he can hardly make any medicine faſten on it, which he would willingly move by vomit, but dares not, knowing how deadly ſick ſhe hath been ſome years ſince with that phyſick. Yet once he ventured on a gentle vomit, but durſt not ſtir from her all the while it worked; and is not willing to venture again. And ſome time a pipe of tobacco doth not only repel an approaching fit, but bring up matter ſeemingly as clear as water, but (whether preſently, or after ſome time, I remember not) if ſtirred with a ſtick is ropy and viſcous like the whites of eggs. The moſt of evacuating phyſick, that he uſeth, is now and then ſome very gentle pills, ſcarce more than to keep the body ſoluble. But (beſide what others I know not) the chief remedy he applies (and with good ſucceſs) is an arcanum (which my other papers mention) much of kin to ſpirit of harts horn; but, he ſaith, more prevalent than either that or ſoot (for he uſeth them all very frequently with his patients;) and I ſuppoſe it is ſome animal ſpirit, but from ſome other animal (yet not ſpirit of blood neither,) of which ſhe hath taken abundance, I think conſtantly, about an hour or two before dinner, and before ſupper. To which he attributes what of preſervation or cure is wrought. Dr. *Willis* (upon the account above) hath delivered his judgment of it to be a diſaffection in *genere nervoſo*; and adviſeth ſpirit of harts-horn,

horn, or of ſoot, which agrees well enough with the judgment and courſe already taken. He tells me of a peculiar juice he apprehends to be conveyed by the nerves, quite different from the circulation of the blood. While I was in the country with her (after the date of the paper, which gives account of it) ſhe had ever and anon rather attempts of fits than perfect fits, but ſevere enough, if ſhe had not known worſe, if at any time ſhe did eat either more freely, or more haſtily than ordinary (for ſhe is forced to be very moderate, and very deliberate in eating.) Any ſudden ſurpriſe of paſſion (whether joy, grief, or other) is very apt to diſcompoſe her. Theſe fits keep her very faint and feeble, though not ſick. If they return with the winter, as they were laſt winter, they muſt needs be very dangerous: if but as they are, they muſt weaken, and muſt needs threaten very ill conſequents.

Oxford, April 29, 1665.

SIR,

YOUR honour doth not expect I ſhould tell you, that I have already read over that excellent book of yours, which I received this day from your favour. But I have already peruſed ſo much thereof, and ſeen therein ſo much of worth, that I ſee great cauſe not only for myſelf to thank you, (which I heartily do) but for mankind to do the like; for ſo much of coſt and pains, which you have ſuſtained to enrich them. Which ſhould they fail to do, you would thence have occaſion to enrich your ſecond title, with one general more, of ſubjects diſpoſed to be frozen; while yet I ſhall deſire to have the honour of being ranked under your third title of ſubjects indiſpoſed; nor ſhall I think, that indiſpoſition to be a diſeaſe, but a duty. Sir, I hope your honour hath received thoſe papers, which on Monday laſt I ſent, with a letter directed to your honour, by *Bartlet* the carrier. Which, becauſe of frequent neglects in carriers, I take this occaſion to mention; not that I think them of ſo much worth, as that I ſhould be ſolicitous about the miſcarriage of them; but, that I would not be thought guilty of diſobeying your commands, intimated in your honour's laſt to me; and becauſe I am ambitious of ſubmitting all I do to your honour's judgment, having had ſo oft experience both of your ability to judge, and of your inclination to be favourable to,

SIR,

your honour's very humble
and obliged ſervant,
JOHN WALLIS.

SIR, if you have the opportunity of ſeeing Sir *Robert Moray*, you may pleaſe to repreſent him my humble ſervice; and aſſure him, that as I am ambitious to obſerve all his commands, ſo I ſhall be particularly careful of thoſe concerning the gentleman he recommended to me in his laſt.

Oxford, July 17, 1669.

SIR,

AFTER my humble thanks for the honour of your's of July 3, I thought it not unfit to give you ſome account of our late proceedings here. Friday, July 9, was the dedication of our new theatre. In the morning, was held a convocation in it, for entering upon the poſſeſſion of it. Wherein was read, firſt, the archbiſhop's inſtrument of donation (ſealed with his archiepiſcopal ſeal) of the theatre, with all its furniture, to the end that St. *Mary*'s church may not be further profaned by holding the act in it. Next, a letter of his, declaring his intention to lay out two thouſand pounds for a purchaſe to endow it. Then, a letter of thanks to be ſent from the univerſity to him; wherein he is acknowledged to be both our creator and redeemer; for, having not only built a theatre for the act, but, which is more, delivered the bleſſed virgin from being ſo profaned for the future, he doth (as the words of the letter are) *non tantum condere, hoc eſt creare, ſed etiam redimere.* Theſe words (I confeſs) ſtopped my mouth from giving a place to that letter, when it was put to the vote. I have ſince deſired Mr. vice-chancellor to conſider, whether they were not liable to a juſt exception. He did, at firſt, excuſe it; but, upon further thoughts, I ſuppoſe he will think fit to alter them before the letter be ſent and regiſtered. After the voting of this letter, Dr. *South*, as univerſity orator, made a long oration. The firſt part of which conſiſted of ſatyrical invectives againſt *Cromwell*, fanaticks, the Royal Society, and new philoſophy; the next, of encomiaſticks, in praiſe of the archbiſhop, the theatre, the vice-chancellor, the architect, and the painter; the laſt, of execrations againſt fanaticks, conventicles, comprehenſion, and new philoſophy; damning them *ad inferos, ad gehennam.* The oration being ended, ſome honorary degrees were conferred, and the convocation diſſolved. The afternoon was ſpent in panegyrick orations, and reciting of poems in ſeveral ſorts of verſe, compoſed in praiſe of the archbiſhop, the theatre, *&c.* and crying down fanaticks. The whole action begun and ended with a noiſe of trumpets; and twice was interpoſed variety of muſick, vocal and inſtrumental; purpoſely compoſed for this occaſion. On Saturday and Monday, thoſe exerciſes appertaining to the act and veſpers, which were wont to be performed in St. *Mary*'s church, were had in the theatre. In which, beſide the number of proceeding doctors (nine in divinity, four in law, five in phyſick, and one in muſick) there was little extraordinary; but only that the *terræ filius*, for both days, were abominably ſcurrilous; and ſo ſuffered to proceed without the leaſt check or interruption, from vice-chancellor, pro-vice-chancellors, proctors, curators, or any of thoſe, who were to govern the exerciſes: which gave ſo general offence to all honeſt ſpectators, that I believe the univerſity hath thereby loſt more reputation, than they have gained

gained by all the rest; all or most of the heads of houses, and eminent persons in the university, with their relations, being represented as a company of whore-masters, whores, and dunces. And, among the rest, the excellent lady, which your letter mentions, was, in the broadest language, represented as guilty of those crimes, of which (if there were occasion) you would not stick to be her compurgator; and (if it had been so) she might (yet) have been called whore in much more civil language. During this solemnity, and for some days before and since, have been constantly acted, by the vice-chancellor's allowance, two stage plays in a day (besides those of the duke of *York*'s house) at a theatre erected for that purpose at the Town-hall; which (for ought I hear) was much the more innocent theatre of the two. It hath been here a common fame for divers weeks (before, at, and since the act) that the vice-chancellor had given three hundred pounds bond (some say, five hundred pounds bond) to the *terræ filius*, to save them harmless, whatever they should say, provided it were neither blasphemy, nor treason. But this I take to be a slander. A less encouragement would serve the turn with such persons. Since the act (to satisfy the common clamour) the vice-chancellor hath imprisoned both of them: it is said, he means to expel them. But enough of this.

I AM next to acquaint you with a discourse of another nature; and which, I trust, will be, if not more acceptable, yet less ungrateful than the former. Since the act, Sir *James Langham* (with his lady, and some other persons of quality) did me the honour to dine with me. He is a person, of whom I have sometime heard you speak with very good respect; and whom (I think) I may safely represent as one, who honours you very much, and who hath divers times told me, how ambitious he should be of obtaining a nearer acquaintance with you. He was telling me of an excellent lady, of whom he hath a very great esteem: and I have the less reason to think him mistaken in his judgment, because he hath had all the opportunities of knowing her very well; having married a sister of hers, and, upon that occasion, being thoroughly acquainted with the state of that family. It is the lady *Mary Hastings*, a daughter of the countess of *Huntington*, and sister to the present earl, and to the lady *Elizabeth*, in whom Sir *James* did think himself very happy, while he enjoyed her as his wife. Of this lady he gives so high a commendation for her temper, her parts, her worth, her virtues, her piety, and every thing else; as makes him extremely solicitous to see her happy in a suitable consort; and doth profess himself so serious in it, that, were it a thing lawful, there is no lady he knows, whom he should sooner have made choice of, to have succeeded her sister in that capacity. It is true, I have not my self been so happy, as to know that excellent lady; but he, that hath had the opportunity of knowing her so well, doth represent her, not only so accomplished, as to make an excellent wife, but particularly as an excellent wife for esquire *Boyle*; and doth undertake to answer all objections, not only which you might make as to the lady, but (which perhaps may be the greater difficulty) as to the condition also; and hopes he shall be able to shew you reasons, not only, to marry her, but to marry. I should have added (though that be a consideration of less moment, than some of the rest) that her portion will be at least four thousand pounds, and so much he will see made good; her age, about five or six and twenty; and as to her person, virtues, and other perfections, you will have so many ways of informing yourself, that what I might say would be superfluous. If I might be a happy instrument in making two so excellent persons happy in each other, as he persuades me I might, if you think fit, I do not know, in what else I could more approve myself,

SIR,

Your honour's very humble

and affectionate servant,

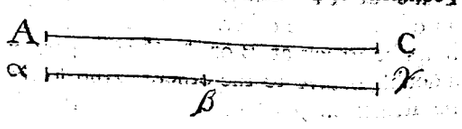
JOHN WALLIS.

You will oblige me, to present my service to the very good lady, with whom you are; and to preserve me a place in her good opinion. And you will doubly oblige my wife, at this time, to afford her the like in your's.

Oxford, March 14, 1676-7.

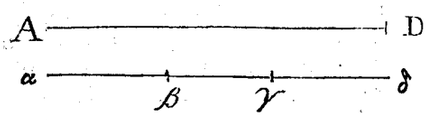
SIR,

I HAVE thought fit to give you notice of a discovery, that hath been made here (about three years since, or more) which I suppose may not be unacceptable to those of the Royal Society, who are musical and mathematical. It is this, whereas it hath been long since observed, that if a viol string, or lute string, be touched with the bow or hand; another string on the same, or another instrument, not far from it (if an unison to it, or an octave, or the like) will at the same time tremble of its own accord. The cause of it (having been formerly discussed by divers) I do not now enquire into. But add this to the former observation, that not the whole of that other string doth thus tremble, but the several parts severally, according as they are unisons to the whole, or the parts of that string, which is so struck. For instance;

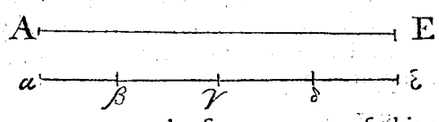


supposing *A C* to be an upper octave to $\alpha\gamma$; and therefore an unison to each half of it, stopped at β. Now if, while $\alpha\beta$ is open, *A C* be struck, the two halves of this other,

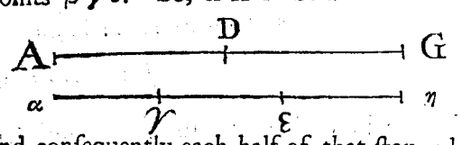
other, that is $\alpha\beta$ and $\beta\gamma$, will both tremble, but not the middle point at β; which will eaſily be obſerved, if a little bit of paper be lightly wrapped about the ſtring $\alpha\gamma$, and removed ſucceſſively from one end of the ſtring to the other. In like manner, if *AD*



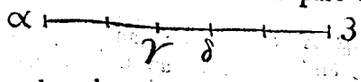
be an upper twelfth to $\alpha\delta$, and conſequently an uniſone to its three parts equally divided in $\beta\gamma$. Now if $\alpha\delta$ being open, *AD* be ſtruck, its three parts $\alpha\beta$, $\beta\gamma$, $\gamma\delta$, will ſeverally tremble; but not the points $\beta\gamma$, which may be obſerved in like manner as the former. In like manner, if *AE* be a double



octave to $\alpha\varepsilon$; the four quarters of this will tremble when that is ſtruck; but not the points $\beta\gamma\delta$. So, if *AG* be a fifth to $\alpha\eta$;



and conſequently each half of that ſtopped in *D*, an uniſon to each third part of this ſtopped in $\gamma\varepsilon$: while that is ſtruck, each part of this will tremble ſeverally, but not the points $\gamma\varepsilon$: and while this is ſtruck, each part of that will tremble, but not the point *D*. The like will hold in leſſer concords; but leſs remarkably, as the number of diviſions increaſe. This was firſt of all (that I know of) diſcovered by *William Noble*, a maſter of arts, of *Merton* college; and by him ſhewed to ſome of our muſicians about three years ſince; and after him, by Mr. *Thomas Pigot*, a batchelor of arts, and fellow of *Wadham* college, who giving notice of it to ſome others, found, that (unknown to him) the ſame had been formerly taken notice of by Mr. *Noble*, and (upon notice from him) by others, and it is now commonly known to our muſicians here. Of this you will find a particular notice is taken in Dr. *Plott*'s natural hiſtory of *Oxfordſhire*, now in the preſs, and will be ſoon abroad. I add this further (which I took notice of, upon occaſion of making trial of the other) that the ſame ſtring, as $\alpha\gamma$, being ſtruck in the midſt at β (each part being uniſon to the other) will give no clear ſound at all, but very confuſed. And not only ſo (which others alſo have obſerved, that a ſtring doth not ſound clear, if ſtruck in the midſt) but alſo if $\alpha\delta$ be ſtruck at β or γ, where one part is an octave to the other. And in like manner, if $\alpha\varepsilon$ be ſtruck at β or δ, the one part being a double octave to the other. And ſo if $\alpha 3$ be ſtruck in γ or δ; the one part being a



fifth to the other. And ſo in other like conſonant diviſions. But ſtill the leſs remarkable, as the number of diviſions encreaſeth. This, and the former, I judge to depend upon one and the ſame cauſe, *viz.* the contemporary vibrations of the ſeveral uniſon parts; which make the one tremble at the motion of the other: but when ſtruck at the reſpective points of diviſion, the ſound is incongruous, by reaſon that the point is diſturbed, which ſhould be at reſt. I add no more, but that I am,

Yours, *&c.*

JOHN WALLIS.

Mr. Edward Stillingfleet *to Mr.* Robert Boyle.

Sutton, October 6, 1662.

SIR,

I HOPE my diſtance from home (ſince the time you were pleaſed to honour me with that great teſtimony of your reſpect in that excellent diſcourſe you ſent me) will plead ſomething by way of apology for my incivility, in being ſo backward in expreſſing my high reſentments of ſo great an honour. Sir, as there is no perſon in our nation hath more obliged the world than yourſelf have done, in the diſcourſes you have lately made the world acquainted with, ſo it is the earneſt deſire of all ſuch, who value reaſon and knowledge, that you will pleaſe ſtill to employ your excellent pen in a further diſcovery of thoſe rich mines of experimental philoſophy, which with ſo great happineſs and ſucceſs you have been converſant in. And although the privacy and retiredneſs of my abode hath made me ſomewhat uncapable of thoſe high improvements, which others have the advantage of; yet it is here my happineſs and delight, to converſe with thoſe excellent perſons, who have endeavoured to make the world the wiſer for their being in it. Among whom your great name is deſervedly placed, not only for your deep ſearch into nature, but your ſucceſsful pains in vindicating the honour of religion. Sir, I could heartily wiſh you would pleaſe to communicate to the world thoſe papers you are ſomewhere pleaſed to mention, in behalf of Chriſtianity (againſt *Hobbes*, p. 11.) that it may be ſeen yet further, that thoſe great perſonages, who have courted nature ſo highly, that her cabinets are open to them, are far from looking on religion as mean and contemptible. But I ſhould be injurious to yourſelf, and the world, to exerciſe your patience with a tedious letter. The only favour I deſire is, that you will pleaſe to account among the train of thoſe, who moſt honour your perſon and undertakings,

SIR,

your moſt obliged ſervant,

EDW. STILLINGFLEET.

Letters from Dr. Lower *to Mr.* Boyle.

Christ-Church, Oxford, Jan. 18, 1661.

Honoured Sir,

I RECEIVED your letter, and should have wrote to you sooner, but that the doctor was not at leisure till of late to make those dissections of the brain, which he hoped; but at length we have had the opportunity of cutting up several, and the doctor, finding most parts of the brain imperfectly described, intends to make a whole new draught thereof, with the several uses of the distinct parts, according to his own fancy, seeing few authors speak any thing considerable of it; so that at present I shall suspend my thoughts which I had of sending you a relation of the discourse we had in the several dissections, and only tell you, that, according to his opinion of the use of the cerebellum for involuntary motion, he shewed me several times the nerves (which authors call the sixth conjugation) to proceed out of a stalk or stem, which comes down out of the cerebellum, and makes a great half circle under the medulla oblongata, and so returns and ends in that nerve, on each side; which half circle is clearly distinct from the medulla oblongata, by comparing the several texture and position of their fibres, as well as their outward line and figure; so that one may very well conceive, that circle to serve for a distinct and particular use, and to differ from the medulla oblongata, as well as to conceive the spinal marrow, with the medulla oblongata, to be really distinct organs (which is certain from palsies of half the body) and yet they are not throughly divided, but only superficially along the middle. The auditory nerves also, which lye next behind the other, and go into the os petrosum on each side of the scull, seem to arise out of another ring, though less than the former; into which ring descends also that stem out of the cerebellum. And *Varolius* formerly affirmed, that the auditory nerves came out of the cerebellum. The doctor likewise observed the cerebellum to be distinguished into two medullary parts, the middle part (which being cut, does so elegantly resemble a tree with branches) being as it were the pars corticalis dividing between the two medullary parts, for what use you may hereafter hear. He shewed likewise the optick nerves plainly to ascend on each side of the bottom of the brain into those two parts on each side the rima, about the middle of the medullary substance of the brain, where he thinks imagination to be performed, whence he judges to be that quick and most perfect communication between the sight and the fancy, there being no sense so certain and quick as that. In the cutting up the eye of a little dog, we held up the eye (after we had cut off all the muscles, and fat, and skins, from the outward coat of the eye) to the sun, and a candle, directing the cone of the light to the very optick nerve; and though it have no cavity as some affirm, yet it appeared very light, even as the flame of a fire, a pretty way up the nerve. Whether it may be seen in the eyes of greater animals, we have not yet tried, but suppose it will: and I believe the eye of a creature newly dead will be best to make trial, lest the humours should turn thick, as they do in a day's time. We took likewise the vitreal humour out, and dropped it into a glass of fair water, and could not find it again, or see it in the water; so that Dr. *Wallis* would not believe, that the vitreal humour was in the glass, till the water being poured away, it appeared in the bottom. We have likewise dissected the ear, and I have prepared a bone full of the bones and parts of the ear for him, when he shall be at leisure to consider of it. But in all the dissections we made, we could not discern or find that passage from the ear to the mouth, which anatomists mention to be so large, that juglers commonly take tobacco, and force the smoke out that way. And there is one Mr. *Henshaw*, a fellow of *All-Souls*, who, by stopping his mouth and his nostrils, can blow out a candle at either ear, or both at once; which several of the fellows have seen him do very often. He is much deaf, and cannot hear, unless the voice be loud, which perhaps may be from that large passage or cavity into his mouth, so that the tympanum is not affected so smartly with the sound, as in others, who cannot shew the same trick. Some of the dogs, which we dissected, we killed after the butchers way, by cutting in two the spinal marrow in the neck, just under the occiput, to see if the parts below the wound would retain any motion for a little while, because some affirm, that since the spinal marrow is nourished with arteries, as the brain is, that spirits are generated in it, for the motion of all the parts along as it goes; but the dogs never stirred any part below the wound, (for we did not tie them down to the table on purpose to try, but had a strong fellow to hold them down, till execution was done) but the eyes moved and the eye-lids; but whether the heart did beat, because its motion depends upon the nerve of the sixth conjugation inside the skull, we did not think of trying. I enquired of the doctor, what he thought of the nourishment of the liquor, which is thought to be in the nerves; and he told me, he did not think it did much nourish, if at all; yet, that there is a liquor in the nerves, he does believe, because he hath often observed in those men and women, that usually are troubled with convulsions, epilepsies, or hysterical fits, three or four days together, without any long intermission, all that while their urine is little and very red, but afterward, when they recover from those fits, they make water for the like space of three or four days in very large quantity, and very clear, though they drink as little or less than formerly, when their fits were on them: the former urine he thinks to come from the blood, the latter he takes to be the water of the nerves; for when this water is made, there is a perfect solution of the disease, and

their heads become clear and light, which were before heavy, dull and turbulent.

THE doctor does likewiſe intend, when he ſhall have opportunity, to ſyringe in ſome kind of liquors, tinctured with ſaffron, or other colours, into the arteriæ carotides, the brain being firſt opened, juſt after the creature is dead, and warm, to try how the blood moves, and how the tincture may be ſeparated in the brain; in the mean time tying ſome of the nerves, to ſee, if they will ſwell above the ligature. Upon your relation of your experiment of *Tunbridge* water being ſyringed into a dog, a little while ſince I ſyringed into a dog's jugular vein about two quarts of warm water, and, in a little ſpace, his bladder was very much diſtended with urine, though a little while before he had diſcharged himſelf that way very freely, as uſually they do in ſuch ſolemn frights. I had not the opportunity of doing it again, but intend to try it with ſeveral liquors; and I have a fancy to try, how long a dog may live without meat, by ſyringing into a vein a due quantity of good broth, made pretty ſharp with nitre, as uſually the chyle taſtes taken out of your common receptaculum; for though it be not ſo finely prepared as chyle is, yet I have a belief, that it may ſerve turn a pretty while; and ſince I read the ſtory in *Sneider de Catarrhis*, in quarto, of a man being drunk and bruiſed with a fall, when he was let blood, at the firſt tapping of the vein, they that were preſent immediately ſmelled the wine more ſtrongly, than if it had been ſtewed over a fire; I do think, that many liquors may conſiſt with the blood as well as that; broth being nearer to chyle than ſack, and conſequently more fit to nouriſh: and doubtleſs a bitch's milk ſyringed in the ſame manner would preſerve the life pretty well, if it be done in juſt time and proportions, were it not, that the milk loſes much of that tartneſs and nitroſity, by circulating in the blood before it is ſeparated again in the breaſts, which it had in the veſſels before it went into the blood; and if it were not for this change, the chyle and milk would be ſtill the ſame; and therefore, being ſyringed in often in ſmall quantities might perhaps preſerve the life, as the continual inſtilling of it in, out of the vaſa thoracica, into the axillary vein, doth: and, in children, or other perſons, who ſuffer a fluxus chyloſus, or diarrhæa, becauſe the glandules of their meſenteries being ſcrophulous or ſchirrous, by compreſſing the venæ lacteæ, hinder the farther paſſage of the chyle, and ſo, conſequently, ſtarve the patient, a woman's milk ſyringed in may ſomewhat ſupply the want of their chyle, provided the nurſe eat ſuch meats as the patient formerly did, ſo that the milk may not be too weak or ſtrong for his blood: and this in men might be done better than in beaſts, becauſe they can tell, when they are faint, hungry, or thirſty, and ſo may be ſatisfied accordingly. When I am in the country, if I can have leiſure to attend it, I ſhall try it in a dog, and I ſhall get a tin pipe made, about two inches long, and about the uſual bigneſs of the jugular vein, and hollow, which I may put into the vein, by cutting the vein aſunder, and drawing on the two ends of it upon the pipe, and tie it round with a thread there to remain, and, in the middle of the pipe, muſt come out a ſmaller pipe, fit for the ſmall end of a ſyringe to go into, which may be ſtopped with a cork, to take out when need ſhall require: the figure of it is thus. There be many inconveniencies would diſ-

ſuade the trial hereof, as namely, that for want of chyle and liquor in the guts, to dilute and mitigate the choler all along in its paſſage from the duodenum, the guts may be ulcerated and inflamed, with many more; but howſoever I ſhall try, either what good or harm will follow. In the mean time, I have nothing more to tell you, but, that when I return, I ſhall bring with me (God willing) thoſe odd kind of ſtones and minerals, which the miners cannot give an account of; as there be ſome, which are as heavy as lead, and of ſeveral colours, which they cannot tell what they are. But, Sir, I am ſenſible of the great trouble I give you by this long letter, and beg your pardon; which I hope I may the more eaſily obtain, by the aſſurance I give you by my long journey, that I ſhall not offend in the like for a good while. I therefore take my leave, and remain,

your moſt obliged, and

very humble ſervant,

R. LOWER.

Chriſt-Church, Oxon, Nov. 26, 1662.

Moſt Honoured Sir,

I SHOULD have ſent you this incloſed ſooner, but that I have been out of town, ſo that I had not the opportunity of tranſcribing it till now. The doctor hath now perfected the anatomical part likewiſe, but being not ſatisfied in ſome things, I ſuppoſe he will hardly be induced to publiſh them yet a good while. Since my return hither, I have received ſome Corniſh diamonds, which I have ſent you, together with this letter. Thoſe, which I gave Mr. *Stall*, were very dull and thick, and but little more tranſparent than alum; ſo that I did not think them worth ſending to you, though I purpoſely procured them for you. I have ſent into *Cornwall* for thoſe mineral pieces, which I mentioned to you, and as ſoon as I receive them, I ſhall acquaint you with it. And when you certify me, what authors you have already collected, you may direct me what other you would have me firſt collect, and I ſhall employ all the leiſure I have to anſwer your expectation therein: and if you pleaſe in your next to communicate unto me thoſe preparations of laudanum, ſpirit of hartſhorn, and that ſpe-

cifick for the rickets, I ſhall faithfully obſerve thoſe conditions, on which you part with them, and remain,

SIR,

your ever moſt obliged,

and moſt humble ſervant,

RICH. LOWER.

April 27, 1663.

Moſt Honoured Sir,

HAVING received your letter, I went to the regiſter of the univerſity, who keeps the records of all things acted in the convocation, and regiſters the names of all perſons, who take any degrees; and, by the information I gave him of the time, he preſently found the gentleman in the regiſter of that year, recorded to have been admitted batchelor of phyſick, the very firſt convocation after the earl of *Pembroke*'s coming to viſit the univerſity; but he could not find any thing of his taking a maſter's degree that year, or any other; for he ſearched ſeveral years before and after: ſo that I have ſent what I found (and which, I ſuppoſe, will be ſufficient for the gentleman's purpoſe) atteſted by the regiſter, or publick notary, whoſe name is authentick in any certificate; for he being a ſworn officer, his teſtimonial cannot be refuſed: and there is none, that takes any degree, who has any more than his ſingle certificate, or elſe I ſhould have ſent it confirmed with more hands, but that it had not been the uſual way. As for Mr. *Hewes*'s powder, I inquired of Dr. *Willis* concerning it (having ſeen two ſad examples of it myſelf) and he told me, that though he had ſeen it uſed ſometimes ſucceſsfully enough, yet ſince he hath known ſo much harm done by it, that he would never adviſe any one to venture to take it any more, eſpecially if the perſon be of a lean habit of body; but if the perſon be fat and full, there is not ſo much hazard or inconvenience to be feared. Madam *Walton* made a ſad experiment of it the laſt year; for with one doſe of his powder (which ſhe was perſuaded to take by Dr. *Lamphyre* for the ſcurvy, and fits of the ſpleen) ſhe fell into a great flux, and ſalivated a full half year, without any intermiſſion, which could not be ſtopped with all the drying diet-drinks, purges, bleeding, baths, or any thing, which the doctors at *London* could invent. At length ſhe came down hither, and being reduced to a mere ſkeleton, and not being able to ſleep above an hour or two in a week's time, Dr. *Willis* perſuaded her to drink milk, and nothing elſe, which ſhe did with much refreſhment; but the cold weather coming ſuddenly on, put her again into her former flux, which in three weeks time after ended her miſery: and when ſhe died, I never ſaw a more exact ſkeleton, except that it was clothed with ſkin. Sir, if it may not be a trouble, Dr. *Willis* and myſelf ſhall be very much obliged to you for thoſe paſſages of *Regius*, concerning Dr. *Bills*'s experiment, which he nor I ever ſaw yet, unleſs it be in his *Hepar Redivivum*, which *Bartholine* wrote againſt, and which *N. Stenon* makes mention of in his tract *De Glandulis*. If the meaning of the paſſages be eaſy to comprehend, without the ſcheme, the Dr. would by no means give you the trouble of ſending it. Sir, I am very ſorry, that I can give you no account, as yet, of what I promiſed you; for I have been wholly diverted by Dr. *Willis*, whoſe deſire it is, that I ſhould be preſent at his operations, which now are very near finiſhed, and I hope will make ſome apology to you for my idleneſs before long; for the Dr. intends, before Midſummer, to put his book into the preſs; which is all, that I can tell you at preſent, but that I am,

SIR,

your moſt obedient,

and humble ſervant,

R. LOWER.

I RETURN you many thanks for the laudanum, which you ſent, and for thoſe other preparations, which you were pleaſed to communicate to me. I have not had much opportunity of trying them as yet, but as ſoon as I can, I ſhall give you an account of the ſucceſs.

DR. *Willis* preſents you his ſervice. Dr. *Bathurſt* is in *London*.

YOU will take notice of *perſcrutatis* taken paſſively, which I deſired the regiſter to alter for *examinatis*; but he told me, it was the word uſed in the ancient certificates, and therefore was more authentick, than a better word, and truer Latin.

June 4, 1663.

Moſt honoured Sir,

I RECEIVED your papers incloſed in Mr. *Hook*'s letter long ſince, but have not had an opportunity of returning you my thanks till now; and I hoped, that Dr. *Willis* would have excuſed it, when he went to *London*, but it ſeems he had not the happineſs of finding you at your lodgings. We have read thoſe papers, and find but little conſiderable in them, except only what he mentions about the ventricles of the brain, and that he deſcribes very obſcurely; yet it being ſomewhat agreeable to the doctor's deſcription, hath made him reſolve to print his anatomy forthwith. Dr. *Wren* hath drawn moſt excellent ſchemes of the brain, and the ſeveral parts of it, according to the doctor's deſign, and the next week he will have finiſhed the ſcheme of the eighth pair of nerves, and then all the work is at an end. I ſhall not trouble you with the manner or deſcription of any part of it, but only acquaint you with one or two obſervations we lately made: one was in a gentleman's head, (whoſe body we opened for

for another disease more fatal to him) in which the carotidal artery in the right side (inside the scull) was wholly choked up and obstructed with a yellow substance, perfectly hardened into a stone, whereby the course of blood being totally hindered on that side of the brain, did probably come in more vehemently into the other artery on the left side of his head, which tormented him very much a quarter of a year before his death, and made him much more impatient of his other disease. And this reason of his hemicrania seems more probable by what we have several times observed in others; for in some, whom we have opened, we have found both the carotidal arteries all along from the very heart into the brain almost filled with a rope, as it were, of congealed blood, turned yellow by long stagnation (which is very commonly found in bodies, which lye languishing under chronical diseases) so that but very little space was left for any blood to pass through those vessels; yet both being equally obstructed, the persons never complained of any such symptom as the man before mentioned. Since that we have made another experiment, which is this. Whereas several anatomists, and particularly *Webser* in his book *De Apoplexiâ*, finding in several bodies dead of apoplectical fits the carotidal artery full of such a congealed substance, as I mentioned before, have made it the chief cause of apoplexies; because, as he supposes, the influx of blood into the brain being by that means totally intercepted, consequently the spirits for want of supply must extinguish, and so all sense and motion perish. All which need not at all to be feared, granting, that both the carotidal arteries were choked up, so that not the least drop of blood could pass through either of them: for the carotidal and vertebral arteries have so many anastomoses, so divinely contrived inside the dura mater, before they go up into the brain (as you will see exactly described in the doctor's scheme) that if three arteries were quite obstructed, the fourth would convey blood into all parts of the brain and cerebellum, sufficient enough for life and motion. And to confirm this, this week we took a young spaniel, and tied both the carotidal arteries in the neck very fast and close with silk, and the dog was not at all altered by it, but continued very lively and brisk, and was so far from taking unkindly what was done to him, that within a quarter of an hour after, he got lose and followed the doctor into the town, as he visited his patients. In this pleasant humour he continued two or three days, and then we opened his head, and found all the vessels of the brain as full of blood as usually they are in other dogs, who did not suffer the same experiment. But this I might have told you in a shorter time; for if one artery be syringed with any tincted liquor, all the parts of the brain will equally be filled with it at the same time, as several times we have tried The other experiment is this. Whereas all authors, and particularly Mr. *Delhaoe* in his Theses, say, that the water falls from the ventricles of the brain by the infundibulum upon the throat and palate, *&c.* we experimented it quite otherwise lately in a calf's head, after this manner: under the glandula pituitana in a calf's scull, there are commonly one or two holes, which receive vessels from the glandule, into which hole we syringed in milk, and immediately it came out of the jugular veins more slowly or fast, according as the milk was injected; but looking into the mouth, we could not discover the least drop of milk; whereupon we tried the same with ink, and it came all out of the jugular veins, but not a drop appeared any where about the mouth or throat, nor the least tincture of ink: and to be more sure, we continued syringing and opening the jugular veins, until we followed it to the side of the bone, whereon the glandula pituitana lies, and there we found a pretty great vessel come out of the hole in that bone (in the outside of the bone) into the very cavity of the jugular vein: and it being thus in that animal, the doctors next work is to search and inquire how it is in men, there being great hopes in the mean time, that they both agree, that so the old doctrine of catarrhs may be washed away. There are very many like experiments in the doctor's book, but I shall not give you any farther trouble at this time, but only return you very many thanks for the glass of laudanum you sent me, which I have used with very great success and credit in the cholick, gout, *&c.* and more particularly in those grievous torments of the belly and stomach proceeding from the scurvy, to all which it hath given present ease, by causing great and sudden sweating. I never observed the utmost dose of it to give sleep, but only a pleasing drowsiness and inclination to rest, which usually ceased with their sweating. As soon as this glass is spent, I shall earnestly desire another from you, and I will tender you a particular account of both together. In the mean time I beg your pardon for giving you this diversion, and haste to remain

Your most obliged, and

most humble servant,

RICH. LOWER.

June 24, 1664.

Most honoured Sir,

SINCE you were pleased so favourably to receive my last long letter, I have ventured once more to send you another concerning some farther observations in the way of our employment.

THERE happened the last winter a great rot (as they call it) or disease in sheep, so that they being very cheap, I had frequent opportunity of inquiring into them, and into the cause of their general disease: most of them I have observed to have dropsies in their bellies, others in their breast also. I took out of several of their bellies four or five quarts

(more or leſs) of reddiſh water, even juſt ſuch as there is in men, that die of dropſies; and after the water was taken out, all the veſſels appeared very clear and plain, eſpecially the lymphatick veſſels, which were every where more large and turgid with clear water, than ever I ſaw in any large greyhound or maſtiff; ſo that *Bartholinus*'s conjecture cannot be true, that dropſies come from the breaking of the lymphatick veſſels within the cavity of the abdomen, (but rather it ſeems to come immediately out of the ends of the arteries, and that becauſe it is always of a thin bloody colour.) Theſe lymphatick veſſels I found in the ſame manner large and turgid in ſix or ſeven ſeveral ſheep, who had the like quantities of water in their bellies, when I killed them.

BUT the great and conſtant diſeaſe I always diſcovered was in their livers, and that but only in one part of the liver, *viz.* in the veſſels of the porus biliarius, all whoſe veſſels and branches were always more or leſs full of broad live worms like little plaices, with a kind of dark rotten ſanies, in which they lay: in ſome livers they were ſo numerous, that they ſwelled the branches of the porus biliarius, and made it ſtretch into ſeveral abſceſſes or cells in which they lodged; beſides the veſſels of the porus biliarius, the bladder of gall was moſt commonly full of the ſame; and the ductus communis all along into the very entrance into the duodenum, and many times I found them travelled as far as the ſmall guts. In theſe places and veſſels I conſtantly found them in all ſheep, and no where elſe, for the veſſels of the vena porta, and the vena cava in the liver, had not the leaſt appearance of any worm, or any ſanious or diſcoloured matter in them. In the next place I tried how to kill them, which I tried by pouring ſeveral liquors on them, as ſpirit of urine, aqua vitæ, ſpirit of ſal armoniac, *&c.* all which did make them ſtir a little more than ordinary, but without much more inconvenience. Then I tried ſpirit of ſalt, and the leaſt drop of that did not only kill them ſtark dead without any further motion, but ſhrinked them up preſently, and quite changed their colour from dark to white; and did likewiſe præcipitate that dark kind of ſanies, in which they lay, into a white ſlime, ſo that the worms looked as if they had been pickled a month. This I repeated in ſeveral ſheep with the ſame event, which called to mind the remedy, that I have often ſeen uſed in our country with very ſtrange ſucceſs, which was at ſpring and fall of the year, when the dew is counted moſt dangerous, to drench thoſe ſheep, which they perceived to grow faint and ſickly, with ſix or ſeven ſpoonfuls in a morning faſting, (they being kept from meat all night on purpoſe) of very ſtrong brine, and ſtale urine with ſoot ſteeped in it; and this courſe of phyſick they continued eight or ten days, or till they perceived them to eat their meat heartily, and to keep company again with their fellows; and if they were taken in time, there ſeldom died any ſheep in a whole flock. The other remedy uſed by people, that lived nearer the ſea, was to turn their ſheep to feed in the ſea-marſhes after the tide was gone out, and there to continue them between every tide for a fortnight, and then to take them home, where they remained not only healthy, but moſt commonly grew very fat; yet I enquired of our butchers, who converſe with the people in this country, and they never heard any ſuch thing uſed in this country.

THOSE ſheep, whoſe lungs were full of bladders of water, I could never find any worms in thoſe bladders, nor any where elſe, but in thoſe veſſels of the liver.

IN all theſe ſheep I found the vaſa lactea in the meſentery filled with water, ſo that they looked like lymphatick veſſels; and I ſuppoſe, that it is only in carnivorous creatures, that the chyle is white, and thence we may give that denomination to thoſe veſſels in ſuch like creatures, which colour I ſuppoſe is not found in thoſe animals, that feed only on graſs and water.

OR what I ſuſpect alſo, that the venæ lacteæ may have ſome little veſſels diſſeminated in the guts (beſides thoſe, that terminate in the guts to receive the chyle) to ſerve and ſupply the office of lymphæducts, which is as neceſſary to be done in the guts as any where elſe in the body, for there are as many veſſels of blood there, as any where elſe in the body; and there may be as great reaſon, that the chyle be diluted with that thin liquor in thoſe little veſſels, as well as in the commune receptaculum, thoſe ſmaller veſſels being more likely to be obſtructed than the vaſa thoracica; and yet I do not think the only uſe of the lympha in its general conflux from all parts of the body to the common receptacle, is only to dilute the chyle for its eaſier paſſage, but chiefly to prepare it for a better mixture with the parts of the blood: for, as *Stenon* obſerves, it is ſuch a kind of liquor, that it will readily incorporate with any other liquor or body, that we take. Since in a dog, which I fed, but was forced to hang an hour or two ſooner than I was reſolved, I found the venæ lacteæ of the upper half of the meſentery full of chyle, and the other venæ lacteæ of the lower half to contain a clear water, which I ſuppoſe was the thinner and potulent part of his entertainment, which had been expreſſed out of the ſtomach firſt.

IN the ſame dog I found two very large lymphatick veſſels coming from one of the kidnies, and ending in the commune receptaculum. I confeſs I was in hope, at firſt ſight of them, that they had been veſſels, which come from the commune receptaculum, and ended in the cavity of the pelvis of the kidney, that thereby an account might be given of the ſudden and large quantity of water, made after drinking mornings draughts; but I was deceived.

BESIDES in that and in ſeveral other dogs, I have ſeen, and can ſhew at any time, ſeveral venæ lacteæ coming out of the duodenum juſt below the pilorus, and climbing over the pancreas,

pancreas, and thence tending to and terminating in the commune receptaculum, but not one coming out of the pancreas, or ending in it.

In the ſame dog I took a ſpoonful of chyle out of the common receptacle, and poured into it ſome of the gall of the dog; and they preſently mixed together as ſoon and as well as water would with urine; ſo that I believe they are as much miſtaken, who affirm, that the gall will not mix with the chyle in the guts, as they are, who ſay the gall doth not come into the guts, till the chyle be all gone by.

In another dog ſince I tried an experiment for Dr. *Willis*, to ſee whether any chyle doth go into the meſeraick veins, as well as the venæ lacteæ (out of which the doctor will not be perſuaded.) We fed the dog, and after five hours found all the venæ lacteæ full; whereupon we filled the duodenum and the jejunum with ink, diluted with ſpirit of wine, and ſqueezed the gut between the two ligatures, to ſee if any of the tincture would go into the venæ meſaraicæ, but could not obſerve any; and, which was more obſervable, none of it went into the venæ lacteæ, not ſo much as to give the leaſt colour. So that their mouths ſeem not to be directly open into the guts, for otherwiſe the more the gut was ſtretched, the wider they would have been; whereas if they come between the coats, as the ureters into the bladder, or the ductus communis into the duodenum, the more the guts were diſtended, the more compreſt their entrance would be.

So that this experiment failing, we are trying to feed a dog with ſome tinctured liquor, which probably may retain its tincture in the chyle (there being ſeveral things, which retain their tincture to the very bladder) notwithſtanding all thoſe ſeveral changes and paſſages they do firſt undergo, as the decoction of madder-roots in milk, or broth, or ſome ſuch thing, will render the very urine red, as rhubarb doth ſtain it yellow, when it is given in purging infuſions.

One thing more I have ſeveral times ſeen in great large dogs, *viz.* the eighth pair of nerves accompanied all along the neck with two veſſels of blood in the coat of it, one on one ſide of the nerve, the other on the other ſide. I ſuppoſe one was a vein, and the other an artery, but I wanted a microſcope to perceive the difference; and I verily think, that every nerve, eſpecially the great ones, are nouriſhed with blood, as well as the brain and ſpinal marrow.

Being occaſionally the other day at the butcher's, he ſhewed me a fat lamb, which he had killed, one of whoſe kidnies was as big as a boy's head of two or three years old, and very tranſparent, it being nothing but a congeries of ſeveral thin bladders containing a very clear water. I carried it to Dr. *Willis*, and we took a quart and a half of clear water out of it, beſides what was ſpilt. It had an emulgent vein and artery, but very ſmall and ſhrunk, but no ureter; the taſte of the water was ſalt, and the ſmell ſomewhat urinous: the other kidney was ſound enough.

So much for beaſts; in men, that have died and been opened here in town, I have obſerved theſe following caſes. In a ſenior fellow of a college, who died of a dropſy, we found not above three or four quarts of water in his belly, becauſe it had found vent by ſome ulcers in his legs, to the quantity of a pint every day, for three weeks together; ſo that he found ſo much eaſe and help for the preſent, that he beſpoke a new ſuit of clothes againſt the time he ſhould come abroad, but within a week after he decayed ſuddenly and died. His guts we found all grown together, and compacted like a bunch of grapes, which, I ſuppoſe, happened in the time of his ſickneſs. In his gall we found nothing liquid, but there were ſeven or eight black pills as exactly formed, as if they had been made in an apothecary's ſhop: we bruiſed one of them, and found by the colour, that the choler had been hardened into that form. I would have kept three or four of them to have tried, whether they would have had the operation of common pills; but the gentlemen's curioſity to keep them for a ſight, would not allow me any for the experiment. In this ſame perſon, though he had been as good a fellow all his life as any of the college, yet he had but one kidney, but that was recompenſed by its unuſual greatneſs; and being divided into ſeveral lobes, it had likewiſe two emulgent arteries, and two emulgent veins, and two ureters.

The moſt obſervable thing in the courſe of his ſickneſs was, that within three weeks of his death he could not ſleep, unleſs his head and face were inclined forward; for if he lay on his back, he preſently ſtarted and awaked in a trembling and kind of convulſions, and ſaid it drowned him; whereupon opening his head, we found much water in it, which, as he lay on his back, fell down upon the medulla oblongata, and all the nerves; but inclining his head forward, it flowed toward the former part of his ſcull. And I have obſerved the ſame in one more, who could not ſleep, but with his head inclined forward very much; and after he died, the like quantity of water was found about the bottom of his brain.

This man had but one vertebral artery, but that was as big as two. The ſame I ſaw a little before in another, who died of an apoplexy, neither of which complained of any inconvenience in their head.

About a fortnight ſince we opened the head of a ſcholar, who being a very able and healthy youth, fell ſuddenly into a lethargy, and within a week's time died of it. His brain we found very firm, all the veſſels of blood going to and coming from his head very free and open, not any way obſtructed; but the ventricles of the brain were extraordinary full of a very clear water, and all the bottom of the brain and nerves drowned in the ſame water. The paſſage of the infundibulum was not obſtructed, but in the glandula pituitaria

pituitaria there was a cavity not unlike that of the pelvis in the kidney, which cavity was filled quite up with a clear gelly to the bigneſs of a bean, ſo that it probably obſtructed the paſſage of the water out of the ventricles of the brain; whereupon it broke the pia mater at laſt, which encompaſſeth and incloſeth the brain about the ventricles, and ſo fell down outſide the brain upon the medulla oblongata and the nerves, whence came thoſe little convulſions firſt, and after by the increaſe of the ſame water, a lethargy; and this was the moſt probable reaſon we could find of his death and diſeaſe, there being no other way to convey away the water from the ventricles of the brain, but through that glandule.

AND here, next to the dropſies of the head and belly, I ſhall give you an account of a dropſy in the breaſt, which happened the laſt autumn.

A YOUNG gentleman, a fellow of All-Souls, having formerly weak lungs, being occaſionally at *London*, took a cold, and fell into a cough after it, but ſpit nothing but a thin frothy water, ſometimes a little ſtreaked with blood. Within three weeks he complained of a weight and heavineſs in his breaſt, which did very much oppreſs him, and made him ſhort-breathed, and about a week after could not lye on his left ſide; during which time he took electuaries againſt ſpitting blood and pectoral drinks, all to very little purpoſe, for his ſhortneſs of breath increaſed, and at laſt was not able to lye well on either ſide, but was forced to ſit up either in his chair or in his bed; for if he lay down to ſleep, within half a quarter of an hour he waked in a great oppreſſion, as if his breath had been taken away. I viſited him very often, being a friend of long acquaintance, and conſidering, that he had no kind of pleuriſy or inflammation of lungs preceding, and conſequently could have no empyema, and yet was not able to lye upon his left ſide without great heavineſs and oppreſſion, ſuſpected it might be water in his breaſt, eſpecially becauſe he ſpit nothing but thin watery liquor; and aſked of him, whether he would conſent to be opened, it being the only remedy, which gladly he would admit, if the doctors would conſent to it; but, it ſeems, they were not of the ſame opinion, and thought him too weak to endure it, if it were ſo, alledging the common ill ſucceſs of ſuch operations. So that he continued on his former courſe of phyſick about three weeks longer, all the while complaining for want of ſleep, and that he could not draw his breath, though he endeavoured with all his force, which was attributed to the weakneſs and ſoreneſs of his lungs, which they thought ulcerated. During the latter end of his life, he complained very much of cold, ſo that though he ſat by a conſtant great fire in a cloſe covered frame of wood, yet he could not get any heat. All this while he was moſt perfectly in his ſenſes, but at laſt ſpoke ſo low, that his words could not well be heard, unleſs one ſtood near him, which he attributed to his not being able to draw breath.

WHEN he died, inſtead of impoſtumes or ulcers in his lungs, we found the right ſide of the thorax as full of water, as ever it could hold: the other ſide was almoſt as full, but the lungs were ſo depreſſed and contracted by the preſſure of the water, that till two quarts were taken out, they could not well be ſeen; ſo that it was no wonder he could not draw his breath, becauſe his lungs could not be dilated. His lungs were not ulcerated, but only the pipes of the aſpera arteria full of thin frothy water, which I ſuppoſe had been aſſumed out of the water in the thorax.

I HAVE ſeen one ſince opened, who died of the ſame diſeaſe, in whoſe breaſt the lungs were ſo compreſſed by the water, that there is room enough for a knife to enter without danger of hurting, if they would conſent to be tapped. You need not take notice of this relation, when you come to *Oxford*; for when he was opened, it was agreed not to ſpeak any more of it.

AND this diſeaſe puts me in mind of another, *viz.* of a young healthy gentleman, Dr. *Willis*'s patient, as I remember the lady *Littleton*'s ſon, who, coming lately from *Tangier* to *London*, upon his arrival, was taken with a great pain in his ſhoulder, to which one of the *London* doctors applied a plaiſter (which ſince the gentleman underſtood by the apothecary to be *empl. vigon. cum mercur.*) which took away the pain in one night, but the next day he broke a vein, and ſpit blood in great quantity, and is now in a very ſad condition. His lungs were ſo ſound before, that he never remembered, that he had ſo much as a cough.

I OBSERVED lately in a man mentioned in Dr. *Willis*'s book of fevers, who had like to be ſtarved, becauſe he could not ſwallow, till he invented a whalebone with a button at the end, to thruſt his meat down: the fault it ſeems is in the lower part of the oeſophagus, or in the orifice of his ſtomach, for he is able to ſwallow down five or ſix good morſels (enough I ſuppoſe to fill all the oeſophagus) but then he can ſwallow no more, till with his whale-bone he hath thruſt down all that continued in his throat (as he calls it) into his ſtomach: the like he doth with drink, for he can take a whole beer-glaſs at a time, but it ſtays in his throat, till he forceth it into his ſtomach with his inſtrument. This the doctor thought might be cauſed by ſome tumor or ſchirrhus, near the mouth of the ſtomach; but lately it appeared otherwiſe, for being a while ſince in a fever, he could ſwallow down any thing, as readily as ever he could in his life; and ſo he continued during that ſickneſs; but as ſoon as he recovered, he loſt that faculty again, and is forced to uſe his whalebone as before.

THERE is one thing more, which I have begun to try, but have not had time to finiſh or duly conſider: it is the reaſon of the different colour of the blood of the veins and arteries:

arteries: the one being florid and purple red, the other dark and blackiſh; and therefore, in letting blood, the blood in the diſh, after it hath ſettled, that which is uppermoſt (I mean in healthy perſons) is always florid and finely red, and that under it always dark and black, which the apothecaries and ſurgeons very gravely call melancholick bad blood; whereas the purple part is the arterious blood newly come into the veins by anaſtomoſis, without any change; the black part is the arterial blood circulated through the habit of the muſcles, where without it loſeth many parts (*viz.* by lymphatick veſſels, *&c.*) before it is reſumed into the veins, and this I have tried to prove by two or three experiments.

FOR I opened an artery in a dog's thigh, and kept a porrenger full of the arterial blood, a day or two, and it continued to be of the ſame florid purple colour throughout to the bottom of the diſh. I opened preſently after the vein in the other thigh of the ſame dog, and kept it the ſame ſpace, and it remained black, except a little thin ſkin of redder blood on the top, which was of the very ſame colour as the arterious blood of the former diſh; which redder part, that it came out of the artery into the veins by anaſtomoſis, I am apt to believe, becauſe by ſyringing milk into an artery in the thigh or arm of man or beaſt, or into the emulgent artery (and perhaps into all the reſt) the milk will come forcibly and preſently out of the vein belonging to it, mixed with the blood, though not ſo perfectly mixed, but ſo as you may diſcern it very plainly; which difference of colour cannot be diſtinguiſhed ſo ſoon in the two bloods, becauſe they are of a nearer colour and mixture, but after ſettlement they ſeparate again, and the arterial part ſwims uppermoſt, becauſe of the difference of its part, and being more ſpirituous and lighter.

AND beſides it is obſerved, that the laſt blood, which comes out in letting blood, is always the moſt fine and purpureous, becauſe it was laſt ſupplied out of the arteries, and perhaps not ſpoiled of ſo much of its parts by the lymphæducts; which being ſtopped, as well as the veins, by the ligature, could not receive any more liquor. Now how much the ſeparation of the lympha from the arterial blood, before it is reſumed into the veins, may alter the colour of the venal blood, may be conceived, by drawing off or rectifying any liquor, which always renders that, which is left behind, more dark and groſs, ſo that the blood in the veins is like the caput mortuum, when the lympha is ſeparated.

AND here having mentioned anaſtomoſis, I cannot but tell you of an experiment or two concerning it.

IN the country, not far off, at a ſheep-ſhearing, a country man ſtanding by, the ſheep kicked the ſhears out of the ſhearer's hand, and it ſtruck the inſide of his leg, and cut the great artery in his leg, ſo that he loſt about three quarts or more of blood before the ſurgeon (*viz.* old *Day* of *Oxford*) could come. He uſed ſeveral things to ſtop it, but all to no purpoſe, ſo that he laid the wound open, and took up the artery, and made two ligatures, and cut off the artery between them, where it was opened; and the fellow came to town about a fortnight after a-foot, though it was nine miles off, and was as well as ever, only complained, that that foot, below the wound, was a little colder than the other, and a little benumbed for a day or two after, but ſince was as hot and well as the other.

AND ſince I have tried in ſeveral dogs, and in a man laſt aſſizes, and found an anaſtomoſis between all the arteries in the body, ſo that if one be ſyringed with milk, it will return and come out of all the reſt in the ſame part of that body; and the ſame we tried in the meſentery. We took a little branch of the meſenterical artery, and ſyringed it with milk, and it ran into all the arteries of the meſentery, which was the pleaſanteſt ſight I have lately ſeen in anatomy.

ONE thing more I tried, that the arteria hepatica goes into all parts of the liver; for if it be ſyringed, it will come out of all the lobes of the liver, if you cut off the edge of them. So that doctor *Gliſſon* was much miſtaken to affirm the contrary in his books; but I ſuppoſe he did not uſe ſyringes, without which anatomy is as much deficient, as phyſick would be without laudanum.

I HAD the opportunity lately to make uſe of millepedes. There was a child here in this town (a citizen's daughter) of ſix years of age, troubled exceedingly with ſore eyes, eſpecially one of them, which ſhe would not ſuffer to be touched or opened for eighteen weeks and more, nor could not endure the leaſt light, having a very ſharp fretting rheum in it, which did inflame all the cheek on that ſide, on which it fell. She had been touched for the evil, but received no benefit. I only gave her ſmall beer with millepedes bruiſed and infuſed in it, for a fortnight, to drink for her ordinary drink, and one gentle purge before the uſe of them; and ſhe is as well recovered as ever ſhe was in her life; the rheum is all gone; ſhe hath no blemiſh at all in them, only a little ſpeck upon the cornea, which ſince is worn quite off. And this I muſt acknowledge I received from the reading of your book concerning millepedes, for which I am aſhamed I have not returned my thanks ſooner.

DR. *Willis* a while ſince cured a child extraordinarily afflicted with the ſtrangury, only with millepedes in the like manner; ſo that in a ſhort time he could make water without any pain or anguiſh, which formerly he had not done in a great while.

I SENT Mr. *Hook* a while ſince ſomething concerning the difference and fabrick of the ſtomachs of creatures, which chew the cud, not knowing whether you were in town. It deſerves your conſideration, as well as any thing in the body of ſuch creatures, eſpecially ſince it ſo nearly relates to the beſt chemical proceſ-

ſes in diſtillation. But this I muſt tell you, what I had forgot to mention to him, that that part of the ſtomach, which I called the preſs, which ſqueezes the thin tincture into the next ſtomach, is not ſo hard, nor the ſeveral cakes between its ſeveral coats ſo dry this time of year, when they eat graſs, as in winter, when their food is drier.

DR. *Willis* is ſo taken with it, that he will make a lecture of it the next term, though he hath not been at leiſure yet to ſee them opened. My letters to Mr. *Hook* will inform you more fully.

BUT, Sir, I am very ſenſible, how much I have tired your patience already, aſſuring you, that I ſhould not have ventured to have given you ſo great a trouble, but that your accepting of my laſt letter invited me to write this. Therefore pray pardon this long ſcribble, and I ſhall remain,

SIR,

Your moſt obliged ſervant,

R. LOWER.

IF you write to me again, you may not direct it to me a ſtudent of *Chriſt Church*, for I have been put out of my place above a year and half ſince, for not being in orders, without which I could not keep my ſtudent's place, unleſs I had got a phyſician's place in the college, there being two allowed, but I had not the favour or friendſhip to obtain either; but I live in a chamber of the college, where, if you are pleaſed to honour me with a letter at any time, I ſhall moſt gladly receive it.

DR. *Willis* will ſend his book of the Diſeaſes of the Head to the preſs this winter, if he be not hindered and forced to defend his laſt. There is not a diſeaſe of the head, which he doth not excellently illuſtrate with very rare obſervations and caſes; ſo that it is pity the world ſhould be any longer deprived of them. When you come down, you may ſet it more forward; but pray take no notice, that you have ſeen any thing of them already, but only by hearſay and report.

Chriſt-Church, Oxon, June 8, 1664.

Moſt Honoured Sir,

I SHOULD have returned you my thanks ſooner, together with an account, how I have employed your laudanum; but that I hoped to have ſeen you before this time, either here or at *London*, and told you ſome other obſervations, which lately I have met with; but now I cannot defer it any longer, having promiſed to be in *Cornwall* after the Act, where, if I may ſerve you in any thing, pray let me receive your commands. I have ſome pieces of minerals, which I would have ſent you a-while ſince, but that Mr. *Croſſe* made me believe you were coming down. If I may know, whether they ſhall find you at *London*, I will ſend them by the firſt opportunity; otherwiſe I will leave them with Mr. *Croſſe* for you.

THE caſes, in which particularly I tried your laudanum, were, firſt, in one of ſixty years of age, who being cruelly troubled with the gout in his feet, and being impatient of any longer pain, applied repercuſſive plaiſters, which, within half an hour, repelled the humour from his feet into his heart and ſtomach; ſo that he had a very intermittent and trembling pulſe, and continually vomited, with a violent pain at his ſtomach; and when I came to him, I found him very weak, and in a cold ſweat. I gave him twelve drops of the laudanum, with one ſcruple of diaſcordium, and a draught of hot poſſet drink, boiled with camomile flowers, after it, and ſo left him, with little hope of ſeeing him again; but when I came two hours after, I found him very well, in a great ſweat, and a deſire to reſt; for he had not ſlept three or four nights before, by reaſon of his gout. He told me, that his pain went away from his heart and ſtomach, within half an hour, as ſoon as he began to ſweat; whereupon he continued in a ſlumber and a ſweat four hours longer (being a groſs bodied man) and the next day roſe, being neither troubled with gout or any pain elſe, and ſo he continued a quarter of a year, though his gout formerly continued upon him at leaſt a fortnight together: after which time, by taking cold in his feet, his gout returned upon him again, with the ſame violence as before; and, notwithſtanding I had told him the danger of uſing ſuch repelling plaiſters, yet being overcome with the pain, he uſed the ſame plaiſters again, and preſently after fell into the ſame ſymptoms, but was recovered again by the uſe of the ſame laudanum, beyond the hopes of all his friends, who deſpaired of his life; for as ſoon as he had taken it, he fell into a ſweat, and continued therein all night. In this man, as in all others, in whom I tried it, I always found it to cauſe ſweat extremely, but not ſleep, but rather a ſlumbering and deſire to reſt.

ON another I had occaſion to try it, who was ſick of a ſcorbutick fever, with a very great burning and heat of his body, without much thirſt or drineſs in his mouth, ſo that if he could ſweat, he hoped to be much better. His doctor had given him three nights following one dram of mithridate in poſſet drink, but without any ſweat after it; but he being ſent for out of town, the man deſired me to come to him, and I preſcribed him a clyſter, and afterwards at night gave him fourteen drops of the laudanum, with half a dram of diaſcordium, with a draught of hot poſſet-drink after it; and within a quarter of an hour he fell into a very great ſweat, and ſo continued till eight the next morning, not being much weakened by it: he ſlept pretty well all the while, ſo that he told me, his ſweat was not at all troubleſom to him. After he was out of his ſweat, he found his body very light and cool, his water became

became very good, and, whereas he had not ſlept in two or three nights before, but continually toſſed and tumbled, he reſted very well that night by fits, and found himſelf wonderfully eaſed and refreſhed, as he told me; and within two days after recovered very well; for which I had more thanks from the patient, than from the doctor.

A LITTLE before this time, I had an opportunity to try it in a gentlewoman very much weakened and tormented with thoſe pains of the ſcurvy in her belly, and at the pit of her ſtomach. She had took phyſick two years together from a country phyſician for fits of the mother, he having perſuaded her, that that was her grief: whereupon I took away the bay of caſtor and aſſa fœtida from her neck, which ſhe confeſſed did very much offend her, and made her much fainter; and the firſt night I gave her twelve drops of the laudanum in ſome conſerve of roſes, and ſhe ſlumbered all the night, and felt no pain at all, and in the morning awaked in a great ſweat: whereupon I left ſo much laudanum, mixed with conſerve of roſes, (for ſhe lived in the country) as ſhould ſerve her four nights more, and preſcribed her an electuary for the ſcurvy, to be taken twice a day, drinking after ſome wormwood wine, with ten drops of elix. proprietat. in each draught, and with theſe only things ſhe recovered ſo well in a fortnight's time, that ſhe told me, half a year after, when I ſaw her again, that ſhe was never better, when ſhe was a maid of twelve years old, though for the two laſt years ſhe never enjoyed one day without much pain and torment; ſo that ſhe ſaid, ſhe did commend my phyſick in all companies and places, where ſhe came.

AND ſince I have uſed it in the ſame pains of the ſtomach and belly with the ſame ſucceſs.

ANOTHER time I tried it in a gentleman, who had been troubled with a great flux, and a feveriſh diſtemper together, five or ſix days, whereby he was very much weakened. I gave him ten drops in conſerve of red roſes, which made him ſweat very well in the night, and very much abated his flame; but upon the ceaſing of his flux, he grew more feveriſh, ſo that I gave him another doſe, the next night, in the ſame conſerve; and it cauſed ſweat more largely, ſo that his flux quite ceaſed, together with his fever.

I HAVE uſed it in continual fevers with very good ſucceſs, by giving twelve drops in ſome temperate cordial, which always gave eaſe, by cauſing reſt and ſweats, though the patients were ever ſo hot and unquiet before.

I TRIED it once in a young country fellow, that was quite raving mad, without any fever or ſickneſs preceding, whom nothing could make ſleep. I gave ſixteen drops at a time, once a day, and at the ſame time uſed other remedies, *viz.* I let him blood at three or four ſeveral times, forty or fifty ounces of blood, and vomited him with ſtibium three or four times, and as often purged him with reſin of ſcammony, and extract of hellebore, and all this in a fortnight, giving him nothing all this while but plain water-gruel, and raw apples as many as he would eat; and for his drink only whey or fair water boiled with apples, and a little ſal. prunel. diſſolved in it: beſides, I made him an iſſue in his arm, and another on the top of his head, where it is preſcribed; and with theſe things he recovered perfectly well within a fortnight, and continues as well as ever he was in his life. The very ſame I tried once ſince on another with the ſame ſucceſs; but the laudanum did not make them ſweat as it did all others, becauſe continually they threw off their clothes, and lay naked.

AND here by the way I muſt acquaint you with another accident concerning the ſame diſeaſe. Here was a young gentleman, who formerly being very far in a conſumption, had ſeveral iſſues made, to the number of nine, which, together with the uſe of aſſes milk, reſtored him pretty well; but going to *London* lately, met with ſome company, who perſuaded him to drink ſack with them, according to their own rate; ſo that in a ſhort time he was drunk, and that night was very ſick and feveriſh; ſo that all his iſſues were dried up, and the next day (though his feveriſh diſtemper was gone) yet he continued to talk as if he were yet drunk, which condition he remained in two or three days, till at laſt he became perfectly mad, and was thereupon brought down to *Oxford*, tied faſt in a coach, and here he remained in the ſame caſe about a week, and then he died; and notwithſtanding all things poſſible uſed, yet they could not make any of his iſſues to run again.

BESIDES the caſes abovementioned, I have uſed the laudanum very proſperouſly in pleuriſies, colicks, hyſterical fits and catarrhs, and once or twice in an eriſipelas; all which it wonderfully helped by large ſweats; ſo that if I had a quart of it, I ſhould not be able to keep it long; for thoſe, that have had the experience of it in one diſeaſe, think it will cure all. And now I am going into the country (pray pardon my boldneſs to requeſt ſo great a favour) if I might have another little bottle, I ſhould think myſelf more ſecure in my journey, and hope to be the better welcome where I go.

BUT I ſhall not trouble you any farther with the commendations of it, but only tell you in general, that I think it is the only medicine in the world, that can properly be called a ſudorifick; for it never fails to do it more or leſs, according as the body is more thin or groſs; and, which is the great conveniency of it, it cauſeth reſt and ſlumbering together, ſo that ſweating cannot be ſo troubleſom as otherwiſe it would be.

AND here I ſhould put an end to your trouble, but that I write to you but ſeldom, and cannot but tell you (at this opportunity) of an experiment or two I have lately ſeen or made.

THE one is of an ancient gentlewoman, Dr. *Willis*'s patient, which after a fever for two years ſince is troubled with a defect of ſight

sight every other day; for one day (be it never so serene and clear) she cannot see at all, save only a glimmering light; the next day (be it ever so rainy, southerly and dull weather) she can see very well, and read the smallest print: the same day she cannot see, she is indisposed in body and dull; the next day very clear and well, be it what weather soever; so that the doctor is curing her almost as one of an intermittent fever: what the success is, you shall know hereafter.

THE other experiment is this: having occasion to use some powder of vipers, I cut off their heads, and after touching one of the great teeth in the upper jaw (there being three on each side, contained in one skin, as it were in a sheath) which you know they can erect and contract at pleasure; every time the viper shot forth these teeth, there appeared upon the middle of it a little drop of liquor, partly yellow and green mixed, but very clear, not exceeding the head of a pin, just as it is on the sting of a bee, when she thrusts it out; and this liquor continually appeared at the end of the tooth every time I took up the tooth: whereupon finding the gall afterwards of the same colour (though it looks a little more green while it is contained in the bladder) I preserved three of the galls to try them on a dog; which within three days I did; and having opened one of the dog's jugular veins, and made a ligature above the orifice, I dropped in two galls into the vein, and presently compreſt the vein downwards towards his heart, that the galls might not run back again out of the orifice, but before I could drop the third gall into it, the dog cried out, and sprawled on the table, and gaped in the greatest agony imaginable; and besides was in greater convulsions than a puppy dog is of nine days old, when the eight pair of nerves are tied in the neck; so that we thought the dog was almost dead, and layed him down on the ground, where he lay sprawling for life, but within a quarter of an hour he recovered pretty well, so as to stand, and since is well again, and living. I have not yet tried, whether wounding a dog's skin, and dropping a drop of the gall into it, will kill him as if he were bit, as I believe it will; for I verily think the gall to be the same liquor with that, which drops from the tooth, though I did not try to find the ductus from the one to the other, which *Severinus* mentions.

ANOTHER experiment, which I intend to make as soon as I can get two dogs of equal bigness, is this; to let both bleed into one another at the same time, from the artery of one into the other's vein, *& sic vice versâ*, for an hour's time, till they have wholly changed their blood: and then to make the experiment surer, whether one dog can live with another's blood, I intend to take away as much blood from one dog, until he be quite faint and cannot stand, and then let the other dog's blood run into him, to supply the loss, and see whether immediately he recovers his strength again, and will live after it. And if this succeed, it may be tried on creatures of several bloods, as on a sheep and a mastiff; but howsoever if the blood of two several creatures cannot agree together, yet perhaps that of a sheep may agree with a man's blood, and incorporate together, it being almost of the same taste and nature, and not so rank as that of unclean creatures, nor altogether so fibrous as that of oxen: and if so, it may be improved in several cases, *viz.* in great losses and evacuations of blood, to have it supplied from a sheep, which may be dieted before, to make his blood more agreeable.

A LITTLE while since I syringed in about a quart of warm milk into a great dog (having first taken some blood from him to make room for the milk;) and though at first he seemed not much altered, but looked upon it very unconcernedly, while it was doing, yet within a quarter of an hour he began to groan exceedingly, and draw his breath with great difficulty, and seemed to be very much oppressed at heart, and struggled very much; and, which was very remarkable, he drivelled at the mouth a kind of white liquor, as if he had been lapping milk. When we perceived him in this agony, we removed him from the table; but he was not able to stand, nor raise his body, but lay driveling and groaning, and almost presently died; and as soon as we opened him, we found all the vena cava, the ventricles of his heart, and the great artery, full of blood, mixed with milk, as if both had been curdled together, for it was very fastly mixed, so that it could not easily be separated.

THERE are several other small experiments in anatomy, which we have lately made, which at some other time I should acquaint you with, if I were sure of your pardon for giving you so great a trouble at present.

Sir, I remain

your most obliged servant,

RICH. LOWER.

I WOULD gladly send those minerals to you, that I may have your opinion of them, and farther directions, before I begin my journey. What some of them are, I know not; but there is a piece or two of copper ore, as rich, I believe, as any in the world; and the gentleman, who sent it me, hath a whole hill of the same metal, but is loth to have it known; for it being a royal mine, they may break up his land, and allow him no advantage for it: but if he might be assured, that he should be paid for his ground, I believe, not only he, but several others, might do the king as much good, as if they had discovered another island in *America*.

Christ-Church, Oxon, July 18, 1664.

Honoured SIR,

BEING stayed in town longer than I expected, I had the happiness to receive your letter last night, and I assure you I shall

ſhall make it my buſineſs to ſatisfy you in thoſe things you mention, both as to ſufficient quantities and information concerning them, or any other ſtrange mineral I can get. I forgot in my laſt to mention two or three very obſervable things, which you might have the opportunity to enquire of more fully when you come down to *Oxford*.

ONE is of Dr. *Priaux*, a doctor of divinity and prebend of *Saliſbury*, who being a while ſince here in town upon another occaſion, enquired of Dr. *Willis* concerning a ſtrange obſervation he had made of himſelf, *viz.* that his ſweat did always ſtain his ſhirt as blue as any thing could be died of that colour; and it is only the ſweat of his back, and no part elſe of his body, that hath the ſame effect. Dr. *Willis* told me, he ſaw the experiment of it ſeveral times here in town; and to be more certain, he made him put on a new ſhirt never worn before, and the next morning it was ſtained as blue, as if it had been died with indico, ſo that it could not be waſhed out. The doctor is an ancient man, yet very healthy, and of as ruddy and lively complexion as any man of thirty years.

THE other is of a lad here in town of fourteen or fifteen years old, the ſon of one *Franklin* a taylor, living over againſt *New-Inn Hall* in *Oxford*; who being taken with a ſuppreſſion of urine for a day or two, and in great pain, there met ſome of the neighbours in conſultation, amongſt whom an old woman gave her judgment, that it proceeded only from wind (as they think moſt diſeaſes do) and adviſed to give him a pipe of tobacco, which ſhe commended upon her experience to be very good againſt wind. Whereupon the boy began to take the pipe, but before a quarter of it had been taken, he called for a chamber pot, and made a great quantity of water, and was in perfect eaſe (but it ſeems the tabacco wrought otherwiſe beſides that by urine, it being the firſt pipe he ever took.) But about twelve hours after he was in pain again, and could not make water without uſing the ſame means, and ever ſince for theſe two years he continues in the ſame condition, only with this difference, that now he hath no pain though his urine be ſuppreſſed a whole day and night, ſo that his parents are careful to make him take tobacco every morning, midday, and at night; whereas being not provoked by any pain or oppreſſion, he would otherwiſe forget, not knowing the danger of its long retention, or elſe not liking the taſte of tobacco.

THE other relation was given me by a maſter of arts and fellow of *Magdalen* college, one Mr. *Mew*, a very honeſt and underſtanding perſon, who having travelled in the winter about Chriſtmas about forty miles in one day with his brother, and being to riſe early in the morning, he waked about five of the clock, and at firſt riſing in his bed, he was aſtoniſhed to ſee the bed within the curtains very light, as if there had been a candle in the room. There being a flame upon the coverlid as big as his hand, like the flame of burning aqua vitæ; which after he had contemplated a while, he put his hand to touch it, and the flame came from the bed to his hand, and there continued in the ſame faſhion without any heat. He ſtirred it with a finger of his other hand to and fro upon the palm of that hand, which took it up, until by degrees it leſſened and vaniſhed; and after his hand was very much drier than the other (for they were both in a ſweat, when they waked) he thinks, if he had not took it from the bed, the flame would have laſted much longer.

I SUPPOSE, if the boy before mentioned had taken fit remedies for his diſtemper before his bladder had been weakened by uſing only tobacco at ſet times, he might eaſily have been reſtored at firſt; but it is harder to perſuade mean people to take phyſick, than it is to cure their diſeaſes.

I HAVE received your laudanum, and return you my moſt hearty thanks for ſo great a favour; as ſoon as I have uſed it, I ſhall give you a farther account of it. In the mean time I take leave to reſt,

SIR,

Your moſt obliged, and
moſt humble ſervant,
RICH. LOWER.

Treemere, near *Bodwin* in *Cornwall*, Sept. 3, 66.

Honoured Sir,

YOURS of the 26th of June, after it had lain at Mr. *Croſſe*'s about three months, was occaſionally found and ſent to me in the country by a friend, together with another from Mr. *Mayer*, with a little box of braſs pipes; whereby I underſtand, that the account of bleeding one dog into another, which I ſent you before I left *Oxford*, had miſcarried, and that Dr. *Wallis* had not given you a full information how I performed it, for I tried it before him and ſeveral others with very good ſucceſs, and that ſeveral times, but not by that way of conveying the blood from one dog's jugular vein to the other by pipes, as we endeavoured to try, when you were there, and ſince often, but found it altogether impoſſible, becauſe the blood was apt to congeal in thoſe pipes, and ſo ſtop its own paſſage: but the way I did effect it ſince, was by bleeding from one dog's carotidal artery into the other dog's jugular vein, which by reaſon of the ſwift motion of the blood out of the artery will keep open its own paſſage. The exact way of doing it is this.

FIRST take up the carotidal artery, and ſeparate it from the nerve of the eighth pair, and lay it bare above an inch: then make a ſtrong ligature on the upper part of the artery not to be untied again; but an inch below, *viz.* toward the heart, make another ligature of a running knot, which may be looſened or faſtned, as there ſhall be occaſion, having made theſe two knots draw two threads under the artery, between the two ligatures, and then open the artery, and put in a quill, and tye the artery upon the quill very

very faſt by thoſe two threads, and ſtop the quill with a ſtick.

AFTER this make bare the jugular vein in the other dog, about an inch and half long, and at each end make a ligature with a running knot, and in the ſpace betwixt the two running knots, draw under the vein two threads more: then make an inciſion in the vein, and put into it two quills, one into the deſcendent part of the vein to receive the blood from the other dog, and carry it to the heart; and the other quill put into the upper part of the jugular vein, which comes from the head, (out of which the dog's own blood muſt run into diſhes.) Theſe two quils being put in and tied faſt, ſtop them with a ſtick, till there be occaſion to open them.

ALL things being thus prepared, tye the dogs on their ſide toward one another ſo conveniently, that the quills may go into each other (for the dogs necks cannot be brought ſo near, but that you muſt put two or three ſeveral quills more into the firſt two to convey the blood from one to another.) After that unſtop the quill going down into the dog's jugular vein, and the other quill coming out of the other dog's artery, and by the help of two or three other quills put into each other, according as there ſhall be occaſion, put them into one another; then ſlip the running knots, and immediately the blood runs through the quills, as through an artery, very impetuouſly; and immediately as the blood runs into the dog, unſtop the other quill coming out of the upper part of his jugular vein (a ligature being firſt made about his neck, or elſe his other jugular vein being compreſſed by one's finger) and let his own blood run out at the ſame time into diſhes, (yet not conſtantly, but according as you perceive him to bear it) till the other dog begin to cry and faint, and fall into convulſions, and at laſt dye by his ſide.

THEN take out both the quills out of the dog's jugular vein, and tye the running knots faſt, and cut the vein aſunder; which you may do without any harm to the dog, one jugular vein being ſufficient to convey all the blood from the head and upper parts, by reaſon of a large anaſtomoſis, whereby both the jugular veins meet about the larynx: this done, ſew up the ſkin, and diſmiſs him, and the dog will leap from the table, and ſhake himſelf, and run away, as if nothing ailed him. And this I have tried ſeveral times before ſeveral in the univerſity, but never yet upon more than one dog at a time, for want of time and convenient ſupplies of ſeveral dogs at once: but when I return (which I hope may be this autumn) I doubt not but to give you a fuller account, not only by bleeding ſeveral dogs into one, but ſeveral other creatures into one another, as you did propoſe to me before you left *Oxford*, which will be very eaſy to perform, and will afford many pleaſant and perhaps not unuſeful experiments.

BUT becauſe there are many circumſtances neceſſary to be obſerved on the performing this experiment, and that you may better direct any one to do it, without any danger of killing the dog, that is to receive the other's blood, I will mention two or three: firſt, that you faſten the dogs at ſuch a convenient diſtance, that the vein nor artery be not ſtretched; for then being contracted, they will not admit or convey ſo much blood: 2. That you conſtantly obſerve the pulſe beyond the quill in the dog's jugular vein (which it acquires from the impulſe of the arterious blood) for if that fails, then it is a ſign the quill is ſtopped by ſome congealed blood, ſo that you muſt draw out the arterial quill from the other, and with a probe open the paſſage again in both of them, ſo that the blood may have its free courſe again. For this muſt be expected, when the dog, that bleeds into the other, hath loſt much blood, his heart will beat very faintly, and then the impulſe of blood being weaker, it will be apt to congeal the ſooner, ſo that at the latter end of the work, you muſt draw out the quill often, and clear the paſſage, if the dog be faint-hearted, as many are, though ſome ſtout fierce dogs will bleed freely and uninterruptedly till they are convulſed and dye: but to prevent this trouble, and to make the experiment certain, you muſt bleed a great dog into a little, or a maſtiff into a cur, as I once tried, and the little dog bled out at leaſt double the quantity of his own blood, and left the maſtif dead upon the table; and after he was untied, he ran away, and ſhaked himſelf, as if he had been only thrown into the water: or elſe you may get three or four ſeveral dogs prepared in the ſame manner; and when one begins to fail, and leave off bleeding, adminiſter another, and I am confident one dog will receive all their blood (and perhaps more) as long as it runs freely, till they are left almoſt dead by turns, provided that you ſet out the blood proportionably as you let it go into the dog, that is to live.

3. I SUPPOSE the dog, that is to bleed out into diſhes, will endure it the better, if the dogs, that are to be adminiſtred to ſupply his blood, be of near equal age, and fed alike the day before, that both their bloods may be of a near ſtrength and temper. There are many things, which I have obſerved upon bleeding dogs to death, which I have ſeen ſince your departure from *Oxford*, of which I ſhall give you a relation in my next. In the mean time, ſince you were pleaſed to mention it to that honourable Society, with a promiſe to give them an account of this experiment, I could not but take the firſt opportunity to clear you from that obligation, and the more willingly, that I might expreſs myſelf grateful for all thoſe kind remembrances you have of me; and that I am,

Honoured Sir,

your moſt obliged, and

moſt humble ſervant,

R. LOWER.

Letters from Mr. Robert Hooke *to Mr.* Robert Boyle.

London, June 5, 1663.

Ever honoured Sir,

I HAVE put up and sent the things you gave order for, together with four pair of gloves Mr. *Whit.* spoke for; and should have come away my self, but that having received a particular favour from the Society, and also an extraordinary injunction to see the condensing engine in a little order against the next Wednesday, I did hope you would be pleased to dispense with my absence from attending on you for two or three days longer, till the next Wednesday be past, and that because those extraordinary days being holidays, you may perhaps have other avocations, especially being but newly come thither. For I remember you were pleased to say, that you thought it would be a week before the ceremony of visits would suffer you to settle about any business, and so should have little use of me till then; and if your occasions would permit a dispensation for my stay here any longer time, I should endeavour to improve the time the best way I am able to serve you. But, Sir, I make it no further my desire, than the convenience of your affairs permit, having wholly resigned myself to your disposal. Nor should I have presumed to have trespassed your commands thus far, had I not thought, that the Society might have taken it a little amiss, if, at the very next meeting, after so great an honour done me, I should be absent. There was nothing of experiment, but only a trial of the condensing engine, which only held enough to shew us, that it would not hold long enough with that kind of cement we used; for after the air was condensed into about half its dimensions, it forced its way through the cement of the covers, though laid very thick in the joints. But I think that inconvenience will be easily remedied against the next day. Dr. *Bates*, I understand, was chosen by the council a member of the Society, who thereupon returned a great compliment, together with a present of ten pounds in new coined silver. There happened an excellent good discourse about petrefaction; upon which occasion several instances were given about the growing of stones: some, that were included in glass viols; others, that lay upon the pasture ground; others, that lay in gravel walks; which was known by putting a stone in at the mouth of a glass viol, through which, after a little time, it would by no means pass. Next, the story of a field's being filled with stones every third year, was confirmed by some instances. And that the stones in gravel walks grow greater, had been often proved by sifting those walks over again, which had formerly passed all through the sieve, and finding abundance of stones too big to pass through the second time. Upon this, mention was made of the production of stones or lapidious concretions in the bodies of animals, and abundance of very strange instances were alledged of the finding of stones in several parts of a man's body, as in the joints of his fingers and toes, and of other parts of his body; and it was generally agreed to by all, that those people, that drink petrifying waters, are extremely subject to the stone. A place was mentioned in *Oxfordshire*, where there is such a water, and the people round about are extremely plagued with that disease. Mr. *Pell* and some others mentioned to have read somewhere an observation, that there were more such concretions taken from one man, than the weight of his whole body amounted to.

MR. *Palmer* related a story of a French physician (whose name I have forgot) who landing sick at *Dover*, and taking a glister, voided an incredible number of small and great cockle-shells. The matter of fact was confirmed by very many of the Society, who had either had very good relation of it, or seen some of the shells. Dr. *Charlton* added, that they had lain a good while upon sea, and fed upon nothing but cheese (made of the milk of goats, which fed upon the mountains of *Bononia*, which are very full of such shells) and brandy. Monsieur *Monconis* related a story of a woman in France, who for a long time together every month voided the perfect bones of children *instar menstruarum purgationum*, and has promised to send over some of those bones. Another very strange story he related of a woman, who, being opened, was found to have a child petrified in a certain bag or appendix distinct from the uterus. Upon this several instances were added by many of the Society, about conceptions *extra uterum*. Dr. *Clark* told of a woman in *London*, who had carried a child eighteen years in her belly, and that she had in the mean space several children, one whereof he said was eleven years old, when, by an impostume on the side of her belly, all the bones of the child came from thence. There were several of the Society, who had seen the bones, and talked with the woman, and Dr. *Clark* named the physician, who extracted those bones. Collonel *Long* added, that a very noble lady, now alive, had told him, that a child remaining in her a good while, she knew not how, she was afterwards delivered of it *per sedem*, and added, that he had seen the bones. Dr. *Charlton* upon this mentioned *Denfingius*'s little book about a petrified child found in the abdomen. To which Dr. *Clark* added, that the book was lately reprinted with the opinion of several learned men, most of which judge it a fiction, from several contradictions it contains. Dr. *Clark* likewise told a very odd story, which the duke of *Albemarle* told him, of one of his officers, who was grievously tormented with the stone in his kidnies, of which he was perfectly cured merely by chewing tobacco; and that the duke commends it to the world, as an excellent remedy for most kind of diseases. Sir *Robert Moray* brought in a petition, that was presented to his majesty, wherein

in the petitioners deſired a patent for an invention of meliorating all kinds of grounds, ſo as to make the worſt to bear any kind of grain; and for another of making all kinds of fruits and flowers better, and the bearing plants more fruitful. Much was argued for and againſt the ſteeping of corn, and ſeveral ways were mentioned, by which it had been done, and with what ſucceſſes. It was generally concluded to preſerve corn from ſmut; ſeveral other ways were hinted of preſerving corn from ſmut. Mr. *Henſhaw* mentioned a way of ſhaking off the mildew from the ears of corn, by a rope drawn over the tops of them by two men at either end of it; which mildew was found to make the corn hide-bound. Mr. *Long* told of a ſtrange increaſe, that was received from corn ſown in bad ground with the huſks on. Mr. *Parker* affirmed, that there was a gentleman in *Suſſex*, that had a way of chuſing the ears of corn, whilſt in the blow, for his ſeed wheat, which is ſo excellent, that he will be bound to forfeit a great matter, if any of his ſeed corn yield ſmut, though ſown in the ſame ground ſeveral years. Mr. *Long* related the improving of many thouſands of acres of land, from ſixpence an acre to fifty ſhillings, by means of conveying water to overflow it. The drying and ſingeing, and ripening of corn was mentioned, as likewiſe the way of preſerving corn in the huſk for very many years. Several other obſervable particulars were mentioned. But they would be too long to trouble you with, you having already received too much by this long ſcribble from,

Honoured Sir,

your honour's moſt affectionate,

moſt faithful and moſt

humble ſervant,

RO. HOOKE.

I HAVE here incloſed a letter I received from the amanuenſis of the Society.

DR. *Kuffler*'s wife has been here to enquire of me about an engine for diſtilling water, of which I told her I would acquaint you, when I next wrote.

SIR, my lord *Br.* and Sir *R. M.* preſent their humble ſervice to you. And Sir *R. M.* ſays, he has a quarrel with you, becauſe you would not let him ſee you, before your leaving the town.

I HAVE not been able to meet with doctor *Sydenham* all this morning, and ſo cannot ſend any of the ſage, for there was none left at my lady's houſe.

[About July 1663.]

Right Honourable,

I DID expect and hope, that you would have been in *London* before this; nor are your friends at *Greſham* college leſs ſollicitous after your return; I being aſked by every one almoſt, when you would be here. There was but little done this laſt Wedneſday, becauſe of ſome papers which were read, which took up almoſt all the time. The one was ſent in from Sir *Paul Neile*, being an account of his way of making, ordering and bottling of cyder, and his judgment of the cauſe of the fermentation of it, *&c.* wherein indeed were very many new obſervables, though ſeveral of them were contradicted by Mr. *Waller* and ſome others, Sir *P.* being very much againſt the fermenting of cyder very much; and Mr. *Waller* and ſome others of the contrary opinion. There was likewiſe read a relation ſent from the coaſt of *Coromandell* in the *Eaſt-Indies*, by a perſon of credit, and one, who had lived a governor there above eleven years. The ſum was this, that for three or four months, in the ſummer time, the wind did all day, from eight in the morning to four in the afternoon, blow ſo extremely hot from the land, that the people are hardly able to endure it, but are fain to ſit in tubs of cold water, up to the neck, to preſerve themſelves from being ſtifled; that every night the wind blows directly contrary, namely, from the ſea, with as great an exceſs of cold. But this is not ſo ſtrange, becauſe it happens in ſeveral other parts of the world; but what he added further is ſufficiently ſtrange to an European, *viz.* that their way to preſerve their drink cold in this extremity of heat, was to put it up in their earthen veſſels (what form they are of I know not) and expoſe the bottle, hung by a ſtake, or the branch of a tree, to the ſcorching ſun and ſuffocating winds; for by that means they find the contained liquor, at four in the afternoon, exceſſively cold, and extremely pleaſant and refreſhing; nor would the relator himſelf, nor any that he had heard of, venture to give a reaſon for it. We made a trial of monſieur *Zulichem*'s experiment, where indeed it ſucceeded ſo far, that with the pumping, that was uſed about it, the water would not deſcend, though I am very confident, if the pump had been longer plied, the event would have been much otherwiſe; and we ſhall this next week try with a pipe of five or ſix foot long, whether it will remain ſuſpended or not. We have lately likewiſe tried two other experiments: the one was, there were two bolt-heads full of water inverted into reſtagnating water, out of which, when the air was extracted, there remained in each a ſmall bubble at the top: into the place of one of the bubbles of extracted air as much common air was put, and then both of them ſet aſide and obſerved. The event was, that both the bubbles vaniſhed into the water, but that of the common air remained longeſt. Since that, we exhauſted the air out of one of thoſe bolt-heads, and put common air in the place of it; then the other was filled with common water, and a bubble of air, equal to that in the other, was put into it, and it was found, that the air was vaniſhed into the exhauſted water, but that the other remained almoſt entire in bulk.

bulk. I am taking order about the engraving of my microſcopical pittance, which I hope will be very well done. I this week obſerved a creature newly come out of the egg, which by comparing it with the biggeſt old one I have ſeen of that kind, I found to be above 130000 times leſs than the bulk it was likely to come to, if it ſurvived; of which, I believe, we ſhall not find many other examples in nature. I have now procured the new Jamiaca nuts; and had I not been advertiſed, that your return would be either this Saturday, or the following Monday, they had been ſent you by,

Right honourable,

your honour's

moſt affectionate

moſt faithful and

moſt humble ſervant,

ROB. HOOKE.

I HAVE ſent a ſmall bag of the nuts, underſtanding by Mr. *Wh.*'s letter, that you will not be here till Thurſday. The two foot perſpective I alſo ſent, the box was delivered to the carrier the laſt week before he went away. Mrs. *Kuffler* is very earneſt to know, when you will give order about the engine, and ſeems to be a little angry, and wonders you ſhould be worſe than your word, and ſuch kind of ſpeeches; though I had given her the reaſon, why you could not do it before you went hence.

[July , 1667.]

I WAS very ſorry to find the coach return from *Leez* without bringing you in it; but I am glad however to hear, that your return will be the beginning of the next week. There was but little done this Wedneſday at *Greſham* college, much of the time being taken up in obſerving the experiment, which was made with the glaſs tubes of forty five foot high, in which there was little remarkable, but what you will eaſily predict muſt neceſſary follow; that is, that the water, upon the turning off the lower ſtop-cock, fell down to between thirty two or thirty three foot from the bottom; that as it fell, and a good while after, abundance of bubbles appeared near the top of the water; that as thoſe bubbles riſe for a good while, ſo all that while the water continued to deſcend a little; inſomuch, that when we were coming away, I obſerved it to be about 29½ foot high, and it is likely it would afterward deſcend lower. That one of our tubes conſiſting of ſeveral pieces, leaked. That upon theſe obſervables, ſeveral things are ordered to be tried the next day; as firſt to fill the tube with exhauſted water to * * * the bubbles that riſe; to make a device to cloſe the ſtagnant water ſo, that the air may not get in: to make the other tube tight, and ſo to join both together by a bended pipe at the top, and the like. After we returned from this experiment, Sir *R. Moray* preſented the Society with an engine ſent to them by prince *Rupert*; being for raiſing water, ſuch a one as, I am ſure, you have ſeen and taken notice of in *Scottus* his mechanicks, whoſe contrivance is, continually to raiſe water, by turning round a cylinder with a ſliding board in it, included in another hollow cylinder or barrel. The engine has not been tried, but it will be the next Wedneſday. But I find, that it goes exceeding hard with the ſeveral grating and ſliding motions, that it has, ſo that it is more likely to prove a pretty curioſity than a uſeful engine. But this gave an occaſion of producing the definition or deſcription of the marquis of *Worceſter*'s water-commanding engine, which is ſo purely romantick, that it would ſerve one rarely to fill half a dozen pages in the *Hiſtory of Fortunatus his wiſhing Cap*. A tranſcript of ſome of the moſt obſervable paſſages, becauſe I could not procure the book itſelf to ſend you, I have here encloſed, which if it ſhould chance to perform but the leaſt part of what is therein ſpecified, my lord *Brereton* is likely to pay 5 *l.* towards the revenue, that is to accrue thereby to the marquis, he having wagered ſo much againſt him. I was ſince my return to *London* to ſee this engine, where I found *Caltrop*, his chief engineer, to laugh at it; and as far as I was able to ſee of it, it ſeemed one of the perpetual motion fallacies. Of which kind *Caltrop* himſelf, and two or three others, that I know, are labouring at this time in vain, to make, but after ſeveral ways; and nothing but coſtly experience will make them deſiſt. We had next Sir *R. Moray* and Mr. *Oldenburg*'s relation of the excellent French lithotomiſt, which gave occaſion to Sir *Anthony Morgan* to relate the hiſtory of an Iriſh lithotomiſt that does the ſame thing, though, if it be according to his deſcription, by a more eaſy and expedient way. And Dr. *Whiſtler* affirmed the ſame to be done by a Scotchman, and calls it cutting by the gripe, the more perfect relations of which are to be given in by thoſe perſons in writing. Sir *R. Moray* likewiſe produced the ſtone cut out of the heart of the Scotch nobleman I formerly told you of; it was very hard, and of a miſhapen figure, and looked in colour like a flint. Mr. *Pell* brought in a bag of ſand, which he affirmed would be baked into a ſubſtance like Flanders jugs. It looks and feels like clay beat to duſt, and I gueſs it to be a ſubſtance between both; that is a ſandy clay, or clayiſh ſand. I cannot find any peculiarity in it with a microſcope. Dr. *Charlton* gave a deſcription of *Aubery* in *Wiltſhire*, which ſeems indeed by his relation a very ſtrange piece of antiquity, and more admirable than *Stoneheng*, which he hopes to make an argument to confirm his hypotheſis about that *Chorea Gigantum*. Dr. *Pope* is going for *Italy*, but I ſuppoſe will not be gone before your return, who will be very glad to be charged with inquiries by you. Some things about the growth of ſalmons were handed to and fro, ſome flatly

flatly contradicting others. The laſt thing we had was a relation of Sir *W. Petty*'s ſhip new modelled, upon which he has already laid 50*l.* that it ſhall go ſafe to *Holy-Head* and back again; and it was ſet forward on that attempt before he writ that letter, which was read. I have ſent you likewiſe a new book of philoſophy, but I fear it contains but little of that ſubject worth any thing. I but juſt now received it, and have not had time to look it over. There is nought elſe worth your knowledge, only this encloſed, which I ſuppoſe contains ſeveral things, which ſhould elſe have been ſent you by

Right honourable,

your honour's moſt affectionate,

moſt faithful, and

moſt humble ſervant,

R. HOOK.

Friday 10 in the morning, from *Pall-Mall*, [1663.]

Honoured SIR,

I HAVE not received any of your commands ſince I took my leave of you for *London*. I know not, whether there has any thing miſcarried, nor have I written any thing ſince this day ſev'night, there having happened little or nothing conſiderable in that time; only I ſhould have ſooner given you an account of an interview I had of Mr. *Hobbes*, which was at Mr. *Reeve*'s, he coming along with my lord *De.* to be aſſiſtant in the chooſing a glaſs. I was, I confeſs, a little ſurpriſed at firſt to ſee an old man ſo view me and ſurvey me every way, without ſaying any thing to me; but I quickly ſhaked off that ſurprizal, when I heard my lord call him Mr. *H.* ſuppoſing he had been informed, to whom I belonged. I ſoon found by ſtaying that little while he was there, that the character I had formerly received of him was very ſignificant. I found him to lard and ſeal every aſſeveration with a round oath, to undervalue all other men's opinions and judgments, to defend to the utmoſt what he aſſerted though never ſo abſurd, to have a high conceit of his own abilities and performances, though never ſo abſurd and pitiful, *&c.* He would not be perſuaded, but that a common ſpectacle-glaſs was as good an eye-glaſs for a thirty ſix foot glaſs as the beſt in the world, and pretended to ſee better than all the reſt, by holding his ſpectacle in his hand, which ſhook as faſt one way as his head did the other; which I confeſs made me bite my tongue. But indeed Mr. *Pell*'s deſcription of his deportment, when diſcourſed with about mathematical demonſtrations (which he gave the laſt Wedneſday) ſurpaſſes all the reſt. There was very little done this week at *Greſham* college, the whole ſtay being not much above an hour. My lord *B.* Sir *R. M.* and Monſieur *Zul.* were very inquiſitive when you would return. There was an account read of Monſieur *Le Fevre*'s trial to volatilize ſalt of tartar with burnt alum, which you have long ſince heard. Monſieur *Zul.* tried his own experiment, but it ſucceeded not, though he confeſſed the engine was very tight, and it will be tried again the next day according to his ordering. The accounts, which I acquainted you with the laſt week, were not brought in as was expected. Sir *R. M.* gave in the meaſure of an infant of ſixteen weeks old, which was ſent him out of Scotland, a pattern whereof I have here encloſed. There is a meeting of the council upon Monday, where your preſence is much expected and longed for. There is very little in Dr. *Power*'s microſcopical obſervations but what you have ſince obſerved; only there is a pretty experiment he tried with the leeches in vinegar, that ſurvived the freezing of the vinegar they lived in; and another pretty experiment he has in his philoſophical reflections upon his obſervations, which is of making a certain kind of coals kindle into a fire and flame, by throwing water on them, when newly dug out of the mine. I am ſorry to ſee, that he intends to publiſh ſeveral experiments about colours, which I am confident might be originally yours. He will likewiſe publiſh the experiment of freezing an eye, to find the ſhape of it, whoſe invention he aſcribes to another. There is not much more beſides, that is very conſiderable in it, and therefore I ſhall refer the further account of it till your return, till when I ſhall keep the book by me. I have made a microſcope object glaſs ſo ſmall, that I was fain to uſe a magnifying glaſs to look upon it, but it did not ſucceed ſo well as I hoped; but I ſuppoſe it might be, becauſe this being the firſt I had made, the tool was not very true, nor my hand well habituated to ſuch an employment. And therefore I deſpair not of better ſucceſs in my next attempt. Mr. *Lower* was to have waited on you, and was ſorry to miſs you here in town. He had Dr. *Willis*'s ſervice to have preſented to you, whoſe book he tells me is within a little while to come forth, and he added, that Dr. *Wren* had drawn the pictures very curiouſly for it; and I am glad to hear it will afford ſuch conſiderable diſcoveries, which I doubt not but you know. I queſtion not, but that Mr. *Oldenburg* has acquainted you with the news, that is extant, in this encloſed, and therefore I ſhall not trouble you with that particular. Nor has there occurred any thing elſe ſince my coming worth your knowledge; otherwiſe it ſhould have been ſent you by,

Honoured Sir,

your moſt affectionate,

moſt faithful, and

moſt humble ſervant,

ROB. HOOKE.

I SUPPOSE Mr. *Murray* has told you, that Mr. *Nicolls* deſires to ſpeak with you.

I JUST now received a letter from Mr. *Whit.* to ſend down the horſe; but it is ſo lame, that it is altogether unable to perform a journey.

Aug. 25, 1664.

SIR,

I HOPE this will find you ſafe returned to *Oxford* after your Weſtern journey, which I underſtood you intended upon Thurſday laſt to begin, or elſe I had before this ſent the paper you gave me charge of; but being unable to do it time enough the laſt week, by reaſon I could not ſpeak with my landlord, I have delayed it till the latter end of this, as ſuppoſing your return to *Oxford* could not be ſooner. I have likewiſe here encloſed an Iriſh letter, which I received from my lady, and one from Mr. *Oldenburg*, which he gave me this afternoon. I have ſince your departure been on the top of *Paul*'s ſteeple, in order to make ſeveral experiments, which will be proſecuted this week; but it being the firſt time I had been there, I could not be ſo well provided with an apparatus as I found was requiſite; and therefore I was fain to return with only making ſome obſervations. One was, that a pendulum of the length of one hundred and eighty foot did perform each ſingle vibration in no leſs time than ſix whole ſeconds; ſo that in a turn and return of the pendulum, the half ſecond pendulum was ſeveral times obſerved to give twenty four ſtrokes or vibrations. Another was, that this long pendulum would ſometimes vibrate very ſtrangely, which was thus. The greateſt part of the line, by gueſs about ſix ſcore foot of the upper part of it, would hang directly perpendicular, and only the lower part vibrate, at what time the vibrations would be much quicker, and this though there was a weight of lead hung at the end of the ſtring of above four pound weight. In another place of the Tower, where I had very clear perpendicular deſcent, I with a plum-line found the perpendicular height of it two hundred and four foot very near, which is about ſixty foot higher than it was uſually reported to be. In which place I ſhall, with ſome other company, this week try the velocity of the deſcent of the falling bodies, the Torricellian experiment, and ſeveral experiments about pendulums, and weighing. I have ſince the laſt week almoſt brought my treble writing inſtrument to be practicable, inſomuch, that I hope to make it as eaſy to write three copies as one. I have made ſeveral trials of it, and have writ three ſides together very well, but yet I hope to make it better. We yeſterday made ſeveral odd experiments about the velocity and ſtrength of a bullet ſhot out of a carbine, whereof ſome circumſtances will certainly ſeem very odd: one of which was, that the bullet pierced through a board three inches thick, and yet broke not a very ſmall weak piece of white thread, that held that barred againſt the force of the bullet: a ſecond was, that though two of theſe ſmall threads were tied acroſs the noſe of the piece, ſo as one would have thought it impoſſible, that the powder ſhould have been diſcharged without breaking thoſe threads; yet, notwithſtanding, both the powder and bullet were diſcharged out of it, without doing the thread any other harm, than only a little ſinging it, which made me a little reflect upon the ſtrange effects I had obſerved in thunder and lightning. And this puts me in mind of an excellent account we had of a prodigious ſtorm, that lately happened in *Italy*, between *Venice* and *Padua*, which I ſhould have added, but that I ſuppoſe Mr. *O.* has given you a copy of the letter. My lady I underſtand does to morrow intend to go towards *Leez*. I was among the bookſellers this afternoon, but found nothing new.

MR. *Faithorne* has promiſed me to make all poſſible ſpeed with that you ordered him, but he does deſire a little farther directions. Whilſt I was writing this, Mr. *Faithorne* has ſent me the ſketch, which I have encloſed, to ſee whether you approve of the dreſs, the frame, and the bigneſs; what motto or writing you will have on the pedeſtal, and whether you will have any books, or mathematical, or chemical inſtruments, or ſuch like, inſerted in the corners, without the oval frame or what other alteration or additions you deſire. It is almoſt ten o'clock, and therefore I hope you will excuſe this ſcribbled paper, and the abruptneſs, wherein I am forced to ſubſcribe myſelf,

Moſt honoured Sir,

your moſt humble, and

moſt faithful ſervant,

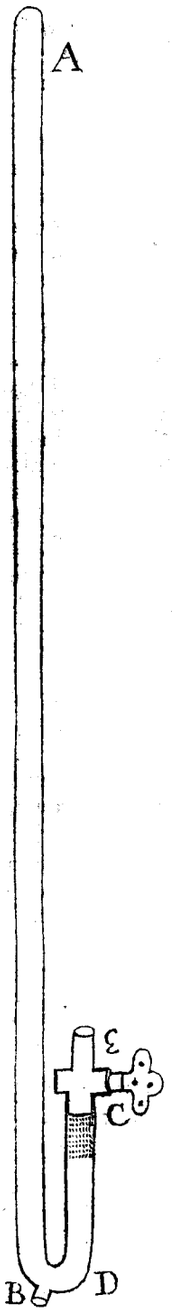
R. HOOKE.

Moſt

Thurſday-night, [Sept. 8, 1664.]

Moſt Honoured Sir,

I MUST in the firſt place return you my moſt humble acknowledgment for the honour and favour you have been pleaſed to oblige me with in your letter, which, to my power, I ſhall ever be ready to expreſs my ſenſe of. As for the experiments, that I gave you an account of, that I intended to proſecute on the top of St. *Paul*'s, I have, by reaſon of ſome miſcarriages, only proceeded thus far, that drawing up a mercurial tube, made after the form, and ordered according to the manner here deſcribed, [A B a glaſs pipe, about three feet long, whoſe end A was cloſed, and the other open at C, and bended in the manner of a ſyphon, as appears in the figure; into C was cemented a ſmall ſtop-cock, to open and ſhut at pleaſure: and juſt in the bending of the pipe, was drawn a ſmall hole B, by which the whole inſtrument, when the cock was ſtopped, was filled carefully top-full with quickſilver; and then the hole was very well ſtopped with a ſmall plaiſter of cement, ſpread on leather, and bound on when hot: then, by inverting the tube, and opening the cock, the quickſilver would fall to its uſual ſtation; then, by turning the cock, this inſtrument became portable, and might eaſily be carried up and down, without any danger of loſing the mercury, or admitting any air; for the mercury would not at all vibrate, which, without the cock, it was ſo very apt to do, that without a great deal of care and trouble, it could not be ſtirred or moved, but the air would break in, and get above the mercury,] I found the quickſilver to be at the top, full half an inch lower than it was at the bottom. The manner of making which experiment was thus. The ſteeple being without any kind of lofts, but having only here and there ſome rotten pieces of timber lying a-croſs it; I cauſed a rope to be ſtretched quite croſs the top, and faſtned, in the midſt of which I fixed a pully, through which I let down the ſtring and weight to the bottom (for only in the very middle of the ſteeple was there a broad clear paſſage from top to bottom) and to this I could not at the top approach within eighteen foot:) having thus let down the rope, thoſe that were at the bottom hung on this mercurial tube (which I had exactly marked, and ſtopped, and ſet ready before I went up) a large weather-glaſs (which moved by the rarefaction and condenſation of the air only, which I had likewiſe marked and ſtopped) and a ſealed thermometer, which I had likewiſe marked. After theſe were drawn up, and, by a contrivance of another pully, I had drawn them to me, I found the thermometer, the glaſs being but thin, broken. The quickſilver, upon opening the cock, I found to fall very conſiderably, which ſince, upon meaſuring, I find $\frac{25}{28}$ of an inch: the weather-glaſs I found to be riſen ſomewhat more than two inches: then cloſing them again, I cauſed them to be let down, and giving them charge not to let it quite down till I called to them from below, I went down myſelf, and found, upon opening the mercurial tube, that it roſe exactly to its firſt ſtation; as did alſo the weather-glaſs. I had deſigned to have tried many others then; but the night came ſo faſt, that I could hardly ſee to get up again, and give order for the clearing of the lines. But I deſign, within a day or two, to make ſeveral other experiments. We have ſince the laſt made very few experiments worth your hearing, only trying the velocity of ſeveral ſmall balls of bees-wax, which deſcended in a glaſs pipe filled with water, and divided into inches, we found, by ſeveral trials, that it moved almoſt the whole length of 81 inches downwards, with very near an equal velocity, only ſomewhat accelerated towards the bottom, if the balls were very ſmall; but if they were any thing big, we found them much ſlower towards the bottom; the reaſon of which was accidental, and would not have happened, had not the lower end of the tube been ſomewhat leſs than the top; but thoſe ſmall ones, whoſe motion the narrowneſs of the tube did not at all or very little ſtop, were obſerved for near twenty inches, to keep even pace with a half ſecond pendulum, moving juſt an inch every vibration, but beyond twenty they grew ſwifter. I have conſulted with Mr. *Faithorne*, who is ready to do any thing he ſhall be directed, and has deſired me to contrive it, how it will be moſt convenient, and he will punctually follow directions. I have made a little ſketch, which repreſents your firſt engine placed on a table, at ſome diſtance beyond the picture, which is diſcovered upon drawing a curtain. Now, if you think fit, I think it might be proper alſo to add, either by that, or in the corners A or B (where alſo you may have any other inſtruments, or any thing elſe added, if you think fit) your laſt emendation of the pneumatick engine. One word or two I beſeech you of directions in this particular. I ſent by the Wedneſday's coach a ſmall weather-glaſs, and Dr. *Henſhaw*'s book, which is printed in *Ireland*, wherein he has mentioned you; and he has added a preface, and altered many things in his book. I hope, by the next poſt, to ſend you a farther account of



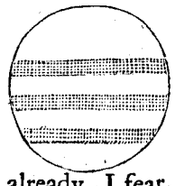
of my trials on *Paul*'s: in the mean time, and ever, I must remain, and in great haste subscribe myself,

Most Honoured Sir,
your most humble, and
most faithful servant,
ROB. HOOK.

Gresham-College, Sept. 15, 1664.

Most Honoured Sir,

I RECEIVED the honour of your letter, and shall endeavour to see your desires therein most punctually performed. As for the experiments on *Paul*'s, I have, since my last, made several other trials, which, I suppose, will not be unwelcome to you. Upon Tuesday, the lord *Br.* Sir *R. M.* and myself, were again at the same place, and examined the vibrations of a pendulum of two hundred feet long: the line was a treble hard twist, one about the bigness of a very small goose-quill; the weight of it somewhat more than half a pound; at the lower-end of this was hung a weight of lead of 28 pound averdupois; this we found, when each vibration was about 12 or 14 feet, to make one single vibration in 7 seconds and almost an half; that is, we found it to make 13 vibrations in 100 seconds pretty exactly; this we repeated several times, and found the same; then we suffered it to vibrate not above a foot, and we found them somewhat quicker; that is, 13 vibrations in 98 seconds. After this, we tried the same experiment, with a small wire about a 32 part of an inch in diameter, to which we hung the same weight, and found the vibrations very much the same, but somewhat swifter and longer. This we tried, both with longer and shorter vibrations, and found them to correspond with the former. On Wednesday we made farther trials at the same place; and that was with a very curious beam we brought two weights to an equilibrium at the top of the tower, the one was a 15 pound weight of brass, the other, that counterpoised it, was a company of smaller brass-weights tied in a small canvass bag together with the former small line, by which, after we had hung the beam over the very middle of the steeple, we let down the bag of weights to the bottom, and with long adjustening we found, that the counterpoising bag and string was grown lighter by a drachm. And this was very observable, that though the weight hung at that distance, and though, by some misfortune, the cock of the beam was missing, yet was the beam so tender, that a very small weight, as some very few grains, would very sensibly turn it, and, when brought to an equilibrium, the beam would vibrate, as if it only had a pair of short scales hanging to it. The cause of this phænomenon, *viz.* why the bag, that was let to the bottom, was found lighter, was judged to proceed from the density of the air at the bottom, which I acquainted you with, as I think, in the last letter: but we repeated the Torricellian experiment since, and found the difference some very small matter less than half an inch. But our weather-glasses again failed us, as did also our instrument for the velocity of falling bodies: yet some we made, but those so imperfect, that I shall not, till we make them more accurate, trouble you with an account of them; nor of some other attempts, till I have farther perfected them. We made, on Wednesday, a very considerable experiment with powder; for inclosing only six pennyweight of P. *Rupert*'s powder in one of our cylinders (the fashion whereof you, I doubt not, do well remember) and having very firmly screwed it up, it was fired by a small touch-hole, no bigger than a pin's head, which was drilled through the side of it: the effect was, that it broke the cylinder (which was every where very sound, and made of very tough iron, and, in the thinnest place, where it broke, was above half an inch, and in some near three quarters thick, so that I can hardly think the weight of 100 tun hung at it, would have been able to have pulled so much iron in sunder point blank) in four (if not more) pieces, and that in such places, where there was no beginning of a crack, with a most hideous crack and noise, like a small field-piece of ordnance: the side in which the touch-hole was made, we found intire; nor was that hole any thing widened by the eruption of the fire. We shall yet again make some more trials of it before we leave it, that so we may bring it to some certainty and theory. I begin now to make use of a 36 feet glass, and hope shortly to make some observations, which I hope may be worth your knowledge, the Society having very freely and willingly furnished me with tubes, according to my directions; as also with an exact time-keeper, which, I have some reason to believe, shall not be much excelled by any whatever. But these are not yet completed. In the mean time, I find very much is to be discovered with these long glasses, which none of the shorter I have yet seen would help one in; and this both in the moon, and the other planets; and, looking this night on Jupiter, I found its form somewhat of this in the margin; of which I never saw it before, but only in Mr. *Reeve*'s threescore feet glass some-while since. But I have already, I fear, given you too much trouble with this tedious scribble; and therefore shall not, at present, add thereunto, by relating my designs and intentions, whereof I may more seasonably hereafter inform you, when experiment has been made; it being my design to acquaint you chiefly with matter of fact: and this method I am sure I shall not break, when I assure you, that I am,



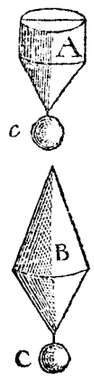
Most Honoured Sir,
your most faithful, and
most humble servant,
R. HOOKE.

Most

[Oct. 6, 1664.]

Moſt honoured Sir,

I HAVE forborn all this time to give you the trouble of one of my ſcribbles, that I might have been able to have made it ſomewhat the leſs troubleſom, by giving you an account of ſome further trials made on Paul's. But ſuch have been the diſappointments, from winds, and rains, and divers other accidents, that we have not as yet made any further proceeding in that buſineſs. The magnetical experiments alſo which you were pleaſed to propound ſhould long ere this have been tried, had not the multitude of iron bars, wherewith all the top ſtone, and indeed all the ſtones of the ſteeple are tied together, wholly ſpoiled that deſign: and indeed I fear (the winter weather coming on ſo faſt) we ſhall hardly make any more trials there before the next ſpring. Concerning hygroſcopes I have lately made ſeveral trials, and among the reſt I find, that there is no body ſo ſenſible of the changes of the air, as to drineſs and moiſture, as the beard of the ſeed of geranium moſcatum, and of ſeveral other ſorts of large cranes bill, a vegetable ſubſtance, that has not, that I know of, been taken notice of by any writer or other perſon whatſoever; and I have found it, if the ſeed be perfectly ripe before it be gathered, to be indeed the moſt proper body to make a hygroſcope withal. I have alſo, ſince my ſettling at *Greſham* college, which has been now full five weeks, conſtantly obſerved the baroſcopical index (the contrivance, I ſuppoſe, you may remember, which ſhews the ſmall variations of the air) and have found it moſt certainly to predict rainy and cloudy weather, when it falls very low; and dry and clear weather, when it riſeth very high, which if it continue to do, as I have hitherto obſerved it, I hope it will help us one ſtep towards the raiſing a theorical pillar, or pyramid, from the top of which, when raiſed and aſcended, we may be able to ſee the mutations of the weather at ſome diſtance before they approach us, and thereby being able to predict, and forewarn, many dangers may be prevented, and the good of mankind very much promoted. We have at the Society made lately ſeveral trials about the deſcent of variouſly figured bodies through the water, and amongſt the reſt (which are not yet brought to an exactneſs, and therefore I ſhall not till then trouble you with them) there was this very conſiderable diſcovery (for I do not find it was diſcovered, or ſo much as ſuppoſed before, but rather the clean contrary believed and builded on) that of two bodies of equal weight of the ſame wood, of the ſame ſhape, as to that part, which did as it were cleave the water (which was conical, being a cone, whoſe baſis was three inches diameter, and whoſe altitude was two) that body did deſcend the faſteſt through the water, which had the upper end flat, and that body the ſloweſt, which had the hindmoſt end ſharp. So that it ſeems, that that edge, which comes behind a ſquare or flat ſterned veſſel, and is called the dead water, and which is much greater in ſuch an one, than in a tapering ſterned veſſel, and is therefore commonly ſuppoſed to hinder and obſtruct the ſwiftneſs of the veſſel ſo much the more, does rather very much promote or accelerate its motion. The figures of the bodies were theſe in the margin, expreſſed by *A* and *B*, *A* repreſenting the body, that went the faſteſt; and this did not ſeem to proceed from any other cauſe than the flatneſs of the upper ſide of *A*, and the ſharpneſs of that of *B*; the weight *C*, that ſunk both the one and the other, being one and the ſame. We did yeſterday likewiſe make a conſiderable experiment of refraction in the refracting engine (which I ſuppoſe you might ſee before you went for *Oxford*) for firſt we found the refraction of water (being able to meaſure it with accurateneſs to minutes) to be very near what has been hitherto aſſigned it, namely, we found the angle of incidence to be 41°. 35′. and the angle the refracted ray made with the perpendicular to be 30°. 00′. the ſigns of which angles (being 66371 and 50000, that is, as 398+ to 300) are almoſt as 4 to 3. But all things remaining as they were, only removing the water out of the veſſel, and putting in, inſtead of it, ſpirit of wine highly rectified (which we found would burn all away, and was by weight in proportion to the water near as 19 to 22) we found, that the refracted angle remaining the ſame of 30°. 00′. the angle of incidence was 42°. 45′. whoſe ſines being 50000 and 67880, the proportion is ſomewhat more than 3 to 4, namely, are 300 to 407; ſo that it ſeems the refraction of ſpirit of wine is greater than that of water. This experiment we tried upon Mr. *Oldenburg*'s being informed, that an experiment ſomewhat of this kind had been made at *Paris*. Both theſe experiments of the deſcent of bodies through the water, and of the various refractions of ſeveral ſorts of liquors, I ſuppoſe we ſhall ſhortly proſecute more fully; there being many uſeful things on the true theory both of the one and the other. I am now engaged in a very great deſign, which I fear I ſhall find a very hard, difficult, and tedious taſk, and that is, the compiling a hiſtory of trades and manufactures; the perſon I formerly told you of, namely, Sir *John Cutler*, having very nobly and freely, without any compulſion or excitement, not only kept his word, but been better than it, ſending me in yeſterday a half year's ſalary before hand, as an earneſt of his intention. The moſt I think I ſhall be able to do in this buſineſs this term (being engaged to read for doctor *Pope*) will be only to make a ſhort ſpeech, both in praiſe of Sir *John*, my noble patron, and of the excellency and uſefulneſs of the deſign it ſelf, and of what method and courſe I ſhall take in it; and, by God's aſſiſtance, I ſhall endeavour to the utmoſt of my power, to go as far in it as I am able, being reſolved wholly to apply my mind and endeavours to it. And if I can therein any way ſerve you, as I have great hopes I may,



may, it will be eſteemed a very great happineſs by,

Moſt honoured Sir,
your moſt faithful
and moſt humble ſervant,
RO. HOOKE.

Greſham College, Oct. 21, 1664.

Moſt honoured Sir,

I AM extremely ſorry, that I have not been able ſooner to ſend down the ball and ſocket you deſired; for ſuch have been the diſappointments of thoſe I had beſpoke it of, that no leſs than three have failed me, and I was fain to ſtand by a fellow moſt part of this day to direct him, and he has not yet quite finiſhed it; but I hope to ſend it down to morrow morning, for Mr. *Reeves* (who underſtands theſe things, and I think he only, of all the turners I have met with) is at preſent in ſuch a condition, that he can do nothing. Perhaps you may have heard of it: if not, in ſhort, he has, between chance and anger, killed his wife, who died of a wound ſhe received by a knife flung out of his hand, on Saturday laſt. The jury found it manſlaughter, and he and all his goods are ſeized on; and it is thought it may go hard with him. As for the time of the conjunction of Mercury and Sol, there are ſo various calculations of it, according as they are made from theſe or other tables, that it is certainly the moſt ſafe way to watch for it two or three days before, and two or three days after the 25th of October. If it appear not ſooner, we do here intend, God willing, to watch and make as diligent and accurate obſervations, as the ſeaſon (which I am apt to think will be fair) and the apparatus we have will afford; whereof, God willing, I ſhall give you a more full account in my next. Here have not been many experiments ſince the laſt time I wrote worthy your notice: only we did yeſterday try the deſcent of bodies through water; the manner of which trials, though we have not yet brought them to any accurateneſs or method, may perhaps be not unacceptable to you. We took then a good large, round, thick glaſs, and by putting in very ſmall ſhot, we brought it to an equilibrium with the water, in which we immerſed it; and then taking the exact weight of it, we had thereby the weight of as much water as was equal to it in bulk. Of this weight we weighed five ſeveral parcels of ſhot, and four other parcels, that were equal each of them to a quarter only of this weight; then putting in one of theſe quarters, we found this bottle (which was hereby a quarter heavier than water) to deſcend eight foot of water in about 4″. 45‴. putting in a ſecond, and ſo making it half heavier than water, it deſcendeth the ſame depth in 3″. 14‴. putting in a third, which made it ¾ heavier, its deſcent was in 2″. 45‴. by a fourth made as heavy again, or twice the weight of water, it deſcended in 2″. 14‴. by a whole parcel added, made thrice as heavy as water, it deſcended in 1″. 41‴. made four times as heavy, in 1″. 17‴. five times as heavy, in 1″. 10‴. five times and a half as heavy, which filled the glaſs with ſhot, in 1″. 6‴. I have not yet had time to caſt up and ſee, what proportions theſe times keep to the preponderation of the deſcending globular glaſs; nor ſhall I trouble you with the repeating of theſe trials, which were found by the inſtrument for falling bodies not to differ more than ſome few thirds one from another. But by this way, when proſecuted, I hope we may be able to raiſe a true theory of the reſiſtance of a fluid medium; but I have not as yet any time to ſpend on theſe things, and therefore ſhould be very glad, if yourſelf, or Dr. *Wallis*, or Dr. *Wren*, would examine what might be done in that kind; and what obſervations ſhall be further made, I ſhall moſt faithfully give an account of. I am ſpeedily going to make obſervations and tables of refraction by the inſtrument, which I find exceeding exact. And monſieur *Zulichem*'s account, which he ſends to Sir *R. M.* of their being able to ſee the ſatellites of Jupiter paſs between that body and our eye, and to ſee the ſhadow thoſe little moons make on the body of that earth; and to ſee thoſe ſix ſeveral belts, and ſeveral other things, whereof I am apt to think Sir *R.* himſelf may have acquainted you with, has at length made me ſet upon my way of making object glaſſes, which, you may remember, I did long ſince acquaint you with; for, certainly, if theſe be made with a mandrel only, without any tool, as the letter affirms, I hope I have reaſon to expect greater events from this, which muſt certainly be the moſt accurate way imaginable for making ſpherical glaſſes. What my ſucceſs therein ſhall be, I ſhall be ſure to acquaint you with. As concerning the baroſcope; I find, that upon the fourth inſtant it was very low, and the wind was exceeding high; many of which inſtances I have not yet obſerved; but as ſoon as I can get a little time to make me a weather clock, and to ſet all my things in order for the enquiring into the cauſes of the changes of weather, which I fear will not be till after this term, I hope I ſhall be able to give you a better account. I meet with nothing now in *Paul*'s Church-yard, but two pamphlets, which, whether worth your ſight, or not, I had not time enough to examine. I had herewithal encloſed alſo a ſmall microſcope, made with one ſingle glaſs, which I find to magnify the object, and make it as clear, when conveniently placed, as one of Mr. *Reeve*'s largeſt; but the glaſs was ſo ſmall, that, in putting up, it was rubbed off and loſt: but by the next I hope you may have as good a one ſent you by,

Moſt honoured Sir,
your moſt affectionate
and moſt faithful
humble ſervant,
R. HOOKE.

Moſt

Moſt Honoured Sir,

THERE has very little happened ſince you left *London*, that I have met with worthy your knowledge. I did (as I remember) acquaint you with the ſucceſs of the powder encloſed in an iron, which neither broke the caſe, nor was perceived to go off. Upon opening this laſt Wedneſday, there was found a pretty quantity of a black dirt, which laid on paper preſently diſſolved like an alcali; ſome of it put on a coal did not at all burn like ſalt-petre, ſulphur, or gunpowder. The ſame experiment will be tried again with double the quantity of powder, which will be a noble experiment, if it break not the veſſel, nor force itſelf away between the plug and the hole; which laſt I gueſs will be almoſt as difficult as the former; for the plug is made of ſteel, and by ſcrewing makes its own way in, and beſides the heat will make them, if poſſible, ſit cloſer together. And indeed upon viewing the laſt, I could find no ſign, by which I could gueſs it to have leaked, unleſs the alcaliſate nature of the included ſubſtance be one, of which I can ſay nothing. Some experiments we made of breaking wood, which were conſiderable, and gave occaſion to hope, that this ſubject will afford many uſeful experiments. We had a relation of a way of diſcovering the ſholes of fiſh from the top of certain hills in *Cornwall* and in *Ireland*, which was ſeconded by many teſtimonies, and is indeed a very philoſophical one, and may afford good hints. The ſtory in ſhort was this. That in thoſe parts it is uſual for a man ſtanding on the top of ſome hill near the ſea, to diſcover, where the fiſh lye in the ſea, and which way they move, and from thence by certain ſigns with his feet, and hands, and hat, to direct the fiſhermen on the water, who can perceive nothing of what he on the mountains ſees, though they be juſt over the ſhole of fiſh. Some obſervations, ſomewhat like this, I remember I have often taken notice of, from the tops of hills near the ſea ſide, whence I could perceive plainly, how far the rock ran out into the ſea, though they were covered with water to a great depth, which I could not at all ſee, when I was on the water in a boat, which made me think (and this of the Corniſh men has confirmed me) that all the appearances in theſe parts of the moon, which are accounted the ſea of it, may this way be ſolved. And this minds me to acquaint you with an obſervation I made ſeveral nights this laſt week with a teleſcope not above eight inches long, wherewith I could plainly ſee the ſatellites of Jupiter and Saturn oval, though not angulated, and the body of Jupiter appeared full as big as with a four foot glaſs; which ſhews what one might expect, if we could make object glaſſes, that would bear a large aperture and a deep charge. We ſhall to morrow make a good experiment of the velocity in the vibrations of a ſounding ſtring, of which I ſhall acquaint you by the next. There is a gentleman here in town, that has a better way of teaching muſick than what *Kircher* cauſeleſly enough vaunted his *Ars Combinatoria* to be, whereby he has preſently taught the duke of *Buckingham* to compoſe very well, though he knows nothing of the practick part of muſick. For buſineſs; here has been lately the queen's receiver to demand rent for *Stalbrige*, and has deſired to have an anſwer ſent him as ſoon as I could. Mr. *Longe* has been here likewiſe to deſire ſome ſpirit of harts-horn and ens Veneris for Dr. *Clodius*, becauſe he cannot get any of Mr. *Pullein*, and the doctor has not as yet, it ſeems, any conveniency of making it himſelf. Here was yeſterday Dr. *Willoughby* of *Merton* college in *Oxford*, to have waited on you, and deſires to have his humble ſervice preſented to you. As for my own buſineſs, wherewith I acquainted you before your departure, I cannot get any ſettlement of it, and know not as yet what it may prove, but I fear it is very dubious. Nor is there any thing done in the other buſineſs, the one, I think, hindring the other. The condenſing engine and the ſcales I have now by me, but did not ſend them, becauſe I hope my lord *Orrery*'s ſafe arrival will haſten your return to town. The pipes likewiſe are ready; and if there be any thing elſe you deſire to be provided againſt your coming, they ſhall, upon the receiving of your commands, be ſpeedily provided by,

Moſt Honoured Sir,

your moſt faithful, and

moſt obliged humble ſervant,

ROB. HOOKE.

MR. *Oldenburg* deſires to have his ſervice preſented to you.

[Oct. 29, 1664.]

Moſt honoured Sir,

I WAS not a little troubled, when upon Friday noon calling at the *Saracen's Head*, to ſee whether the ball and ſocket were gone (as the porter, that belongs to *Moore*, had with all aſſeverations promiſed it ſhould be by that morning's coach, for it was delivered to him before nine of the clock that morning) I found, that he had played the rogue, and kept it behind, intending to ſend it, as I ſuppoſe, by the next week's waggon, and this, though it were delivered to him with as great a charge as could be imagined. But as it has ſince fallen out, I hope there was not much harm done, Mercury having been too ſubtil for thoſe, that laid ſpies for him, by ſlipping by the ſun either in the night, or at leaſt by one ſide of the diſk of the ſun; for to none of thoſe, that endeavoured to find this conjunction here at *London*, has there been any glimpſe of it, though upon Tueſday, as I imagined we ſhould, we had very fair and clear weather. All which day my lord *Br.* Sir *W. P.* Mr. *Ball*, and myſelf, were very diligent in obſervations. I did not neither omit to obſerve the ſun on Monday and Wedneſday, as oft as I had opportunity

portunity of ſeeing it appear from between the clouds. Upon Wedneſday laſt we had ſcarce any thing done, the moſt of the Society being gone to *Woolwich*, together with the king and council, and moſt part of the court, to ſee the great ſhip launched. I did notwithſtanding diſſect a viper, which gave ſome good diſcourſes of poiſon, among the reſt Dr. *Croone* gave an account, that he had newly ſpoke with a perſon, that had a long time lived in the court of the king of *Macaſſer*, and had ſeen hundreds diſpatched with thoſe ſtrange kind of poiſons: and though very many European chirurgeons had tried to recover the perſons, only very ſlightly hurt by the poiſoned weapon, and though they had immediately, as ſoon as ever the perſon were hurt, cut out all the wounded part; yet within a very ſhort ſpace thoſe poor wretches would fall down ſtone dead. But as concerning the fleſhes being turned into a gelly, he could never have any certain knowledge of it, having never himſelf ſeen any ſuch effect. Mr. *Povey* affirmed further of our Engliſh vipers, that though many had thought the biting no way mortal, yet that not long ſince a gentleman, with whom he was intimately acquainted, was, by a bite in his hand from a provoked Engliſh viper, though all endeavours had been immediately uſed to prevent any ill ſymptoms, at length killed, after he had ſuffered an exceeding chillineſs and deadneſs in that hand and arm for about a twelvemonth, ſo as that he could not keep any heat in them, though wrapped with all imaginable care in furs and other warm clothes. Now though I was able to obſerve little in that day, yet I have ſince by examining the carcaſe found, that the teeth (though at firſt they appeared perfectly tranſparent, and ſeemingly ſolid) were all hollow, and filled with a liquor, or juice, which it is not unlikely may be their poiſon; for upon the drying of the teeth, I found, that that juice was alſo waſted, and by a chain of ſmall bubbles, which then was viſible enough through the microſcope. I perceived the air had found the way into the cavity of the teeth. I fancied this viper had two fangs growing directly under each eye: that of them, which was under the right eye, though to the naked eye it appeared only one was diſcovered by the microſcope, to conſiſt of two ſmall teeth much like cat's claws, that on the left ſide was only one ſingle one. The contrivance for erecting and retracting, or ſheathing the teeth, was very pretty, and like all other articular motions of the body very mechanical; for by their opening their mouths, two ſmall jaw bones (as I may call them) which lay in the roof or upper part of their mouth, were made to thruſt outwards and forwards, and thereby being joined as it were to the midſt of the fangs; they erected the fangs, and there made them unſheath or appear without a kind of lid or præputium, into which they did again ſlide and lye concealed, when thoſe bones were drawn backward and inwards. Theſe ſmall bones had each of them ſeven or eight ſmall teeth apiece: the viper had alſo two ſuch ſmall bones in the under-chop. Exactly like theſe Dr. affirms, the teeth of a rattle ſnake to be, but exceedingly bigger; and the hole in thoſe teeth to be big enough to have a pin thruſt into it. I did alſo make ſeveral tables of refractions from experiment, and find the hypotheſis of ſines to hold ſo great exactneſs, ſo that I think we need not much doubt, but that could we make elliptical glaſſes, much might be done in microſcopes more than has been yet performed. I tried the refraction alſo of a very ſtrong ſolution of common ſalt in water, and found the refraction greater than in common water. But which is more ſtrange than any yet made, I found very clear oil of turpentine to have the greateſt refraction of any body I have yet tried, though it be in ſpecie much lighter than the ſpirit of wine or any body I know. What my calculations are, I have here tranſmitted in the following tables. I have alſo in the encloſed box put up one of the ſeeds of muſk graſs, which is the only one I have left, having given but one of the bills this year: this you will find under the ſmall microſcope. The glaſs of this microſcope, though very ſmall, is, I think, very good, which you may perceive, if, without ſtirring the ſmall bruſh of hairs I have ſtuck on to it, you view them againſt the light of a candle, or of the window. I am now very buſy about an engine for making long teleſcopes, and almoſt finiſhed it; and hope by the next to have ſo far proceeded and ſucceeded in it, as that you may receive an account of it, which I hope will not be unacceptable to you, from,

Honoured Sir,
your moſt affectionate,
moſt faithful, and moſt
humble ſervant,
RO. HOOKE.

Greſham College, Nov. 10, 1664.

Moſt honoured Sir,

I HOPE you received the ball and ſocket, together with two little pamphlets, and the beard of a muſk graſs ſeed, which I ſince incloſed in a ſcribble. I have not ſince that met with any thing worthy your knowledge; only this week I made two experiments, which perhaps may not be unacceptable; the one was of refraction, wherein, in proſecution of the former experiments, I made ſome further trials upon ſallet oil, and found the refraction of it to be much greater than that of any liquor I have yet tried; the refraction of thirty grains requiring no leſs than an angle of inclination in the air of 46°. 30′. and of twenty, an angle of inclination of 29°. 47′. So that the proportion of their ſines is very near as 20 to 29$\frac{1}{4}$. or almoſt as 2 to 3. Theſe experiments I am further proſecuting, to find out the refraction of all kinds of ſaline menſtruums, of hot and cold water, of ſeveral kinds of oils; after that, I intend another inſtrument to find all the various refractions of cryſtal, glaſs, ice, horn, gums, and other tranſparent ſolid bodies; the refractions alſo of the parts of the eye, *&c.* Of each of which, as faſt as I make them, I ſhall ſend you an account. The other experiment (which I ſhall hardly, I confeſs, make again, becauſe it was cruel) was with a dog, which, by means of a pair of bellows, wherewith I filled his lungs, and ſuffered them to empty again, I was able to preſerve alive as long as I could deſire, after I had wholly opened the thorax, and cut off all the ribs, and opened the belly. Nay, I kept him alive above an hour after I had cut off the pericardium and the mediaſtinum, and had handled and turned his lungs and heart and all the other parts of its body, as I pleaſed. My deſign was to make ſome enquiries into the nature of reſpiration. But though I made ſome conſiderable diſcovery of the neceſſity of freſh air, and the motion of the lungs for the continuance of the animal life, yet I could not make the leaſt diſcovery in this of what I longed for, which was, to ſee, if I could by any means diſcover a paſſage of the air out of the lungs into either the veſſels or the heart; and I ſhall hardly be induced to make any further trials of this kind, becauſe of the torture of the creature: but certainly the enquiry would be very noble, if we could any way find a way ſo to ſtupify the creature, as that it might not be ſenſible, which I fear there is hardly any opiate will perform. I obſerved this, that at any time, if the bellows were ſuffered to reſt, and that by that means the reciprocal motion of the lungs were not continued, the animal would preſently begin to die, the lungs falling flaccid, and the convulſive motions immediately ſeizing the heart and all the other parts of its body; but upon the renewing the reciprocal motions of the lungs, the heart would beat again as regularly as before, and the convulſive motions of the limbs would ceaſe. There are ſeveral, that are much awakened by this experiment, and, I find, intend to proſecute it much further; of which I hope I ſhall have a certain account. There was the laſt day of meeting, Nov. 2. a letter from monſieur *Zulichem*, wherein mention was made of a weaker glaſs made by the means of the riſing and falling of a ball of wax in ſalt water. This I had then acquainted you with, but that I knew it would be no news, ſince I well remember, there were ſeveral experiments of this kind proſecuted by you at *Chelſea* three or four years ſince. There has nothing elſe occurred worthy your knowledge; which if there had, or that for the future any ſuch ſhall, you ſhall thereof receive a punctual account from,

Moſt honoured Sir,

your moſt humble and

moſt faithful ſervant,

R. HOOKE.

I HAVE not yet made any trial of my new engine, though it be now up, and was yeſterday examined by my lord *Br.* Sir *R. M.* Sir *Paul N.* and ſeveral others, and not one objection made againſt it, but approved by all. I hope within ſome few days to make ſome trial, how it will anſwer expectation. I forgot to acquaint you in my laſt, that it was Mr. *Richard Reeves*, that has killed his wife, but he now hopes, that he ſhall be able to get off, only it will coſt him ſome money. The bookſeller's ſhops afford nothing new.

November 24, 1664.

Moſt honoured Sir,

HAVING received the honour of your commands by Dr. *Wren*, for procuring an inſtrument for refraction, whereby, as he told me, you deſigned to try the refraction of the humours of the eye; I did that very afternoon beſpeak it; and I hope within a few days it will be ready to be conveyed to you. I have likewiſe procured out of Mr. *Oldenburg*'s hands ſome of the firſt ſheets; and ſhall delineate as many of the inſtruments you mention, as I ſhall find convenient, or (if it be not too great a trouble to you) as you ſhall pleaſe to direct. I think it will be requiſite alſo, becauſe your deſcriptions will not refer to the particular figures and parts of them by the help of letters; that therefore it would not be amiſs, if I add two or three words of explication of each figure, much after the ſame manner, as the affections of the priſm are noted in your book of Colours. The figures I think need not be large, and therefore it will be beſt to put them all into one copper plate; and ſo to print them, that they may be folded into, or diſplayed out of the book, as occaſion ſerves. This puts me in mind to acquaint you

you also, that Mr. *Faithorne* has now at last promised me with all the asseverations imaginable, that he will not fail to finish your picture by the middle of the next week at furthest, and therefore I think I shall employ Mr. *Loggan* (who is an excellent graver also) that I may not take Mr. *Faithorne* off from finishing that plate. As for the microscopical observations, they have been printed off above this month; and the stay, that has retarded the publishing of them, has been the examination of them by several of the members of the Society; and the preface, which will be large, and has been stayed very long in the hands of some, who were to read it. I am very much troubled there is so great an expectation raised of that pamphlet, being very conscious, that there is nothing in it, that can answer that expectation; but such as it is, I hope I shall prevail with the printer to dispatch some time this or the next week. I have not yet brought the new way of grinding glasses to such perfection, as may deserve your knowledge, though I have not been wanting in endeavouring to go through with that business. And though I meet with many rubs, which bare speculation could not so easily inform me of, yet observing, that to be a fortune, which is almost inseparable from all attempts of any new thing, and out of the common road, I shall not at all slacken my diligence in prosecuting of it. The person you were pleased to mention, as having made the anatomical experiment on the heart of a dog, was at the Society the next day, and made a short report of it. I have been able to try very little in anatomy since my last; only I opened a viper, and found, that all the lungs were nothing but one continued bladder, which reached more than half the length of the body; that the upper part only of it was interwoven with an infinite company of veins and arteries; and that near those vessels I could discover several small vessels, which seemed filled with several chains of small bubbles. I have not yet been able experimentally to determine, what the use of them may be: whether they were to be conjoined with the blood in the vessels, or with the open air, I cannot yet determine. I hear of nothing new in *Paul*'s Church-yard, but only *Ricciolo*'s second part of his Almagestum is published and expected daily. There has nothing else occurred worthy your knowledge, which, as often as there does, an account thereof shall be speedily presented you by,

Most honoured Sir,

your most humble and

most faithful servant,

R. HOOKE.

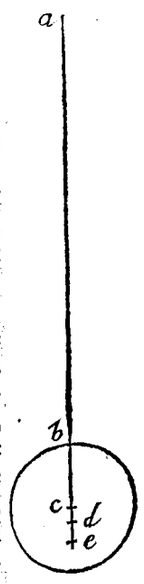
THIS inclosed I received from Mr. *Evelyn*, who desires his most humble service to be presented to you.

I

Dec. 13, 1664.

Most honoured Sir,

I AM not only ashamed, that I have not sooner given you an account of what I promised in my last, but much more, that I am able as yet to say so little to the purpose; for though, when I last writ, I was promised, both by Mr. *Faithorne* and Mr. *Thompson*, that I should have those things which they had in their hands, finished within three or four days; and though I have often called upon them, and urged them all I could, I have not been able to get them done. I have lately observed many circumstances in the height of the mercurial cylinder, which do very much cross my former observations; for at this very time the quicksilver is as high as I have a long time observed it, and I don't remember, that it has been higher: it has risen a little for these four or five days, and has continued so, notwithstanding the variety of winds, and the multitude of rain, that has lately fallen; and, I think, it rises a little yet, but it is but little. I have taken notice also of two or three other very odd particulars lately in it, which have crossed several other observations. The experiments we are now most busy about, are concerning the adjustening of the length of pendulums, thereby to settle a common standard for length; of which kind, Mr. *Zulichem* has sent over some very pretty theories; but upon very careful trial with several accurate and large pendulums, made with balls of lignum vitæ, some of which balls are six inches over, others no bigger than the head of a pin, or a small shot, and suspended by a very curious hair, which seems as likely a way as any to find out to what point of the globular body, hung at the end of a string, the length of such a pendulum is to be reckoned. Monsieur *Zulichem* says, it is $\frac{2}{3}$ parts of a third proportional below the center of the ball c, the first of which proportionals are, $ab + bc$ (that is, ac) and bc; namely, $ab + bc$, $bc :: bc; \frac{bc\,bc}{ab+bc}$, which we will suppose ce; $\frac{2}{3}$ of which taken below the centre gives d the point, to which the length of the pendulum ad is to be measured from a, the point of suspension. Sure it is, that this point is below c, the center of the body; but whether at d, I cannot positively yet affirm. The plate for your book was graven before I received your last of Mr. *Evelyn*'s. I have only taken notice of seven instruments, which you in those sheets I looked on have described; and those I so put into one small plate, that they will fold out of the book, when there is occasion. This last of Mr. *Evelyn* I have given a small draught of also to the engraver, who is not an Englishman, but one, that I find a very good workman, and very punctual to his word; which was the reason I did not employ Mr. *Faithorne*, as you directed, he having so very often and often disappointed my expectation. I have since my last made an anatomy of a dog, and hope, that I have made



made a considerable new discovery; but this being the first time I have seen it, at least taken notice of it, I cannot, till further trial, positively affirm any thing, which, as soon as ever I am assured of it, you shall thereof receive an account from,

SIR,

your most faithful, and

most humble servant,

R. HOOKE.

I HOPE, Sir, you will pardon this hasty scribble, for it was very near eleven a clock this night, before I could get from some company, met about the business of Sir *J. Cutler*.

Dec. 15, 1664.

Most honoured Sir,

THIS letter coming so late to the post-house on Tuesday night, was brought back to me, since which I have made farther trial of Mr. *Zulichem*'s experiment; and both my lord *Br.* Sir *R. M.* and Dr. *Wren*, were judges and examiners of the experiment, and find, that the trials made with these pendulums, whose balls were of lignum vitæ, did not answer to Mr. *Zulichem*'s rule, and therefore it is now much doubted of. We had yesterday in several parts of *England*, an account of the appearance of a very great comet in the south south-east, with a very long tail, extended towards the north-west; some say about ten yards long, some about two; but how much that is, is difficult to guess, unless we could see it, which I have done all this last night, but to little purpose, by reason of the thickness of the air. It has been seen in *Yorkshire*, and in *Cheshire*, and at *Portsmouth*, and several other parts of *England*. I this day got a sight of Mr. *Faithorne*'s plate, and indeed he has done the face very carefully and well; and, I think, very like; but has not quite finished the plate. The other cuts are finished for your book of Cold; but Mr. *Thompson* has again disappointed me. Your anatomical experiments, read by Mr. *Oldenburg*, were very highly approved of by the whole Society. I cannot yet perfect my telescope glasses, though they do now very much more flatter me with hopes than at first; so that I shall not yet give over. It seems, by some papers of Mr. *Oldenburg*, that they have made in *France* object glasses of 250 palms, which is about 160 feet long, and make use of them without a tube.

Gresham-College, July 8, 1665.

Most Honoured Sir,

I DID this last week send down by *Moor*'s waggon a weather-glass poised upon its centers. I supposed it would be very easy to get a frame made for it at *Oxford*, otherwise I would have sent one with it, but it would have much endangered the breaking of the thermometer, which it did once in our packing of it up; but I caused another to be made, which I think is very strong, and, I hope, very safely packed up. I doubt not, but that you have long before this heard of the adjourning of the Royal Society, and of the increase of the sickness, which rages much about that end of the town you left. I hear, several in the *Pell-mall* are infected, and one house almost emptied. It is not much spread as yet in the city, God be praised, though it be dangerously scattered. I cannot, from any information I can learn of it, judge what its cause should be, but it seems to proceed only from infection or contagion, and that not catched but by some near approach to some infected person, or stuff: nor can I at all imagine it to be in the air, though yet there is one thing, which is very differing from what is usual in other hot summers, and that is a very great scarcity of flies and insects. I know not whether it be universal, but it is here at *London* most manifest. I can hardly imagine, that there is a tenth part of what I have seen other years. We have made very few experiments since you were pleased to be present, but I hope, as soon as we can get all our implements to *Nonsuch*, whither Dr. *Wilkins*, Sir *W. Petty*, and I, are to remove next week, I shall be able to give you an account of some considerable ones, we having designed to prosecute the business of motion through all kinds of mediums, of which kind Sir *W.* has made already many very good observations. We shall also take the operator along with us, so that I hope, we shall be able to prosecute experiments there as well almost as at *London*; and if there be any thing, that you shall desire to be tried concerning the resistance of fluid mediums, or any kind of experiments about weight or vegetation, or fire, or any other experiments, that we can meet with conveniencies for trial of them there; if you would be pleased to send a catalogue of them, I shall endeavour to see them very punctually done, and to give you a faithful account of them. I very much fear also, that we shall be forced against our wills to stay there long enough to try experiments of Cold, though I have some thoughts of removing to another place farther from *London*, where I have designed to try a large catalogue of experiments, such as one cannot every where meet with an opportunity of doing; but the country people are now so exceeding timorous, that they will not admit any, unless one have been a considerable time absent from *London*. I was this day informed by one, that received a letter thence, that the plague rages so extremely in *Southampton*, that sometimes there die thirty in a night; and that has made *Portsmouth*, and the isle of *Wight* so fearful, that they will suffer none to enter. The founder has brought home the saucer stop-cock, which I sent about the case of the weather-glass. Mr. *Thompson* also has sent home the instrument for taking angles, and demands two and thirty shillings. It is not quite finished, but I intend to take it with

with me to *Nonſuch*, and there to make trial of it, and adjuſten it. I ſhewed it the laſt meeting of the Society, which it was very much approved of; and I hope it will be the moſt exact inſtrument, that has been yet made. But I weary you with my impertinencies, and muſt therefore humbly beg your pardon, and make haſte to ſubſcribe myſelf,

Moſt honoured Sir,

your moſt humble, and

moſt faithful ſervant,

R. HOOKE.

Aug. 15, 1665.

Moſt honoured Sir,

I HAVE not ſince the receiving of your letter, had the opportunity of ſending to Mr. *Oldenburg*, to learn from him the account of the experiment, which you were pleaſed to mention in it. I have longed very much to be ſatisfied concerning it, as believing it very conſiderable. I have made trial ſince I came hither, by weighing in the manner, as Dr. *Power* pretends to have done, a braſs weight both at the top, and let down to the bottom of a well about eighty foot deep, but contrary to what the doctor affirms. I find not the leaſt part of a grain difference in a weight of half a pound between the top and bottom. And I deſire to try that and ſeveral other experiments in a well of threeſcore fathom deep, without any water in it, which is very hard by us. One of our quadrants does to admiration for taking angles, ſo that thereby we are able from hence to tell the true diſtance between *Paul*'s and any other church or ſteeple in the city, that is here viſible, within the quantity of twelve foot, which is more than is poſſible to be done by the moſt accurate inſtrument, or the moſt exact way of meaſuring diſtances. The other, which is yours, I hope within a day or two to perfect it, ſo as to go much beyond the other for exactneſs, of which I may give you an account as ſoon as I have tried. There happened lately a pretty odd accident: A very young and ſeemingly healthy gentlewoman by drinking the *Epſom* waters, and afterwards giving her young child (not yet much above a quarter old) ſuck, found, to her extreme ſorrow, that though the waters did not at all work with her, yet that ſo wrought on the ſucking child, that it fell into a moſt violent looſeneſs and griping, which within three days killed it. I made laſt night alſo a pretty odd diſcovery of a new kind of ſhining animals, whoſe blood, or juices, did ſhine more bright than the tail of a glow-worm, when the candle was put out. I have nothing more to add, but that I am,

Moſt honoured Sir,

your moſt faithful, and

moſt humble ſervant,

R. HOOKE.

THERE is ſomewhat above thirty ſhillings due to Mr. *Thompſon*. I have forgot the particular ſum, but if I miſremember not, it was thirty two ſhillings: but as for Mr. *Faithorne*, I never made any bargain for more than twelve pound, nor did he at firſt mention any more of me. If you have any further commands, you may ſend it thither by the poſt, I ſuppoſe, if not to be left for me at *Greſham* college, from whence I receive letters uſually once a week. I am ſtill at *Durdens*, my lord *Berkley*'s houſe near *Epſom*, where Dr. *W.* only remains, Sir *W. P.* being gone to *Saliſbury*. My ſervice, I beſeech you, Sir, to Mr. *Croſſe* and his lady, and to Dr. *Lower*, if in *Oxford*.

Durdens, Sept. 26, 1665.

Moſt honoured Sir,

I WAS a little troubled at the miſcarriage of my laſt letter, and ſo much the more, becauſe I could not till now find an opportunity of repeating my requeſt I therein made. I did therein, as I remember, ſend an account of ſome trials I had then newly made in a well not far from us, which, upon meaſuring, I found to be no leſs than three hundred and fifteen foot in its perpendicular depth, though that was ſhort alſo of the depth, that I was aſſured it was of, before it had been filled up by timber, ſtones, and other rubbiſh; for the owner of it affirmed it to be no leſs than ſeventy fathoms deep by meaſure, or four hundred and twenty foot, ſo that it ſeems no leſs than a hundred foot is filled with rubbiſh, at leaſt it is ſtopped by ſome croſs timber, which I rather ſuſpect, becauſe that I found the weights to be ſtayed by them, if I ſuffered them to deſcend below that depth. One of the experiments I tried in it was that of gravity, which upon accurate trial I found to proceed altogether as the former, whereof I gave you an account before. I tried alſo an experiment in it with four large candles, lighted and placed at a convenient diſtance, one from another, in ſockets faſtened on a board for that purpoſe. The iſſue was, that they burnt very freely, and blazed, till they had deſcended about two hundred and forty foot from the top, where they ſuddenly began to grow dim, and quickly after went out all together, as if ſuddenly quenched or extinguiſhed by their ſinking into a damp; which if ſo, the damp muſt be no leſs than threeſcore foot deep. I was not then able to repeat the experiment, by reaſon of the loſs of thoſe candles by an unlucky accident before I had got up the line.; nor have not ſince had time, but I propoſe, God willing, ſhortly the further proſecution of it, together with a long ſeries of experiments, which I have thought on, it being ſuch an opportunity, as is ſcarce to be met with in any other place I know. I have in my catalogue already thought on divers experiments of heat and cold, of gravity and levity, of condenſation and rarefaction of preſſure

ſure, of pendulous motions and motions of deſcent; of ſound, of reſpiration, of fire, and burning, of the riſing of ſmoke, of the nature and conſtitution of the damp, both as to heat and cold, drineſs and moiſture, denſity and rarity, and the like. And I doubt not but ſome few trials will ſuggeſt multitude of others, which I have not yet thought of; eſpecially if we can by any means make it ſafe for a man to be let down to the bottom. I ſhould very gladly receive from you, if it be not too great a trouble, a catalogue of ſuch experiments, as you ſhall think fit to be tried to it, which was indeed the chief buſineſs of my laſt ſcribble. I am going ſhortly for a little while into the *Iſle of Wight*, and ſo perhaps may not till my return be able to make thoſe trials; but I ſuppoſe the winter will not afford leſs inſtructive experiments than the other. And therefore what you ſhall pleaſe to ſuggeſt now will not come too late for winter experiments, eſpecially if I can give order for making ready an apparatus for them before I take my journey, which I ſhall be able to do, if by the return of this bearer you pleaſe to ſend them to,

Moſt honoured Sir,

your moſt humble, and

moſt faithful ſervant,

ROB. HOOKE.

Greſham College, February 3, 1666.

Moſt honoured Sir,

I DID by my laſt letter, which I ſent to you from *Durdens*, acquaint you with my laſt trials, which I made in the deep wells, which were indeed ſo conſiderable, that I have many times ſince wiſhed, that I could have another opportunity of examining them further. Whether that and another I ſent not long before came to your hands, I now begin to doubt, being aſſured, that many other letters, which I ſent from *Epſom* to be delivered at the poſt houſe, in that time of confuſion, miſcarried, eſpecially ſince Mr. *Oldenburg* tells me, that you have intimated to him, that it is much longer ſince you have received any from me. I am ſomewhat troubled, indeed, that my laſt did miſcarry, if it has ſo, becauſe therein I had ſet down, whilſt they were freſh in my memory, moſt of the particulars, which I thought moſt obſervable in thoſe trials. The ſum of which, if I miſremember not, was this; that the air at the bottom of the well was exceeding hot, when the air above was ſo very cold, that every thing froze immediately almoſt; ſo that, notwithſtanding the great increaſe of preſſure at that depth, yet the air in the inſtrument we let down for that purpoſe was abundantly much more rarified at the bottom, than it was before we had let it down, and after we had pulled it up. Another thing, which was not leſs obſervable, was, that all the glaſs veſſels we let down into the well were, when we pulled them up, all covered over very thick with great drops of dew or water, ſo that from one of the bottles, I believe, ſeveral ſpoonfuls might have been collected; and notwithſtanding this, the hygroſcope I let down at the ſame time manifeſted, that the air at the bottom was exceeding much drier than it was at the top; the candles, which we divers times tried, went out much about the ſame depth always; and ſometimes, by ſuddenly pulling them up about half a dozen fathom, they would rekindle, and burn afreſh. We found but little difference between the time, that wooden and leaden bullets deſcended this ſpace; nor could I ſenſibly diſtinguiſh, that there was any difference between the reſounding eccho from the bottom, and the like eccho from an horizontal wall equally diſtant upon the ground, though the return were very much ſtronger, but more confuſed by the greatneſs of the noiſe. The weather was ſo very cold, when we made theſe experiments, that made us haſten then ſo much the more; and I have not ſince had an opportunity to repeat them, though, God willing, I intend to make many other of the like kind, either there or elſewhere, ſome time this ſummer; and I have great hopes of having an opportunity of examining both greater depths and much greater heights, in ſome of our Engliſh mines, and ſome of the mountains in *Wales*; which, with ſome other good company, I deſign to viſit this next ſummer. Mr. *Tillotſon* has a very young child, which, from the ſwelling of the joints, ſome imagine to have the rickets; and, upon my naming of your ens veneris, he has much deſired me to procure him ſome of it. I would deſire therefore in your next, that you would be pleaſed to direct me, where I may meet with ſome of it, that is good and well made, that I may procure for him. I am now making a collection of natural rarities, and hope, within a ſhort time, to get as good as any have been yet made in the world, through the bounty of ſome of the noble-minded perſons of the Royal Society. I hope we ſhall have again a meeting, within this week or fortnight at fartheſt, there being now a ſufficient number of our members in town; and then I hope we ſhall proſecute experiments and obſervations much more vigorouſly; in order to which alſo I deſign, God willing, very ſpeedily to make me an operatory, which I deſign to furniſh with inſtruments and engines of all kinds, for making examinations of the nature of bodies, optical, chemical, mechanical, *&c.* and therein to proceed by ſuch a method, as may, I hope, ſave me much labour, charge, and ſtudy; and in this deſign there will be ſome two or three others, that will join with me, who, I hope, are of the ſame mind with me. But I much forget my ſelf, to trouble you, Sir, with theſe my impertinencies, before they are completed; though, when they are ſo, I muſt beg, that you will ſend a word or two of directions (concerning ſome chemical operations and methods) to,

Moſt honoured Sir,

your moſt humble ſervant,

R. HOOKE.

March 21, 1665-6.

Honoured Sir,

THIS account having had the honour to be very well approved in the Royal Society, though the experiments contained in it are no other than what I have formerly acquainted you with yet, there being ſomewhat of new hypotheſis, and giving ſome account of the apparatus which is now preparing for the trial of thoſe experiments, and ſomewhat likewiſe of the main drift of them, I have added them to this ſcribble. Mr. *Tillotſon* returns his humble ſervice for the ens Veneris you were pleaſed to promiſe him, but I have ſince procured him ſome very good here in town, which has ſerved the turn ſo, that I ſhall give you no further trouble concerning it. I have given Mr. *Shortgrave* directions for making of a wheel baroſcope for you by a new way, which is much more facil than the former, both in making, filling, and rectifying. He ſhews me likewiſe ſome braſs pipes, which if they be for injection, or tranſfuſion of blood, they would be ſomewhat better to have ſmall protuberances left at the end, that they may not ſlip out of the veſſel, when they are tied on to it; but knowing not the deſigns of them, I could not direct him. I very much rejoice to hear of your return to theſe parts, and am glad you have made choice of this end of the town: the place I was lately to ſee, and believe it to be a very good air; it is pleaſant, private, and there is a very good neighbourhood, and it is not full three miles from hence all over pleaſant fields. I do not hear of the death of any of your workmen ſave Mr. *Thompſon*, and Mr. *Shaw* the founder; and here are others of the ſame trade good workmen. I thought to have conveyed this by Dr. *Wren*, who is this day gone for *Oxford*, but I was hindered by company this morning. He has ſomething worth your peruſal; amongſt the reſt a relation of *China*, new and very good of its kind, though it contain not much of philoſophical information till towards the latter end, much of which ſeems to be tranſcribed from others. Two or three leaves I have turned down in it on ſuch things as I met with remarkable. But I have already given you too much trouble, and therefore beg your pardon. I am,

Honoured Sir,

your moſt humble, and

moſt faithful ſervant,

R. HOOKE.

OUR collections of rarities at *Greſham* college is now very well worth your perſual, and I hope to increaſe it every day. We had yeſterday a very full meeting here of the Society, and I hope a greater the next week. I am very glad to hear, that you have a ſixty foot teleſcope; certainly it may help us to many good diſcoveries, if it be well made uſe of. I did the laſt week ſee an elliptical glaſs, which in truth did ſomething extraordinary, and more than I had ſeen before; and I expect ſhortly to ſee much better.

GRAVITY, though it ſeems to be one of the moſt active principles in the world, and conſequently ought to be the more conſiderable, has yet had the ill fate to have been alway till of late eſteemed otherwiſe, even to ſlighting and neglect. But the inquiſitiveneſs of this latter age has begun to find ſufficient arguments to entertain other thoughts of it. *Gilbert* began to imagine it a magnetical attractive principle inherent in the parts of the terreſtrial globe. The noble *Verulam* alſo in part embraced this opinion. But *Kepler* (not without good reaſon) makes it a property inherent in all celeſtial bodies, ſun, ſtars, planets: this ſuppoſition we may afterwards more particularly examine. But firſt it will be requiſite to conſider, whether this gravitating power be inherent in the parts of the earth; and if ſo, whether it be magnetical, electrical, or of ſome other nature diſtinct from either.

IF it be magnetical, any body attracted by it ought to gravitate more when nearer its ſurface, than when farther off. To examine which propriety ſeveral trials have been made both on the higher parts of *Weſtminſter* abbey, and alſo at the top of St. *Paul*'s ſteeple: but though in the making of them, I endeavoured to be as accurate as the way was capable of, I tried it by; (which way by counterpoiſing a heavy ſolid body, and as much braſs wire as would ſerve to let down that body from the top to the bottom of the building; and then poiſing thoſe equilibrated bodies, firſt whilſt the ſolid body and wire were in the ſcale at the top, and afterwards by poiſing them likewiſe when the body was let down almoſt to the bottom by the wire, whoſe upper end was faſtned to the ſcale at the top;) yet ſuch were the inconveniencies this wire was ſubject to from the vibrations of ſo long a line, and from the motion of the interpoſed air, that nothing of certainty could be collected from theſe trials, ſave only, that if there were any difference in the gravitation of the body, it was but very ſmall and inconſiderable. Since I found in the trials made from the top of the abbey, that a few grains put into this or that ſcale would manifeſtly turn the beam this or that way, notwithſtanding the former inconveniencies. But to diſtinguiſh, whether there be any the leaſt variety, muſt be attempted ſome other way, of which by and by.

NEXT, if all the parts of the terreſtrial globe be magnetical, then a body at a conſiderable depth below the ſurface of the earth ſhould loſe ſomewhat of its gravitation, or endeavour downwards by the attraction of the parts of the earth placed above it. This opinion ſome experiments made by ſome worthy perſons of this honourable Society ſeem to countenance. But conſidering the vaſt proportion of the decreaſe of gravity at ſo ſmall a depth, it ſeemed not improbable, but

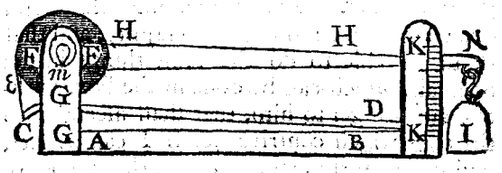
but that the motion of the air, or some other unheeded accident, might intervene in these experiments, which might much contribute thereunto. For the trial of which I had a great desire; and happily meeting with some considerable deep wells near *Banstead Downs* in *Surry*, I endeavoured to make them with as much exactness and circumspection as I was able: my first trials were, a well of about fifteen fathom deep, or ninety foot; the thread I made use of was about fourscore foot long. The bodies I weighed by it were brass, wood, stone, each of which at several times I counterpoised exactly, and hung the scales, which were very good ones, over the midst of the well, so as the packthread might hang clear down to the bottom without touching the sides: the effects were these, that each of these bodies seemed to keep exactly the same gravity at the bottom and top. For trying it when the air was still and calm, I found, that the weight of a grain would easily turn the scales either way, according as it was put into the one or the other scale; which exactness of equipollency in the scales I found, both before I let down the body by the thread, when they were so let down, and after they were again drawn up. So that it seemed manifest, that about a pound weight, either of wood, flint, or brass, by being placed fourscore foot either nearer or farther from the centre of the earth, did not vary its weight more than a grain, that is, not more than a 7680 part of its weight, by having fourscore foot of earth situate about it, whereas the other experiments make it lose near a sixteenth part in depth not much greater.

THIS experiment I afterwards tried with the like circumspection in a well of near threescore fathoms deep, where the weight, though suspended at the end of a string of about three hundred and thirty foot long, seemed to continue of the same weight, that it had above, both before it was let down, and after it was pulled up. For the beam of the balance, though very tender, did in all these trials keep as to sense exactly its horizontal parallelism or equilibration; so that this opinion, how probable soever it might seem to *Gilbert*, *Verulam*, and divers other learned men, is not at all favoured by the experiments made in these wells; whether from the peculiar nature of the earth about these wells (which was too pretty solid chalk) or from some other cause, I determine not, till further experiment manifest it.

BUT in truth upon the consideration of the nature of the theory, we may find, that supposing it true, that all the constituent parts of the earth had a magnetical power, the decrease of gravity would be almost a hundred times less than a grain to a pound, at as great a depth as fifty fathom; for if we consider the proportion of the parts of the earth placed upon one side beneath the stone, with the parts on the other side above it, we may find the disproportion greater. Unless we suppose the magnetism of the parts to act but at a very little distance, which I think the experiments made on the Abbey and St. Paul's will not allow of. If therefore there be any such inequality of gravity, we must have some ways of trial much more accurate than this of scales, of which I shall propound two sorts, which (if any such difference be) seem capable of distinguishing and finding it out. The first is by the motion of a swing clock; for if the attraction of the earth towards its centre be less, the farther the body is placed below or above its surface, then the motion of such a watch must be slower there than on the surface. And though perhaps the difference be so small, as not to be sensible at one, ten, or a hundred vibrations in many thousands of them, it will not be difficult to find it. But a clock for this purpose ought to be sealed up exactly in a glass, so that no air may have any intercourse with it; otherwise the changes of it may perhaps be rather ascribable to the air, which is evidently of a differing constitution. And by this means, which I look upon as the most exact, I could wish, that trial were made at the top and bottom of some very high hill, that so by the differing velocity of the clock at the top of the hill from that at the bottom, we might be able to judge, whether there be any such variation of gravity; and, if such, whether it be analogous to the attraction of the magnet.

THE other instrument for this purpose may be some such as this described in the adjoining figure, which ought also to be well fortified against the mutations of the ambient air; otherwise in so nice an experiment nothing can be done.

A B, a frame, to which is fastned C D, a spring from the end of which C a thread C E is fastned to a small wheel F F, which moves on a very sharp edge in the hole m. To the other side of this wheel is fastned a small long beam H H, reaching beyond the



frame A B, namely to N, to which a weight of a convenient bigness I being fastned, and the instrument carefully conveyed from place to place. The end of the beam will shew upon the divided pillar K K, the differing weight of that body in several places.

Now because the design of both these experiments are to find out a difference of gravitation, if there be any to the end, that comparing them with the attraction of the loadstone, we may the better judge of this supposition; it will therefore be requisite to make several experiments on a good magnet, for the finding out of the decrease of the force of its attractive power upon a body, according as it is placed at greater and greater distances, or according as it is further and further placed within the hollow of a terrella, for

for which I have contrived and design to make an appropriate instrument. Now these experiments, as they are wholly new, being not attempted that I know by any hitherto, no magnetical writer that I have met with having taken any notice of it; and as the magnet affords many helps towards the finding out the nature of the magnet, and the laws and reasons of divers other motions; so if this analogy between the decrease of attraction of the one, and gravitation of the other, be found real, we may perhaps, by the help of the loadstone, as it were epitomise all the experiments of gravity, and determine, to what distance the gravitating power of the earth acts, and explicate perhaps divers other phænomena of nature by ways not yet thought of.

Gresham College, Sept. 5, 1667.

Honourable SIR,

WE have had so little worth communicating since your departure, that I have hitherto forborn to give you the trouble of a letter; and the business indeed of this paper is nothing but to express my service and duty. For most of the Society being out of town, we have for some weeks omitted our meetings, and so there has been nothing done at *Arundel* house. And the heat of the weather, till of late, has been such, that I could not proceed with the experiment of the air-box, though, upon my next attempting of it, I despair not of bringing it to a good issue, which the coldness of the weather, and the meeting of several of the Society every Thursday in the afternoon at my chamber, will now speedily put me upon. There will be, I doubt not, very many noble experiments discovered by it, of which I have conceived a good number. And I hope likewise to add one contrivance more to this enquiry, and that is, to be able to do the same things in the open air, which can be done in the box, without any danger to him, that shall ascend into the air; which contrivance, if I can perfect, will be of great use upon many other accounts. I was lately informed of a very pretty experiment of reducing the whey and curds of a posset back again into milk, by the nature of a certain liquor. I doubt not at all of the truth of the experiment; but I do not yet certainly know the liquor, with which it is done. I question not, but that you will easily find many, that will do it; I have not, I confess, myself had any time to make enquiry after it since. I have, upon some trials, found a liquor, that does brighten steel, and extract a blood-red tincture from it, which has neither the ill taste nor smell of other solutions of that metal. I believe the tincture may be of good use in physick, as well as the brightning of steel will be to mechanicks. I suppose you have heard before this from Mr. *Oldenburg*, who is got out of limbo, and now again breaths and enjoys the free air. He will not, I hope, leave off his philosophical intelligence. I hope this peace will reduce all things again into order, and be a means likewise of hastening your return to *London*, where you are very much expected and wished for. I hope I shall prevail upon Dr. *Lower*, and for him, so as to get him anatomical curator to the Society. He has most incomparable discoveries by him on that subject, and a most dexterous hand in dissecting. Some of his discoveries I understand will be published in the next edition of Dr. *Willis*'s book *De Cerebro*. Political news I doubt not but you understand from better intelligence. I am,

Honoured Sir,

your most faithful

humble servant,

ROB. HOOKE.

THERE were about half a score of the Society met at my chamber this afternoon, where we had some discourse of philosophical matters, to keep the memory of that subject alive. I have lately contrived a new way of wheel work for clocks, watches, *&c.* which I think does much excel all the ways yet known: and indeed I think it the very perfection of wheel work, and capable of the highest perfection, that can be expected in that kind. There has been nothing like it yet practised. Many other things I long to be at, but I do extremely want time.

Mr. John Eliot *to Mr.* Robert Boyle.

Roxburg, August 26, 1664.

Right honourable,

I AM but a shrub in the wilderness, and have not yet had the boldness to look upon, or speak unto those cedars, who have undertaken an honourable protection of us. But for sundry reasons, I have now broke out, and have taken upon me the boldness to write unto yourself, right honourable Sir, because I do sufficiently understand, how learning and honour do rendezvous in your noble breast; and what a true friend you are to all learning, and also to this good work of the Lord, in promoting religion, and the knowledge of Christ among our poor Indians.

I DO humbly present my thankfulness to your self, noble governor, and all the rest of your honourable society, for your favourable protection and diligent promotion of this work, which otherwise might have been sunk and buried before this day; but by your vigilance and prudence, noble Sir, it is not only kept in being, but in a state of flourishing acceptation with his majesty, and other great peers of the land; which favour of yours, Christian duty doth oblige me to acknowledge.

I AM

I AM bold to present some things to the honourable corporation (according as I am advised) by the hand of my Christian friend, Mr. *Ashurst*. What doth more immediately concern learning, I crave the boldness to make mention of unto yourself. You are pleased to intimate unto me a memorandum of your desires, that there may be a grammar of our Indian language composed, for publick and after use, which motion, as I doubt not but it springeth from yourself, so my answer unto yourself about it, will be most proper. I and my sons have often spoken of it. But now I take your intimation as a command to set about it. When I have finished the translation of the *Practice of Piety*, my purpose is, if the Lord will, and that I do live, to set upon some essay and beginning of reducing this language into rule; which, in the most common and useful points, I do see, is reducible; though there be corners, and anomalities full of difficulty to be reduced under any stated rule, as yourself know better than I, it is in all languages. I have not so much either insight or judgment, as to dare to undertake any thing worthy the name of a grammar; only some preparatory collections that way tending, which may be of no small use unto such as may be studious to learn this language, I desire, if God will, to take some pains in. But this is a work for the morrow; to day my work is translation, which, by the Lord's help I desire to attend unto. And thus, with my humble thankfulness, I shall cease to give you any farther trouble at present, but, commending you unto the Lord, and to the word of his grace, I remain,

Right honourable,

yours in all service I can

in Christ Jesus,

JOHN ELIOT.

Letters from Dr. Ralph Cudworth *to Mr.* Robert Boyle.

May 27, 1664.

Honoured Sir,

UNDERSTANDING a while since by Sir *William Morrice*, that you were pleased to express your approbation and good opinion of a small pamphlet of mine long ago published, concerning the Lord's Supper, and (as I apprehended him) that you wanted a copy of it; though my own were long since all dispersed, yet I procured this of a friend, to present to you; desiring you to accept it as a small expression of my thankfulness to you, for those many worthy and learned works of yours, both philosophical and theological, with which you have obliged the publick; in which both your singular piety and transcendent learning doth appear. And, beseeching God to prosper your studies and endeavours, that you may further inrich the world with more such learned monuments, I remain,

SIR,

your most humbly devoted servant,

RA. CUDWORTH.

October 16, 1684.

Honoured Sir,

I AM extremely sensible of my obligation to you for your great civility, in sending me this, and other of your learned works before. I do assure you, Sir, I have a very great value for them; and the age, and world is much beholding to you. I wish with all my heart, you would get those, which are not already, all translated into Latin, and printed in folio together. Then, what you shall superadd will be easily collected and added afterward. And I pray God continue your life and health, that you may still enrich the world with more. The writers of hypotheses in natural philosophy will be confuting one another, a long time, before the world will agree, if ever it do. But your pieces of natural history are unconfutable, and will afford the best grounds to build hypotheses upon. You have much outdone Sir *Francis Bacon*, in your natural experiments, and you have not insinuated any thing, as he is thought to have done, tending to irreligion, but the contrary. My good friend, Dr. *G.* seemed to have taken his Life of *Matt.* from the lord *Verulam*. With the renewal of my thanks, I shall always remain,

SIR,

your most obliged, and

most humbly devoted servant,

R. CUDWORTH.

Letters from Mr. Seaman *to Mr.* Boyle.

London, Oct. 5, 1664.

Honourable Sir,

UPON your honour's laying down your intention of printing that part of the New Testament, which I had translated, I made Mr. *Diggs* acquainted with it, unto whom I had before communicated the printing thereof; but he would not hear of laying it down, encouraging me to go forward with it: so that he having not only largely subscribed himself, but also taken much pains in getting subscriptions, to help to support my charge, I have undertaken to print the whole New Testament; not doubting, but while that, which I have already done, is in the press, I shall be able to translate and prepare the rest; being resolved to spend my time in this work, that so (if it please the Lord to spare

spare my life and health) I may go through with it. I have here inclosed sent your honour the propositions, upon which I am engaged; and what money is subscribed and paid, I am to give a proportionable number of copies for; and the rest of the copies I shall have towards my pains herein; and if they yield me any thing considerable, I shall thereby be better enabled to spend more of my time (if the Lord lengthen out my life) in works of this nature.

IN the way, that it is in, there is no question, but the books will be generally dispersed; the chief number of subscribers being merchants trading into *Turky*; and that I know was one chief thing your honour aimed at: and I know your goodness is such, that you will be well pleased, that I am like to have any encouragement by it. I do hereby humbly tender the premises to your honour, and shall very thankfully acknowledge it, if you please, by subscription, to help forward this work in my hands. I thought it my duty to give you an account of this transaction under my own hand. So with the presentation of my humble service, I remain, and rest,

your honour's most humble servant,

WILL. SEAMAN.

London, Oct. 19, 1664.

Honourable Sir,

MR. *Clarke* writeth me, you desire to know what encouragement I have. The propositions I sent your honour, I communicated only to Mr. *Diggs*, the merchant, who hath gotten the governor of the Turky company to subscribe, with other Turky merchants, about an hundred pounds already; and the governor told me, that, when it hath gone through more hands, if it be not sufficient, they will go over again; and if it were not, that they design to help in the printing of my Lexicon, they would have contributed to this, as a company, out of their stock. I humbly return thanks to your honour for what Mr. *Clarke* writeth me, you will be pleased to do in it: if that I have from merchants, with what your honour subscribeth, defray not the whole charge, I shall, God willing, make up what it wanteth myself. This account being, what I have at present to tender to you, in answer to the abovesaid, desiring the Lord to preserve your health, and safely to return you to these parts, I remain, and rest,

your honour's most humble servant,

WILL. SEAMAN.

Honourable Sir,

I THOUGHT fit to certify your honour, that I went sometime since to the Dutch minister, to know Mr. *De Gheer*'s mind, whether he were willing to transmit his Turkish translation of the Old Testament into *England*, if so be the charge of the printing of it might be borne upon subscriptions to be procured here. To which the Dutch minister replied, that Mr. *De Gheer* is not willing to send it into *England*, in regard it may be printed at less charge in *Holland*; but if it shall please any gentlemen in *England* to subscribe any considerable sum of money towards the printing of it, he will go in hand with it there, and they shall not pay the money they subscribe, until they have their number of copies subscribed for, delivered into their hands. Upon this, they desire to know, what your honour will please to subscribe towards the printing of it there. I promised to wait upon your honour in it; but not having had my health so well as to venture so far, I am fain at present to take this way to do it, humbly desiring your honour, that by any of your servants hands, you will signify by two or three lines, whether or no your honour please to subscribe any thing towards the printing thereof in *Holland*. With my humble service presented to you, I take leave to rest

your honour's most humble,

and affectionate servant,

WILL. SEAMAN.

FROM my house in *Middle-Moorfields*, *London*, at the lower end of *Whitecross-Alley*, the first day of May, 1683.

Letters from Dr. More *to Mr.* Boyle.

Christ-Church-College, June 5, 1665.

SIR,

I RECEIVED your excellent Treatise of Cold a good while since, but deferred to return my thanks, that, upon the perusal thereof, I might be enabled to do it the more amply. But my occasions have been, and still are, such, that I cannot yet give myself that full pleasure of thoroughly perusing so singular a treatise, and of so select a subject. But so far as I have gone, I am sure it affords extraordinary delight to the reader, and is no ways unworthy of so illustrious an author. Sir, you will infinitely oblige posterity, by the records of your so faithful and multifarious experiments, which you have transmitted to them in your several writings. They certainly are of far greater consequence, as your last has but justly taken notice, than the framing of any hasty hypotheses, though witty, and, within some circuit of considerations, pretty coherent. *Opinionum commenta delet dies, naturæ judicia confirmat*; it is the saying of *Cicero* somewhere, but an undoubted prognostick of a durable honour done to your name, whose repute with posterity must have no such firm foundation, than the constancy of nature, of which your writings will now find so true a copy, as that future appeals will be

be made to them amongst the learned, as to the judicature of nature herself. This is the due acknowledgment, that all the world owes you, but none can make more readily and willingly than,

Honoured Sir,

your most humble, and

affectionate friend and servant,

H. MORE.

Christ-Church College, Nov. 27, 1665.

SIR,

I HAVE forborn all this while to return you thanks for your kind acceptance of that small signification of that respect and honour I have for your person and virtues; because, till within a few days ago, I had no information of the affair was in the subject of the inclosed letter. But now I can tell you, with what great thankfulness Mr. *Fulwood* does embrace the terms specified in your letter, and also how glad his brother, my acquaintance, now in the town, is of this opportunity given to his brother, the physician (for that is his employment) to improve himself under so excellent and knowing a person. When you have use for him, if you please to send me word, he shall have notice of it, and wait upon you. I am much obliged to you for your favourable judgment touching my idea. If any thing like you thus by pieces, I know you will find a new pleasure in considering the congruity of the whole; but most of all, if your leisure and patience will ever permit you to peruse my Synopsis also, and compare it with the idea. What you conceive of so free speaking and writing, that it is likely to procure me many adversaries, I am not only of the same opinion, but have the certain knowledge and experience of it; and may very likely find the effect of it in a rude manner this very day; Dr. *Sparrow* visiting us this afternoon: but knowing so well what is at the bottom, I shall, I hope, bear cheerfully whatever he is able to do against me. For I heard one say, that he protested he would prosecute my opinions as long as he lived. And what opinions nettle him and Mr. *Thorndikele* most, is not hard to conjecture. I must confess, it is very hard for me to suppress my zeal for the protestant religion; and I thank God it is so. You see how the case stands with me, and therefore you will excuse me, if I abruptly take leave to subscribe myself,

Honoured Sir,

your most humble,

and affectionate servant,

H. MORE.

SIR, I heartily thank you, for your care in directing me to so excellent a medicine, as you specify in your note, against my quartan; but my quartan, as it happened, was cured by this diatrion, fasting, sack, and mathematicks; especially *Oughtred*'s *Clavis*: of this more when we meet. If they out me out of *Christ* college, my abode will be more at *London*.

Christ-Church College, Dec. 4.

Honoured Sir,

MR. *Foxcroft* being at my chambers yesterday, and acquainting me so explicitly how you have taken offence at what concerns you in my *Enchiridion Metaphysicum*, it has quickened me to do that, which I was sometimes thinking to do, since I saw you last. For I had some such inklings before now. But when I was with you, you seemed not to be concerned for yourself, but for *Des Cartes*. I shall now briefly answer as touching both. And truly, whatever I have writ in that book, touching *Des Cartes*, I confess, I have not the least dislike of it, it being so exceeding requisite for me to do as I did. I have, from my very first letters to *Des Cartes*, till this last book of mine, always expressed my opinion, that this mechanical way would not hold in all phænomena, as I always verily thought: but this would not save us from being accounted amongst the wits, one of their gang; and a perfect Cartesian, as to the hypothesis; and, indeed, no less than an infidel and atheist. And I was informed out of *Holland*, from a learned hand there, that a considerable company of men appeared there, mere scoffers at religion, and atheistical, that professed themselves Cartesians: and that his philosophy may naturally have such an influence as this, I can neither deny, nor could conceal in my preface to this book; for it had been to the prejudice of religion, and to my great reproach, for me, who have been, from my youth to this very day, so open a stickler for the support of natural religion, and for Christianity itself, in the best mode thereof, to be found of so little judgment, as not to discern, how prejudicial *Des Cartes*'s mechanical pretensions are to the belief of a God. Certainly, all those of the atheistical party, that have observed my zeal in the behalf of religion, in almost all my writings, must, as once I heard a known physician say of them of our profession, that God Almighty has sent none but a company of fools upon his errand, take me to be one of the chief of them; or think me a juggler and deceiver, I not declaring against that philosophy, which is the pillar of many of those mens infidelity, and of their atheism; and it is not a week ago, since I saw a letter, that informed me, that *Spinosa*, a Jew first, after a Cartesian, and now an atheist, is supposed the author of *Theologico-Politicus*. I suppose, you may have seen the book. Wherefore what could I have done less, than declare my sense of the Cartesian philosophy, and vindicate myself from the imputation of so fond a blindness, as not to be aware of the danger of that philosophy, if it be credited; and, which

is beſt of all, to put it quite out of credit, in that ſenſe I oppoſe it, by demonſtrating the great weakneſs thereof, in its pretences of ſolving, though but the eaſieſt and ſimpleſt phænomena, merely mechanically? which, I think, I have done irrefutably, nay, I am unſpeakably confident of it: and have therewithal ever and anon plainly demonſtrated the neceſſity of incorporeal beings; which is a deſign, than which nothing can be more ſeaſonable in this age; wherein the notion of a ſpirit is ſo hooted at by ſo many for nonſenſe. This yet I am very confident in myſelf, I have proved over and over again, by invincible arguments, to be no figment in this diſcourſe: which, whatever the opinions of other men are, is a ſatisfaction to my own mind, which I value more than any thing this world can afford me. And if in a compliment to *Des Cartes*, I ſhould not have taken my full ſtroke at this daring monſter, that ſtruts thus confidently in this preſent degenerate age, I had been perfidious to the church of God, and to the kingdom of his ſon Jeſus Chriſt; whom, however I compliment others, I am bound to the utmoſt of my power really and cordially to ſerve.

AND truly I expected, that all, whoſe hearts are ſeriouſly ſet upon God and religion, would give me hearty thanks for my pains: but, however, my reward is with him, that ſet me on work: and as I do not doubt, but my diſcourſe is firm and ſtrong from the beginning to the end, ſaving in ſome few miſtakes, which were no errors of my judgment (as that quotation in the margin of the preface, pag. 3, where it ſhould be part 2, art. 21; and pag. 218. line 11, where it ſhould be, *quam dimidium ejus, quod globuli occupant*; and line 13, *ſpacium ille dimidium*, for ſo it was in my Engliſh Eſſay; but I was mindleſs in the tranſlating of it, and the context plainly ſhews it muſt be ſo) ſo had I had a very great ſatisfaction in my performance, had I not had the ill hap to give offence to that incomparable perſon Mr. *Boyle*; which, I profeſs, I could not foreſee, doing no other thing to him, than what, if it were done to myſelf, I ſhould take no offence at; and therefore, I could not perceive aforehand, what would be the event, having acted according to the royal law of equity; which might well make me careleſs of imparting to him my purpoſe in that matter; and the experiments of his, which I drew into my diſcourſe, they were of that excellent importance for the deſign of my book, and the demonſtration of the grand point in hand, that I could not by any means omit them, having mentioned them alſo in ſeveral places of my writings, as a main pledge of the tenets I ſo much contend for; that the phænomena of the world cannot be ſolved merely mechanically, but that there is the neceſſity of the aſſiſtance of a ſubſtance diſtinct from matter, that is, of a ſpirit, or being incorporeal, as I muſt confeſs, I do conceive myſelf moſt firmly to have concluded from theſe experiments; for which, I ever hold the world and myſelf obliged to you: and though there be an infinite diſparity betwixt your experience and experimenting and mine, yet I did preſume, for thoſe few I did conſider, that I might thoroughly underſtand them ſo far as concerned my purpoſe, and make ſafe uſe of them: and if I be miſtaken in my inference from them, as to the main, I am ſo groſly and unexpectedly diſappointed by my reaſon, that I ſhall never hereafter truſt mine own, or any one's elſe ſubtil reaſonings in philoſophy; but altogether endeavour after as perfect innocency as I can; and then I hope my ſoul in the other world will be gathered to the good, whoſoever's are gathered to the wiſe. But I was ſo tranſported and warmed with the light and clarity of my reaſonings in this diſcourſe, that I hope, if in ſo full a career of heat and zeal for the main points I labour for, any thing has happened, that may ſeem leſs diſcreet, your great candour and Chriſtianity will eaſily pardon it; and that ſo great and virtuous a ſoul, that is acquainted with ſuch ſentiments of the mind, as infinitely ſurpaſs all notions and ſpeculations, that are not ſubſervient to that end, will not think himſelf damnified, if other conceptions, that make nothing to that noble end, be aſſaulted by any one; eſpecially, if they appear ſound after the aſſault; and if they do not, yet there is the gain of a new truth if one will, or the loſs of ſuch a victory: ſo little hurt is there in philoſophical oppoſitions amongſt the free and ingenuous! For all things are but fancies, ſaving the life of God in Chriſt, and what tends thereto. And I have found it a great inconvenience to find myſelf vulnerable in any concerns but of that, but a convenience to be wounded by any good hand of providence, which might cauſe me to retreat into what is the beſt; nor let my ſoul out unto vanities, and that which profiteth not; which might make this fatal miſtake of mine more grateful, if I could imagine it needful to a perſon ſo excellently accompliſhed. But come it in what circumſtances it will, Sir, I will aſſure, it came from one, that does very highly honour you and love you, and whatever diſpleaſure you may conceive againſt him, is reſolved, whether you will or no, to love you and honour you, and wiſh you all good poſſible, and, in this ſenſe and reſolution, does heartily ſubſcribe himſelf,

Honoured and dear Sir,

your moſt humble, and

moſt affectionate ſervant,

HEN. MORE.

From Mr. R. Baxter *to Mr.* Robert Boyle

June 14, 1665.

Moſt dear and truly honoured Sir,

I WILL not accuſe you for tempting me to be proud, by the favour of ſo worthy a per-

a person as yourself, expressed in your visit, and the gift of your many excellent books. For it is no dishonour to good, that *omne malum est ex bono*, nor to God himself, that none giveth so many occasions of sin, whilst none is so far from being the cause. But I will rather look back to one of my old lessons, that our greatest benefits must be received in the most timorous watchful posture. The recreations, which I have oft taken in your experimental philosophy, and other such writings, are not like those, which some men seek in cards and stage plays, and other murderers of precious time, whose fruit is nominally some true commodity, and really in hand; some unwholesom sensual delight, and finally the sting of sorrow, when irrevocable time is gone. But they have been a profitable pleasure, which prepare not for repentance. But your plea for scripture style, and your Seraphick Loves, and the noble designs of your Arabick publication of *Grotius*, and now your pious meditations and reflections, do call to me for greater reverence in the reading of them, and make me put off my hat, as if I were in the church; and have not in vain excited me to the expectation of some higher benefit, as they stand nearer to my ultimate end. I read your theology as the life of your philosophy, and your philosophy as animated and dignified by your theology, yea indeed as its first part. For God himself beginneth the holy scriptures with the doctrine of physicks: and he, that will handle the covenant and laws of God, must describe first the covenanters God and man, the constitutive parts of the universal kingdom. He that will justly frame a pansophy (as *Commenius* calls it) must begin with ontology, of which God and man are the parts, which we are most concerned to know: and having first gone through the doctrine of entities, must come down to that of conception, and expression, and action. And he that knoweth, that this is the difference between our knowledge of God in this life and the next, that here is known as in a glass, and there by intuition, will neither with the illiterate despise the glass, nor with the atheist and prophane overlook or deny the face, which it representeth. Such as these last I have heard you complain of, and find by your remedies, that you are not unacquainted with the lamentable increase of this disease. I was naturally as much inclined as others, to play with the gilded leaves and outside of my books, and handsomly depaint the letters before I understood the sense: to take up my time in the search of creatures, and words, and circumstances, and to mortify all these by separating them from God! And it was not soon enough that I reduced all my learning to the doctrines, *de fine ultimo, et de mediis* practically, and that I studied and estimated all the means according to their places and value in their tendency to the end. But when God removed my dwelling into a church-yard, and set me to study bones and dust, and by a prospect into another world, awakened my soul from the learning of a child, and shewed me, that my studies must not be play, but affective, practical, serious works; I then began to be conducted by necessity, and to search after truth, but as a means to goodness, and to perceive the difference betwixt a pleasant easy dream, and a waking working knowledge. He, that hath well learned in the alphabet of his physicks, wherein a man doth differ from a brute, hath laid such a foundation for a holy life, as all the reason in the world is never able to overthrow. For by knowing his faculties and capacities, he will quickly know their end and use; and his relations to his Creator, his efficient, dirigent, final cause: that his nature was formed to be holy, even to know, and love and serve his Maker, as truly as the lower creatures are formed for our service! That to love God above all, and to serve him with all our powers and gifts, is as unquestionably the duty of man, as it is the use of a horse to carry us, or of a knife to cut, and much more, because the aptitude and obligation were more essential to us: and he will as easily know, that all this duty is not to be performed in vain; and that the rectitude, perfection, and use of nature, was never intended by our Creator to be our misery; and therefore that holiness is the way to happiness. And as I never met with the infidel, that durst say, that he is certain, that there is no future life of reward and punishment; so it is most easy for unprejudiced reason to discern, that the probability or possibility of an endless joy or misery hereafter obligeth us to provide for it, whatever it cost us in the world! And nature itself, by the very revelation of that probability or possibility, hath made it every wise man's duty to make it the chief care and business of his life to obtain that happiness, and escape that misery; and to contemn all the hopes and fears of this world, which stand against it: and consequently that he liveth against the law of nature, who liveth not a holy life. And then he must conclude, that either really there is such a life of happiness, which we are naturally thus bound to seek, and such a danger, which we must labour to avoid; or else that God hath deceived man in the very frame of his nature, and made both his noblest faculties, and the chief duties of his life to be delusory, frustrate, and our torments; and that he loseth and suffereth most, who is truest to his God and conscience, which the knowledge of God will easily confute. He reproaches his Creator, who saith, that he gave man higher faculties than the brutes, to know, and love, and serve his God, and this that he might be so much more miserable than the brutes, by his foresights, labours, and frustrations. Besides what I have oft said, that the world neither ever was or can be governed according to the nature of man, without the fears and hopes of life to come! Were it not for these, there would be no law or virtue, but carnal interest, craft, and strength: and he were a fool, that could not with probable safety murder or undo him, that standeth in his way. It is well

well for the world, that beaſtly infidels do oft want wit to do miſchiefs, as well as to know the truth: and better yet, that atheiſm ſeldom doth totally preclude their proſpect into another world, and conquer all thoſe fears and hopes; and yet better, that atheiſts have ſeldom the government of the reſt: and that thoſe, that have wit and power enough to do miſchiefs, have uſually the wit to ſee why they ſhould not do it. I ſpoke from my heart, when I told the world, that every man is a ſaint, a brute, or a devil, as he is either holy, ſenſual, or malignant. I thank you therefore for all your books, but moſt for thoſe, which have moſt for God: for, as to the ſubject, that which ſtands next to heaven is beſt: there are my hopes, and that way lye all my buſineſſes and concernments. What a poppet play is the life of ſenſuality, worldlineſs, and pride? And how low a game is it, which emperors and commanders play, who ſeek no higher things in compariſon of a humble Chriſtian, who by the conduct of the word and ſpirit of God, is ſeeking the immortal pleaſures? If theſe be not my happineſs, I ſhall conſent to have no other, much more if they be. Let me have more than this malignant diſtracted world affords, or let me have nothing. Let me be happy longer than ſeventy years, or let me never be happy. How I am eſteemed, or called, or uſed here, for ſo ſhort a time, I deſire to make it but little of my care, nor much to regard, whether ſo ſhort a dream be ſad or pleaſant. He loſeth nothing, that loſeth but this ſhadow: and in the end he will confeſs, he hath got nothing, who hath got no more. If the poſſibility of endleſs joy or miſery prevail not with me againſt all that the world can offer, I will be judge againſt myſelf, and freely confeſs, that by ſinning againſt reaſon, I forfeit all pretenſions to felicity, and if there be hell, it is my due.

THE matter of your book having occaſioned all theſe words, I muſt thank you for it alſo as to the manner, and that upon a double account. 1. That you call men to the manly work of meditation, to waken the ſleepy reaſon of the world, and bring it into exerciſe: moſt of the world would become much wiſer (and conſequently better, and conſequently happier) if they could be brought to be more conſiderate: if they were but ſhut up in the Jeſuit's dungeon one hour in a day, to think ſeriouſly of God, and of their happineſs and duty, and were forced to give an account of their thoughts to ſome ſober perſon! For the matters of God and their ſalvation are ſo great, and have ſuch evidence, that if they would but think oft and ſeriouſly of them, ſure they would think rightly of them at the laſt, at leaſt ſo far as to ſet them in the way, and to call off their hearts from all that, which now diverteth and deceiveth them. Would they but ſometimes lay by ſenſuality, and think ſeriouſly what all the pleaſures of this world will prove at laſt, they would read in the dark the Spaniſh proverb, *The world is a carrion, and they are dogs that love it.* But men are ſuch hypocrites and atheiſts, that while their clothes, and words, and all that is ſeen of men, are compoſed as beſeemeth men awake; their thoughts, which are ſeen to God alone, are wilfully left ſo diſcompoſed and diſtracted, as if they were dreams or Bedlam-ravings: and if one day's thoughts were written down, and read over before a ſober company, they would meet with more ſuch cenſurers than me. Senſuality having hired reaſon for its ſervice in all the ungodly, doth ſet them on the purſuit of a miſtaken intereſt, and involveth them in ſuch a multiplicity of diſtracting buſineſſes, with turbulent paſſions and deceiving luſts, that ſometimes I have queſtioned, whether a wiſe man in his ſleep be not more likely to uſe his thoughts aright, than ſuch men as theſe while they are awake. 2. And your ſpecial way of occaſional meditation, I take to be exceeding uſeful! Your examples are the tranſlating of the ſeveral creatures into a language underſtood; ſo that it will teach men, when they ſee the words (the things) to ſee withal the ſignification (the uſe:) as thoſe, that know not only the materials of an apothecary's ſhop, but alſo the medicinal uſe of the ſimples and compoſitions. I know, that ſet methodical meditations are moſt excellent for thoſe, that are able to manage them: but ſhorter occaſional meditations are every man's hourly employment: the weakeſt heads, that cannot hold their thoughts to method, may manage theſe ſhort reflections to their benefit, and without any danger of overſtraining their imaginations. As the moſt learned muſt not diſdain this way of cogitation, ſo women and weak perſons may well make it their frequent profitable work. A little and often is the diet of the infirm. And thoſe are the beſt writings, which are ſuited to the moſt, and the moſt neceſſitous. If the attempt you have here made to draw on yourſelf, or ſome other well furniſhed perſon, to write ſuch a commentary upon all the moſt ordinary occurrences of each day, what an excellent help will it be to them, that need ſuch an interpreter, that they may walk in their gardens and meadows as phyſicians, and not as mere huſbandmen, and may hear every creature praiſe its Maker, and the mute to ſpeak the heavenly dialect? "All thy works ſhall praiſe thee, "O Lord; and thy ſaints ſhall bleſs thee," Pſalm cxlv. 10.

IT is grown a controverſy, whether a contemplative or an active life be the more excellent? and whether it be more advantageous to holineſs, to ſhut up our ſenſes againſt the creature, and retire to an abſtracted communion with God; or to make ſo much more uſe of creatures, as we would attain to more of the knowledge of the Creator, becauſe it is but in a glaſs, that here he can be known. Doubtleſs in our innocency this was the book, which man was made to learn and read. And it is ſo far from the intention of the Redeemer, to cloud the glory of the Creator, or to diminiſh our higheſt reſpects to him, as that it is indeed his office to redeem, and ſave, and

reſtore

restore the creatures to their Maker's favour, love, and service, and so to their primitive use and end. In innocency God appeared to man sufficiently amiable in his worship; but to a guilty, cursed, condemned sinner, bound over to everlasting punishment, it became impossible to love the God, that doth condemn and punish him: but we love him as our Redeemer, that we may love him again as our Creator; and thus Christ is the way to the Father, and faith is the way to love, and the gospel is far from abrogating nature's law; and on the Lord's day we commemorate the wonders of redemption, in order to our just admiring the creation; and the seventh day's work is not abolished, but inclusively to be performed on the first. So that indeed so far as we are yet corrupt and weak, it is safest to retire as far from the creature as well we can; for experience assureth us, that the objects of sense, though they may and must be used to our helps, such powerful diverters and deceivers of the mind, and clogs in our highest contemplations, that ordinarily they are the most terrene and sensual men, who are most busied in terrene and sensual things. But so far as we are restored sanctified persons, we are above the snare, and may see and love God in his creatures, and serve him by them, and make them all the ladder of our contemplations, and utensils in our father's work. And thus the world is no worse to us, than a good horse, and a fair way, and a good inn, and company, and weather to a traveller, or as a ship, in which we must sail to the harbour of endless rest. And thus indeed we have nothing to know but God, and the significant sanctified creature; nor nothing to do but to see and love him in himself and his works, and serve him by them. But a man must know himself, that will know his duty. And if all men, then the weak, especially, have need to watch as well as to pray, Lead us not into temptation. And the new book, which Christ hath given us to know God by, is much more legible (now) and less dangerous, than the old blotted book of the creation. The darkness of which, and the perils in using it, are grown so great, that it hath tempted some learned men to think, that as gospel remedies will not perfectly cleanse us from sin till death, so till then they will not bring us up to be fit for the higher form, which we fell from, even to know and love the Creator purely in his creatures, and that there we shall be returned to this employment, when all "Things are restored," Acts iii. 21. "And the creature itself shall be delivered "from the bondage of corruption, into the "glorious liberty of the sons of God," Rom. viii. 21. "And the kingdom shall be delivered up to the father, that God may be "all in all," 1 Cor. xv. 24, 28. "But we "are not yet ripe to know the state, or use "of the new heaven or new earth, wherein "dwelleth righteousness," 2 Pet. iii. 13. "It "is enough to know, that it will be to the "glory of the blessed Creator, who is now "dishonoured by his depraved works; and "that we shall be with Christ, and see his glory, "and see, and love, and praise our Maker," John xvii. 24. & xii. 26. 2 Cor. v. 7, 8. Mat. v. 8, &c. For my part I will be none of those, that looking at simple duty, and bare possibility, do set the hardest lessons to the youngest, and draw men to venture too boldly into the world, under pretence of seeing or of serving God. I will not bid a child leap into a river, because a strong man, that can swim well, can get through it; nor will I set an infant on a lusty horse, because he may expedite another man's journey; nor set beef and sturgeon before the sick, because a sound man's stomach can digest them. Nor yet will I so retire from the creature, as to shut my book, and reject the glass, in which the image of God appeareth; or to hide my talents for fear of the austerity of my Lord! But for the direct illumination, sanctification, and comfort of my own soul, I will desire to improve opportunities of contemplation, (ascending from creatures to the most abstracted apprehensions, that I can reach:) and for the serving of my Lord, and the good of others, I will be as glad of the opportunities of profitable action, believing, that I shall lose nothing by it in the end, but that doing good is the surest way to receive good: and when God restraineth me from out of these (as now he doth from the latter) I shall be glad, that I may be employed in the other. The sum is, though a contemplative life may be more predominant with some, and an active with others, yet there are none but the utterly impotent, who are not obliged to use them both: but it is our contemplation, which fitteth both for action and fruition. While I intended but to thank you for your excellent book, this superfluity of words hath made that eruption, for which I may crave your pardon, remaining,

Honourable and worthy Sir,

your very much obliged

and esteeming servant,

R. BAXTER.

Mr. Boyle's *Answer.*

[From the original in the library at *Red-Cross street.*]

Worthy Sir,

WHEN I thought it my duty to present you those trifles, of which you are pleased to take such obliging notice, I did not think, that they should put you to the trouble of a long letter, or procure me so many good instructions, as that is replenished with. But I was much more surprised to find, that you look upon that as a temptation to an over great esteem of yourself, which is so defective an expression of the esteem, your devout and happy composures have justly given considerabler readers, than I pretend to be, of you:

you: it is more my satisfaction, than my wonder, that you have found an innocent divertisement in the perusal of what I have ventured to write about experimental philosophy.

You are too much a friend to contemplation, and too well versed in it, to be an enemy to that sort of learning, that furnishes it with a very copious, and diffused, as well as noble object; and there are divers things, that speak you to be none of those narrow-souled divines, that, by too much suspecting natural philosophy, tempt many of its votaries to suspect theology. I am very glad to find, that your kindness to the design of my Occasional Reflections gives you such favourable thoughts of them. And your approbation comes the more seasonable, because, though at *London*, they have been more generally fortunate, than could be well expected, and have not received an ill character, even from divers of the poets and wits themselves (some of them indisposed enough to give a good one to any thing, that aims at the promoting of piety) yet in another place I find, that these harmless papers have not escaped the censure of three of our learned men, who yet seem not to dislike them for their own sake, but mine, pretending, that composures of that nature might well have been spared by a gentleman, whom they are pleased also, on this occasion, to look upon as a philosopher, and not unfit to write books in that capacity. But though I had written with no higher aim than applause, I should not be overmuch discouraged, by so small a number of those, who themselves would not have disliked a book, if another had been the author. And as for what you are pleased to hint about the usefulness of making meditations, upon the most usual occurrences, I am so much of your mind, that, before I last waited on you, I was telling some friends of yours and mine, that I should be glad to see such a work undertaken, by a pen likely to go through with it, which mine is not, partly because it is preingaged to subjects of a very different nature, and partly because the expectation, that many have of philosophical discourses from me, would make a work, that does so much more properly belong to divines, unacceptable to many readers; and therefore since we agree in our wishes, that the thing were done, and you both are far more able, and otherwise qualified to undertake it, I shall think the design more excellently well lodged, if you would think fit to take it into your hands; wherein, as in all your studies and attempts, that tend to the good of souls, you will, I hope, easily believe, that a most happy success is heartily wished you by,

Worthy Sir,

your most affectionate

and humble servant,

ROB. BOYLE.

Superscribed,

To my reverend and highly esteemed friend, Mr. Richard Baxter, *at his house at* Acton.

Letters from the lady Ranelagh *to Mr.* Robert Boyle.

January 7.

My Brother,

YOURS, which inclosed one to my brother *Corke*, and another to capt. *Whiteby*, came to my hands by the last post: those two I yesterday dispatched; and that, which by the post before came to me for *Will. Somers*, I endeavoured to have delivered to him with a like diligence; but his being out of town kept me from effecting it. He is now returned, and has it, but was fain to come to me, to make him understand what you meant by the count. I would gladly have got the return you desired from him to have sent you by this dispatch, but he says, he cannot get it, till the next, and then it shall be sent you. I hope the misfortune you are fallen under, by the ignorance or mistake of your lawyer, is no new one; but if it be, I promise myself, that God will make you a greater gainer by those disappointmens he orders you to meet with in your fortune, than if you had received the entire revenue thereof, experience being a greater treasure than money, to those, who are instructed to make a right use thereof; and for your estate, I should not wish it more, unless I had seen, that God had taught you to employ it so, as to make it useful both to your self and others. But having seen that, I durst trust you with it, if it were ten times as much, and cannot but think, that as much as it is, or honestly may be made to be, should rather be yours than any of your agents. Our young earl of *Kildare* I have persuaded into a sense of the fitness of his having some person of conscience, knowledge and discretion, as also of civility and good fashion, to be with him as a companion, that might also do him such services, as a man not so qualified could not do; and he is willing to give such a one fifty pounds a year, his diet, lodging, washing, the use of a servant of his, to do necessary things about him, and a horse kept at his charge for him to use upon his or his own occasions; and desirous, that you would give yourself the trouble of enquiring him out such a one; which I beseech you do, and take the assistance of honest Dr. *Cox* herein, for whose and for his wife's preservation from that loathsom disease I desire to be truly thankful to him, who was their preserver, and who in them has preserved me two friends, to whom I have been very much obliged, and am very really affectionate; and so I beseech you assure them from me, and present them my unfeigned service. For Mr. *Waller*, I never heard one word from him, since I left him, but what you said in your last; and I know his calling as a poet gives him licence to say as great things as he can, without intending they should signify any more, than that he said them, or have any higher end, than to make him admired by those, whose admirations are so volatile, as to

be raised by a sound of words; and the less the subject he speaks of, or the party he speaks to, deserves the great things he says, the greater those things are, and the greater advance they are to make towards his being admired, by his poetical laws. Therefore if he would be but as little proud of saying great things to me, as I hope I shall be in hearing them from him, he would, I am apt to think, escape some guilt, that now his fine sayings lay him under; and I could never give my self a reason, why he, who can say such things upon things that so little deserved them, should be so unwilling to apply that faculty to those subjects, that were truly excellent, but this, that there his subject would have been debased by his highest expressions, and he humbled in the exercise of his wit; but where he has employed it, his subjects have been raised by his fancy, and himself by reflecting upon it. I shall therefore return his great professions with a plain hearty wish, that he may partake in gifts more excellent than his wit, and employ that for the time to come upon subjects more excellent than hitherto he has done; and, without compliment, I should gladly be serviceable to him, or his wife, to whom I am a servant, upon much better accounts, than he hitherto makes it possible for me to be to him. I shall only mind you, that our young earl needs one, that may know how a little to govern and direct, without letting him see he intends to do so; and, as soon as you can find such a one, I beseech you, give notice thereof to me, that order may be taken for his coming over by

Your *K. R.*

June 3.

My Brother,

THIS inclosed, my brother *Corke* sends me word, contains an account of what he has done in your affairs, to which he says a speedy answer from you will be necessary, to enable him to proceed therein to your advantage. A list of your Connaught lands I received from him with this, and not before. I have already sent two of them to the two persons he and I have engaged to try what rents they may be raised to; and when I receive their accounts, I shall, God willing, hasten them to him, that he may pursue what will most tend to your benefit, whose weariness of a place and company, that, instead of helping you to improve your time, does, in spite of your teeth, steal it from you. I wonder not at, nor do I think there is any thing we are more concerned not to consent to, than the parting with that treasure, unless it be towards the acquiring or performing some of those things, in order to which it was given us, since all other talents must be improved, whilst we are here, by the help of that, and when our measure of that is spent, our work ends, and we must begin to receive those recompences, that we shall be receiving for ever, and which will be suitable to what we have done with and in our time. The other being from one of your own fraternity, who thinks himself in the highest class of your philosophical Society, will, I presume, without my solicitation, be afforded a speedy return. I therefore only beg that may come through my hands open; as this does, and for gratitude for that favour I shall solicit a reply. If this find you in the West, let me beseech you to present my humble service to my two lady *Bristols*, and wish you would disappoint *Frank* by bringing a wife of your own to *Stalbridge*; a business I must still mind you of, though you give me cause to doubt, you will as hardly pardon me those few words, as the rest of the trouble given you here by

Your *K. R.*

IF this find you at *London*, let it a little call upon you to be Mr. *Worsley*'s advocate to *Brogbill*, who is of that committee, where the act is like to pass, that, if not prevented, will put him out of his place.

SOME single piony roots I beg may be sent me, fit to plant here, if you can without too much trouble get any.

December 3, [1659.]

My Brother,

BEING able by this to let you know, that my brother *Corke* came safe hither yesterday, I hope by the next you will assure me, you will not be long from hence; and if I may know, how you mean to order yourself, and may be employed in getting you accommodated with lodging, either here in this poor house, as far as its room will go, or near hereabouts, or where else you shall chuse, I hope I need not assure you, you do me but right in believing, I should gladly be set to work in your service, though of so inferior a nature in comparison. Yesterday I received out of France from Mr. *Oldenburg* this relation, which he had from *Montpellier*, and which he desired me to communicate to you, and upon it to beg your thoughts, and those of your brethren philosophers, he assuring, that the matter of fact is indubitably true: A woman of seventy years old, having lived about twenty four years a widow, and often complained to physicians of a heavy stony burden she carried in her belly, did precipitate herself out of a high window, and thereupon died shortly after; but being opened at *Avignon*, was found to have in her belly, where the intrails lie, commonly called abdomen, not in the womb, a child, of the bigness of one of six month's ordinary growth, but with an extraordinary big head, which had begun to petrify, and especially his head turned into a gypsy or chalky substance. This is surely strange, and I long to receive your thoughts upon it. Our publick news you will for the most part find in the print, in *Monck*'s last letter. Commissioners are going down to *New-castle*,

castle, as he desires; and some talk here has been of a petition setting on foot by a great number of prentices, whereof notice was given by my lord mayor to *Wallingford*-house, and such order taken there, that they say they are quieted. Through rich mercy we yet continue in peace and quiet. A rational discourse with some very equal propositions I yesternight received out of France, which, if you give me not hopes of seeing you speedily here, shall, God willing, be sent you. I come just now from my brother *Corke*'s, where was also my sister *Warwick* (and they all your servants) but alas! the entertainment of lords, ladies, and reasonable creatures, are yet several things, to the great grief of

Your *K. R.*

MY girls are your servants.

I AM with many thanks to acknowledge the receipt of the two books by the carrier, that you were pleased to send me for myself, and to be sent into France.

October 12.

My Brother,

IT has pleased God to bring us safe to *Oxford*, and I am lodged at Mr. *Crosse*'s, with design to be able to give you from experience an account, which is the warmest room; and indeed I am satisfied with neither of them, as to that point, because the doors are placed so just by the chimnies, that if you have the benefit of the fire, you must venture having the inconvenience of the wind, which yet may be helped in either by a folding skreen, and then I think that, which looks into the garden, will be the more comfortable, though he have near hanged and intends to matt that you lay in before. You are here much desired, and I could wish you here as soon as you can. For I think you would have both more liberty and more conversation, than where you are; and both these will be necessary, both to your health and your usefulness; and as I am sure I have abundantly shared in the latter from you, so I must profess to be very heartily concerned for the former, and must beg, that you would be so too, and let me see you are, by your care for its preservation, which are the terms, upon which, for ought I see, you must have that blessing, and I am sure you ought not to grudge yourself your cares, since by affording them there, you bestow them too upon your friends, and upon me, I am sure, in the most obliging way, who will not give any of that number, that pretend to that relation to you, the precedency in point of the affection belonging to it, though I must many, in point of the other qualifications. And alas! how evident is it, that we had need of better things, than the best enjoyments of creatures to make us happy; when even friendship itself brings its sensible afflictions as well as refreshments with it? The late experience I have had of this in our parting will not, I hope, be without instruction to me, as I am sure it has not been without great evidence of the much obligation, that lies upon me in point of gratitude, as well of inclination, to be

Yours affectionately and constantly,

K. R.

I RECEIVED the favour of the books from you, by my sister *Corke*, and I hope you will also give me leave to pay for them.

MY service to dear *Broghill*, my sister *Barrimore*, and sister *Broghill*; and the same very affectionately to my dear lord president and his lady. I shall write to them all shortly, if it please God.

Lees, August 6, 1664-5.

I AM glad, my brother, to hear you go on to mend daily, in matter of your health, but sorry to find you are not yet quite recovered to your former state therein. If our reports do not speak louder than truth gives them leave to do, God has again put a new hand of mercy upon this poor nation, to draw it to himself. But, for ought I hear, we are like to make our returns as disingenuous towards him for this deliverance of the many preceding ones, that he has afforded us; which makes me fear, that even our blessings will prove bitterness to us in the end. I congratulate with you the happiness God has given you in making the employments of your health such, as you may seasonably and comfortably review and continue in the times of your sickness: the rarity of the mercy, that brings any one to that course of life, highly recommends it to your value and gratitude, for most people do so live, as to leave themselves no better hope for their death beds, than that thereon they may by repentance undo all they have been doing in their way thither. Whether the dominion you are recommending to men will take so much with them, to raise their ambitions towards its attainment, as that they most commonly pursue with much more pains, I know not, and much doubt the worst. But certainly it is most likely, the best way of man's ruling the creature is by his employing those faculties to that purpose, which God himself has fitted in their employment to make him able to do so; and those are his rational ones, whereby as he may discover the properties and uses of other things, so he may chuse to apply them thereby to their proper ends, the service and instruction of mankind; but swords and guns are taken, upon the word of the great destroyer, to be more suitable means to that end, and used accordingly, though we daily see, that by that way of overcoming we spoil what we should govern. Your naming *Oxford* to me as free from infection makes me fear you may have some thoughts of going thither; which if you have, I shall much more repent my not staying with you, yet dare not persuade against

against it, because I assure my self you are carried thither in pursuit of aims, that I would rather excite than obstruct you in. But I earnestly petition, if you have, that you would before you give me warning enough to make you a visit, for I have now got a lodging at *Newington-Green*, which miss's illness, which for two or three days has been pretty violent, though now turned into an ague at present, keeps from being used by

Yours affectionately,

K. R.

THE ladies here present you services. My girls are your humble servants.

Lees, July 29, [1665.]

I HAD, my brother, rambled so far before I was aware into other matters, in my last to you, that I had not left my self time or room to mention what I chiefly designed, and which I could not therefore endure to mention, *en passant*, my satisfaction in hearing you had near finished your treatise of substantial forms, which will yet so much further explicate your notion of figures and texture, as to help the considering part of mankind to a clearer prospect into this great frame of the visible world, and therein of the power and wisdom of its great Maker, than the rough draught, wherein it has hitherto been represented, in the ignorant and wholesale philosophy, that has so long, by the power of an implicit faith in the doctrine of *Aristotle* and the schools, gone current in the world, has ever been able to assist them towards; and I am not a little delighted to find, that your discourse of the excellency of divinity will be finished about the same time, since that will make it apparently come from one, who chuses it not for the best, because he knows little besides, but from one, who from a general knowledge of other things has, upon deliberation, chosen to give that preheminence of them all, which may very probably invite men to consider it seriously, who have, upon a presumption of their other learning, esteemed themselves entitled to neglect or oppose that. Though you tell me not, who objected against your writing Occasional Meditations, because you have named me, who encourage you to write more of them, I dare venture to lay my credit with you, that you yourself do think your celebrater as competent a judge, in such cases, as your exceptions-maker. And I think the very objections, with the reasons of it, are a strong argument against itself; and shew it is made out of fear, that such things written by a philosopher may do that good in the world, that the objector (who I presume pretends to be one himself, because he would think, being so sets a man above making a use of the creatures with reference to the glory of the Creator, or to beget ingenuous and grateful thoughts in the hearts of men towards him) would have done, and therefore decries it for its meanness, whilst he dares not look at the light it breaks out with, lest that should make him out of love with himself. This makes me hope you will not give such persons as prevailing a power over your thoughts, as you did Sir *Peter* over your discourse of the Scriptures, to cut them off from being published for the further good of those, who own themselves to be benefited by those you have already published; but that, since you are not to be suspected able to keep from making Occasional Meditations upon a subject so plentifully affording you matter for them, as the great judgment now in this nation, and the effects it has already produced therein, you will not be so uncharitable, as to keep them to yourself, since the general fear, struck by this plague into all sorts of people, does surely prepare the hearts, wherein it lodges, with less resistance to hear of a God, and the things of another life, than before that preparation they would have been apt to have heard them with; and since it may also well be supposed, that many, who find that fear disquieting enough, strive to free themselves from that, by endeavouring against thinking at all, because they know not how to begin so to think, as by thinking to get themselves relieved from the torments their fears bring them, or those everlasting ones, which bring their fears upon them, upon the approach of that disease, that scatters death so plentifully round about them, which they know sends into eternity. How obligingly then might you teach such to help themselves in so great a distress, by reading your reflections on the grounds of their fears, without finding therein any particular reproof addressed to themselves, that might arm them with offence against all the good advice given thereupon; and in shewing them there, how those, who are prepared for death, can entertain themselves, upon the approaches of it, as rational and pious persons, taking in as well comforts as cautions to themselves, from both those principles, upon the most mortal occasions; and to find things indeed done, shocks all objections against attempting to do the same things, that can be raised upon the pretence of the impossibility of doing them; and the belief of a possibility of effecting things so conducive to mens present peace and eternal security, as to be rendered hurt-free (though not shot-free) from death-darts, must be a very strong engagement to men, to set themselves diligently and resolutely to make that attainment their own. Now pray do not daub your own conscience, for you will never stop my nor many more mouths with your allowable reasons, known to yourself, and producible to no body else, against so seasonable and assisting a work of mercy; but take up your papers, and add these to the rest you confess lay ready by you, when you published the last, and let us have the second edition, to help the people to spend a fast day devoutly and unweariedly. I send you here the receipt I promised you in my last,

laſt, of which I long for an anſwer, as to the inviting part (here we will help you to take up and tranſcribe.) Our palſy balſam does wonders here, and God does no leſs than wonderfully in preſerving all theſe parts hitherto from infection, though *Crip*'s jealouſy is very inſtrumentally active towards it. All the ladies, the counteſs, and my girls, are your ſervants, and I with great ſincerity and entireneſs

Yours, *K. R.*

Lees, September 9, [1665.]

I FIND, my brother, that though you be retired from *London*, you cannot be ſo from the viſits of your friends, nor from the diſtractions, that the kindneſs of them gives to the happier employments God has enabled you to dedicate yourſelf to. And though I be apt to think, that thoſe things, that would be eſteemed by others welcome diverſions, are to you interruptions uneaſy enough; yet I know not, whether they do not as much recommend more retired and ſerious entertainments to us, in general, by the variety they make us taſte, than they hinder us in the actual exerciſe of our thoughts about them, during the time we are forced to let them take us up; which ſeems to me a piece of the neceſſary penance of this life, that all muſt now and then undergo, to diſcharge the exactions of natural relations, and to continue the affections, with which they ought to be diſcharged. In your letter I met the only news I had heard this good while of my lord and lady *Clifford*, who, I preſume, took you in their way towards *Yorkſhire*, where the counteſs has already paid her ſiſter ducheſs a viſit of a whole week long, and from that went home full of the deſign of treating her and the Duke at her own houſe, from which you will not ſuſpect ſhe will too eaſily be diſturbed, by mortifying conſiderations, though, beſides the publick, and even general ones, which are very great, there is a ſmall particular one added, by poor *Charles Supple*'s being ſhot in the laſt ſea fight with a muſket bullet into the head; of which it is thought he will hardly recover. The *London* weekly bills do, I aſſure myſelf, give you the ſad news that place affords; which is extraordinary enough to be amazing to thoſe, who would but ſeriouſly reflect upon what was doing in that place, before we left it, and what has been ſuffered there ſince. Not that the former is not an apparent and juſt cauſe of the latter, but that that cauſe and effect both may confound us in the ſerious reflection upon them; but ſince you ſtill continue reſolute againſt publiſhing thoſe you make, I dare urge it no further. Eſpecially ſince you ſeem to decline that, in order to recommending things of more uſe, in order to religion, the intereſts whereof have been ſo long ſo much neglected, that they even ſeem to lie a bleeding now; and therefore to be now ſerviceable to them, will be a work, that will appear to carry ſuch a ſincerity in it, as God will not fail abundantly to recompenſe. And how delightful it muſt be to ſee you, whom I love ſo particularly, engaged in ſuch works, that lead to ſuch rewards, you may eaſily gueſs. I can juſt requite the news you ſend me of *Oxford*, with ſending you the like of this; which is yet, through the rich mercy of God (as is alſo my poor houſe at *London*, or at leaſt was three or four days ſince) preſerved clear from the ſpreading infection of this plague. But it is now more beſet with it, than it was when I writ laſt to you; the next town to *Chelmsford*, and one houſe at *Burntwood*, having had ſome in them dead of it, by the coming of perſons thither from other infected places. But few places have it no nearer them than this yet has. The road from *Epping* to *Blechington* my lady *Angleſey* will be able to teach you; for ſhe went it herſelf, and will, I dare ſay, heartily allow you to lodge at her houſe of *Park-Hall*, which is but a mile or two from *Epping*, and from thence hither is about eighteen miles. For my lord of *Warwick*, I can aſſure you, as he does me, that he is not only not afraid, but deſirous of your company here; and he adviſes your lying at *Kimbolton*, my lord chamberlain's houſe, a day's journey from *Oxford*; and from thence at *Audley-end*, another day's journey; and thence hither, but to Mr. *Waller*'s; which I hope is uninfected, and in whoſe houſe I dare ſay you may lie, and be welcome, near *Beaconsfield*, and thence to *Park-Hall*, which is alſo clear, for ought I know, and thence hither, is your neareſt way; and *Crip* would ſend a man to guide you, when you come towards theſe parts, if we might know when you would do ſo; but one of theſe two ways will eaſily be found, and both, I hope, are ſafe. You will be heartily welcome, and very quiet here, and I am ſure give much ſatisfaction to ſeveral, though moſt to me; and it will be to your good nature ſome, to give ſo much; and therefore, in hope of that happineſs, with the ſervices of all here preſented to your honour, I ſhall conclude myſelf

Yours.

IF you make not haſte, the court will overtake you at *Oxford*.

Nov. 14, [1665.]

AS well for juſtice and experience ſake, my brother, as for my own eaſe, I do rather believe, that it is my own misfortune, than your unkindneſs, that has kept me from receiving one line from you ſince that you wrote me by Sir *William Lemans*, though even ſo conſidered, it has afforded me ſome unpleaſant doubts concerning you, which have been increaſed by the memory of the promiſe you ſent me of letting me know, how I might ſend to and hear from you before you left *Oxford*; which whether or no you have yet done, I am ignorant of, and the ſuſpence, that ignorance keeps me in, in reſpect of your health,

health, must be rendered the more uneasy, by the great mortality now stirring in this poor nation. I have not therefore sat still under this unsatisfaction, but have twice or thrice wrote to you, by the way of *London*, not having had any opportunity in that time to send to you more directly from hence, till now Mr. *Jessop*'s going to *Oxford* gives me this; where if he meet you, he will be able to tell you, with how extraordinary a mercy he has preserved this family all this while, not only from that, which, by way of miserable excellency, is called the sickness, but from all other diseases, *Crip* only excepted, who had lately a roaring fit of the gout, but a very short one, in respect of those he used to have at this time of the year, which he attributes much to his chewing of scurvy-grass; of the benefit of which I have received another testimony from one, whom I advised to use it. To repair to myself, your absence, as much as I can, next my submitting to the will of the all-wise Disposer, who is pleased so to cast us, I entertain myself with your books, which yet, by the very few studious persons I meet here, are, as fast as I can suffer them to be, begged or borrowed from me, who lend them willingly, upon the same account I spare you patiently, the hope, that both they and you will do more good abroad, than by being still with me; and I shall ere long have read them all over, as well those I had read before, as the last; and then my fingers will be itching, to look into the sealed roll of papers, written upon, "About religious matters;" and I would fain open them, with your leave, which I hope my being so ingenious a coxcomb as not to do without asking it, will rather bribe you to give, than deny me. But if it should not, I know not what I may be tempted to; and you know I am of a sex, that has long been allowed for an excuse of the frailties of those, who are of it; and, considering how much you believe of those, I must not fear, but you will consider them as tenderly as they require to be considered, and then you will not stick to afford me such a pardon. I am very much pleased with the assurance my experience of God's goodness to you gives me, of your neither being idle, nor ill employed; nor only for your own good; but I should be much more pleased, in having a share in what you are about, that exceeds not my capacity of understanding; and if you would let me receive some such present by the return of this bearer, you would do me a great favour, and give me a profitable employment; for all persons great and fair are not company, nor can give entertainment, that reaches beyond our senses in its pleasingness. *Frank* is, I bless God, freed from her spitting, but afflicted with her head-ach more than usual; to which her not sleeping well, and her want of tea, contributes very much. If *Leeshe* be with you, pray present him my humble service, and my petition for some for her, who and her sister are your humble servants, and I with great affection and reality,

Yours, *K. R.*

Sept. 12. [1666.]

IT having, my brother, pleased God, still to continue us in the safety you left us; I have since taken to myself the mortification of seeing the desolations, that God, in his just and dreadful judgment, has made in the poor city, which is thereby now turned indeed into a ruinous heap, and gave me the most amazing spectacle, that ever I beheld in my progress about and into this ruin. I dispensed your charity amongst some poor families and persons, that I found yet in the fields unhoused. Since then, Mr. *Worsley* has been with me, and given me very considerable particulars of providence, that assisted to his preservation, and that of his goods, which he probably enough thinks raised in value, as to that part of them, wherein you have an interest, by the great consumption, that has been of that sort of commodity, both at *Sion* college, and also in St. *Faith*'s church, where all thereof was destroyed. He very ingenuously told me, he now desired to perfect to you that bill of sale for them, that he at first promised to give you, not seeing, how your title to them can otherwise be legally good and sure; and he proposes then their being in your name put into Dr. *Sydenham*'s hand, as his security for 250*l.* for six months; which, if you have no exceptions to, will fall in well for my occasions, one of the most pressing of which is the paying of 100*l.* to the doctor, which I owe him, and for which your bond was given, by way of collateral security, to confirm the engagement of this house to him therefore, so as he need lay out but 150*l.* and pay himself 100*l.* upon a security worth 5 or 600*l.* and that but for six months. But if you have any exception to this, use the like liberty in rejecting it, that I take in proposing it; or else you will forbid me that sort of proceeding with you for ever: and, possibly, some, where you are, might willingly deal for such a treasure as those things are by this sad accident made to be now; if not, I forget not what you were pleased to offer before you went hence. I am to add to you, from Mr. *W.* that just before this fire, he had from the *Barbadoes* received some of the senna ripe and cured, with an assurance, that his correspondent there had saved enough of the seed to sow half an acre with it; and had taken ground to that end: that he is now going to make the trial of it by himself, having begun to do so by an apothecary, and as soon as he has done so, intends to present his majesty with some of it, to have it tried by Dr. *Cox*, or who else he shall pitch upon, and then to proceed to take out his patent for his privilege, which he looks upon as like to be too considerable to be long enjoyed alone by him, without envy; to avoid which, he did offer to join our friend and his at court, as patentee with him therein. But you know what he assured us together of his inability to advance the 500*l.* expected by Mr. *W.* from him for his admittance into that privilege, and therefore

fore he desired me to offer you the putting in of any ingenious friend of your's, who may be fit to countenance the thing, and apprehensive enough of its value, to look upon his being made sharer therein for 500 *l.* as a kindness done him; and upon your score he shall be admitted. To these two things he would gladly receive your answer with as little delay as you can give it; as I do desire at the same rate to hear how you got to *Oxford*, and how you enjoy your health there. All our news here are the sad stories of undone people, and of those we have great abundance, but scarcity enough of pity towards them, whose wants will increase, as the charity of those, that now relieve them, will tire; to prevent both which ills, some think, the most rational way were, to make a city of huts, till one may again be made of houses, and in them to let the poorer sort of tradesmen and labourers be set a-work and trafficking, and that so by employment and getting something, they may be kept from being idle and at leisure to find out and hatch causes of discontent and disorder. But as yet, no such thing goes about, which makes those, who consider, fear we shall feel more of this ruin, when the undone people feel more of their want, than in their present astonishment they are sensible of. We are, God be praised, reasonable well as to health in this small family, only *Thomas*'s not having been so for two or three days, has hindered him from going abroad in order to obeying your commands. *Gresham* college is now *Guild-hall*, and the *Exchange* and all. If the philosophers and the citizens become one corporation, henceforward, it may be hoped our affairs may be better managed, than they have been, unless the citizens should prove the prevailing party, which, as the worst, it is most like to do in this world, according to the small observation of

Your's *K. R.*

Sept. 18, [1666.]

THOUGH I had not, my brother, received your first letter, and the bag of lime, when I first writ to you, they have both come safe since to my hands; for which I present you my humble thanks, and repeat them for the repeated favour of your other of the 15th instant, which I last night received, and therein the assurance of your acquiescing in the proposal, wherein Dr. *Sydenham* was mentioned, with which I this day acquainted him, who proposed it to me (who came to me fresh from his majesty, to whom he had presented a parcel of his already tried senna, to be further tried by his majesty's command, who received it not only pleasedly, but greedily, and much complimented its presenter) who, upon advice, thought the best way to put it into speedy practice, would be your making him the proposition in a few lines from yourself, Mr. *W.* not being enough a man in his favour, to make it grateful; and I being so much fallen from it (why, I no more know, than I did how I came into it) that he has not since my return home, nor for a good while before, made me so much as a civil visit, and you being a person, for whom he has much reverence, and not the less because you have an estate in land visible to him, and who may properly enough offer the striking off the 100 *l.* I owe him, because you were pleased by your own bond to engage for it. This, if you can satisfiedly do, you may if you please tell him. I shall direct him to the place, where the books are; and I shall either deliver him your letter myself, or make *Thomas* do so, which of the two you shall direct: but if you scruple this at all, be pleased to say so; and I will in your name propound it to him. I may suddenly be able to give you a particular account of the course Mr. *W.* thinks of taking to make his senna presently a commodity, and to multiply it to great quantities; which appears to me neither disingenuous, nor unpolitick. My brother *Burlington* intended not to begin his journey towards *Dublin* (which he will visit in his way into *England*) till as yesterday, which freed me from the fears for him, that last night's extraordinary storminess might reasonably have given me, if I had had cause to suspect he had been then at sea. Our fleet is supposed to have been so, and fifty sail of the *French*, with the duke of *Beaufort*, were very lately seen from the *Isle of Wight* upon our coast. This day the parliament met, but so thinly, that his majesty stayed going thither, till the houses might be better filled to receive him. To this day God is pleased to continue the wonder, of not suffering any act of rudeness or violence to be done by any of those numerous ruined people by the late fire, to those, that were preserved from the judgment, that so destructively fell upon them; though their numbers be still increasing, by the pulling down work, that is still proceeded in about the Turrets and *Tower-Hill*, whereby above one thousand of those, that the fire left in their houses, are turned out of them. Sir *John Langham* has generously given five hundred pounds a year to the poor of the burnt parishes, to be continued to them, during his life, from that family, by Dr. *Cox*, and another friend is yet sent to

Your *K. R.*

My girls are your humble servants. I presented your service to my sister *Burlington*.

November 13, [1666.]

IT is no strange, though it be often an uneasy thing, my brother, to meet with disappointments in what we most desire, or apprehend ourselves most secure of, in this world; and therefore I was not unwarned, that such a matter might be encountered in the

the business of your coming up, which yet I am glad is not delayed by any indisposition you find in yourself, and which I therefore hope you will suffer to be delayed no longer, than your necessary occasions oblige you to. By the ruin of *Paul's* there is made a melancholy discovery of a dead body, buried, it seems, in a vault between that great church and St. *Faith's*, that was under it; which vault being broken by the fall of a huge weight of stones thrown down by the fire, there appears a man of a light brown hair upon his head and beard, in his full and entire shape, except, where his chap is a little broken by some of the stones that fell, and by that breach his tongue is made visible within his mouth, but shrivelled up; his flesh dried upon, but not consumed from off his bones; he stands upright upon his tip-toe, only his head leans a little on one side against the wall. By an inscription upon his breast he is found to have been *Thomas*, bishop of *London*, chancellor, and buried in the year 1402. He was not embalmed, nor is any sear-cloth to be found about him; but upon the skin of his arms some bits of thread, which are apprehended to have been that used in sewing up his shroud, which makes his so entire preservation for now two hundred and sixty four years very remarkable. The ground there, they say, is chaulky (that is I presume lime-stony) which it is yet ascribed to. To what you are pleased to enquire about the papists, my small intelligence capacitates me to return you but this answer, that the apprehension, that you know ran so currently amongst the people, whilst the fire lasted in the city, of its being inkindled with design by the French and Dutch, having received a confirmation by the confession of a Frenchman of that religion, who constantly affirmed, himself and another man of his own country and opinion to have been, by fire balls, the burners of the first house, that proved the train to fire the rest of the city; and he being upon that confession of his often repeated, and, (to the confutation of what was said of his being mad) he having, in the midst of all the ruins, brought his keeper to the very place, where that baker's house stood, and affirmed he there threw the balls with his comrade, and saw them burn down the house, when his fellow went presently for *France*, and he into *Essex*, (where he was taken and brought up) executed at *Tyburn*. And this being now so good a record, that thereupon (I am told) all the judges have given their opinions, that no tenant in the city is bound to be accountable to his landlord for what was burned, because the fire was kindled by a foreign and proclaimed enemy, against whom it was not in the landlord's power to give them protection. This, I say, has revived to the memory of the people the principles and former practices of those of that religion, and raised a fear in them of their being now designing farther mischiefs, that may reach their lives, by a massacre; which fears have run like wild-fire through the whole nation, and caused a loud cry, of the papists having the greatest part of the arms in their hands; on which the House of Commons passed some votes to have all the laws in force executed upon them, and in particular, to have all sent out of his majesty's guards, and disarmed, that were of that religion, and should not prove their not being so, by taking the laws of allegiance and supremacy, and receiving the sacrament according to the church of *England*. These votes being concurred in by the lords, and by both presented to his majesty, he has, pursuant thereto, published the inclosed. I must haste, lest I loose sending. I cannot assure you, but I doubt our fatal bill has this day passed the lords; but I am sure I am

Yours affectionately.

I HAVE ordered *Thomas* to look out for charcoal, and should gladly receive your order to put my back-house in posture to be employed by you, against your coming, that you might lose no time after.

MY girls are your servants.

September 11, [1677.]

I CANNOT, my brother, but condole with you the remove of our true, honest, and ingenious friends in their several ways, Dr. *Worsley* and Mr. *Oldenburg*, since it has pleased God to call them hence so soon one after another. Yet I am not without my fears, that my mentioning of them may revive to your good nature the sorrow, that I assure my self you received the news of their deaths with. But my experience (though I put but an ill compliment upon you in measuring you by myself) has taught me, that it is safer to have those uneasy things to us so far touched upon, as to beget some vent for such sorrows, rather than by smothering them within ourselves to continue to us a longer exercise under them. They each of them in their way diligently served their generation, and were friends to us. They have left no blot upon their memories (unless their not having died rich may go for one) and I hope they have carried consciences of uprightness with them, and have made their great change to their everlasting advantage; and if they be possessed of what we do but hope for, and what we should press after, we need not lament for them: and for ourselves, such losses, by the blessing of God, are made to assist us in the work he calls us to, of getting ourselves weaned from this world, out of which if the few pious and ingenious persons, that make it tolerable, were once taken, what would be left in it but rattles, and fools to play and make a noise with them, or instruments of cruelty, and knaves to use them in doing mischief. Therefore let me beg you to banish melancholy thoughts upon these sad occasions, and instead of recommending serious ones to you, let me beg you to enjoy the blessing God has bestowed upon you, in an ability of knowing how to entertain yourself,

ſelf, and converſe with him in the abſence of all other company; and in ſo doing to find that, which may not only render that abſence tolerable, but welcome. I am loth to conclude after that, with threatning you with my return to you: but the hopes of it may well at the end of a condoling letter be brought in as a conſolation to her, that is

Your own affectionately.

THE counteſs and our youths are your ſervants.

September 14.

BROTHER,

SINCE your going into *Ireland*, I received to this day but two letters from you, and thoſe at one time, written upon your firſt arrival, by means whereof I am kept in a conſtant ſuſpence and uncertainty concerning one of my neareſt intereſts in this world, which is that of your health. But alas! I might be ſo, though I heard as frequently from you as I could hope or wiſh; and indeed there is but one ſatisfying certainty, and that is, that nothing comes to paſs but by the will of our heavenly father, nor nothing to paſs by that will, which is not beſt in its ſelf, and beſt to them, whom he hath dignified by making them his not only by creation, but by union through Chriſt.

THE laſt fortnight I have been ſomething more than ordinarily exerciſed in thoſe accidents, that teach me experimentally to confeſs that ſentence, which *Solomon* pronounced of vanity and vexation upon all things under the ſun, to be extremely true. This day fortnight I had a whole committee to my breakfaſt, who were pleaſed in civility and kindneſs (as they ſaid to me) to call me in, and give me the thoughts they had had of my little affairs, and to hear from me my own thoughts upon theirs, and upon the ſame ſubject. But they, like lawgivers indeed, were to command, and not reaſon; and by exerciſing their legiſlative power, gave the affair the concluſion I formerly told you; which though it was very ſmall in point of receipt, it was not altogether inconſiderable in point of reſtoring and ſecuring, and very welcome to me, as it advanced far towards my freedom from an attendance, that both my body and conſcience were weary of; and in that I began as ſoon as they diſmiſſed me, to delight myſelf. But to chace me out of that fool's paradiſe, that very evening I received a letter from *Charles Rich*, telling me of my ſiſter's being ſtrangely and extremely ill, and inviting me very earneſtly upon that occaſion to *Lees*, which though in relation to my own affairs it was very inconvenient to me to hearken to, in relation to my kindneſs to her, and the diſcharge of my conſcience in ſerviceableneſs towards her in a time of ſuch diſtreſs, (wherein commonly the company of a poor puritan or ſectary is more acceptable, than that of the moſt pleaſant and quick drolls in the world) I could not refuſe it, but went the next morning. And when I came thither, found her a ſad ſpectacle indeed, her diſeaſe lying more in ſtupidneſs than pain, and in her underſtanding and ſpeech (which were both very imperfect,) than in the more remote parts of her body. She was no more joyed to ſee me, though they about her endeared my viſit to her, by telling her, how I had neglected all my own concerns to come, than if ſhe had had as little, as ſhe uſed to have much kindneſs for me, when ſhe was herſelf. This, you will eaſily believe, was a mortifying encounter to me, to ſee her well enough to be out of her bed, and to retain the wonted fulneſs and almoſt colour her face had in health, and not to have any ſettled working of reaſon or plain expreſſion in ſpeech; to ſee the carcaſe of a friend there, and her ſoul gone as to any rational uſe ſhe had of it; and her kindneſs to me as dead, as her reaſonings to herſelf, or her thoughts towards God, for ought I could ſee were alſo. I ſtayed there till Saturday, and then by the doctors and all conſents, brought her away with me: her ſpeech in that time would ſometimes be more diſtinct, and but ſometimes; and at that ſame rate ſhe reaſoned very unfixed and unſettledly, and her head began to ſhake, and ſhe to have a ſenſe of a heavineſs in it, which confirmed the doctor's opinion of its being a ſpice of the palſy: but the doctor here thinks its root to be in the mother, yet confeſſes the cauſe of her ill to be very inward and hidden in his opinion, and therefore I doubt muſt go blindfold towards her cure, which yet advances but very little, if at all. Here I ſaw the vanity of the thoughts I had taken up of ſtaying quietly at home, becauſe this condition of hers made me judge my attendance upon her very neceſſary (though ſeriouſly my lord and lady *Warwick* and *Charles Rich* are very obligingly careful of and kind to her.) But on Monday after I had viſited her, at my return home I found my poor *Frank* fallen very ill: her diſtemper was ſtrongly feveriſh, and increaſed to ſuch a violence in the two following days, that ſhe loſt both her ſenſe and ſpeech, and retained ſtrength enough only to diſorder and endanger herſelf. The manner of her ſickneſs gave me no ſmall apprehenſions of its being the plague; and to increaſe thoſe, an old woman, that then did and formerly had tended her, ſaid there was a riſing about one of her thighs. But God was pleaſed to give me ſo much courage upon that information, as to reſolve not to truſt the old woman's fumbling feeling, but to try myſelf, which I did, and found clearly, that ſhe was miſtaken in that particular, though ſtill ſhe appeared no leſs mortally ſick, than if it had been, that that night I watched with her in expectation that it ſhould be the laſt ſhe would live; but it pleaſed God to carry her through it, and to reſtore her ſenſe and ſpeech in the morning, when alſo the ſmall-pox broke forth, and appeared then a deliverance to me; but now they are upon her

her a disease, and a most loathsom one, though God be pleased to preserve me from the fear of them, and to make me able and willing to be with her, who has a face, that shews what stuff these bodies of ours inclose, and how little all the neatness of art can prevail against its own filthiness, when God gives it a commission to break out; and how little cause we have to make that the object of our pride, that is filled with so many lessons of humiliation. My attendance upon her makes me know nothing of my sister's condition but by report, and that makes it much the same. In this time poor *Fenton Parsons* is dead of a fever, after it was turned into an intermitting ague, as it is thought through being let blood unseasonably by one, that is called a doctor; but sure their trade is rather to cure men of their bodies, than to cure men's bodies of diseases. He was an honest friendly man, and of as great hopes for the things of this world, as any one of his age and profession; but one such blow lays all those hopes in the dust with us, and leaves us miserable, if we had not surer and better grounded ones, which are turned into abiding possessions, when the former perish. Thus you have a long account of my last fortnight's changes; and yet you must not be rid of me, till I have been faithful to you, in telling you, that there is not only in this place, but in this country, so general a visitation of sickness, which are for the most part fevers, fluxes, and small-pox, that there is hardly any family free from one or other of them, so as into this danger you must come, if you come hither; which if you be free from where you are, I do heartily give up your company to your safety, and to that you ought to give up all little satisfactions, that cannot be taken without it. As this scourge is upon us, so are our neighbours of *Holland* of a piece with us in this, though we be little enough one in other matters. For about *Amsterdam*, *Morian* writes, that they have scarce enough healthy people left to milk their cows. And out of *Germany* from a very good hand honest *Hartlib* has received assurance, that their very waters are turned into blood. Out of our Northern parts colonel *George Fennick*, an honest and discreet man, writes, that he saw lately a cloud very black, and about the bigness of an acre of ground, in the midst whereof there was a perfect rainbow for matter of form, but for colour only a pure blue. At each end of this bow appeared men in arms, with all their warlike equipage, who did several times charge one another and with various success, till at length, as I take it, the party at the East end the bow beat the other quite away. These being set for signs and for seasons, do hereby signify something; though I think he, that would dare to affirm in particular what, might be as like to mistake as hit right: but we have a sure word, that tells us, all this old frame of heaven and earth must pass, and a new one be set up in its place, and then your expectation of seven years will be abundantly answered and exceeded; but whether it will come within the seven years, I dare no more say than I do know; only this methinks I am sure of, that it is a brave thing to be one of those, that shall lift up their heads with joy in expectation of a present redemption, when all these ruins and confusions, shall be upon the earth; and such brave men and women are only true Christians. Therefore, my dear brother, let us endeavour for that dignity, though in maintaining it we take courses, that have the contempt of the world heaped upon them; for to be contemned by the contemptible is glorious in the opinion of your

K. R.

IN excuse for my not writing by my brother *Frank*, I must tell you, he never told me of his going, nor heard I till he was gone. My service to him, if he be with you.

THIS is only, my brother, to tell you, that it pleased God to carry me through my journey much better, than I could reasonably have expected I could have passed it, considering my preparation for it was a night full of smart pains, and almost without sleep; and that when I went into the coach, I was ill enough to have been more properly put to bed. Here we have a right prospect of what the world calls greatness, croud, noise, heaps of meat, and drink in proportion, contrivance and pains to please the sense; vexation and fear, and in conclusion emptiness and disappointment. You are now very near the hour, wherein your mistress is, by giving herself to another, to set you at liberty from all the appearances you have put on of being a lover; which though they cost you some pains and use of art, were easier, because they were but appearances. It is well, if she put not herself by that act of bounty into more slavery than she gives you liberty; but now she must perfect making the venture she has so far proceeded in. I must, before I free you, recommend your health to your care, as the only obligation to be put by you upon me, greater than those, that you have already heaped upon

Yours affectionately,

K. R.

Letters from Mr. John Locke *to Mr.* Robert Boyle.

Cleve, Dec. $\frac{12}{22}$, 1665.

Honoured Sir,

I LOOK upon it as the greatest misfortune of my journey hither, that it hath afforded me so little worth your notice; and that after having gone so far, and staid so long, I should yet send you so empty a letter. But, Sir, it is not unusual, that a man far in debt, after long delays, should pay nothing. And had I travelled through more fruitful places, and been myself better able to observe, I should

should still have been in the same condition, and not have been able to return any thing of what I owe to your many and great favours. We are here in a place very little considerable for any thing but its antiquity, which to me seems neither to commend things nor opinions; and I should scarce prefer an old ruinous and incommodious house to a new and more convenient, though *Julius Cæsar* built it, as they say he did this the Elector dwells in, which opinion the situation, just on the edge of a precipice, and the oldness of the building seems to favour. The town is little, and not very strong or handsom; the buildings and streets irregular; nor is there a greater uniformity in their religion, three professions being publickly allowed: the Calvinists are more than the Lutherans, and the Catholicks more than both (but no papist bears any office) besides some few Anabaptists, who are not publickly tolerated. But yet this distance in their churches gets not into their houses. They quietly permit one another to choose their way to heaven; for I cannot observe any quarrels or animosities amongst them upon the account of religion. This good correspondence is owing partly to the power of the magistrate, and partly to the prudence and good nature of the people, who (as I find by enquiry) entertain different opinions, without any secret hatred or rancour. I have not yet heard of any person here eminently learned. There is one Dr. *Scardius*, who, I am told, is not altogether a stranger to chemistry. I intend to visit him as soon as I can get an handsom opportunity. The rest of their physicians go the old road, I am told, and also easily guess by their apothecary's shops, which are unacquainted with chemical remedies. This, I suppose, makes this town so ill furnished with books of that kind, there being few here curious enough to enquire after chemistry or experimental learning. And as I once heard you say, I find it true here, as well as in other places, that the great cry is ends of gold and silver. A catalogue of those books I have met with, some at *Antwerp*, and some in this town, I here inclosed send you, and am told by the only bookseller of this place, that he expects others daily from *Francfort*. The weather is here exceedingly mild, and I have not seen any frost or snow since my coming; but it is an unusual clemency of the air, and the heavens seem to cherish the heat men are in to destroy one another. I suppose it no news to tell you, that the Dutch have forced a surrender of *Lochem*; there marched out of it two hundred and fifty of the bishop's men. In another rencounter the bishop's men killed and took four hundred Dutch horse: so that this has only shaked the scales, not much inclined them to either side. The States of *Cleve* and *March* are met here to raise money for the Elector, and he with that intends to raise men, but as yet declares for neither side: whether he be willing, or will be able to keep that neutrality I doubt, since methinks war too is now become infectious, and spreads itself like a contagion, and I fear threatens a great mortality the next summer. The plague has been very hot at *Cologne*; there have died there within this quarter of a year above eight thousand. A gentleman, that passed by that town last week, told me, that the week before there died there three hundred and forty eight. I know these little trivial things are as far distant from what I ought to send you, as I am from *England*: for this I do not only blame my own present poverty, but despair of the future, since your great riches in all manner of knowledge forbid me the hopes of ever presenting you with any thing new or unknown. I should not therefore take the boldness thus to importune you, did I not know, that there is nothing so slight or barren, which you cannot force to yield you something, and make an advantageous use of poor common things, which others throw away. This is that, which gives me the confidence to tell you, that I am,

SIR,

your most obedient, and

most faithful servant,

JOHN LOCKE.

SINCE I writ this I met with a Jesuit, who had been in *Hungary*. I enquired, whether he had seen the mines; he told me, that he had gone down into a copper mine near *Neisol* (if I mistake not the name) six hundred fathom deep; that at the bottom in a hollow of some bigness, there dropped down water, which they received in a wooden trough, wherein they cast pieces of old iron, which by the water would be turned into good copper. That a piece of iron of the bigness of a man's finger would be changed in three months, and that the mutation began from the superficies inwards with streaks (or to use his word *striatum*;) that he had a horse-shoe, whose exterior part was copper, and inside iron. I asked him, whether it were cold or hot, he told me it was warm enough, so that the workmen were naked from the waist upward, and sweat in working. I had not time to enquire after more particulars, being hastily called away. He belongs to the baron *de Goes*, envoy here from the Emperor. If you think this relation worth any further enquiry, or that I can any other way serve you here, I should be glad to receive your commands, which either Mr. *Godolphin* or Mr. *Proctor Thomas* will convey to me.

Christ Church, Feb. 24, 1666.

Honoured Sir,

ACCORDING to the directions you gave in your last letter to Mr. *Thomas*, I have endeavoured to provide paronychia, and I think I shall be able to procure pretty good store of it. The fittest time I suppose to gather it will be, when it begins to be in flower, which will be about a fortnight hence, the spring hereabouts not being over forward. How I shall dispose or order it for you, I must desire to be directed. Though by your approving of that way in other like cases, I have some thoughts to pound and seal up some part of it in a bolt head, and so keep it, since the juice being the thing desired; and not being fully acquainted with the way *Helmont* mentions he made use of to preserve juices, I know not how otherwise well to keep it. In the process of ☉ ⊕ with √ you did me the honour to send me, I must beg this additional favour, to know, whether in each distillation I must draw off the √ of ad siccitatem; for I find, that if the fire be a little augmented, the volatile √ being pretty well first gone over, the remaining liquor will rise in plentiful very white fumes; but I suspect this too violent a way of proceeding. After having distilled it in this manner, I let it stand above twenty four hours to cool; and though when I took off the head from the body, it had been several hours quite cold, and my nose were not within a foot of the mouth of the body; yet there came out so quick and penetrating a steam, that it made me cry out, and made my eyes run over, but the effects of it quickly ended, and I was soon at ease again; though I dare be confident it is one of the briskest and most pungent steams in nature. Did I not know, how favourably you interpret any poor essays, and slight observations of those, that are willing to learn, I should not venture to importune you with such trifles. But since my design is not (nor can ever be) to instruct you, you will permit me by all the ways I can, to assure you that I am,

Honoured Sir,

your most humble, and

most obliged servant,

JOHN LOCKE.

MR. *Thomas* presents his humble service to you. He and I are now upon a new sort of chemistry, *i. e.* extracting money out of the scholars pockets; and if we can do that, you need not fear but in time we shall have the lapis; for he that can get gold and silver out of scholars, cannot doubt to extract it any where else. The truth is, he and I are preferred to be accessors of the poll-money; and if you do not make haste hither, I believe you will at your next coming hither find us both beaten out of town, for having had too good thoughts of our neighbours, it being now an injury to believe any one rich, or a gentleman. We return our thanks for your queries by Dr. *Lower*, and intend some trials on the first opportunity.

Christ Church, March 24, $\frac{66}{67}$.

Honoured SIR,

I SHOULD not have been so slow in returning my thanks for the great favours of your letter, had not the carelessness of the letter-carrier kept it from me two or three days after it came to town. I am concerned that you should believe this truth, and I should be very much ashamed to appear guilty of tardiness, to a person, who thinks his favours need an apology, if they are not as speedy as they are great, who is not content to oblige an undeserving scholar beyond the ordinary rules of kindness, unless he also excuse the excess of his obligations. Had I any skill in the art of speaking, I should on this occasion tell you, that this is to be like the sun, and those other heavenly bodies, who are exempt from the corruption and nigardliness of things here amongst us, and bestow their light and influence constantly, and as it were out of necessity. But, Sir, the pretensions I make to philosophy will excuse my want of rhetorick; and though I have but little of the knowledge, yet I shall make use of the language of a philosopher, and content myself to speak plainly, as I mean honestly; and do therefore with a sincerity due to that profession, tell you, that I have a very great sense and acknowledgment of your favours, however I want words to express it. The warts you speak of, I doubt not but I shall be able to provide you in the place I am going to, though I would be glad to know, whether there hath been any difference observed in the operation of those of stone-horses, geldings, and mares, and whether they are to be taken from live horses, since (if I forget not) *Helmont* some where says, that if in histerical fits, (for in that disease he commends them) you use those that are taken from an horse, *æstuante venere*, they have different effects from others. I desire also the favour to know, how much of sp. * may be thought a large dose, and whether it be that sp. * which is made with ☿, whereof we have prepared some. The particulars of the process Mr. *Thomas* has undertaken to give you

you an account of. Sir, having from a paſſage in your writings taken the firſt notice of the time of gathering pæony roots; and ſince finding it in the obſervations communicated to *Riverius*, where the obſerver ſays it muſt be *inclinante luna in ariete exiſtente*, which alſo *F. Wurtz* confirms with this addition, that it muſt be in April, when Sol is in Aries, and at a plenilunium before the riſing of the Sun. I rode to a place, where was pretty good plenty of male pæony, and on the 14th inſtant between ten and eleven in the morning had ſome of the roots dug up, and am promiſed others to be dug up on the 30th inſtant before ſun-riſing. If there be any advantage in the time of gathering, I owe the knowledge of it ſo much to you, that I ſhould be an unworthy reader of your writings, if I ſhould not return you my thanks, and offer you ſome part of thoſe roots, from whom I learnt the uſefulneſs of them; if you pleaſe to make trial, whether theſe have any more virtue than thoſe gathered at another ſeaſon, I having choſen thoſe times, that I think come neareſt to their directions. I intend to go between this and Eaſter into *Somerſetſhire*, where if I can do you any ſervice about *Mendipp*, or any other way, you will oblige me with the employment. It is ſo much my concernment to receive your commands, that I ſhall be ſure to give you notice where I am, and how I may receive the honour of your letters. After ſome little ſtay in that country, I hope to kiſs your hands in *London*, and I now begin to make wiſhes, that you will come hither very quickly. I am,

Honoured Sir,

your moſt obedient, and

moſt obliged ſervant,

JOHN LOCKE.

MR. *Thomas* preſents his ſervice.

HAVING followed your directions the beſt I could with ♈, and ☋ ⊕i, having drawn ♈ from it till it comes off ſweet, I find the remaining matter when dried retains its acidity, and will not any part of it ſo diſſolve in ♈ as to paſs through a filter, but will eaſily make a maſh with it; but being ſet to digeſt it ſubſides, and leaves the upper part of ♈ clear; whether it ſhould be ſo I know not.

Exeter-houſe, Nov. 12, 1667.

Honoured Sir,

I KNOW you will pardon the ſilence of a man, that hath regard to your time, and is loth to importune you with inſignificant compliments. And I will aſſume ſo much pride to myſelf, as to believe, that you would not think me ſo fooliſh as to venture the loſs of your good opinion, or rob myſelf of the advantage of your letters, by a bare negligence, or for want of writing a few lines. This confidence of your favourable thoughts of me, and an unwillingneſs to trouble you with reading an empty letter, made me forbear ſending to you, though I muſt confeſs, I have a long time wiſhed for a fair opportunity to beg ſome communications from you, without which I ſhall be able to ſend but a very ill furniſhed letter to my friend in *Germany*. I ſome time ſince received from him one of thoſe Scarabei I formerly mentioned to you, which I gueſs to be the *Proſcarabeus fœmina* mentioned by *Mouſet*, Cap. XXIII. and would be very glad to know, whether *Jacob Bobart*, or any other, have found that kind in *England*, for he very much commends the uſe of them in the diſeaſe I told you. The place I am at preſent in, and the remove I am like to make (for I believe I ſhall once more croſs the ſeas before I ſettle) have kept me from attempting any farther experiments in chemiſtry, though I find my fingers ſtill itch to be at it, and I have not met with any thing worthy your notice. I can only inform you, that I am acquainted with a young gentlewoman, who ſome years ſince had the miſfortune to have one of her legs cut off, which yet very frequently does ſo pain her, that I have heard her more than once grievouſly complain of vehement torture, ſometimes in the heel, ſometimes in the inſtep, and at other times in the toes of her dead and buried foot; and ſhe tells me, that ſometimes being wakened by the pain, ſhe has (before recollection) put her hand down to feel for the grieved part, as if her leg had not been cut off. I return you my humble thanks for that preparation of *Helmont*, and the other favours of your letter. The odoriferous oil of vitriol, if it be made by any other or ſhorter way than by digeſting ♈ on ☋ ⊕, you will do me a favour to let me know it; for for ſuch trials I may perhaps get conveniency this winter, and I would not willingly be idle, where I might be encouraged and directed by ſo kind and ſkilful a hand. But I ought not to be begging more, where I am ſo much indebted already, and have nothing to repay, but an aſſurance, that I am,

Honoured Sir,

your moſt humble, and

moſt obedient ſervant,

JOHN LOCKE.

Paris, June 4, 1677.

Honoured Sir,

IF in an abſence, longer than I thought when I ſet out, I have not once writ to you after ſo many obligations, that I have to ſeek all occaſions to teſtify my reſpects to you: you will not, I hope, impute it to want of knowledge in me, or a willingneſs to decline

cline your commands. I am not so insensible of your favours as to be guilty to that degree. And if my omission be culpable, it was only out of consideration, that being in a place, where I had no prospect of any service I could do you, I forbore to give you the trouble of an idle letter. Now I am come to this place, which is one of the great magazines of things and persons of all sorts, I thought, that perhaps there might be something, wherein I might be here in a condition to serve you. And though I believe you are not much concerned to know, whether broad or narrow brim'd hats be like to carry it this summer, or which is the newest alamode cut of pantaloons; yet in this universal mint of new things, there are some others, that possibly you will think worth your enquiry and knowledge. In something of this kind I would be glad to have the honour of your commands; and methinks whilst the press furnishes every day new books to St. *Jaques Street*, the observatoire, laboratories, and other officinæ of the virtuosi here are so busy to produce something new, I should not be without some employment from you. I dare undertake for myself, that I shall be a very faithful and diligent factor; and you cannot blame me for desiring the employment, since I may inrich myself in it very honestly, without at all lessening any part of your returns. And to confess the truth, I have besides this another private interest of my own in it; for who ever served you in any thing without being an extraordinary gainer by it? I would beg the favour of two or three lines from your hand, to recommend me to the acquaintance of any one of the virtuosi you shall think fit here. I know your bare name will open doors, and gain admittance for me, where otherwise one like me without port and name, that have little tongue, and less knowledge, shall hardly get entrance. Pardon, I beseech you, this freedom I take; your goodness hath taught it me, and however faulty it may be, let it pass under the plausible title of *libertas philosophica*. They talk here of a little brass globe three or four inches diameter, that being wound up once a month, shews all the motions of the heavens. I am so newly come hither, and am since my late ague so ill a walker, that I have not yet seen it. But I hope in a little while my legs will come again to themselves, and be able to carry me about lustily; and then I shall be trudging up and down in quest of new discoveries. Excuse, I beseech you, Sir, the trouble and confidence of this letter, and give me leave to assure you, that I am,

Honoured Sir,

your most humble, and

most obliged servant,

JOHN LOCKE.

YOUR letters will find me, if they be directed to me, *Chez Monsieur Charas maistre apothecaire rue de Boucherie dans le Fauxbourg St. Germain à Paris.*

Blois, August 6, 1678.

Honoured Sir,

YOU will not wonder, that I lay hold on so fair an occasion of presenting my service to you, when you reflect on the many great obligations I have to you, and that I should be very unworthy of the honour I have to be known to you, did I pass by any opportunity to express my acknowledgments. I should think it a great advantage to me, whilst I am abroad, if you would honour me with any of your commands. And if in this part of *France* I am now rambling, your curiosity had any enquiries to make, I should with great satisfaction embrace the commission, and be sure to give you an exact account. I have news from *Paris*, from an ingenious acquaintance of mine there, that a friend of his hath found out a very sensible hygrometer, which, besides marking the moistness of the air, will also be improved to wind up a pendulum; which, if it succeeds, will be a kind of perpetual motion. And a watch-maker I know there sends me word, that he is now at work upon a movement, that the air will wind up; which, I suppose, is the execution of the design my friend (who is a very good mechanick, besides an admirable scholar) sent me notice of. He also mentioned to me the extraordinary goodness of a microscope Mr. *Huygens* has brought with him out of *Holland*. But these things having happened in *Paris* since I left it, I cannot give you so perfect an account of them, as I desire. When I was there, I saw in the Charity a boy about eighteen years old, who had a kind of horns grew out in the place of his nails of almost all his fingers or toes; some of them were four or five inches long. I have a large piece of one of them, which was broke off in my presence, and the whole history of the case amongst my things at *Paris*. This accident began to grow upon him, after the small pox, about two or three years since. Enquiring for him a little before I came away, I was informed, that he was cured and gone. Some other things worth observation I have also light on, which would be too long to trouble you with here. And, amongst other things I have a small quantity of a medicine given me, which I believe to be of great efficacy to certain purposes, whereof perhaps you will not be displeased to see the effects. I was extremely well pleased to hear, that the things were sent me from the Bahamas were put into your hands; they could not have been placed any where so much to advantage, and to my desire. For I shall always be exceeding glad, if any thing I have or can may serve to testify the respect and esteem, wherewith I am,

Honoured Sir,

your most humble servant,

J. LOCKE.

IF at any time you deſign me the honour of a letter, it is but ſending it to Sir *John Banks*'s in *Lincoln's-Inn-Fields*, and it will find the way to me.

Bexwells, June 16, 1679.

Honoured Sir,

TO keep my promiſe to you concerning that odd caſe I met with the laſt year at *Paris*, I here ſend you a more particular account of it.

BEING the 24th of May, 1678, at the hoſpital called *La Charité*, I was there ſhewed a lad between nineteen and twenty years old, who had a ſort of horns grew out of all his fingers of both hands, and moſt of his toes. On the two leaſt toes of each foot there were now none, upon three whereof there had never been any, and upon the fourth, which (as I remember) was the little toe of the right foot, that, which formerly grew there, was fallen off about ſix months before, and came no more, but left the nail very little different from natural. On all the reſt of his fingers and toes there were of theſe horny ſubſtances, when I ſaw him, but of very different lengths, ſome of them having began to ſprout a long time after ſome of the others, and others of them having been broken off by the ſurgeon, that healed him.

THE longeſt of all was that on the middle finger of the right hand, when I ſaw him, which was three inches and nine grys long, and one inch ſeven lines in girt, of which the ſurgeon broke off a large piece, and gave me, which you may command, when you pleaſe.

THE youth told me, he had had one formerly on his thumb, much longer and bigger than this on his middle finger, but it was now very ſhort, having either fallen off, or been taken off, I know not whether.

THIS horny ſubſtance grew not out of the end of the fingers, but was, as it were, a riſing of the nail, which, inſtead of growing out in length, increaſed in thickneſs; but yet it roſe not up in a ſtrait line perpendicular to the finger, but, as it lengthened, bended forwards, and ſo grew ſomewhat into the ſhape of a bird's claw, but that it was not taper and ſharp, like that, but blunt at the end, and almoſt of the ſame bigneſs all along, and full of pretty deep chaps in the convex part, but in the concave there were none at all.

THEY were very tender, eſpecially thoſe of his feet, ſo that he complained upon very gentle touching them; but this ſenſibility was not in the horny part, but where it joined on to the fleſh, which was where the nail formerly grew, and ſhould ſtill have grown.

THERE grew alſo horny excreſcences, ſome bigger, ſome leſs, on ſeveral parts of the backs of his hands, that roſe very little above the ſkin; ſome of them looked like flat, but very broad warts, but to the touch they felt as hard as horn.

HE told me it was about three years before, that this began firſt to come upon him after having had the ſmall pox; to the remains of which diſeaſe he imputed this accident, he having elſe enjoyed a health good enough, and kept the ordinary diet of his country, which was Brie.

ABOUT a week after, I went to the *Charité*, to ſee him again, and then, after having been twice purged, ſome of the horns of his fingers began to looſen at the roots.

I WENT thither again to ſee him, ſome time after, but he was gone perfectly cured, as they told me; and that the chief things were done to him were, purging and bathing.

BEFORE I conclude, I muſt not forget to tell you, that the meaſure I made uſe of was the philoſophical foot, *i. e.* $\frac{1}{3}$ of a pendulum of ſeconds, which I divided thus: the foot into ten inches, the inch into ten lines, the line into ten grys; ſo that a gry is $\frac{1}{1000}$ part of PP; which meaſure, whatever it be for other purpoſes, I thought the fitteſt for philoſophical communications, and therefore made uſe of it in this and ſeveral other occaſions. But I have troubled you too long already to mention here the conveniencies of this foot, and (as I think) of the way of dividing it by decimals.

I KNOW you think the works of nature worth taking notice of, and recording too, even when ſhe ſeems extravagant and out of her way. This muſt be my excuſe for ſending you this long, and (as it would be to another) tedious ſtory, to aſſure you, that I am with the utmoſt reſpect,

Honoured Sir,

your moſt humble, and

moſt obedient ſervant,

J. LOCK.

Amſterdam, Oct. 10, 1687.

SIR,

YOUR goodneſs, I promiſe my ſelf, has preſerved me a place in your memory, however I may ſeem to have taken little care of it myſelf. And you will eaſily forgive me a ſilence, which, though in all this time of my abſence it has not afforded you a word, yet has had nothing of forgetfulneſs in it, or want of reſpect. Whilſt I met with nothing on this ſide the water, that I thought worth the communicating to you, I believed myſelf diſpenſed from importuning you with my letters. For thoſe of bare civility and compliment I know you neither want nor deſire. But this incloſed paper newly falling into my hands, freſh from the preſs, and carrying with it the air of ſomething more intelligible and ſincere, than is uſually found in this ſort of writings, I could not ſatisfy the deſire I always have to render you any ſervice I can imagine may be acceptable to you, without ſending it you as ſpeedily as I could; eſpecially ſince I can add this farther concerning it: that I am told

told by a knowing man, and an acquaintance of the publiſher, that he has reaſon to think, that the whole work, whereof theſe aphoriſms are but the ſkeleton, if it were publiſhed, would far exceed all, that is yet extant on this ſubject. I ſhall be glad, if I may be capable of doing you any other ſervice, whilſt I am in this country. Whenever I ſhall be ſo happy, be pleaſed but to ſend your commands inclofed to your acquaintance, Mr. *Benjamin Furley*, at *Rotterdam*, and they will be conveyed to me. I am,

SIR,

your moſt humble

and moſt obedient ſervant,

J. LOCKE.

Oates, Oct. 21, 1691.

Honoured Sir,

BY this bearer, my ſervant, who comes to town on purpoſe, you will receive your papers concerning the titles of the air. I have read them all over very carefully, numbered them according to the titles they belong to, and laid them in that order, the beſt I could, according to the ſtate they are in. I have beſides corrected many of the miſtakes of your amanuenſes; but yet, for all this, they are not in a condition to be ſent to the printer, or put into a bookſeller's hand, in order to publiſhing. For beſides that they are not all laid in the order of the titles they belong to, it often happening, that thoſe of different titles are writ in the ſame paper, which I would not venture to cut in pieces, without your direct order; and ſome of them being writ on both ſides the leaf, cannot be cut; and therefore I have contented myſelf only to mark in the margin the title each belongs to: beſides this, I ſay, there are ſome faults in the writing, which, without conſulting you, I durſt not correct; and in other places defects and omiſſions, which I could not ſupply; and many things, which ſuggeſt queries, which I think fit to adviſe with you about. I know not whether you think it neceſſary to haſten the edition of them. If upon that or any other account you deſire my coming to town, I ſhall not fail, upon the firſt ſummons, to wait upon you. I have with them ſent a copy of my regiſter of the air, and in ſome few places made ſome little additions to the obſervations of your papers, as you will ſee; and I doubt not, but, if one had time, one might find many more. Beſides the many ſtrange and pleaſant remarks your papers contain, and uncommon experiments you have made yourſelf about the air, your deſign opens a large and uſeful field, and I muſt confeſs gives me a larger view than I had before of this ſubject, which yet I have a long time thought deſerved as much to be conſidered, as any part of nature; and which your diſcoveries had ſo much recommended to the ſtudy of all inquiſitive men. But enough of the air on this occaſion. Give me leave now to tell you, that I have water, and I have veſſels, I only want ſoap to be at work. Whatſoever you ſhall give this bearer for me will be ſafely brought me. I hope he will bring me good news of your health, and I ſhall be glad to receive the honour of your commands by him. I am,

Honoured Sir,

your moſt humble, and

moſt obliged ſervant,

J. LOCKE.

I HAD forgot to mention above, that I have a little altered ſome of your titles, the better, as I think, to accommodate them to the papers are to be ranged under them. You will find the alterations I propoſe writ on the backſide of the printed titles, and I know you will pardon this preſumption, ſince I ſhould not make a right uſe of the freedom you expect from me, ſhould I not without reſerve offer my thoughts to you.

AT the end of all you will find ſome papers which I am in ſome doubt about, whether they ought to have any room at all amongſt the other.

WHENEVER you have any commands for me, a letter left at my lodging in *Dorſet-Court* in *Channel-row* will be conveyed to me.

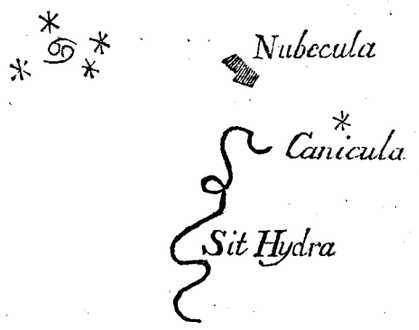
Letters from Mr. Aubrey *to Mr.* Boyle.

Eaſton-Pierſe, March 15, 1665.

SIR,

I HAVE here ſent you, tranſcribed with my ill hand, Mr. *Pell*'s *Idea*, which, I doubt not, but will be very welcome to you. I humbly beg your pardon, that I could not ſend it ſooner, having, ever ſince I had the honour to wait on you, been diverted by ſeveral buſineſſes. I was overjoyed with the good news, which you told me of, that Mr. *Pell* was about finiſhing his Algebraical Treatiſe; I hope it is the *Mathematicus* Αὐτάρκης. I have long been ſo perplexed with the unpleaſant affairs of this earthen world, that I cannot mind ſo much as I would the intellectual one; and ſo am not capable to make you ſuch returns of diſcoveries and fine things, as you expect, and I wiſh. Hereafter, I ſhall be able to add ſomething to your Hydroſtaticks, but they being at preſent unfiniſhed, I will not offer them now; yet as to that part they are, and long ſince by me propoſed, at *Greſham* college, with the ill ſucceſs as not to be taken notice of, the experiment being not rightly made. Upon Candlemas-eve laſt was twelvemonth (which was ſhortly after the appearance of ſeveral comets) about ten at night accidentally looking on a ſerene ſky, I took notice

notice of a nubecula, much brighter than any part of the via lactea, and about five times as big as Sirius. I ſhortly after ſhewed it to my ingenious neighbour colonel *Long*, and another neighbour: when the moon ſhines not too bright, it is very eaſily ſeen, and remains yet; but I cannot ſay, whether altogether ſo bright. It lies almoſt in a right line, between the bright ſtar of the little dog and ♋,



and it is near upon over the head of hydra. After a month's time, you will with difficulty find it, by reaſon of the lightſomneſs of the ſky. Hereafter, when God ſhall bleſs me with a little more peace, I ſhall make bold to ſend you ſeveral experiments, ſome whereof may not be ungrateful. I would willingly take the hardineſs to deſire your reſolve in this Georgic problem. There is a ſort of huſbandry upon the downs called *Burnebeking*, which is to dig up the ſurface of the barren downs, and make little hillocks of the turfs, and then ſet them on fire; afterwards ſcatter the burnt earth, and then plough it, and it will yield for ſeven, eight, nine years, or more, a wonderful increaſe, but afterwards never bear any thing, even ſo much as good graſs, in the age of a man. For the proverb is, It is good for the father, but naught for the ſon; for it is left *a terra damnata*. It would be an excellent diſcovery to bring ſuch land to its former ſtate; and I am confident you are able to reſolve it *primo intuitu*. I do believe, (but for a great quantity of down it would not be *tanti*) that urine well ſcattered would go near to do the buſineſs. My obſervations of my Turquois, I will ſend you about a month hence, with ſome other ruſtick ones, ſome whereof I do not diſdain to learn from ignorant old women. But becauſe you have encouraged me, and honoured me ſo much with your favour, I have preſumed to offer to you theſe rude and haſty lines, which otherwiſe I ſhould not have had the confidence to do, to a perſon of your eminence and ingenuity. Thus humbly begging your pardon, I ſubſcribe myſelf in haſte,

SIR,

your moſt obedient, and

moſt humble ſervant,

Jo. AUBREY.

SIR, you would much oblige, in preſenting my humble ſervice and reſpects to my noble lord *Brereton*, and his ingenious friend Mr. *Pell*.

IF you have any commands to lay on me, be pleaſed to direct your's from *London* to the poſt-houſe in *Chippenham*; from *Oxon*, to *Kingſton* St. *Michael*.

Hothfield, Sept. 6, 1672.

SIR,

I SUPPOSE it is not unknown to you, that Mr. *Wood*, of *Merton* college, hath writ the Hiſtory of the Univerſity of *Oxford*, which is in the preſs. In every houſe he mentions the writers there bred, whoſe lives he traces from their cradles to their graves: he correſponds much with me to give him aſſiſtance herein, and lately, among other queſtions, deſires me to ſend him an account of Mr. *Saunderſon*, who writ the life of king *Charles* I. who died at *Lees*, the earl of *Warwick*'s, where (by my lady) I underſtand you now are. Sir, you will oblige Mr. *Wood* and myſelf very much, if you will deſire one of your ſervants to make enquiry,

Where Mr. *Saunderſon* was born?

What employment or preferments he had? He was of *Trinity* college.

If he writ any thing elſe?

When, and where, he died, and was buried? and his epitaph, if any?

Let your ſervant ſend the beſt account of theſe queries he can, to Mr. *Wood*, at *Merton* college. He hath made a collection in this method of above 800 writers. I humbly deſire your pardon for giving you this trouble of reading it; but it being to carry on ſo publick a work, I preſume the more on your goodneſs.

MY lord of *Thanet*, and my lady (your pious and ingenious niece) remember them kindly to you. My lord is much hypochondriack; I told him of aſhen rinds infuſed in white wine, which I know hath to my relations done great good. His lordſhip intends to take it, but commanded me firſt to deſire you to acquaint him, when, how much, and how long he muſt uſe it; which, though I conceive it be *ad libitum*, yet, for his lordſhip's ſatisfaction, I would deſire you to let him know your opinion. I reſt,

SIR,

your moſt affectionate, and

moſt humble ſervant,

Jo. AUBREY.

SIR, If you would be pleaſed to look in your cabinet for my Turky ſtone ring, you would much oblige me: I would make ſome farther obſervations on it.

SIR, I newly have received a letter from *Herefordſhire* from Mr. *Hoſkyns*, wherein is this recipe for Mr. *Hooke*, if he mends not upon milk. He ſays, an old man near him begged his landlord to give his children one year's purchaſe of his eſtate (for life) and he would ſurrender; but his landlord thought of entering in a month's time. A beggar woman adviſed the conſtant uſe of new butter-

milk,

milk, which recovered him from his marasmus, and preserved him thirty years, to bury his landlord and landlord's heir.

Letters from Mr. Colepresse *to Mr.* Boyle.

Underwoode, near *Plymouth*, Aug. 28, 1666.

Much honoured Sir,

MY occasions not permitting me, till yesterday, to view the cave mentioned some time since by his majesty to you, I humbly offer this imperfect account of it, having not as yet the conveniency of seeing what the earl of *Bath* hath secured in his closet in the Fort Royal (in which this place is) which I guess, by hearsay, to be not much other than great isicles. The cavity I conceive to be natural, lying on the edge of a clift towards the south, though there are many loose uneven pieces within it: it is generally above and beneath uneven, shooting itself into many cranies: the top, or roof, is about five or six feet deep from the superficies of the earth; its height is about sixteen feet, and fifteen feet square, besides the nooks. The marble, or rock, of itself is of colour a dark blue, but hath a coat, or crust of darkish yellow, which is the descending water (though a rocky, dry, and barren place over) there firmly petrified. Isicles, some of a very great compass and length, others less, were in it, but now it is left naked: but that, which caused my admiration most, was (what had escaped others, as the diggers told me, having otherwise no different matter from other caves of the like nature) *viz.* certain veins of a very soft matter, which being pressed, but gently, though in the hand, yields two parts in three of water. I cannot demonstrate it better, than by curds and whey, it being exceeding white, though othersome partaking more or less of a red, which colours our country marble; by which I labour to satisfy myself of the degrees of natural petrification, which I as yet never heard any to discourse of, so I could never meet with a more apt and certain demonstration, which I perceived a little in the isicles. This place, though natural, from many imperfect relations conjoined I gather to have been opened before; finding great bones (supposed of horses) in the entrance into it: and, as it hath been Æolus's palace a long time, it is now to be dedicated to Bacchus, being intended for a wine-cellar. Sir, if any of these curds be worth a securing, on the least intimation from you, I shall double my intended quantity, which will be speedily, or not at all, they daily endeavouring to bring it to a better form. Noble Sir, you see into what depth of presumption I have plunged myself, that I might comply with your desires, humbly imploring the favour to be esteemed

Your honour's most humble,
and most obedient servant,
SAM. COLEPRESSE.

SIR, I have some other things, (seeming rarities to me) which I now forbear, fearing I prove tedious in this: but of them hereafter, if my mouth prevent not my pen. I have begun my collection of minerals for you already; neither doth Sir *William Strode* forget the loadstones.

Underwoode, nigh *Plymouth*, Feb. 1, 1666-7.

Noble Sir,

WHEN I waited on your honour last in *London*, you were pleased to commit some queries about mines to my custody, with a request (which I ever esteem as my command) to give you some satisfaction concerning our western mines, by answering them; the which should I by delays or negligence disobey, I could not in reason expect to be accounted so much your (faithful, though unworthy) servant, as indeed I am. I have therefore inclosed a short and hasty account. Such as it is, I humbly offer to your candid view. Indeed the shortness of time, illness of the season, emergency of other avocations since my return, and want of convenient instruments, have much added to its imperfection; which I hope will the sooner be excused, seeing it is neither my profession, nor can I arrogate (as yet) the title of novice in mineral affairs; I can scarce intitle myself to them, otherwise than by composing and transcribing. For I must ingenuously acknowledge the greatest part of them to be received from your worthy friend, my noble Mæcenas, *viz.* Sir *William Strode*, who gives his humble and hearty service to you; who has newly opened the mine, you were pleased to afford your assistance in obtaining the lease for; and has already met with a firm load of magnetick ore, whose vertue much exceeds that formerly found on the top, having taken up some of an hundred and fifty pounds bulk. There is a reddish brown spar in it. They meet with antimonial ore also, and hope to make some farther discoveries in it. The miners, that dig in this work, find their right arm to be much pained, especially when they grow thoroughly warm in their beds: their hands likewise are for some small time contracted, and as it were scrimmed, by handling the magnetick ore, with its earth about it. The antimonial spirits or steams cause them (strong healthy persons) to vomit and purge lustily. In his ordinary tin-mines he has lately met with several strange loads, as some of marchasites, and black stone; some with marchasites in clay; and other some being broken very like the Guinea ore you gave me in *Oxford*; of which, and others, if you please to command any quantity to be sent you up, Sir *William Strode* has ordered me to acquaint you, they are ready; or if you shall be pleased to respite them, till you come down into these parts, for Sir *William Strode* lays hold on your promise made to his sons (who tender their most

most humble service to you) of visiting him, and those parts, this spring, where you will find a most hearty welcome, and it may be some content, in the many ocular demonstrations our mines and country may afford you, and may not fail of any thing convenient for an elaboration. Sir *William Strode* hopes you have not forgot the promised improvements of tin. Sir, the ill luck I had in my glasses (having broken all in carriage, except the tube, which you gave me; and that too, a sevennight since, just as I was about to fill it with mercury, provided for that purpose; which unhappy accident suddenly dashed all my great hopes of the future contentment I promised my self in making experiments in the depth of mines, on the top of high hills, and on the sea, at some distance from the land, and other places with it) makes me become an humble suitor to your honour for more, encouraged by your noble promise of baroscopes, thermometers, hygroscopes, instruments to find the degrees of heat and cold by a glass bubble in a cylinder of glass filled with water, instruments to weigh water by casting them into it, and instruments (if of glass) to measure the strength of the wind; humbly requesting, that the glass tubes for the Torricellian experiment may have *Hermes*'s scale, because there is somewhat more in melting the glass, than I am aware of. The carrier, that I employ to bring them down for me, comes out of *London* to morrow three weeks, *viz.* the 23d of February; before which time my friend Mr. *Batten* shall wait on your honour, for directions of inclosing them the safest way, who will see them carefully delivered unto the carrier. I humbly beg your pardon, as for my confidence in begging (assuring your honour, if any benefit may accrue by their use, and observation, it shall most gratefully be returned, only the pleasure detained to compensate my pains) so for my boldness in giving you the trouble to read me,

Your honour's

most humble admirer,

and most obedient servant,

SAM. COLEPRESSE.

SIR, if you desire any further satisfaction to any particular queries, I shall be ready to perform it to the utmost of my power.

Inclosed in the preceding.

Answers to the queries of the honourable Robert Boyle, *touching mines in* Devonshire *and* Cornwall, *Feb.* 1, 1666-7.

Tit. 1. 1. OUR country is generally mountainous, distinguished with vales, the hills much elevated, unequal in height, fruitful enough in the summer time to feed cattle and sheep, temperate, but exceeding rocky and solid, running confusedly in ridges, from west to east, nothing parallel the one to the other.

2. THOUGH the mountains in winter be exceeding cold, yet in the vallies they feed both oxen and sheep all the winter at grass, most commonly without hay.

3. HORSES, bullocks, and sheep, all of an ordinary size, colour, shape, longevity; the two last making very good meat, rather exceeding your eastern flesh in sweetness.

4. OUR inhabitants, especially in the most mineral places, are very healthy, and live commonly to a great age.

5. THIS country is well furnished with brooks, rivers, springs, and other waters; some physical, for inward receptions, others for outward applications, most of them well conditioned: the like counties for plenty of rivers are not to be found in *England*.

6. THE air is variable by reason of the mountains, mines, rivers, rivulets, and nearness of the sea (whose variation in short time might considerably be made known by the help of the thermometer, barometer, hygroscope, &c. had, or could I get any in those parts so remote from the place, where they may be obtained.)

7. EVERY vein, whether of metal, marble, or slate, alters the soil over it, both in colour and nature of our marble; red, white, grey, blue and black, well polished, are made curious tables, tombs, monuments, and closel-pieces; and the best, whitest, and most durable lime. Tit. 2.

8. 9. THE signs of mines are commonly on the surface of the earth, from whence usually by art the load is trained. Tit. 3.

10. IT has been observed in ground, through which the load of the silver mine at *Beere Ferris*, in our county, may probably pass, that certain places of the same mould and depth with the rest of the same field, neither bore corn, though manured, ploughed, and ordered in all respects as the rest of the field, or keep grass of the like length or greenness, but is quickly as it were burnt up, even in the winter: yet good mines, especially of tin, have been found in land worth three pounds per acre (no common price with us) as well as bad, and barren, but commonly in barren ground.

11. TREES and plants (for ought has been observed to the contrary) prosper alike.

12. PEBBLES of all colours, weights, degrees of hardness, even to the best porphyry, are found with us.

13. MUNDICK, or maxy, in tin-mines, makes the waters loathsom to taste, and smell, and gives them a blueish reem on the top, so does the silver ore; but for their containing of minerals must be deferred, till farther examination by evaporation, and convenient instruments for that purpose, be obtained.

14. SNOW lies not any considerable time, nor frost continues beyond what it doth in other places supposed to be devoid of metals.

15. FUTURE curiosities may inform, where common and blunt observations at present can give no certain intelligence.

16. IT is not only a common and received opinion amongst our common miners, but even

even verified by the testimonies of ocular witnesses of fiery meteors seen in the air by night (which they term the fiery dragon) to have its motion very swift from the orifice of one supposed mine, to the orifice of another neighbouring known one, by which some have been encouraged to open. Ignis lambens, and Jack with a whisp, and a waze, as they term it, are frequent in our parts; some of which I have this winter been an eye witness of.

17. In cold mornings great steams are observed to arise out of the orifice of opened mines; and they of *Beere-mine* prove not only copious, but very offensive to the smell.

18. By report the virg. divin. has been used in those parts with good success.

19. Only the shode, which lies upon the superficies of the earth, and in the adjacent rivers and brooks.

20. There are clays, marles, and earths, by which the load is adjudged to be nigh; but they are so differing and varying, in respect of their depths, and colour, as can scarce be reduced to any certain rule.

21. Marchasites are found; but it is most commonly the mineral stone, that is looked for.

22. Stones are known by their colour, weight, grute, and countenance of ore.

23. Chance of earth advises where to look after it.

24. There are no known or perceivable damps above ground, thereby to indicate a mine; for they may arise, where is no mine within seven miles.

25. Sometimes they meet with water before they come to the load, but when they come to the load itself, they meet with the greatest stream, which is carried through the heart (as they speak) of the load.

26. By the shode under the superficies of the earth.

27. Finding no shode, signifies their loss of the load.

28. The distinct and determinate kind of metals, or minerals, is known by the shode also, the plenty, by its ponderousness.

29. When they come to the shelf, they know that the load, or some string, is nigh at hand —— but

30. If, when they come to the shelf, they find no shode, or meet not with a string, they know they have missed the load, or intended place.

31. The shaft is commonly five, six, or seven, sometimes ten or twelve foot deep. Tit. 4.

32. Tin usually runs east and west, seldom north and south. In the highest mountains of *Dartmore* it dips towards the south, in the lower mountains towards the north; some dip more, some less, some perpendicular. Sometimes it runs horizontal. It has frequent flexures north, and south, and commonly retains the same form in several loads.

33. Some five or six foot long, and half as broad, perpendicular.

34. They are supported with timber, where it needs, which happens not always through the compactedness of the soil; but when it does, they use four foot strong laths, three wall plates, and three foot stemples, which, if of good oak, may last seven years.

35. One air-shaft (in case of a damp) three foot broad, and five foot long, two fathoms distance from the groove, and as many from that again to another, if necessity require it.

36. They meet with plenty of waters (as before) in the heart of the load.

37. They increase so much in the winter, that they oft enforce them to desist from working. They diminish in the summer. For the proportions, they are not so curious.

38. 39. Common pumps, winders with barrels, some with bags; where a convenience is, they make an adite, which they begin at the bottom, or lowest place, and so drive up on a level, till they come to the work.

40. Great damps commonly arise from mundick in the tin-mines, which perceived aforehand by the miners, through the filthy smell and dimness of their candles, immediately makes them give over, and leave the mine, till they make their air-shaft. Three men, some four years since, were killed by the sudden damps in a tin-mine, called St. *Anne's*, some eight miles beyond *Truro* in *Cornwall*.

41. 42. Our common miners make no known use of the magnetic-needle.

43. They sometimes use fire, made of hard wood and furse, to soften and calcine the great rocks they meet with; sometimes getting sixty seams, or horse loads, out of one rock.

44. This happening but seldom, the inconveniencies are less, and not observable.

45. Sledges of twenty pounds apiece, and gads, which are usually new pointed every week at least.

46. In summer they work cloathed in their wastecoats of thick cloth, and jerkins; but in the winter only in their shirts. They usually burn two candles a day (which is but eight hours, winter or summer) of twelve to the pound.

48. They get it up in barrels, and hollow trees made to kettles, by winders at the top.

49. Tin usually lies in a vein, or load, as it were a wall between too rocks, which is observed in the silver-mine throughout. It is sometimes interspersed in the firm rock; it is very oft found in grains, live gravel, which is termed grain, or stream tin, and the works called stream works. Sometimes it runs out of its harder consistence into a clay; as Sir *William Strode*, since my return, has found a very specious metal in clay, which is ponderous. Sometimes the load runs along in a free soil, without any teguments or medium of any petrified body, between the load and soil. Tit. 5.

50. No metal (only that little gold as yet found with us excepted) is found complete, or neat, in our parts.

51. The gold is found in thin plates of different dilatations, sometimes like shot, but not

not observed as yet to keep any shape or figure of other bodies designed by nature.

52. THERE is no exact proportion of distance from the surface of the earth observed by nature; for sometimes it is nigher, sometimes farther off.

53. TIN seldom has a twofold coat, more oft a single spar. The silver mine has always a twofold coat, somewhat like the skin in man.

54. TIN has, in some few places (to its prejudice) store of mundick mixed with it. There are several sorts of weed mixed with the tin, as mundick, white like silver, yellow like to gold, calx, ire-mould, daxe, &c.

55. THE answer annexed to this quere may not be augmented.

56. MOST commonly inclosed on every side.

57. TIN loads are sometimes two or three foot over, at a little distance scarce an inch over: digging perpendicular (which way the common miners suppose the load to be got down to the center of the earth, they find it to spread, and then grow narrow again. The teguments are usually proportionable to the vein, or load, included.

58, 59, 60, 61. SOMETIMES it runs out into very small veins, which as it were lose themselves in the earth; sometimes degenerates into a clay, as before; sometimes into stone.

62. THERE may be different ores (in respect of goodness) found in one load, which are differenced by the terms of fat and poor.

63. BIGNESS of the grain imports the fatest tin.

64. THREE gallons (containing about sixty pounds per gallon) of black tin, that is prepared for the fire, commonly produces an hundred pounds of metal, at one hundred and twenty pounds to the hundred. But some metal yields more, some less.

65. OUR tin ore very frequently is mixed with mundick, cale, daze, &c. our iron with gold and antimony.

Tit. 6. 66. TIN always, even that, which is found in grains, must be prepared, though the latter with more ease, by stamping, or knocking mills, which reduce the whole body to a very small sand; after which it undergoes a separation, in water, which carries away the heterogeneous bodies, leaving the oar behind, sunk to the bottom.

67. BY reason the extraction of noble metals is so little practised at present (but may in time be more) in those parts, I must be silent in this practical account.

68. TIN and silver ore are not exposed to the open air, or rain, as preparatives; yet our old tinners say, that tin rails being exposed for seven years, the mundick is rotten, and the tin receives an heart.

69. BEATING, or stamping (as before) is always a preparative for the furnace. And burning is always used in the tin ore, which contains any mundick, to burn away the mundick, which is burnt without wind in half an hour's time (and it is observable, that while the mundick is burning away, the flame is exceeding blue; and not only the men, that constantly attend the fire, whilst it is burning, do sometimes break forth about the mouth and face after a strange manner; but even the cattle, which grase where the fuliginous and fumous matter of the mundick may be supposed to fall, lose almost all their hair) but then the black tin is taken out of the fire, cooled of its self, rewashed, and cast up again.

70. No flux-powders are used in tin.

71. THEY melt their tin ore by the force of fire.

72. No considerable difference in the furnaces.

73. AN account to this and others may be expected hereafter.

74. THIRTY packs of charcoal (made of oak, but principally of furse, which by experience is found to run the metal sooner, and waste least, each pack containing three bushels of eighteen gallons to the bushel) last a whole week: yet in *Devonshire* they usually burn moor, or turf-coal, with good success) at a very cheap rate. In *Cornwal* they have usually run down eight hundred pounds of ordinary (but one thousand pounds of the best) ore in a tide, as they term it, which is twelve hours; with us scarce the moiety of it, to which the Cornish men reduce their proportion, for by running down so much, the greatness of their fire rather burns, than melts their ore, losing thereby above one in four.

75. No additament is used for tin.

76. THE tin-ore is melted with a wind actuated by the blast of bellows moved by an over-shoot water wheel.

79. THE metal being melted, runs down into a float, and from thence laden out with an iron ladle into various moulds.

80. WHICH are cut according to fancy in moor-stone; letting the metal cool of its own accord.

81. THEY rectify the fire and wind, if it either be excessive, or defective: the skill and cunning of melting especially consisting in this particular, *viz.* the degree of fire and wind.

82. To take out the dross, or mundick, which sometimes remain, they are enforced to melt down their metal again.

83. IF there remain any dross, it is always in the bottom of the globe.

84. THE best metal comes down first; only in one work, it is observed, that the best comes last.

85, 86. THE more it has of mundick, or other weed, the less price it yields; for sometimes a globe may be tardy ten pounds.

87. THIS (as above) sometimes happens in tin, to get out the remaining mundick. Their preparation is only to chop it in little bits, or pieces, and so throw it up, as before.

88. THERE are some corpuscles elevated, which, for the greatest part, are a metalline flower (though some are easy enough to be distinguished) reducible into a mass, without any considerable diminution of its ponderousness.

89. IN the common tin-ore one thousand pounds of tin yields three hundred pounds of slag; which, being prepared in the stamping-mill, is thrown up again into a furnace, which

which yield ſome conſiderable portion of tin.

90. THE tin-ſlag may, by being expoſed to the open air and rain for a time, be ſooner prepared in the mill, and melted down; but whether it yields more, or better metal, I cannot yet underſtand.

Underwoode, March 19, 1666-7.

Noble Sir,

THAT my ſenſible acknowledgments of your great favours had been no ſooner on their way to attend your honour, proceeded not from that abominated principle of ingratitude, but my obligement to be at our aſſizes held at *Exon* the laſt week: and therefore am the eaſier induced to hope for your pardon of a conſtrained backwardneſs in returning my moſt humble thanks for the box of glaſſes, which came ſafe to *Plymouth*, March 5. but the two water-gages were by a great froſt broken, March 7. before they came to my hands. I hope you have received by this time a box of ores, which by Sir *William Strode*'s order I ſent away from *Brent*, March 1. principally intended for preſent experiments, not for your mineral repoſitory; for which I am daily ſolicitous to prepare a box of mine own collection of the diverſities of ores, weeds or marchaſites, clays, and earths, our mines and country afford, together with a diſcourſe of the art of training, digging, dreſſing, and blowing of metals, as an addition to what I formerly (though haſtily) preſented your honour with on the like ſubject. But this I fear may not be ſo quickly effected, as otherwiſe I could wiſh; ſeeing he muſt patiently wait, not only for a bare opportunity, but even a good humour, wherein to treat with our ſkilful miners, that intends to receive any ſatisfaction to his demands of this nature. That unlucky humour of ſullen and ſurly reſervedneſs being commonly annexed, not only to the ſkilful, yea and pitifully ignorant profeſſors thereof, but even the profeſſion itſelf: and here I muſt humbly beſeech you not to conſtrue it a wilful neglect in me, if it come not ſuddenly. I had the good luck to meet with this good humour once, which I was not over-backward to improve by getting an ample account of training; neither do I doubt (in time) of the reſt. Sir, I was lately, by the common brute of a new metal found in ſuch a place, invited to view the ſaid place (though ſome miles diſtant from me) not altogether loſing my labour (yet meeting with no other metal than the black flint in its embrio;) for in a perpendicular body of ſand (ariſing even with the ſurface of the earth in the ſide of a high cliff) ſome forty feet over, incloſed on each ſide with huge continued rocks of marble; I obſerved a little vein of odd clay about four inches thick, and five over, to run quite through the middle of the ſand horizontal. Its colour is much red, mixed with ſome ſtreaks of white, exceeding cloſe and ponderous; eaſily diviſible into angulous forms, much like the little ſhelfy ſtone, which induces me to believe it is the marble (of that colour) in its embrio, though by many degrees more petrified than ſome ſuch ſuppoſed matter I formerly ſaw, and, as I remember, gave you an account of, obſerved in the (ſometime talked of) cave at *Plymouth* (this place is not far from it.) Its taſte is ſo pleaſingly ſweet, and its matter ſo fat, that I could ſcarce content my palate with the modicum of an ordinary trial. In the ſame ſand I found an earth of a blackiſh colour, running confuſedly in veins alſo very fat and light; of a ſweet taſte, and pleaſant ſmell, being chafed between the fingers, colouring them and paper with an indifferent glaſs, on which I immediately writ without any great difficulty, though laid on pretty thick, without any mixture of a moiſt body, yet lying dry in a box (in a chamber) above theſe five weeks.

I CANNOT pretend to ſuch a compliance with Sir *William Strode*'s deſires, as his merits and my many obligations lead me to, without acquainting you, that we have an old woman in our parts, who is eminent for the cure of what has been accounted the opprobium medicorum, *viz.* the opening and clearing of the obſtructions of the milt when diſordered, only by the exquiſite ſenſe of her hand performed by ſtroking the reſpective vein without any other perceivable ceremony: a good experiment whereof ſhe has lately wrought on Mr. *Charles Strode*, the youngeſt of the two gentlemen, that were with me in *London*, who was for ſome time ſenſible of a continual and almoſt inſupportable pain in his left ſide, and ſhoulder, who felt the pain to fly from place to place under the good woman's hand, immediately after a quarter of an hour's ſtroking; and the place in his ſide, where his pain (juſt before ſtroking) lay, to be very hollow, even to admiration. She has performed moſt notable cures of this nure.

WHAT you mentioned concerning Minver ore, *viz.* lead and antimony, I am ignorant of; neither doth Sir *R. W.* remember, that he preſented you with any ſuch; but if it be any, that was preſented you by my hands, you may have any quantity you ſhall be pleaſed to command. Fondly perſuading myſelf, that ſuch relations will not be overmuch diſpleaſing to your honour, I have given the greater liberty to my ſcribbling pen, humbly craving your pardon for being too tedious, and leave to ſubſcribe,

your honour's deeply obliged,

and moſt obedient ſervant,

SAM. COLEPRESSE.

WE want not waters, but inſtructions how to make good vitriol. Juſt now the abovementioned old woman came in, who tells me ſhe

she had this skill communicated to her by a Dutch surgeon of a ship brought in prisoner to *Plymouth* about forty eight years since, living in the house as a servant then, where this Dutchman performed a notable cure on her master: but he added, that she would never be perfect in this skill, till she had seen a person opened, which she did about twenty years since, from which time she has never failed in the cure. She has publickly professed it these ten years, and is now teaching her daughter the said skill.

Underwoode, June 15, 1667.

SIR,

RETURNING from *Cornwall* the last week, I found at *Nunam* the two glasses mentioned in yours of May the 18th, but indeed not without some wonder (for they were sent to *Wells* in *Somerset*, a road far distant from ours, and accidentally lighted on by a servant of Mr. *Strode* of *Barrington*-house, in that county, to me a stranger, who yet, out of his respect to Sir *William Strode*'s name and family, took care, though through several hands, for its safe arrival) a favour, when I wrote last to your honour, that was then as far beyond my expectation, as it is now above my abilities enough to acknowledge. I had not the convenience of taking any of the strong spirit till this morning in Borage-water; some of the good effects whereof I am even already very sensible of, by smelling thereunto, confidently presuming on its intended admirable effects. Sir, I dare assure myself it will not be overmuch displeasing to you to read an account (by way of return together with my most humble thanks for those many renewed favours your honour has been pleased to grace me with) of some few baroscopical experiments, which I offer not as new; but farther confirming your hypothesis touching the weight of the air. On May the 25th (67) I filled my tube with ☿ (having bestowed several days space to cleanse it from other drossy dirty bodies mixed with it) according to the usual way; which immediately upon the inversion thereof, subsided at 30 inches and $\frac{1}{4}$ of an inch, and so remained till the Monday following, when by seven in the morning I carried it up half ways a meanly elevated, but steep hill, where, upon fastning it to a tree, the ☿ presently subsided at $30\frac{1}{32}$: and coming to the top of the hill it descended to $29\frac{7}{8}$: the weather was very fair, and hot, but a brisk easterly wind, about full sea. Upon my coming down, I placed the B. on the same tree at the middle of the hill, and found it quickly risen again to $30\frac{1}{32}$, which cleared my doubts of any mistake: but placing it in a cellar, lower in the valley, than our house some few fathoms perpendicular, it ascended to $30\frac{9}{32}$, which was the highest I ever yet observed the ☿ at. But repeating this experiment on the same hill, at the same places this morning, being close, but fair, when I went out of our house, I found it to fall short $\frac{1}{32}$ of what the ☿ proportionably fell the first experiment, *viz.* that $\frac{3}{8}$, this but $\frac{2}{32}$; which seems somewhat strange unto me, unless the falling of a shower, and full sea, when I was at the top, might cause it to ascend; for indeed the ☿ was higher on my coming down at the middle of the hill by above $\frac{1}{32}$, than it was at the same place when I went up; and it rise almost $\frac{2}{32}$ on my return above what it was in my chamber above an hour before. May the 7th I attempted to know, what alteration in respect of weight the sound of bells did make in the air, placing my B. without the bell-chamber door in the midst of a peal; but could perceive none (which I attributed to the too much air, and some water in the tube, it being then unskilfully filled) but observed this, that the imprisoned or latitant air in the body of the ☿ did nimbly and frequently enlarge its self, by getting up in little bubbles into the empty part of the cylinder, which I humbly conceive was merely set at liberty by the effects of the sound on the air; and that at seventy feet's height the ☿ fell about $\frac{1}{8}$. I have not as yet found the ☿ to be lower than 29. My late indisposition of health, and some other private business has hindered my prosecuting some (more curious) intended experiments and the gaining the remainder of my promised mineral account, which I hope very speedily to effect. I had made ready some of the supposed talc with some other minerals: but being advised by Sir *William Strode* to respite them, who hopes you will begin your journey for those parts before the box may arrive; and conceiving your own choice on the place may be more pleasing, I forbear to send them up, and further to trouble you at this time, than to read me,

Your honour's infinitely obliged,

and most obedient servant,

SAM. COLEPRESSE.

SIR *William Strode* and his sons present their humble service to you.

Nunam ☿, Nov. 13, A. 1667.

SIR,

AS I came from *Plymouth* this morning, I very fortunately met with the conveniency of Mr. *Verman*'s speedy intentions for *Oxford*, whereby I am only enabled at present briefly to acquaint you with my receipt of both your extraordinary favours, that of the spirits last Friday, and of the book but this very morning: and with the return of my most humble and heartiest thanks to your honour for them, I took some of the spirit in pimpernell-water (the first that came to hand) last Sunday morning with very good success: the sense and vigour whereof by Monday morning expelling in a great measure, that

that of stupifying pain, which has all the last summer somewhat (though not so much since the use of your former spirituous medicine) afflicted my head, and but little less impaired all the exterior and interior senses; but I trust by God's blessing on this medicine will be recovered again. I have lately on request from Mr. *Oldenburg* made a small mineral collection for your Society, intending shortly to speed it for *London*, and to inclose a copy of its catalogue for you, with an account (to me and others somewhat odd) of the operative effect of the oleum succini, or it may be of your former spirit, in my head, which my haste at present will not permit, being to go into the East for some few days very early to morrow, if the weather hinders not. The ☿ in the barometer has within those few weeks measured all the degrees betwen 30½, and 28. I humbly beg your honour to pardon this so slender a return as being sudden, and leave (though abruptly) to subscribe

your honour's most obliged,

and most obedient servant,

SAM. COLEPRESSE.

Leyden 4, Aug. 30, A. 1668.

Noble Sir,

IF this attain the honour of kissing your noble hands at *London*, together with the worthy Dr. *Sampson* (my honoured friend) I may hope for your excuse of my more than uncivil silence, and this the sooner, by the advantage of his mediation, whose parts and travels cannot be but well pleasing, if you fall on that subject.

I KNOW not, whether it may be new to acquaint you, there is a blind man at *Copenhagen* can as well distinguish colours by his touch, as he at *Utrecht*. This I am assured of by an ingenious person of this academy, that came lately from thence, and has accurately repeated the experiment several times.

SIR, my present designs are to settle here for some time, making divinity my principal study. If you shall be pleased to honour me with your commands, it will not only be matter of great comfort, but an occasion of expression, how much I desire to be continued in the quality of

Your honour's humblest and

most obedient servant,

SAM. COLEPRESSE.

ANY superscription for me a student at *Leyden* may come safe.

Leyden, h Apr. $\frac{3}{13}$, 1669.

Great Sir,

IN the beginning of January last, on the return of a student here from *London*, I received by Mr. *Oldenburg*'s means, the honour of your incomparable piece, the Continuation of New Experiments, *&c.* as from your honour: whereby my ambition immediately challenged the subscription of *Ex dono nobilissimi authoris*. But this return was so early succeeded by a new arrival of the learned and judicious Mr. *Bernard*, and Dr. *Wallis*'s hopeful son, full fraught with your noble and affectionate remembrances of me; but withal adding, even at their entrance, that they should as speedily consult a return; that it is all the apology I can frame to excuse myself from more than uncivil neglect, in not making my humble acknowledgments (which is all your honour at last must accept of for your weighty favours) much sooner; unless your kindness shall well interpret the fear I had to present you with but too costly thanks. And now before I mention this last (whose title page I may, by leave, justly alter thus: A continuation of renewed experiments of signal favours towards *S. C.* by the honourable *Robert Boyle*) and that unparallelled piece, the Origin of Forms, and Qualities (and indeed the origin of your favours to me of that quality) I must add these two divine pieces, your never enough to be acknowledged Style of Holy Scripture, and Seraphick Love, and return you innumerable most humble and cordial thanks; for the two former in a more especial manner, the latter on a general account; a hasty sight of which I got so long as to peruse so much (by an Oxonian's favour, that went suddenly for *England*) that I find myself, and those (it may be) that have spent more years in that sacred study, than I as yet weeks, to be highly engaged to express our sense of that almost unimaginable favour you shewed our robe, in vindicating that, on which our whole structure stands, and taking off a calumny, but too often made use of by the nobler sort, *viz.* that what the *Theologi* write on that subject is but partial, and, that they do it more for the maintenance of their profession, than out of pure ingenuity, and their own natural persuasions, *&c.* Sir, if I am incapable to present you with an account of what new notions and experiments are, or may be, sprung and practised here, in medicine or chemistry, you will, I doubt not, forgive me, since I have betaken myself to pry a little into that study of studies, wherein I begin to find in a few weeks, and as few sheets, very many inextricable difficulties, and subtilest nodes (perchance first sought for by the schoolmen) yet perceive a far greater difficulty (nay as yet altogether impossible) to reconcile what in most books is laid down so positive, and seeming plain, to my undirected intellect, where it may be lies the defect. Heartily glad should I be, could I receive satisfaction from a person, that would but deal ingenuously with me, (the most part as yet telling me, this, and this, we must believe and say, but why, and how, nay what we know not,) even in things, that have the general repute of being most orthodox.

YESTER-

YESTERDAY I received an anſwer to ſome mineral queries, I formerly ſent to *Copenhagen*, by his means, that addreſſed it to me, whoſe name it bears. His correſpondent there aſſures him, he had it from the able and experienced Dr. *James George Secmann*, which I humbly offer you, (on the ſcore you were pleaſed ſometime ſince to recommend the mineral queries) together with a few of our diſputations; which, if with the ſeries of mineral ones, not yet compleated by the profeſſor, four or five wanting, ſhall be but graced with your acceptance, though I intend them not to repreſent any new thing to you, but as a teſtimony, that I have a ſenſe of thoſe many ſtrong obligations you have been pleaſed to lay on me, and very earneſt and affectionate deſires of performing ſome piece of real ſervice to you, if ever occaſion may preſent, it cannot but infinitely engage,

Noble Sir,

your moſt humble, and

moſt obedient ſervant,

SAM. COLEPRESSE.

MR. *Strode* paſt ſafe hence to *Flanders*, by the way of *Amſterdam* and *Utrecht*. I ſhould have preſented you now with *De Raie*'s Oration *De Sapientiâ Veterum*: but underſtanding Mr. *Oldenburg* has it, and Mr. *Bernard*, I forbear, till it be compleated by a ſecond, which is to come, on which that extant depends. I have not foreſtalled Mr. *Bernard*, whoſe quality entitles him to more curious narrations, than I can attain the knowledge of.

SIR *William Strode*'s news of your viſiting thoſe parts will be exceeding well-pleaſing.

Letters from Dr. Hyde *to Mr.* Boyle.

Queen's College, *Oxon*, Feb. 14, 1666-7.

Worthy Sir,

PREMISING my ſervice and thanks for all your favours, I make bold to preſent here unto you a paper tranſlated out of ſome Arabick and Perſian authors, giving an account of ſome of thoſe things enquired after in your monthly Tranſactions. The firſt is of ſal ammoniacum, called by the Perſians Nuſhâdur: and this name may be lawfully written ſeveral ways, as alſo Nuſhâdir, or Alnuſhâdur, or Alnuſhâdir, or Annuſhâdur, or Annuſhâdir; and no otherwiſe, although in ſome chemical books it is ſo ſtrangely deformed, that one could ſcarce gueſs it to be the ſame word. The ſecond thing is of petrifaction, and the third of amber, which is the very name, which the Perſians and Arabians commonly call it by. I have likewiſe incloſed a letter to Mr. *Denton*, at *Conſtantinople*; which if you can ſend, you will do me a great favour; which I humbly entreat of you, becauſe I myſelf am wholly unacquainted with the method of ſending to thoſe foreign places, and ſo cannot give myſelf any aſſurance, that my letter ſhall arrive at the deſired place, unleſs it be by your aſſiſtance. I alſo intreat you to be pleaſed to let me know, where I may find the quotation you once mentioned to me concerning *Hermes*'s triple book, occaſioned by me telling you of ſuch another book fathered upon *Zoroaſtes*, or, more rightly, *Zerdûſht*. Dr. *Pocock* is recovered of that dangerous lameneſs and ſore by his heel, which kept him within doors ſo long. The lord of *Oſſory*, lord *Douglas*, and Sir *Nicholas Armorer*, were created doctors of law, as they paſſed through *Oxford*, and ſeveral noblemen of the univerſity were together at the ſame time created maſters of arts. Thus craving pardon for giving you ſo great trouble, I ſubſcribe myſelf,

SIR,

your very much obliged

friend and ſervant,

THO. HYDE.

I HAVE among other things deſired Mr. *Denton* to enquire, if there be any chemiſts about *Conſtantinople*, and to get as many of their books as he can, if there be any; and alſo to enquire for any, who have written of minerals, or any other ſuch curious ſubject.

Queen's College, *Oxon*, March 4, 1666-7.

Worthy Sir,

WITH my thanks for the trouble I have given you already, I make bold, according to your advice, to ſend here another letter to the ſame effect as the former, intreating you to be pleaſed to convey it for me. If for the future I meet with any thing in oriental authors, that may illuſtrate natural knowledge, I ſhall be ſure to take notice of it; and I hope hereafter I may be capable of doing you more conſiderable ſervice, when my buſineſs of making the Catalogue is finiſhed; I now having very little leiſure to make a ſearch, except I can recollect any things, which I have read heretofore. I hope likewiſe we may obtain more conſiderable books of ſuch kind of learning, if we can procure ſome perſon or other to defray the charge of buying them; for their books being all written with the hand, are twice as dear as printed books are here in *England*, except one, who lives upon the place, will be very diligent in watching good opportunities of getting them cheaper. If you can poſſibly recollect the citation of the triple book of *Hermes*, I ſhould be exceeding glad to know it, when you come to *Oxford*. In the mean time, I remain,

SIR,

your much obliged

friend and ſervant,

THOMAS HYDE.

IN

IN the papers I ſent laſt, there is a note concerning oud, that it ſignifies properly lignum aloes; and that is, indeed, the uſual acception of it in moſt authors. But I find ſince, in *Emircond*, a Perſian hiſtorian, ſome mention of oud, and he ſaith, that the Indian oud is like to wax, and melteth, if it be put to the fire. And if ſo, then amber may properly enough be called by the ſame name, as it is in the Perſian author, whence the papers I ſent were excerpted.

Oxon, Saturday, May 20, 1671.

Worthy Sir,

FOR the ſatisfaction of you and my other friends, with whom you ſhall happen to converſe, this is to aſſure you, that this very hour (it being ſix of the clock in the evening) I have finiſhed my long and tedious work of the Catalogue, ſo that it ſhall not lye at my door any longer. The next thing is to get in as many new books as we can, and ſo put it to the preſs as ſoon as the act ſhall be paſt; for I ſuppoſe it can hardly go to the preſs before that time. No more at preſent, but only to ſubſcribe myſelf,

SIR,

your very much obliged,

and moſt humble ſervant,

THOMAS HYDE.

Oxon, Oct. 23, 1671.

Worthy Sir,

I HAVE here ſent you ſome rude papers upon the beginning of Geneſis; they are yet but imperfect, becauſe I ſuppoſe, that upon ſecond thoughts I ſhall both add and alter abundantly, as I ſhall hereafter ſee occaſion. In this manner I ſhall go over the whole Pentateuch, if you think it worth the while. And I intreat you to be pleaſed to tell me freely, what you miſlike, either in my matter or method; for I have not gone ſo far, but that I can eaſily change them both, if it ſhall be thought fit. My method is to give a true account firſt of the Hebrew words, and, ſecondly, to examine how far the oriental verſions do agree with, or diſagree from, the original. For Latin interpreters have not always done their part, ſometimes for want of ſkill, and ſometimes being fearful to recede too far from the Hebrew; ſo that the oriental verſions are many times not ſo well interpreted as they ought to be; and therefore it ſhould ſeem neceſſary to examine them particularly and critically, which I ſhall do according to my ſkill, if it may be acceptable; and in what I ſhall in this kind perform, I ſhall always uſe my own judgment and my own genius, before I look upon any author's, becauſe I will not be led by them. But after I have firſt tried my own ſkill, then I may conſult other criticks, to ſee how far they and I do agree or diſagree: for I do not account it any thing worth for me to collect what others have done already; if I cannot produce ſomething that is new, I ſhall forbear to ſay any thing: and therefore I ſhall conſult chiefly ſuch authors, as have not been peruſed by Europeans; and if, out of thoſe my eaſtern authors, I can, towards the explication of the ſcripture, produce ſuch things, as have not been yet found, or rightly applied, by other men; then I ſhall think my time and labour well beſtowed, and that my eaſtern ſtudies have attained their right end, *viz.* the glory of God, and the edification of others in the truth and right underſtanding of his word. But neither to this, or any other of my own ſtudies, can I apply myſelf, until I have got ſome acceſſion to my livelihood, that ſo I may be delivered from the ſlavery of labouring for my bread. Wherefore you would eternally oblige me, if by any of your friends you could procure for me ſome good prebend or fine-cure, or maſterſhip of an hoſpital, or any ſuch kind of thing, which would not too much call me off from my ſtudies. As ſoon as I can receive information in one or two particulars from beyond ſea, which I every day expect, I ſhall ſend you ſome of my obſervations, in which I have taken more elaborate pains, *viz.* an account of the bird dukiphath in Leviticus and Deuteronomy; an account of the hyſſop mentioned in ſcripture, wherein ſome other obſervations about herbs are accidentally mentioned; and, thirdly, you ſhall have a true and full account of the doves-dung eaten in the ſiege of *Samaria*.

I INTREAT you to be pleaſed to uſe your endeavours to ſecure the Eaſt-India chaplain's place for Mr. *Fraunce*, for I do verily believe he will be an induſtrious perſon in his duty, and he is alſo willing to tarry beyond that time, which is prefixed; and, ever ſince I mentioned it to him, he doth depend upon it. We have here lately, upon the death of Mr. *Wilkins*, choſen one Mr. *Waſe* to be our architypographus and beadle: he is a very good ſcholar, tolerably well verſed in ſeveral both eaſtern and weſtern languages, and is an excellent critick in Latin and Greek, and is a very ſtudious and induſtrious man; and yet our heads of houſes are much offended, only becauſe he was not the man, whom they aimed at. There was alſo the king's letter, which named no man in particular, but did in general adviſe us to chooſe a fit perſon.

THESE firſt papers, which I here ſend, perhaps may not be ſo pleaſing to you, becauſe they have ſo many things in them, which are merely grammatical; but when I come a little farther to deal with paradiſe and its rivers, that will afford other kind of matter. In the mean time I remain,

SIR,

your much obliged, and

moſt humble ſervant,

THOMAS HYDE.

Thursday, Feb. 1, 1671.

Worthy Sir,

I RECEIVED your last, and my friend Mr. *Fraunce* is ready, at the very first summons, to come up to *London*. He is a good scholar, a personable man, and of sober conversation, and usually pleaseth very well in his faculty of preaching. He would come up to *London* presently, but he is not well able to bear the charge of lying there, it being a chargeable place: and therefore I would intreat you to be pleased to order the business so, that he may be called, when the time is very near, if it be not so already. I suppose it is a constant custom to let the chaplains have a part of their stipend beforehand, by way of advance, that so they may fit themselves with clothes and books, and other necessaries for so long a voyage. And therefore my friend hopeth and dependeth upon that favour, that he may have thirty or forty pounds advance money, which shall be accounted towards the payment of his stipend, which the company usually allow to their chaplains. I have here inclosed a few lines of chemistry, which I endeavoured to translate out of an Arabick author, who hath some few more things of the same nature. But I find, that it is a hard matter to translate any thing in physick or chemistry, except a man takes a pretty sufficient time to instruct himself in the terms of art, and other præcognita, which are necessary for a good translator of such things: and he who, setteth rashly upon it without such preparation, can hardly expect to come off so well as he ought, although otherwise perhaps he may be tolerably versed in the language he dealeth with. If I hear nothing more from you by the next post, then my friend shall come to *London* next week: but if without danger of miscarriage, more space may be allowed, then I intreat you to be pleased to signify the same to,

SIR,

your much obliged, and

most humble servant,

THOMAS HYDE.

Inclosed in the preceding.

The composition of the grand and universal elixir, according to Geber.

SCITO coryphæum Gjaberum certiores nos fecisse in relationibus suis ex Socrât, quòd elixir perfectum est illud, quod ducitur seu regulatur ex omnibus corporibus.

COMMENTARIUS.

Dico quòd in faciendo hoc elixire perfecto sunt modi sive ingressus, separationes, et trutinationes, deducta à re substratâ dividenda. Et hoc est, ut corpora impura fiant pura munda, adducta seu vergentia ad rubedinem. Debet [debent] esse de Saturno 3. de Jove 4. de Marte 5. de Sole 6. de Venere 7. de Mercurio 8. de Lunâ 9. Liquefiant Mars & Venus primò: post completam purificationem [depurationem] et mollificationem, [lenificationem] tum adjiciatur illis Jupiter, deinde Saturnus: tum pascatur tota massa malgamatione, quæ fit ex duobus luminaribus et Mercurio, paulatim; donec se tota absumpserint in massam per 3 horas. Tum evacuetur tota massa in locum unum de novo in oleum dulce et defæcatum [clarum.] Tum sumatur tota massa, prout est corpus unum stans seu consistens in medio corporis novi, in quo est compositio secundum modum medium, et adjiciatur ei de coronâ victoriæ quantitas tertiæ partis ponderis ejus. Tum imbibat imbibitiones decem, donec perficiatur elixir perfectum proficuum ad magnam utilitatem.

Gjaber docuit operationes elixiris ex animalibus, ex herbis, ex lapidibus, et miscuit aliquot operationes alias cum aliis: et commemoravit elixir compositum quod imbiberit de aquâ (succo) herbarum et tincturâ animalium, &c.

COMMENTARIUS.

Ad ejus explicationem dico, quod elixir perfectum, quando pervenerit ad completionem suam juxta modum medium, et imbiberit de tincturâ animalium subtiliori, quæ fit sicut simplex, tum amplectetur eam ad perfectionem suam, et convertet eam in seipsum, infiget in eam tincturam suam, et fixabit in eâ utilitatem suam. Et sic est opinio nostra de tincturâ specierum aliquot herbarum salutiferarum veneno expertium, quòd viz. earum elixir perveniet ad effectus magnos ac utiles in omni eo, quod potest esse propter medicinas morborum ac infirmitatum: eò quòd hoc elixir colligit quicquid est utile ex herbis et animalibus, et solvit et condensat: est enim antidotum magnum et elixir universale: et ceratium (i. e. pondus ceratum) ex eo prodest ad utilitatem magnam, per Dei permissionem.

Si autem pars elixiris imbiberit de succo herbarum venenatarum, aut fellibus animalium venenatorum, uti sunt viperæ, pardi, et animalia rapacia; tale elixir erit venenum lethiferum interficiens mero tactu celeriter: et granum ex eo (i. e. pondus grani tritici) interficiet elephantem, qui exinde fiet venenosus: (viz. caro ejus fiet venenosa.) Deus autem nos liberet ab hoc. Et quidem hujus mentionem non fecissemus, nisi ut solveretur id quod posuit (i. e. asseruit) Gjaber, ut explicaret nobis quid in elixire esset utilitatis aut noxæ; ita ut si fortè obtinuerit aliquis elixir quoddam ex thesauro aliquo, aut illud sibi comparaverit à medico, non procederet ad medicinam exercendam per illud, donec sciat originem ejus et summum ejus, et ex quibus rebus sit compositum.

As for that on the other side this paper *, I think I have translated right enough; but on this side † there is more difficulty, so that I being not an adeptus, or son of art, cannot be altogether so certain, whether I have expressed all things so punctually right as they should be. But I have endeavoured, as near as I can, to express the sense of the Arabick words of my author; and, I hope, that I have not very much missed his scope. I suppose

* Viz. from *Scito coryphæum* to *tincturâ animalium.*

† Viz. from *Ad ejus* to *compositum.*

pose *Socrât* may be the name of some of *Geber*'s books; otherwise I know not what it is.

WHAT is here in this paper included in parenthesis, is my own edition, and not the words of my author.

Oxon, Sept. 3, 1676.

SIR,

DOCTOR *Marshall* presents his humble service and thanks for your readiness to favour him: but I doubt Mr. *Watson* hath left *London* by his father's importunity, so that all business with him is at an end at present.

As for the Malayan gospels, they were printed in Dutch and Malayan at *Amsterdam* 1651, in quarto. I suppose they are done after the Dutch version, which is according to *Beza*. The two former Evangelists, *Matthew* and *Mark*, were turned into *Malayan* by one *Albert Ruyl*, the two others by one *Jan van Hasel*; and in our edition the Acts of the Apostles were added by one *Justus Heurnius*, who professeth to have corrected the version of the Evangelists, and compared it with the original text. So that I suppose the version is exact enough, they being ministers and chaplains there, who did it, by the command of the *Heer Generael Pieter de Carpentier*. I am sorry I could not meet with the lord *Berkeley* to pay my respects and thanks to his lordship: wherefore you will favour me, if you please to present my humble service and thanks to his lordship, and let him know, that I was four or five times to have waited upon him. I doubt the nights are grown too cold for the Eastern seeds, neither is there summer enough to bring them to perfection; so that perhaps it will be best to keep them till next May.

I MOST humbly thank you for your readiness to help my friend Mr. *Broom*, when you shall find it may be conveniently done. In the mean time I remain,

SIR,

your deeply obliged, and

most humble servant,

THOMAS HYDE.

Oxon, Easter-Tuesday, 1667.

SIR,

I HAVE by Mr. *Moor*'s waggon sent for you a little packet, which contains seven sheets of the Malayan gospels: what we have already done takes in the beginning of the gospel of St. *John*. I intreat you to be pleased to let your man call for it at Mr. *Moor*'s ware-house at the *Saracen's-head* without *Newgate* any time on Thursday, for it will come to *London* on Wednesday night. As for the Arabick book of curious receipts, whereof you desired the heads, I have looked upon it, and do find, that the heads are too general to do you any service: as for example; chapter concerning puppet-plays; chapter concerning tricks with rings; chapter concerning tricks with cups and glasses; chapter concerning tricks with fireworks, and so the rest, Now under each of these heads or chapters he brings divers instances to his purpose, which must be given in particular, whenever they are to be serviceable. In the mean time, for your present satisfaction, I shall give you this brief account, *viz.* That upon perusal of the book, I am not of the same opinion with Mr. *Watson*, who thought all things were put under disguised names; for to me they seem to be written plainly as the author intended them to be understood by the reader. But that, which put Mr. *Watson* into that opinion, might be the ridiculousness and impossibility of some of them; which I rather attribute to mere superstition and enchantment, of which many of them do much savour. As for example, To walk on the water, take a piece of the skin of a crocodile, and of a sea-horse, and of divers other water-animals, and when the sun is in such a sign, and the planets in such a conjunction, make yourself shoes of the said skins, and with these shoes you shall walk upon the water, without sinking. And there are many more as ridiculous as this, which I have mentioned. But of those, which seem to be more serious and practicable, be pleased to take this following specimen. To sow seeds, which shall grow up presently, take Indian barley, and seeds of cucumber, and steep them in the blood, which comes out of a cupping-glass: there let them steep seven days, standing in the sun. Afterwards take them out of the blood, and lay them upon a clean paper in the sun seven days more. Afterwards wrap them up in a piece of cotton cloth, and keep them for your use. Get also some of the fine earth, which sticks to the plough-share in the time of ploughing, or seed-time, and keep it for your use in a new cotton bag. And when you come into any company, where you have a mind to show this trick, take some of this earth (not letting the company know but that it is common earth) and make it into little furrows, and sow your corn in it, and sprinkle it well with warm water, and cover it with a cloth born up hollow by little sticks set upright about it; and after two hours it will grow up. When you have a mind to put an egg into a narrow mouthed bottle, or to draw it through a ring, take a new-laid egg and put it into wine-vinegar, in which hath been dissolved some sal armoniack: leave it to soak in this liquor, which will soften the egg-shell, so that you may put it into a bottle. And when it is in the bottle, put ordinary water into it, and it will harden again, and look like a firm egg. When you have a mind to break an egg, and find writing on the inside of the shell, write first upon the outside with water, in which hath been dissolved chalcanthum, and write the same strokes

ſtrokes over again the ſecond and third time: and after it is dried, throw it down and break it, and you ſhall find red writing on the inſide of the ſhell. When you would have an egg like the ſun-beams, take a freſh pigeon's egg, and by a little hole ſuck out all that is in it, and leave it to dry; and fill it up with dew, and ſtop the little hole, and put it into an hot place, and it will fly in the preſence of the company to their great wonder. To make an egg ſtand faſt upon any convex ſuperficies, though it is ſhaken, ſuck out what is in the egg, and fill it again with quick-ſilver, and ſtop it with wax, and it will ſtand upon any round place. If you deſire to put fire into your mouth without any hurt, take ſal armoniack, and an herb called pyrethrum, and chew them well, but do not ſwallow any of your ſpittle: and then putting an hot iron upon your tongue, it ſhall hiſs, but not hurt you. If you deſire to carry fire, and it ſhall not hurt you, take yellow arſenick and alum, and grind them well together: then take ſome juice of ſenagreen, and ſome of the gall of a bull, and with this anoint your hand, and no fire ſhall hurt it, neither ſhall you feel the heat.

WHEN you deſire to ſet fire on any one's clothes without hurt, take froth of the ſea, of egg-ſhell, and of quick-lime, of each a like part, and grind them well together, and wet them with old wine vinegar: then beſprinkle his clothes well with this liquor, and alſo ſcatter ſome of the dry compoſition upon his clothes, and putting to fire, it ſhall burn without hurting: and when you would quench it, caſt on cold water. Take red arſenic and alum, and work them well together with the white of an egg; and rubbing ſome of it upon your hand, if you carry fire, it ſhall not hurt you.

WHETHER theſe are of any uſe, you can judge: to me they ſeem of but little worth. But there are here and there ſome few thereof, which ſeem practicable, the books being pretty large in quarto, as thick as one's thumb. The author is *Abu'l Kaſim Irakienſis*, commonly called *Sheich Ahmed Irakienſis*. There are in the book many odd words proper to the author's own country and dialect, which are not to be found in any dictionary. But towards the end of this ſummer, I look for two men, who are natives of thoſe parts, who perhaps may unriddle the hard words for me. It were to be wiſhed, that we had in *Oxford* a college for the maintenance of ſome able men out of the ſeveral eaſtern countries; it would be a great help to all eaſtern learning: and when the church of *England* ſhall be ſo zealous as to have a college *de propaganda fide*, ſuch eaſtern men being amongſt us, would enable us to be ſo accuſtomed to the true and genuine pronunciation of thoſe languages, that ſo our emiſſaries might be enabled to diſcourſe readily with the natives; for book-learning alone will not do it. And therefore I, for my own both benefit and pleaſure, do catch at all opportunities of diſcourſing with the natives of thoſe countries in their own languages. But having been too tedious, I only ſubſcribe,

SIR,

your moſt humble ſervant,

THOMAS HYDE.

Oxon, July 31, 1677.

SIR,

YOU may juſtly wonder, that you have heard nothing from me thus long; the reaſon was, becauſe I hoped at one trouble to ſend you the whole, without interrupting you with ſuch frequent letters. But the extreme tedioufneſs of the printer (he having gotten another piece of work into his hands) makes it thus long before I can ſend you the laſt chapter of the Acts, which I had hoped to have ſent above a month ago. But now at laſt I have ſent the whole remainder of the text, which, thanks be to God, is finiſhed.

WHEN Mr. *Hall*, the printer, did at firſt compute the number of ſheets, he over counted it very much; for I now find, that the number of ſheets will not be ſo many, nor the charge ſo great, as he then eſtimated it; ſo that it will not coſt you ſo much money as at firſt I thought. But of what the charge is, you ſhall have a faithful account, and the remainder of the money returned back to you by Mr. *Davis*; for I did let the money remain in his hands, to pay the printer, as occaſion required. We are now printing the title-page and a preface, which I and doctor *Marſhall* have contrived, to give an account of the work, and the reaſon of undertaking it, and what hath been done in that kind, *&c.* And more we ſhould have done, if we could have gotten any helps for the Malayan language in their own characters. Dr. *Marſhall* hath ſhewed himſelf very ready and willing to ſerve you in this buſineſs; for I have given him a great deal of trouble, by going to him with every proof-ſheet, to conſult his copies and dictionaries, about doubts, which did perpetually occur. So that I ſuppoſe you will be pleaſed to beſtow upon him a copy of the book, which we print; and I beg one copy of you for my ſelf; and there are two gentlemen at *London*, who lent us one Malayan teſtament, and gave us another, which aſſiſted us much in the work; ſo that I muſt beg a copy for each of them; and then, according to the act of parliament, there muſt be three copies reſerved, *viz.* one for *Oxford*, another for *Cambridge*, and a third for the king's library: ſo that the whole number will be ſeven copies, unleſs you will pleaſe to take care your ſelf to preſent one to the king's library, you being near it. But, concerning this, I ſhall wait for your farther order. When I ſend the title-page and preface (which I hope will be this next week) then you ſhall have an ex-

act account of the charges. In the mean time I remain,

SIR,

your ever obliged,

and moſt humble ſervant,

THO. HYDE.

Oxon, Aug. 14, 1677.

SIR,

I HERE ſend you the completion of the whole work, which (thanks be to God) is happily finiſhed. In the preface we have diſcourſed concerning the remiſſneſs of our people, in endeavouring the converſion of thoſe poor heathens, of whoſe temporal goods we participate, and of the worthineſs of promoting ſo good a work; and therefore we thought fit to print ſome ſupernumeraries of the preface, that ſo, after the copies are gone from you, you may have ſome of thoſe prefaces by you, ready to communicate to any perſons, whom you think fit for the promotion of ſo good a deſign: and we alſo keep ſome by us at *Oxford*, for the ſame purpoſe. I have cauſed twenty five prefaces to be ſtitched up in blue paper, ready to your hand, and I have ſent them in a packet by Mr. *Moor*'s coach, at the *Saracen's-head* near *Newgate*, where your man may find them. This, which I here encloſe, is to be joined with the ſheets, which I formerly ſent you, to make them up a perfect copy.

IT now remains, that you will be pleaſed to ſend me your order, what to do with the five hundred printed copies of the book. I ſuppoſe you would have them ſent up to you in quires, that ſo you may bind them up as you ſee fit. And therefore (God willing) I ſhall ſend them up to you the next week. Perhaps there may be ſome more than five hundred; but whatever it is, you ſhall have an account by my next letter.

THE printing did coſt fifteen ſhillings per ſheet, viz. fourteen ſhillings to the printer himſelf, and one ſhilling to a corrector, to read it once over by the copy, to cleanſe it from the groſſer faults, that ſo, when I myſelf came to read it by the copy, I might find it pretty well cleanſed.

Now the whole number of the ſheets being twenty nine, twenty nine times fifteen ſhillings makes twenty one pounds fifteen ſhillings. So that of the thirty one pounds ten ſhillings, which you paid to Mr. *Davis*, there remains nine pounds fourteen ſhillings, which he muſt repay to you; only he muſt deduct about half a crown, which we paid for the ſtitching up of the prefaces, and for the carriage back of the remainder of the paper to his houſe. For we having bought too much paper, I deſired him to take back the remainder to himſelf, which was twenty five reams, at ſix ſhillings per ream, which makes ſeven pounds ten ſhillings. So that he is to be accountable to you for nine pounds fourteen ſhillings, and ſeven pounds ten ſhillings, that is, ſeventeen pounds four ſhillings, which will return clear unto you, out of the fifty pounds, excepting only the odd ſhillings abovementioned. He hath promiſed me this day to write to you, and give you the account under his own hand. I have alſo here incloſed the printer's account under his own hand, as he exhibited it to Dr. *Marſhall* and me.

I HAD forgot to tell you, that it is uſual for a book to be preſented to the vicechancellor, becauſe he licenſeth it. And ſince I have talked with the printer, I find, that it is a cuſtom, as well here, as at *London*, for every one in his houſe to have a copy in ſheets, or money for it; wherefore I think it is beſt for you to redeem thoſe ſix copies, which he expects, and give him ſomething in money for them; for you will make a better uſe of them. This is all at preſent from,

SIR,

your moſt obliged

friend and ſervant,

THO. HYDE.

IF you hear of any ſhip going to *Bombay*, I would entreat the favour to have notice of it.

Oxon, Sept. 22, 1677.

SIR,

I RECEIVED your laſt of the 19th of this inſtant, wherein I find, that you do not miſlike my way of directing an epiſtle to you, which we here do alſo judge to be a very fit way. But you ſeem, in the end of your letter, to intimate, that what Dr. *Marſhall* hath ſpoken concerning *New England*, ſhould be taken out: if ſo, it will cauſe the reprinting of one whole ſheet; and therefore I would know your full reſolution about it. It ſeemeth to me, that what he hath ſaid may well enough ſtand; eſpecially becauſe it is no more than what is ſaid in the preface of the bible, or ſome of the books printed in *New England*, and the reflection made upon the opinion or obſervation of *Increaſe Mather* (there quoted) makes for the vidication of our New-Englanders. But after all this, we are ſtill ready to do as you ſhall direct; and Dr. *Marſhall*, who preſents his humble ſervice to you, is ready either to add or alter, or take it quite out, or what you ſhall pleaſe to appoint in your next letter. In my addreſs at the beginning of the epiſtle, I choſe to mention your relation to the Eaſt-India company, becauſe the thing, which we do at preſent, is for the uſe of the Eaſt-Indies. To reckon up all titles, which might be given you, I thought too long for our preſent occaſions, in caſe I knew them all; but I being ignorant in that point, I doubt not but to be readily excuſed from you, who do not affect any titles. But however I would intreat

intreat you to be pleased to condescend so far in that point, as to hint unto me any thing, which may be proper for me to express in my address, that of being one of the commitee being but a slender encomium; but only that I thought it apposite to the present occasion. Yet nothing hinders, but that something else may be joined with it, if you think fit, and will please to give me an hint of what is proper. I have made some little addition to the epistle, of which I here send a copy; and as soon as I receive your approbation, or alterations (if you make any) I shall with all speed get it printed. In the mean while I caused one hundred books to be bound plain, whereof ten a little finer. These shall be put into a box, and sent by Mr. *Moor*'s waggon, where you may have them on Thursday morning, as also the one hundred and fifty unbound copies, packed up in paper only, because perhaps you will open them at *London*; but if they are sent farther, there must be some coarse cloth wrapped over them.

YOUR experiment of light will be very welcome. But in the mean time I would entreat you to inform me, whether Mr. *Davis* sent unto you seven copies, unbound, of the Malayan; because, when I required them of him, he told me, that he had sent them unto you. And I would fain have our accounts stand exact, that none of your copies may be embezzled. In the inclosed paper, that which hath the line drawn by it in the margin, is added over and above what was in the former. I would willingly keep in the word Director in the address, if you think fit; and then the allusion to it in the epistle will be more perspicuous. And Committee alone seems not to be a word of so good a sound. But however I shall do what you think fit, as soon as I receive your next, wherein you will give full instructions in this and all other things, to,

SIR,

your ever obliged and

most humble servant,

THO. HYDE.

Oxon, October 16, 1677.

SIR,

I HAVE now at last gotten the things printed, and have sent them to you in a packet by Mr. *Moor*'s waggon, where your servant may find it on Thursday morning, at the *Saracen's-head* near *Newgate*.

I HAVE sent, in parcels, one hundred and fifty of the half sheet reprinted for the one hundred and fifty books, which I sent up to you unbound; and the like number of the epistle to be prefixed to the same books. In another parcel I have inclosed one hundred of the epistle, and one hundred of page 9 and 10, which may be pasted and inserted into the books already bound, in case they are not yet sent away. And there is one of each for the single book, which you had at first. In a third parcel there are twenty five of the epistle, and the like number of the half sheet, to be inserted into the supernumeraries; and so the former half sheet, where is the mention of *New-England*, may be cast away; and so also in the rest of the unbound books. I am sorry to hear, that the business of the merchants is at a stand; but I hope they may write to the rest of their company, and get their consent by letter. We hear, that Dr. *Busby* will give two thousand pounds towards the erecting of a congregation *de propagandâ fide*; and we are beginning to consult of setting aside a hall in *Oxford*, to bear the name of *collegium de propagandâ fide*, and some proposals will be drawn up and offered to consideration: of this you will hear more from the bishop of *Oxford*, who will be in *London* about the end of this month, or the beginning of the next. I think it might be convenient, if you would please to present to the bishop of *Canterbury* and of *London*, either each of them an entire book, or at least the epistle and preface. And so also to the secretaries of state, if you think fit. And I believe the design will take; of which I am very glad; for I have been often contriving how to find out patrons for such a design. I suppose, that at the factories in *East-India* there are vocabularies for teaching the Malayan tongue to merchants and interpreters: if any such could be procured, it would do us good service. I have been told, there is a merchant at *Kensington*, who hath some strange books, with which he useth to baffle all people, who come near him. It were to be wished we could know what those books are. In the mean time I remain,

SIR,

your ever obliged

friend and servant,

T. HYDE.

Oxon, Thursday, November 29, 1677.

SIR,

THIS day the bishop of *Oxford* is to preach in *London*, at the anniversary meeting of the ministers sons; and being in *London*, there is no doubt but he will come and visit you. My present occasion of writing is to acquaint you, that I have lately discoursed with him about Dr. *Busby*, and he doth seem to doubt, whether his promise will be made good or not. But, however, I could wish, that you would be pleased to take the pains to visit Dr. *Busby*, and let him know, that you have heard something concerning his intention of contributing a sum of money towards the raising a fund for the propagation of the gospel; and so you will quickly find, whether he will be likely to hold to his word,

word, or not. I suppose my lord of *Oxford* will solicit Mr. *Daniel Sheldon*, and some others of the merchants, who (upon his discoursing with them, not long since) did shew great willingness to have something set apart yearly for the propagation of the Gospel.

MY friend, Mr. *Fraunce*, whom you formerly procured to go chaplain to *Bombay*, is dead half a year since. He told me, in one of his letters, that he had gotten for me the *Zundavastaw*, and some other books, in the Eastern languages: but now I fear they will be lost, unless any friend could direct me how to recover them. I suppose it must be by writing to the governor of that factory, to whom I am not known.

SIR, at your leisure I would intreat you to be pleased to inform me what disagreement there is between vinegar and nitre, because of Proverbs xxv. 20. "As he, who taketh a-"way a garment in cold weather, and as vi-"negar upon nitre, so is he, who singeth songs "to an heavy heart." It should seem, that their nitre was natural, and therefore perhaps different from ours, which is artificial.

IT was probably the same nitre mentioned by the prophet, "Though thou wash thy-"self with borax, and useſt much nitre, yet "shall not thine iniquities be cleansed, saith "the Lord." For though the ordinary translation, instead of borax, reads soap, yet I think, that borith ought to be translated borax; which is also a sort of salt, much of the same nature with nitre, and therefore not unfitly joined with it, for the very same use of cleansing, which is proper to all salts. And I my self have fetched a spot out of my garment, by wetting the place, and laying nitre upon it, and rubbing it hard on. But I cannot find what is the opposition between vinegar and nitre. And therefore I beg your information, to,

SIR,

your obliged servant,

THO. HYDE.

IF you can inform me, how I may send a letter to *Tangier*, it would be a favour unto me; for I have scarce been able to make a letter arrive safely thither.

Oxford, New-years-day, 1677.

SIR,

I LATELY met with Dr. *Masters*, the chancellor of *Exeter*, concerning whom I lately wrote unto you, that he had a brother residing at the Fort of St. *George* at *Matrespatan* in *India*, who is governor of all our factories thereabouts, and that he might be serviceable to you. He tells me, that he was twice at the East-India house, in hopes to have met you there; and that he hath sent to his brother some of the prefaces, which I gave him; and that he doth not doubt, but that his brother will be most ready to recommend the business of the propagation of the Gospel to those chaplains, who are upon the factories, the doctor having written to him to that purpose at my request; so that if you should think fit to send any books thither, he will manage them to the best advantage: and he will in the mean time get for us some helps for the Malayan language.

I HAVE been told, that there is a merchant at *Kensington*, near *London*, who useth to puzzle all people with a strange book. I wish we could find any means to know what it is.

I MAKE bold to request your advice in the behalf of two friends of mine, who are perpetually troubled with a great heat in their blood, and biting and gnawing in their stomach and guts, and it hath been so for three or four years: and I cannot guess what should be the cause, unless perchance by the often taking of mercurius dulcis. For by the advice of somebody or other, they used always, when they took any purging pills, to add several grains of sweet mercury, to make it strongly purgative. Wherefore I would entreat to know your opinion, whether mercury may possibly have any such lasting effects, as gnawing and excoriation of the stomach, and putting a constant heat into the blood? And if so, then I would intreat you to inform me, if you know any thing may correct and check that corroding quality; for the persons are my near relations. The best thing they have yet found, is sallet-oil, which being drank, gives present ease and cooling, even as water doth extinguish a fire: but it doth not remove the cause. They have tried many other things, but in vain; and purging doth no good. If they eat or drink any thing, which is salt or naturally hot, it puts them to pain and griping. One of them had the corroding sharp humour once beginning to break forth upon the outside of the stomach, and then had ease: but it unhappily sunk in again, and then the pain returned. I hope you received my account of *Lullius*'s books. And so wishing you a merry Christmas, and a good new-year, I remain,

SIR,

your ever obliged

friend and servant,

T. HYDE.

Oxon, Feb. 17, 1677-8.

SIR,

I HAVE here inclosed a transcript of the life of *Raymund Lullius*, according to two authors, which is all we have concerning his life. You may allow the transcriber what you please. Here is also an account of the number of leaves in all, which we have of him, either printed or manuscript; by which any body may easily make an estimate of the number of sheets. I humbly thank you for your kindness to the Pers-Armenian. I have also

alſo ſhewed thoſe worthy gentlemen of *Holſtein*, what could poſſibly be done in ſo ſhort a time as their ſtay was at *Oxford*. I ſhewed Dr. *Sall* that part of your letter, which concerned him, and he returns you his very humble ſervice with many thanks, which he deſired me to do for him, that ſo he might not give you the trouble of a letter for that alone.

I THINK I remember you told me, that you had found ſome of my papers of notes upon the ſcripture: what you have found, I would intreat you to be pleaſed to ſend unto me, and the reſt as ſoon as you can light upon them; for I would as faſt as I can review them, and try what thoſe with ſome others of like nature will amount to. Thoſe which I ſent you were upon the beginning of Geneſis and the beginning of St. *Matthew*. This is all at preſent from,

SIR,

your deeply obliged, and

moſt humble ſervant,

THOMAS HYDE.

Publick Library, *Oxon*, Aug. 2, 1678.

SIR,

UPON the information from my worthy friend Dr. *Marſhall*, how well the archbiſhop of *Canterbury* and other great perſons did reſent the buſineſs of the Malayan and the propagation of the goſpel thereby, I made bold lately to trouble you with a letter about it, intreating alſo the Eaſt-India company might be a little farther ſtirred up in that matter. But my preſent occaſion of writing to you, is to inform you, that a country gentleman, who came to *Oxford* laſt night, reported, that the miniſter of *Stalbridge* is dead. And if the report be true, and the place be void, I humbly and earneſtly intreat you to be pleaſed to remember me, and favour me with the next preſentation, which will be a making to me for ever. And then I ſhall not have need of the library, nor of any thing elſe. I have been told by ſome perſons, who live not far from *Stalbridge*, that your ſteward uſed ſome dealings laſt time, which I am ſure you would not allow of, if you had known it: and I only give you an hint of it, that ſo you may prevent him for the future. When I ſhall have any occaſion to wait upon you, I ſhall acquaint you with more particulars about it. In the mean time hoping for your favour, I remain,

SIR,

your ever obliged, and

moſt humble ſervant,

THO. HYDE.

I HAVE a friend gone this day towards *Dorſetſhire*, who will ſpeedily give an account by the poſt, whether the information about *Stalbridge* was true or not.

Oxon, December 9, 1679.

SIR,

ACCORDING to your deſire, I have conſulted the natural hiſtory of *Mexico* by *Francis Hernandez*, and I do not there find any mention of the Jeſuit's powder not under any name or title, which I could imagine fit or probable to be ſearched: ſo that I do conclude, that there is not any thing of it. But I found there another antifebrific plant, the deſcription whereof I have here incloſed, ſuppoſing it might be grateful to your friend, to know any thing of the ſame nature with the thing he ſearcheth for. I have alſo conſulted Dr. *Moriſon*, who doth not know any thing about the plant or tree, of which the Jeſuit's powder is made. As for *Andreas Solea*, we have not any thing of him.

As for the copy of the letter out of *Eaſt-India*, I think the ſubſtance of it may without prejudice be ſhewed to any body, if you pleaſe to let your man tranſcribe a copy of it, omitting the name of the author at the beginning, and the ſubſcription of the Fort St. *George* at the latter end. And the ſame favour I begged of the biſhop of *London*, in which, I hope, he will gratify my requeſt, although he hath not ſent me my anſwer; neither do I hear any thing of his receipt of the Malayan goſpels, which I ſent unto him: but I hope the carrier was careful to deliver the book. If it comes into your mind, when you next happen into his company, I humbly intreat the favour, that you would pleaſe to know of him, whether the copy of the letter from *India* came to him or not? I am not certain of any occaſion, which may bring me up to *London* this winter; and the roads are dangerous, for this very week the *Oxford* waggon and coach were both robbed upon *London* road, and laſt week there were ſeveral robberies committed upon people going to *Woodſtock* fair, and near *Abington* one killed, who was heard to cry out murder, and by the track of his blood down to the waterſide, it is gueſſed his body was thrown into the river. And this laſt week we had a young ſcholar, a ſervitor, murthered in *Baliol* college, in his own chamber, by a townſman, who formerly had been a dragoon, now a taylor. He by his acquaintance with the ſcholar came to know, that he had a parcel of money ſent to him by his friends, in order to the taking of his degree: whereupon this taylor borrowed an hatchet, and pretending to give a viſit to the ſcholar, while he was gone down to the buttery, attempted to break open his ſtudy: but the ſcholar coming up again ſooner than he expected, and ſo finding him in the fact, the taylor grew reſolute and deſperate, and with the ſame hatchet killed the ſcholar, cutting him about the head and face, and afterwards carried away his money, and his linen, which was after found upon him with the mark of the ſcholar's name; and it is found of whom he borrowed the hatchet, which was found bloody;

and

and the taylor being apprehended, hath confessed all things. But I have trespassed upon your patience, and therefore I beg, that you will pardon,

SIR,

your most affectionate,

and humble servant,

THOMAS HYDE.

Inclosed in the preceding.

Franc. Hernandez, Hist. rerum Mexicanarum, Lib. IV. *cap.* 21.

De Ytzticpatli frutice febrifugâ.

YTzticpatlis, quem alii Teçonquilitl vocant, frutex est radicem fundens crassam et longam, intus candentem teneramque, plenam succo, et ex eâ stipites purpureos; folia in plures cuspides divisa, et has ipsas interdum sinuosas quoque. Florem candentem ac parvum; et fructum rotundum, Ponticis nucibus penè parem. Nascitur in collibus Hoitzocensibus. Radix dempto cortice, qui impense refrigerat, in lævorem redacta, adversus febres solet devorari. Jus decocti ejus, loco aquæ fontanæ aut fluvialis bibitum, eundem usum præstat, præter quod calidas quasvis intemperies emendat ac corrigit. Nec est planta ulla apud has gentes, quæ in extinguendo calore, majori in pretio habetur, aut possit huic aliquo modo comparari.

After this description, are added these notes.

Ad geranium fortè pertinet hæc planta: sed repugnat radix tenera succo plena, quæ obscurè rubet, folium ferè cannabis. Caules etiam rubent: fructus nodo conclusus non conspicitur.

Exponere hîc libuit hanc quoque Malvaceæ, ut videtur, earum regionum imaginem, cui quamvis in autographo nomen inscriptum non sit, à nonnullis tamen affinis prædictæ Ytzticpatli censetur: folia quidem sunt Geranii, flos ex alâ pediculo longo insidet. Calix magnus fere castaneus, flos luteus, pallidus, radix crassa.

BY this you see, that there is *Ytzticpatli simpliciter sic dicta*; and another sort called *Ytzticpatli Malvacea*; both which have their icones or brass cuts expressed. You may also observe by the description, that this is the only plant among them, which cooleth the blood, and is good against fevers: and that therefore probably the other plant, of which the powder is made, is not to be expected in these parts.

Oxon, July 14, 1683.

SIR,

I AM ashamed, that I should be so long in acknowledging the receipt of the book of the China pulse. But if I had written sooner, it must have been an empty letter nothing to the purpose, because I could not till within these few days get the judgment of a person, which I much desired, who is an ingenious physician in our university. He told me, that he had heard such great things of the Chinese's skill in feeling pulses, and had read in Dr. *Vossius*'s *De Viribus Rhythmi* such a mighty character of them upon that account, that he expected to find very great and useful things in this book, as being their oracle, from whence all their physick (especially the diagnostick part) was deduced. But he was extremely deceived in his expectation, there being little in it but an heap of irrational directions; and indeed could not be expected to be much otherwise from a people wholly ignorant of anatomy, which can only give light in this philosophy. For if they mistake the disease, they have no way to rectify themselves, since by the custom of the country they must not dissect the carcase, and so discover their mistake. Yet they have luckily hit upon some things, which are very pretty: as first, they saw the necessity of a circulation of the blood before ever the Europeans dreamed of it, *viz.* four thousand years since; but their account of it is somewhat monstrous. Only herein they have hit pretty right, in that they say circulation begins at the lungs, and ends in the liver, which is something agreeable to the truth. Their circulation is performed fifty times in twenty four hours, or twelve Chinese hours. But why? Because the heavens, which they divide into fifty houses, are turned about in that time. For they have a strange fancy of comparing the microcosm with the macrocosm, and thence fall into a thousand errors. 2dly, They have one rule in feeling pulses very rational, not much observed amongst us, *viz.* an accurate observation of the proportion betwixt the pulse and respiration, of which you may see a critical account page 16th and the 79th.

NOTHING can be more absurd than their rules in judging by pulse. For why should the sun, and moon, and the three pulses of each hand, be correspondent to the three regions of the body? And then it is a wonder they take no care of the brain, no pulse being allowed to discover its disorders, though even the pericardium be reckoned amongst the principal viscera. Hence, I think, I may boldly infer, that their ætiology is horribly ridiculous.

SOME tells us, that the Chinese without asking one question or inspection of ☉, only by the pulse will infallibly discover any disease: and those [*Vossius*] who assert this, do hence take occasion to expose the ignorance of European physicians. We have indeed several stories of this nature, but how true, I know not. But whatsoever empirics they are, I am sure they are no philosophers. That the doctrine of pulses may be improved, is very certain; partly by feeling the pulses of several parts of the body (for if the circulation of the blood be unequal, either by obstruction, inflammation, *&c.* in any part, the pulse must needs thereabout be brisker and stronger) and partly by observing, whether it be hard or soft, *&c.* which seems to depend upon the constriction or relaxation of the

the nervous coat of the arteries, whence the indoles and temper of the ſpirits may be found out. But I have not time to inſiſt on theſe things at preſent. I ſhall only add a pretty odd reaſon, which the Chineſe have againſt phlebotomy, which they wholly condemn, *viz.* As hot water is not cooled by taking away part of it, but by pouring cold water into it; ſo is it in the blood. Thus I have in brief given you my ingenious friend's opinion upon it. He had not time to make a full and exact obſervation of every thing.

HERE alſo comes to you a tranſlation of that tract of yours, which you preſcribed, ſhould be begun upon as a ſpecimen, to try how the tranſlator could deal with your chemical and philoſophical matters in Latin. If he hath not done all things according to your deſire in this ſpecimen, be pleaſed to give us farther directions, which will ſerve for future procedures of this kind. For Mr. *Waſe* hath ſo great a command of Greek and Latin, that he can manage the ſtyle, how you will pleaſe to have him do it. And ſo when he once knows, which way you like beſt, he will be ſure to follow it. He followed the quarto edition of your tract; and therein page 37, he prays you to examine, whether he hath done right about the conſtruction of double concave glaſſes, page 48. he doth not fully comprehend what you mean by tin hour-glaſſes; but he hath tranſlated verbatim. He prays you would pleaſe to conſider, whether there be not ſome miſtake in your Engliſh, pag. 16. where you range gravity firſt amongſt the more, and immediately after amongſt the leſs catholick affections of matter. He deſires to know, whether he muſt follow the known terms of chemiſtry in Greek words, or rather turn them into Latin? As pag. 4. whether for ſo obvious a phænomenon, he ſhould ſay, *Rem tam obvium*, pag. 7. of that ſtrange and unexpected phænomenon, *id arcani omnium opinioni refragantis*. Page 16. Springineſs, *elaſticitas*, or *elaſtica vis*: query whether not rather *tenſio* or *tortio*: for in Greek *elaſticitas* properly imports only ductility. He deſires to know, whether you permit him to depart from the abuſes of Greek words, *viz.* whether for *Diaphanus, a, um*, of a falſe declenſion and analogy, you permit him to uſe *Diaphanes* and *Diaphanôn*. But I ſuppoſe in all theſe and ſuch like things, you would rather he ſhould ſtick to the received words, which are beſt known in chemiſtry. And therefore when he hath your directions once, he will know how to go on always.

THE tract tranſlated made forty nine pages in your Engliſh in quarto, which makes ſix ſheets and one page. So that at the rate you propoſed of ten ſhillings *per* ſheet, it comes to three pounds. Dr. *Watſon*, a phyſician of *Dundee* in *Scotland*, as he paſſed through *Oxford* two months agone, preſſed me hard to know ſome ſecret medicine, which you told him I had formerly imparted to you out of ſome Arabick book: but he could not tell me what it was about, and ſo I could not recollect what it was, nor where I had it. And I promiſed him to write to you, praying you would tell me what it concerned, that ſo I might retrieve it for him. Wherefore if you can pleaſe to mind me what it concerned, he will be mightily pleaſed. And now having been ſo tedious already, I ſhall not detain you any longer than to profeſs myſelf,

SIR,

your ever obliged, and

moſt humble ſervant,

THOMAS HYDE.

Queen's-College, Oxon, Feb. 24, 1683-4.

Good Sir,

I RETURN you my moſt humble thanks for your hiſtory of human Blood, which I received of Mr. *Davis*, together with another copy for the publick library, both bound. I doubt not but to receive much both pleaſure and ſatisfaction in the reading of it. I remember you were pleaſed to tell me, that you were about an hiſtory of the Air, which will alſo be a deſirable and very acceptable variety, whenever you ſhall think fit to favour the world with ſo curious a treatiſe by ſo able an hand.

Now that the ſevere weather is gone, and ſtudying weather begins to come in, I was in good hope to have done ſomething in my ſtudies: but our curators of the library have deviſed ſome new troubles for me to loſe my time, and rob me of it. So that I muſt only wiſh for ſuch a condition, wherein I might have quietneſs and ſome tolerable command of my time, ſo as to be able to call it my own, and not be a ſlave to other men's humours. I have made conſiderable progreſs in notes upon the ſcripture, and the hiſtory of the kings of *Perſia*, and the religion of the old Perſians, and divers other ſubjects of the like nature: but enjoyment of my time and of quietneſs (the loſs of which I deplore) muſt bring them to perfection. I will not now treſpaſs upon your time any farther, than only to ſubſcribe myſelf,

SIR,

your ever obliged, and

moſt humble ſervant,

THOMAS HYDE.

Queen's-College, Oxon, Sept. 23, 1684.

SIR,

I HAVE received of Mr. *Davis* two copies of your book concerning the poroſity of bodies, for which I moſt humbly thank you, and for all other your favours. As for the buſineſs of the hoſpital, our biſhop tells me, that ſuch a thing is intended; but it is as yet merely in propoſal, there being nothing done in

in order to it. There must first be ground purchased, and then a building raised, and then by temporary subscriptions of well-disposed persons to maintain some number of sick and lame people. Perhaps about a year hence, we may be able to tell you more about it; for I do not perceive any thing likely to be done in it suddenly. As for the Malayan grammar of Mr. *Mainstone*, Dr. *Marshall* is not now in *Oxford*: but the bishop tells me, that it is a pitiful trifle, not of any worth. However when Dr. *Marshall* comes home, I will discourse with him farther about it. What I requested of you to the countess of *Rochester*, I humbly remind you of it: a general character and recommendation to favour will be sufficient at present. I remain,

SIR,

your most obliged,

and ready servant,

THOMAS HYDE.

Queen's-College, Oxon, March 21, 1684-5.

SIR,

I HUMBLY thank you for your letter, giving me an account of my misinformation about Mr. *Rich* and *Stalbridge*. And these my thanks I had sooner returned, but that I waited to get a sight of *Maimbourg*'s book, which I could not light upon till within these three days. I perused part of it my self, and communicated it to a judicious friend also to peruse it. And we find, that in his preface he owneth, that the design of his book is to remove those obstacles cast in the way by the rigid part of the church of *Rome*, which hinder those of a different persuasion from joining with them: and this he doth in order to serve the king of *France* in the design of uniting all the subjects into the same opinion, and bringing them all to the church of *Rome*. And in order to this, he denieth the pope's infallibility, and his supremacy in temporals, and his indirect supremacy (if I rightly remember) whereby he hath power over princes, so far as to serve the occasions of the church (as the Jesuits contend) though they cannot give him an absolute and direct power over them. And he also makes the pope inferior to a general council. And these things do much eclipse the power of the pope, who (as I am informed) did therefore excommunicate Mr. *Maimbourg*. This is the matter of fact: but if you would know any thing farther, as what inferences may be made from it, or any thing of that nature, be pleased to give me an hint of your mind in any particulars, and I shall give you the best information I can. But as yet I have not heard much said of it.

As to what you once told me about papyrus, that it seemed to have a kind of gross thready grain, I have since lighted upon a piece of the same matter, which I find is not papyrus, but the leaf of a certain kind of Indian palm, with leaves as broad as a bushel, out of which they cut long narrow slips, and write upon them sometimes with a sharp iron-steel, and sometimes with ink, and that in the language of several of those countries.

BUT about the true papyrus, I am as yet unresolved. When I can serve you in any thing, be pleased to favour me, by giving so good an opportunity to him, who is always most readily and freely,

SIR,

your ever obliged,

and most humble servant,

THOMAS HYDE.

Publick Library, *Oxon*, July 26, 1687.

SIR,

THE bearer hereof, the Chinese, hath been with us at *Oxford*, to make a catalogue of our Chinese books, and to inform us about the subjects of them. We have some of *Confucius*'s books; but most of what we have is physick. He is extremely well versed in his own language, having studied it many years, and also *Confucius*'s philosophy, which he doth not praise. He is a very good-natured man, studious and industrious, and sober. His Latin is a little imperfect; but it is well he hath any Latin; for before him there was never but one (who is dead) that understood any Latin. And now this is the only man left. I have made what use of him I could in a few days, losing no time ever since he hath been with me. He tells me, that in his province of *Nankin* (*i. e.* the south-court) they have but two months of winter, and very little ice or snow. The temper of the clime is much better than *England*, only hotter: but about *Pekin* (or the north-court) it is cold enough. You may make a shift to understand him, though he speaks but imperfectly. He was very desirous to be recommended to your favour and friendship by,

SIR,

your ever obliged

and most humble servant,

THOMAS HYDE.

His name is *Michael Shin fo-çung*, whereof *Shin* is the name of his family, and *fo-çung*, *i. e felicitatis radix*, is his own name. It is the manner always to put first the name of the family, as *Cung-fu-çu*, where *Cung* is the family name, signifying *foramen*, nothing to the purpose: but *fu-çu* signifies *magister*.

SIR,

Publick Library, *Oxon*, Octob. 25, 1668.

SIR,

I HAVE conſidered, that if you would have me to do any thing in the Malayan language, it is abſolutely neceſſary, that I ſhould be furniſhed with all ſuch helps as can be found. Now thoſe helps, which are found, are written in the Dutch language, which I do not underſtand. We have in Dutch and Malayan a grammar and two vocabularies, which muſt of neceſſity be tranſlated, if you would have me do any thing for you in that language, we being deſtitute of fit helps for it. And therefore I would gladly know by the next poſt, whether you will be pleaſed to be at the charge of paying for the tranſlating of them, which being but thin books, cannot coſt much. The reaſon, why I would have ſuch a ſpeedy anſwer, is, becauſe we have now with us a man, who is able to tranſlate them, who will in a week's time be gone from us, unleſs I can ſet him upon it preſently. And he being a grammatical and critical man, I perhaps may not find ſuch another.

I ALSO intreat, that you would be pleaſed to haſten the 3 l. 11 s. 6 d. which is due to the poor letter-founder, he being in great want of it. Yeſterday the biſhop of *Wincheſter* returned to *Oxford*, and this day he is to readmit the preſident and fellows of *Magdalen College*. And I remain,

SIR,

your obliged and

humble ſervant,

THOMAS HYDE.

Publick Library, *Oxon*, Dec. 29, 1688.

SIR,

THIS is to acquaint you, that I long ſince received of Mr. *Bartlet* the money due to the letter-founder, who through ſeveral ſickneſſes, and the burden of many children, and want of work during this time of troubles, is in great want; ſo that unleſs we can find him ſome work to help him, he muſt preſently miſcarry and run away from us; for he hath five ſmall children, and not one jot of work or money to maintain them. I my ſelf have contributed ſomething towards his maintenance, becauſe he is the life of all our printing deſigns. And though it is an ill time to propoſe any thing of charge, yet I muſt take the freedom to acquaint you, that if you deſign any thing ever to be printed in Malayan, it is abſolutely neceſſary to preſerve this man in *Oxford*; otherwiſe all you have done already is loſt. For there are ſeveral other things for the Malayan to be cut and caſt, which muſt be done in *Oxford*, where I am preſent, to give direction; for at a diſtance nothing of that nature can be done.

WHEREFORE I have lately peruſed the Malayan grammar, and conſidered as accurately as I can, what more will be wanting, in caſe any thing is to be printed in the Malayan character; and upon conſideration I do find, that thoſe things, which are farther yet to be cut and caſt by the founder, will amount to about ſix or ſeven pounds. The ſum is not great. Now if, for the preſervation of this man, you will be ſo kind as to ſet him on work, now at this time, it will be both a great act of charity towards the maintenance of his poor family, and alſo help you to obtain the pious end of perfecting your Malayan deſign, which is yet imperfect, and muſt be loſt, unleſs this man is preſerved in *Oxford*.

AND I muſt farther add, that if, upon the grounds and reaſons abovementioned, you do think fit to ſet him preſently on work for the completeing of what is yet wanting, you muſt pleaſe to ſend down ſix pounds now preſently, beforehand, becauſe of his preſſing neceſſities; and for your ſecurity, I will take of him ſome certain pledges of double the value, until he ſhall perfect and complete ſuch things as you yet want, equal to the value of that ſum, which you ſhall ſend to me.

I SHOULD not propoſe this to you at ſuch a juncture of affairs, but that I do think the preſervation of ſuch an artiſt with us to be abſolutely neceſſary to all literary deſigns, and particularly that of the Malayan; and it is alſo the ſupporting of a parcel of fatherleſs children. If you intend the thing ever to be done, it is but doing it now a little ſooner. And it is not given, becauſe he will do work equal to the money. And therefore I hope you will be pleaſed to pardon this earneſtneſs of,

SIR,

your affectionate

and humble ſervant,

T. HYDE.

Publick Library, *Oxon*, Feb. 23, 1688-9.

SIR,

WE have now (God be thanked) cut the punchions, and ſtamped or ſtruck the matrices, and caſt ſuch a parcel of Malayan letters, as might keep within the compaſs of the money you ſent, that ſo I might not put you to any new charges. And the founder remaineth in our debt about ten or twelve ſhillings, which I ſhall leave till another time, becauſe we ſhall probably want ſome few ſorts of ſome kind or other, which cannot be foreſeen, till trial of printing: neither was it poſſible to gueſs at the quantity of letters to be caſt, ſo exactly to anſwer the money, as that there ſhould be nothing over or under.

I FORMERLY acquainted you, that the printing of St. *Luke* and the Acts in the Malayan letter, would make about thirty ſheets, which may coſt the printing near about ſixty pounds.

But

But I take it for granted, that you will not begin upon it, until your affairs are better in *Ireland*. But in the mean time, ſome preparatory care may be taken, in order to it, by getting ſome helps for the more perfect underſtanding of the language; that ſo what I ſhall do for you may be ſolid and authentick. For I find, that the Dutch prints, which we have followed, and which we are to follow, have many literal faults, which I muſt be able to correct, that ſo I may not turn thoſe faults into a Malayan character, and make the thing ſeem nonſenſe to the natives, for whom you intend it. And furthermore, the Dutch way of expreſſing the ſounds of the Malayan words is ſo diverſe in itſelf, and ſo unintelligible to us, that without accurate ſkill in the language, it will be often difficult, and ſometimes impoſſible, from their writing, to know how to put the words into Malayan letters: to the obviating of which difficulty, it would be neceſſary to get ſome vocabulary, where the words are expreſſed according to our Engliſh way of ſounding them. And to this purpoſe it were earneſtly to be wiſhed, that you would uſe your intereſt with counſellor *Jones* of *Lincoln's-Inn*, to procure the Malayan papers of his brother-in-law, Mr. *Mainſtone*, deceaſed, who, when he lived in *India*, had prepared for that language a dictionary, which he intended to print. And the ſooner this were done, ſo much the better, that ſo I may have time to ſtudy the language, and fit myſelf for the buſineſs to be done.

SIR, I formerly made my humble requeſt to you, that you would be pleaſed to beſtow upon me the next preſentation to *Stalbridge* in *Dorſetſhire* in your patronage: for that wicked wretch, Mr. *Rich*, is fled, and never like to appear there again; ſuch have been his groſs and ſcurrilous abuſes againſt the prince of *Orange*, and his adulteries and other immoralities, and his turning papiſt, or promiſing to do it, *&c.* that he hath certainly merited deprivation, and the men of the pariſh are in wait to lay him in priſon, when they can catch him. So that there is abundant matter for his ejection, there being ſufficient proof of theſe things, as ſome of the pariſh do now tell me. So that I do now humbly renew my requeſt of that preſentation; to the obtaining whereof, though I will not plead merit, yet I might hope from you with more pretence than others can, I having formerly done you near a year's ſervice in the printed Malayan, and am ſtill like to do you more ſervice in the ſame language, in which I am ſure there is no man now alive in *England*, who is able to ſerve you beſides myſelf. And I am ſure, that whenever we begin, it will coſt me at leaſt two years pains to bring to paſs the thing, which you deſire and deſign. For beſides my preparatory ſtudies, to accompliſh me for the well doing of that work, the very tranſcribing of ſo much matter into a ſtrange character, will be a long and tedious taſk; and afterwards to correct it at the preſs will be another taſk as great. And ſeeing it is in your power to reward me, without any charge to your purſe, it ſhould ſeem better to give it to me, than to ſomebody elſe, who perhaps will not be ſo able to ſerve both you and the publick. For if I were ſo far enabled, as to ſpare any thing from buying my bread, I ſhould both cut all ſorts of exotic letters, and publiſh things both uſeful and curious, which otherwiſe will never be done, but muſt die and be buried with me. And yet no body will vouchſafe to conſider me, nor redeem me out of this low condition. Be pleaſed to pardon my prolixity.

I HAVE by *Bartlet* at the *Oxford-Arms* in *Warwick-Lane*, ſent a little book wrapped in paper and directed to you; not well remembring, whether I had preſented it to you or not. If he doth not bring it to you on next Wedneſday, you may pleaſe to let your ſervant fetch it on Thurſday. It is about ſome China matters. And I have by me, upon ſeveral other heads, much more of that China learning, which (if any would be at the charge of printing) might perhaps not be ungrateful to the curious. I have incloſed alſo a leaf of an Hebrew book, which I am now printing; of which I told you, that when it ſhould be printed, I would then do ſomething upon the bible. Having none other by me, I was forced to ſend that foul leaf, by which, however, you may make a ſhift to read my note upon *Taprobana*, whereby you may make ſome gueſs at the reſt of the book. Sir, in the abovementioned buſineſs you may eternally oblige

Your moſt humble

and ready ſervant,

T. HYDE.

Oxon, March 5, 1690.

SIR,

I HUMBLY thank you, for giving me notice of the company's intention of ſending two chaplains into *India*; though that part of *India* will not ſerve my occaſions of learning, there being not about thoſe parts any of the people or books, after which I am enquiring, as I was informed by Mr. *Gifford*, formerly governor of that fort, who did the beſt he could for me, but could effect nothing, for the reaſon aforeſaid. But however I am glad to get *Oxford* men to be employed to that part, becauſe I ſhall find out ſome way, wherein they may be ſerviceable to our univerſity. And therefore I would beg you to be pleaſed to ſecure the two chaplains places for two very fit perſons, whom I have ſought out for that ſervice. And in my next I ſhall give you a more particular account of them.

THAT, which I chiefly deſire (and which would improve the deſigns of learning) is to get a chaplain to *Bombay*, or rather to *Surat*: for partly there, and partly by the frequent opportunities of ſending by the caravans into *Perſia*, he may do very good ſervice. And therefore if by Sir *Joſiah Child*, or any other intereſt

interest in the company, you can procure me the nomination of a chaplain to the hither parts of *India*, I do humbly beg it of you. To Sir *John Chardin* I would entreat my service may be presented, I having been formerly known to him, and have spoke Persian with him. He hath formerly shewed me some of his inscriptions, of which I shall tell you more by discourse, when I can get to *London*. He formerly entrusted me with one or two of them, to his advantage: and I should be glad, if he would please to entrust me with the rest of them to *Oxford*, where I might endeavour the unriddling of them, for his satisfaction, as well as mine own; and particularly, I would see the delineation of a Persian king, who is posited as adoring the sun and the fire. If I cannot unriddle them, I am sure none in *England* can do it; there being none else (except Sir *John*) who understands the modern Persian, and much less any thing of the ancient. The other person, who favours my designs, I should be glad to know some time, when you think it proper for,

SIR,

your affectionate and

humble servant,

T. HYDE.

SIR, my eyes being of late troubled with a watery humour (but not painful) especially in the night time, when I lie down in my bed, I would beg the favour of you to tell me the best way of using eye-bright, and what hurts or inconveniencies are in it; and whether taking of nitre (as my lord *Bacon* did) be of any use to that purpose.

Oxon, June 11, 1691.

SIR,

I RECEIVED yours with the enclosed paper from Sir *Josiah Child*, which is very satisfactory; and accordingly I shall order two persons to fit themselves for the service required of them. And in order to it, I would willingly write to Sir *Josiah Child* myself, if I knew where he is at present, and how I may direct my letter to him. And therefore I would humbly beg the favour of that information from you. To Sir *John Chardin* I would also write, who used to live in *Leicester-fields*. But in the said paper I see a date from *Turnham Green*, which perhaps is now his habitation.

Now since I perceive the good inclinations of the company to do something for the service of God and religion, it may perhaps be seasonable to remind them of educating some chaplains to be furnished with the Malayan language for the propagation of the Gospel. The design was some years agon proposed by the pious bishop *Fell*, and in a manner agreed to by the company, and I cannot tell by what accident diverted. The proposal, which the bishop urged, was, that the company should allow annually twenty five pounds apiece to four young men, who should study the Malayan for four years, and oblige themselves to the service of the company, when required to it. And to me the bishop had spoken to be tutor or instructor to the said young men in the Malayan language, it being part of his proposal to them, that they should allow a decent salary to such a tutor. This is not proper for me to move, lest, coming from so mean a person, should spoil the design. But it would be very proper for you to press it forwards to Sir *Josiah*, and you are the only person to move it. And therefore if you would please to take the trouble of being a little active in putting it forward, it would be for the glory of God, which you designed in your private capacity to have promoted by the help of the Malayan language, if publick affairs had not run cross to you. Be pleased to afford two or three lines to

Your humble servant,

T. HYDE.

Letters from Dr. Peter du Moulin *to Mr.* Robert Boyle.

Canterbury, Dec. 28, 1669.

SIR,

TO the ambition of publishing my verses I have added a greater, presuming to honour them with your name in the front of the epistle. I have now some copies of them by me, of which in duty I should send you the first, that appears abroad, and without delay, but that the great frost puts a delay upon book-binder's work. And truly I would have taken order, that it had been sent to you from *Cambridge*, where it was printed, but that I would correct some important faults with my hand. I might have put off this address to you, Sir, till my other in print had been ready, but that I was afraid you should hear by others of the coming out of the book, either from *London* or *Cambridge*. Be pleased, Sir, to pardon all errors, and accept of the forwardness of my humble affection, in telling unto the world in print, how really I honour your great worth, and value the love, wherewith you have graced me. One of the prime licensers of the book, Dr. *Gunning*, would not suffer the heroicks in commendation of the Royal Society to be printed with their fellows. It grieves me to see a feud between that noble Society and the Universities, to which Mr. *Glanvill*'s books have much contributed. Your great credit, prudence, and moderation, may stop that growing evil, if any thing in the world can. That honour and blessedness may attend your piety and virtue for ever, is the prayer of,

SIR,

your truest honourer,

and humblest servant,

PETER DU MOULIN.

MY wife is your humblest servant.

SIR,

Canterbury, July 3, 1671.

SIR,

I RECEIVED your late encouragements, (which to me are commands) to make the translation of the French king's declarations against the protestants; and I have by rising early found time to do it. It is about a fortnight since I had done a moiety of it, and there made a stop; yet to resume it, when I have laid up some materials for a preface, and made them into some form, which afterwards may ripen by me, while I am translating the other moiety. The truth is, Sir, I am stung with a jealousy of God, at the pride, insolence, and uncharitableness of our men of preferment, that unchurch all our churches: and I intend (God assisting me with his grace) to take occasion of these miseries of our brethren, to make them (for others, that are better Christians than they) sensible how criminal before God and man is their insultation. Handling that argument as a moderate episcopal man, that is as myself, who yet will forbear to put my name to it, a custom lately begun, which gives somewhat more liberty to the writer. When I have done, I intend to put it in your hands, Sir, *ut arbitrio stetve cadat-ve tuo*, knowing that I cannot call to council more wisdom and more goodness. That God join to it the blessings of bodily health and spiritual comfort is the prayer of,

SIR,

your most hearty honourer,

and humblest servant,

PERER DU MOULIN.

THE first time, that I asked a licence to print my Πάρεργα at *Cambridge*, Dr. *Gunning* got it upon condition, that the verses to the Royal Society were put out of the manuscript.

BUT the licence for the Incrementum, where those verses are, was got in his absence.

GIVE me leave, Sir, here to present my best service to my honourable lady *Ranelagh* and to her noble daughters. The like to them and yourself from my wife your most humble servant.

BE pleased, Sir, to burn this letter.

Canterbury, Oct. 1, 1673.

SIR,

MR. *John du Bois*, a merchant dwelling in *Aldermanbury* near the church, to whom I have committed my translation, had promised me to bring it to you. But either your absence from the *Pall-Mall*, or his from the city, have hindered his performance. I have renewed my request to him by letters this week. When he hath delivered it to you, you may be pleased to use that friend's kindness, who hath promised to get it printed. Give me leave, Sir, to entertain you with another business. Mr. *Peregrine Bertie*, who is a member of the House of Commons, told me, that at their last session a motion was made by Sir *Thomas Clarges*, that I should be sent for to justify that, which I have undertaken in my book against *Philanax*, to make good before authority about a deputation of some Jesuits from their brethren in *England* to the *Sorbonne*, and so to *Rome*, about their design of promoting the late king's death. But that some wise men of the House would not have me sent for, till it was known first what I could say. This put me to a necessity to prepare myself, that I might not be sent for being unready; and I have set down in the paper, that I sent to you, all that I can say. The like I have given to Sir *Edward Deering*, and may give the like to some other parliament-men, hoping, that seeing all that I can say, they will not send for me. You may soon see, that if I had been sent for, when I made this offer, I had convincing proofs. But the main witness being dead since, I cannot convince an adversary, but persuade all equitable judges with the clearness of my evidences. My business is now, and with me of all wise and pious protestants, to look out more intelligences of the behaviour of the papists, in two conjunctures; the one about the time of the king's death, the other in 1663, when my book appeared first; and the mention of that deputation struck an extreme terror into those malefactors, of whom Sir *Kenelm Digby* was the head. In this important occurrence I do in all humility consult the oracle of your wisdom, and crave the assistance of your love. I have found you stored with the best intelligences, as in nature, so in state, which at this time would be very conducible to,

SIR,

your real honourer, and most

affectionate humblest servant,

PETER DU MOULIN.

IN all humility I give here my service to my honourable lady *Ranelagh*.

Canterbury, Feb. 23, 1673-4.

SIR,

I HAD given order, that a dozen of my books should be sent to my sister *Claver* for her to distribute; and that you should be the first served. But I hear, that my stationer hath deceived my expectation. What orders I have renewed since, I forbear to tell you. But I would be glad to know, whether it was sent to you, and likewise if my honourable lady *Ranelagh* was presented with one. How it was licensed, and no imprimatur to it, is a mystery, which is yet unknown to me. In this happy turning of publick businesses, I conceive, that the translation of the grievances of the French protestants might find a way

way to the press. It is yours, as done by your order, and you may do with it according to your wisdom. We have seen here an amazing account of the danger of the Irish protestants; yet I hope, that the present posture of the English affairs secureth them from a massacre, which doubtlessly had been executed, if the late design of the papists of *England* had had the intended success. Blessed be the great keeper of his Israel, who never slumbereth nor sleepeth. To that loving keeper I commend you with my hearty prayers, and my honourable lady *Ranelagh*, to whom I give my humblest service, and rest,

SIR,

your most real honourer,

and most humble servant,

P. DU MOULIN.

YOUR dear nephews are well, and give their humble service to you, my wife does the same.

To my honourable lady *Ranelagh*, our dear gallants and my wife give their humblest service.

Mr. Winthrop *to Mr.* Robert Boyle.

Boston in *New England*, Oct. 27, 1670.

Honourable Sir,

THE good contentment I had conceived at the arrival of Mr. *John Pell*, in hopes to have received by him the desired intelligence of your continued health, when he delivered me your letter of June 21 last, was soon blasted by his sad report of your sickness, and am thereupon necessarily under clouds of disconsolate thoughts, until I have the good tidings of your happy recovery. Mr. *Pell* had a good opportunity, at his arrival at *Boston*, for the easier expedition of his business, meeting a vessel of *Fairfield*, the place where his uncle had lived; and in that vessel was one Mr. *John Bankes*, who was appointed one of the executors in trust by his uncle Mr. *Thomas Pell* deceased; and in the same vessel, together with Mr. *Bankes*, had (that very day of his arrival at this town) passage hence towards the place of his inheritance, and had my letters with him (I being then occasionally at this town) to the magistrates and others there, for their respect and assistance to him, and their ordering his speedy and quiet possession of that, which was his right; and wrote to several others of the magistrates of that colony, by the first opportunity over land, for their like favourable assistance in his concerns, as occasion might be. Concerning the Indian work, I suppose there is full information, and good satisfaction from the commissioners of the colonies, those of them, who met at *Boston* this month, three or four of them; I could not be with them this last meeting, and therefore had not so full notice of the present state of those matters; but I spoke with Mr. *Eliott*, and some others, concerned in that work, and am satisfied of an hopeful progress therein. I shall now make bold to acquaint your honour with a strange thing, which happened the beginning of this last summer at *Watertown*, a place of the *Massachuset* colony, about six miles from this *Boston* in *New England*, and is very certain. There is a large pond of fresh water at that place, in which were several sorts of fish; and multitudes of those fish of all the divers kinds, which were in that pond, suddenly died; there were pike, roach, perch, and other sorts, with eels also, besides very many of another kind, which come out of the sea in the spring thither to spawn; there were very many of all of them found dead round about that water, as near the shore as they could come; the water growing shallower by degrees from the depth of the pond to the shore, and the dead fish lying very thick in that shoal water in the whole circumference thereof, which was great. There be many difficulties, in the consideration about this, as to any natural cause of it. The pond is large (some miles about) and of great depth, and a brook running out of it, so as it cannot be likely, that the water should be tainted by the multitude of fish. I went to the place to see it, but it was above a month after the first notice of it; there were there divers yet whole, but the bones of many other, and pieces; it was towards evening, and I had not time to view much of it. There were some Indians then there; I spoke to some of them; they had not seen (they said) the like there, or in other waters, though there were some very old amongst them; but their apprehensions were, it might be by the lightning, there having been at that very time, and at that place, great thunder and lightning. I am upon further inquiry about it, and of what particulars have been taken notice of as most remarkable; and if any come to my knowledge worthy your notice, may be transmitted by some other opportunity; and shall be bold humbly to crave your judicious thoughts of this thing, whether any natural cause can be known; and whether any memory of this age, or history of former of the like in any lakes in *Ireland*, or ponds, or lakes in other parts of the world, hath observed apparent causes, or whether only to be looked upon as supernatural. Your judgment at your next convenient time will greatly add to the many deep obligations, wherein I am ingaged ever to be in great reality,

Honourable Sir,

your most humble servant,

JOHN WINTHROP.

Letters

Letters from Sir Paul Rycaut *to Mr.* Robert Boyle.

Smyrna, July 2, 1671.

Honoured Sir,

THE fair opportunity, that I have by the bearer hereof, Mr. *Smith*, to kiss your hands, induces me to put you in remembrance, that you have a servant here, who would rejoice and be proud of nothing more than receiving your commands. And though, Sir, my fortune was never so favourable, as to bestow upon me a felicity so inestimable, as the enjoyment of conversation with so excellent a person as yourself; yet having read your soul in your books, I can boldly say, that I have often discoursed with you at *Smyrna*, and by your helps to contemplation I have entertained dialogues with you, and in fine am concluded under an irresistible principle of loving your virtues, and admiring your knowledge.

I WISH, that these addresses were accompanied with some substantial account of affairs here, or philosophical discoveries of something curious, and worthy your observation: but, Sir, you may be pleased to consider, that I live in *Turky*, and am so employed in directing trade and merchandize, and other petty matters annexed to the government of this consulate, that I am almost become a stranger to more ingenuous and liberal arts. However, when I have time and leisure, I adventure to blot some sheets of paper (as Mr. *Smith* will inform you) with matters of these countries, relating to the Christian churches, and to the annals of the Ottoman successes in these latters years. Whether they may be worth the knowledge or notice of the world, I cannot tell, at least I have this satisfaction, that they have been my pastime in my hours of leisure, and recreated my mind, when my thoughts have been overcharged with less pleasing considerations: but, Sir, no employment can be so delightful to me as to be busied in your commands, nor can I ever be satisfied, whilst I am idle and useless in your service, who am,

SIR,

your most humble servant,

PAUL RYCAUT.

Dublin-Castle, March 3, 1685-6.

SIR,

YOU might justly accuse me of too long a neglect in not writing to you, considering the great concernments you have in this kingdom, and the great interest and power your commands have over me. * The croud of business, which pressed me at my first arrival here, gave me but little leisure to attend to an intercourse of letters with my friends in *England*; and I was then so much a stranger to all the affairs of this country, that I was afraid to give any account of matters here, lest I should have mistaken in my first rudiments.

I AM now become a little better acquainted with persons, and the state of affairs in this kingdom; so that matters, which now come to appear before me, seem less strange and difficult than at first. The account you gave me of the state of this country one day at a private conference together, I have often remembered, and compared with the disposition of this country, and find it very agreeable, and corresponding in all particulars. Nothing hath had a greater influence on the peace of this kingdom, than the arrival of this lord lieutenant, who having declared in council, the same hour he received the sword, that his majesty resolved to maintain the act of settlement, the minds of those present were greatly exalted, and the good news was quickly dispersed over this whole city, with general satisfaction. I am very well assured, that never any governor was more welcome here, than this lord lieutenant, who, by his even carriage towards all people, hath strangely gained upon the affections of all parties. Certainly never any man was ever more assiduous in business, nor more indefatigable than he; so that I am very well assured, that this kingdom and people will be extremely happy and flourishing, if his industry and methods be not stopped, and subverted by other measures from *England*. I have sometimes the opportunity to discourse with my lord *Burlington*'s agent, touching his lordship's affairs, and have also received the honour of two letters from my lord's own hand. I could wish I were capable to render his lordship that service, which might at his arrival here in *May* next (which he gives us hopes to expect) make me worthy of his lordship's favours.

I SHALL shortly give you some particulars of what we transact at our royal society here. I have but once been present with them, as yet, being commonly obstructed by business; but shortly I shall endeavour to accommodate my business in such manner, as that I may more frequently afford them my company. Sir, I desire you to present my most humble service to my lord *Burlington*, and be pleased to command me in any thing, wherein I may be useful to you, who am

Your most faithful, and

most humble servant,

PAUL RYCAUT.

Hamburg, August 3, 1691.

SIR,

JUST now I received the favour of your letter, with the much esteemed present of a book (called the Christian Virtuoso) delivered to me by the hands of Mr. *Chamberlaine*. The letter bearing date of the 13th of February last,

last, was not (as I thought) to be longer laid aside, or my answer thereunto, or my thanks for the book, and your obliging enquiries after my condition and health, to be one moment deferred; for I was impatient of doing both, and especially to let you know, that my returns would have been much sooner, had your letter come in due time; yet I am sure it could never come too late, to make me sensible of the favour, nor unacceptable by the hands of that worthy gentleman, who was the bearer of it.

I NEED not enquire, Sir, what you are doing, since you give such frequent demonstrations and proofs of your labours, which have enriched and cultivated the minds of mankind with philosophy and religion. I cannot say, that I have as yet read your last book, it not being above two hours since it came to my hands; but I have delighted myself in reading the preface, and in my thoughts on the title, which confirms unto me the truth of that saying, that a little philosophy may make a man an Atheist, but a great deal will advance him to the state of a Christian. So that I must needs say, that you have been very happy in pitching upon such a subject.

ABOUT six or seven months ago I wrote to you, and inclosed the letter in my packet to *White-hall*, which I hope you received. I then, as I remember, told you, that I employed my vacant hours in writing the history of the last wars and troubles in *Hungary*; in which I have lately received great helps by papers, and manuscripts, sent me from *Vienna* and *Transilvania*, by my lord *Paget*, and other friends at *Vienna*.

THIS work serves to keep me from idleness, and to fill up my leisure hours, I mean, as many as I can spare from expected and necessary correspondences. In the mean time (I praise God) I enjoy a perfect health, in this air, which I esteem very good and dry, and very agreeable to my natural constitution of body: I hope you do the like at *London*, of which the best assurances I can have, are from your writings, which are the best evidences, in my opinion, of health; for great strength of reasoning, or exalted fancy, can never proceed from a languishing body. It would be a great satisfaction to me, to hear sometimes from you, both as to your health, and recovery of your estate in *Ireland*, which I am glad to hear is almost totally reduced. I should also rejoice to hear of my lord *Burlington*, and the welfare of all your honourable family; and to your self I am full of warm wishes for your health, prosperity, and long life, being, with all reality,

Honoured Sir,

your most obliged,

and most humble servant,

PAUL RYCAUT.

Letters from Dr. Bernard *to Mr.* Boyle.

Right honourable,

HAVING deferred my journey to *London*, till it please God to give me another year of life, I account myself obliged to premit this humble acknowledgment of the last book, and the former favours you have conferred on me, beseeching the Best to bless you with the mercies of both worlds, and reward you for the various good you have done in this.

IF any gentleman, amongst the many that covet to wait upon you, have a desire to advance the study of the oriental languages, which open to us the divine word, the treasure, that Mr. *Huntington* lately brought from the East, amounting to four hundred mighty volumes, and more, in Hebrew, Syriac, and Arabic, deserves well the purchase, that it will come at, namely, the very cost of them upon the places in the Levant, being as so many pounds sterling for the said number of manuscripts, most of them in form very large.

THEY are as yet entire, but I fear, unless a patron interpose, will soon be parted, and thereby lose a great deal of their use and profit, which ariseth from their conjunction, as happens likewise to all good things. I commend my humble service to my honoured predecessor, the lord bishop of *Sarum*, who will supply the mathematic study with books to the value of one hundred pounds; and also to Sir *Christopher Wren*, whose benefaction in the like kind we already use, as far as may be, by the leave of *Josephus*, and the meanness of,

Right honourable,

your most obliged and

most humble servant,

E. BERNARD.

I HEARTILY congratulate the honours lately conferred on your noble family.

May 13, 1673.

Honourable and my very good friend,

I MAKE bold to send you a specimen of the Arabic proverbs, which Mr. *Scott*, bookseller, desired to be made, in order to print the whole, if one hundred copies could be taken off by our friends here (Dr. *Castell* promising for a like number at *Cambridge*.) In the edition I would, if it be agreeable to the mind of the ingenious, that a smart Latin version be put to the Arabic proverbs, and then a verbal for the use of the students in that ample language.

MY hours spared from mathematics, and my good friends, I chiefly design upon the Psalms, both because of the frequent and deserved use of that holy book, and also the remains of ancient versions and commentaries thereon.

thereon. When I have finished the first and second psalms, I shall present you with a specimen thereof, which will better explain my intention than I can do at present. To this end, there is an Arabic manuscript in the library of our society at *Arundel* house, which hath these two things, for which I desire to borrow it, upon the security of my honoured collegue, *viz.* a good preface, and the Coptic interlaced, of which I am a mean student, by the example and encouragement of Dr. *Marshall*, the worthy rector of *Lincoln-College*. Now I most heartily condole with you, and all pious and ingenious men, the loss of my dear friend and brother Mr. *Smith*, of *Queen's-College*, who was taken away from preferment, as it was approaching him, and is now infinitely more happy. I pray for your health, which is of greatest moment to all solid learning, and its prosperity. I verily believe, that Dr. *Vossius* will deserve better preferment from our church, than what he now commences in our habits. Mr. *Frampton* will precede doctor this act, and will (God willing) preach the act sermon here.

THE rest of this affair Dr. *Wallis* will better acquaint you with; only I must acknowledge, by my own hand, as well as by his assurances, that I am

Your most humble, and

most obliged servant,

E. BERNARD.

December 30, 1673.

Honourable Sir,

I AM obliged to you for many favours this decayed year, for those good books, which no sickness could hinder the publick of, for the favour of your last letter, and particularly for your good character of Sir *Christopher Wren*, who we wish our burgess. The voice of the university is not yet certain, because divers persons suspend till the writ comes down. I hope well on my patron's side, and my little credit with some friends is now exercised.

HONOURABLE Sir, I beseech God Almighty to give you a happy new-year, good health, and all spiritual comfort, and am

Your very obliged

and most humble servant,

E. BERNARD.

I WISH prosperity to the Royal Society, and desire to serve them.

Oxon, May 1, 1680.

Honourable,

HAVING some months experience of this learned Breman, and besides his skill in physick, admiring his singular knowledge in our tongue, I could not but gratify his ambition of waiting upon you, or rather offer this occasion for your commands into *France*, whither this gentleman is going. The affairs of this place I concede to my good collegue, to relate to you in presence, and only claim the honour of professing myself

Your much obliged,

most humble, and

most obedient servant,

E. BERNARD.

IN the antiquities I am arrived to *Heliopolis*, where the patron saluted his beloved *Joseph*. The Gallican copies would ease my task, and not increase, but shorten the various lections.

Oxon, Oct. 18, *hora vix sexta*, 1680.

Honourable,

THE great advantage I have received in the conversation of Dr. *Hansen*, both from his own virtue and spirit, and also his large intelligence with the more curious and learned of this age, makes me bold to recommend him to your renewed favour and colloquy; yet with the hopes and reserve of his speedy return with his conduct the excellent count *Coningsmark*, unto this seat again, to be farther loved and admired. The health also of Dr. *Pocock* and Dr. *Wallis*, your dutiful friends, now busied or in the difficulties of the holy prophets, or in the ill-transcribed harmonicks of *Ptolemy*, I chuse to mention in this time of epidemical malady, together with the perpetual duty and obligation of,

Honourable Sir,

your most obedient,

and most humble,

E. BERNARD.

Oxon, January 15, 1680.

Right honourable,

I SEND, with the wishes of a good year, my humble gratitude for your aerial noctiluca, which excels other phosphori, as the phosphorus of heaven doth other stars, or as your writings outshine the philosophies of this age, how various, how curious soever.

I HUMBLY recommend to your influence the retrieving of the most ancient Greek copy of Genesis, borrowed by the late lord *Stafford*, but indeed a just part of the library of Sir *John Cotton*. *Lambecius* shews us a like exemplar, in his description of the Cæsarean library.

LASTLY,

LASTLY, I congratulate the honour and advantage done the Society, in your taking the care and preſidence over it, which adds another obligation to the ready ſervice of

Your moſt humble, and
moſt bounden ſervant,
E. BERNARD.

Oxon, February, 24, 1683-4.

Honourable and moſt worthy,

I RENDER you my humbleſt thanks for your treatiſe of that ſtream, by which we all live, and by whoſe inundation not a few periſh.

THIS hard winter hath, and it is its beſt effect, approved another book, you long ſince obliged the ingenious by, of the nature and power of cold, which hath been little underſtood, either by the ancient or modern philoſophers. Pray grant me your good wiſhes, that, with the ſpring, my vigour and intention may return for ſacred and human ſcience, by the grace of the Omniſcient. Wherein, or to what elſe my meanneſs may apply, you may juſtly and eaſily command the obſervance of,

Honourable Sir,
your moſt obliged, and
affectionate ſervant,
E. BERNARD.

Oxon, Sept. 17, 1684.

Right honourable,

THIS gentleman, of great and unuſual learning, is conſcious of the general eſteem and gratitude I bear you: and this letter renders particular thanks for the treatiſe of poroſity, which you lately honoured me with; indeed ſo much the more welcome to my mind, in regard of my conſent with *Hippocrates*, the ancienteſt and beſt profeſſor of the ſalutary art, concerning the perviouſneſs of our bodies, *cribra planè carnea*, to all good or bad afflations of air: which one element doth more to the temperatures and conditions and ſpirit of animals, than all the reſt, not to add your medicine itſelf. For this very rarely and with a circuit corrects the fault and bane of an untoward atmoſphere.

I HAVE adventured to offer you a tranſaction, not for the worth of ought therein contained, as that I might not be wholly empty.

LASTLY, I recommend to you the hiſtory of Sir *Otho Helvig*, from the mouth of this worthy ſcholar; who deſires, that neither his own prince, nor your honour, may ſuffer by the pretences and falſe glories of that knight.

Now I pray for your long and peaceful life, and beg your bleſſing upon your obliged in this univerſity, and particularly,

Right honourable and devout,
upon your moſt obedient
and affectionate ſervant,
E. BERNARD.

Oxon, Aug. 1, 1619.

Honoured Sir,

I HUMBLY entreat you to procure amongſt the Eaſt India merchants a complete alphabet of the Brahmins or Hanſcretan writing, and alſo of the Malabar; which will be a great obligation to

Your humble ſervant,
E. BERNARD.

I FEAR this writing is erroneous, as well as imperfect; but it is all the printed books will give us.

Honoured

Oxon, Feb. 1, 1690-1.

Honoured and beloved,

AS you have done a good and dutiful ſervice to the Author of all, in tranſferring the attributes of nature, which ethnicifm and ignorance long miſplaced, unto the right and omnipotent cauſe, ſo you perſiſt in honouring the Creator, by carrying all curious and generous minds through the regions of his works, unto the throne of his glory, mercy, and perfections. This is certainly the moſt worthy epilogue and corollary of all the years of your philoſophical contemplations; and adminiſters to me and to thouſands more a freſh and noble argument of the pure condition of our reaſon; that a mind for many and many years converſing with all the varieties of the material world, and trying all the forms, motions, and changes of ſublunary bodies to ſundry advantages of human life, ſhould, as unſatisfied and not pure enough, yet pierce farther unto what is more clear and refined, even than number and analogy, unto the eternal, the almighty, and adorable Spirit, to whoſe grace and illumination you are heartily recommended this recent year, by,

Honourable Sir,
your moſt obliged ſervant,
E. BERNARD.

WHATEVER is againſt reaſon, that is, againſt all poſſible means of arguing and referring, is abſurd and unworthy religion: and what is above reaſon, that is, above and beſides all human traditions, doctrines, writings, and diſcourſes, and the laſt concluſions from theſe, is not to be received, unleſs upon a principle moſt reaſonable and ready, even as our ſight, that is undeniable witneſs; and ſuch is the divine ſcripture, for which God be ever bleſſed. But alas! it is the pride and pazzia of theiſts and ſchoolmen, to fancy that to be above and againſt the right reaſon of mankind, which is above or againſt their ſingle and unimproved intellects.

Letter from Sir John Finch *to Mr.* Robert Boyle.

Florence, Feb. 6, 1667-8. N. S.

SIR,

I AM glad of any errand to convey my reſpects to you, which are ſo great to your perſon upon ſo many ſcores, that I had rather leave you gueſs at them by what they ought to be, than by endeavouring to repreſent them to let you ſee they fall ſhort of what my obligations ſhould render. Sir, I hear from others, how publick a debtor you have made me to your goodneſs; for the wars have not ſuffered me to be ſo happy, as to ſee what you bleſſed this age withal ſince I left *England*: but alas! Sir, a perſon of your value and eſteem (with whatſoever in this world can make a judgment) has diſpenſed a character ſo much in my favour, that nothing of private can ever acquit the obligation, nor nothing of publick can ever make good to the world that belief of me you have raiſed. I confeſs, Sir, having made your great abilities much of my diſcourſe, I have gained ſome reputation abroad of judging aright; and I muſt aſſure you, Sir, that the late pope was very high in your commendations. What the princes of *Italy* think of your perſon, I need not atteſt, ſince cardinal *Leopoldo* declares their ſenſe in ſo frequent admiration of your diſcoveries; and I will aſſure you, Sir, the cardinal gave me but two of his books for *England*; one whereof was for his majeſty, and the other for yourſelf, which he deſired me to convey with expreſſions of ſo much eſteem, that I will leave you to gueſs at the ſincerity of them, by what he owns to the world in print. And now, Sir, I have declared my meſſage, I ſhall for the future beg your audience; and when you are more at leiſure, I ſhall give you the trouble of ſomething to entertain your curioſity at leaſt, by an account of what paſſes in theſe parts; but at preſent time will only permit me to make the promiſe, which I ſhall perform by the firſt occaſion; and with all the devotion the heigth of reſpect can dictate, ever remain,

SIR,
your moſt humble, and
moſt obedient ſervant,
JOHN FINCH.

DR. *Baines* deſires me to preſent you with his moſt humble ſervice.

MY brother will give the cardinal's book he ſent, to whom you ſhall order to receive it.

Letters from the earl of Winchelſea *to Mr.* Robert Boyle.

Eaſtwell, Sept. 10, 1675.

SIR,

I HAVE thought the time very long ſince I had the honour to have waited upon you; my occaſions keeping me here in the country muſt be my excuſe. Intereſt, which ſways ſo much in prince's courts, muſt have weight in the balance alſo with thoſe, that live the moſt remote.

MONSIEUR *de Son* hath made me a moſt excellent engine, that forceth water up to this houſe one hundred foot high, in great quantity, and works without any jarring, or ſhaking, and yet with great force and conſtancy. A deſign of which my ſon *Heneage* will ſend you.

ONE of my ſons I have ſent for *Smyrna* to conſul *Rycaut*, to be bred up for merchandize or navigation. My ſon *Heneage* is to go abroad with me, for I intend with my wife, and a ſmall retinue, for to go into *France* next month. I have a great deal of reaſon to prize my health, which is impaired in this cold

cold climate, and I go chiefly to recover it. I have served this king and his father ever since the treaty in the *Isle of Wight*, and had sooner, but that I was too young. It is now high time to think of myself and my children; for it is too much to suffer twice, once for hating *Cromwell*, &c. and now to be forgot.

I SHALL choose one of the best airs I can for to live in, and a climate between 42 and 40; one place for the winter, which is warm, and another for the summer, which is cool; some parts of *France*, or *Italy*, or *Spain*. My intentions are not to stay abroad above three years, and in that time I shall have my son *Heneage* well instructed in those three languages, and have seen enough. I have cause to look well after this son, for I lost my eldest first in his match, whilst I served the king in *Turkey*, and at last in the wars with the Dutch.

WHEN I shall be abroad, if I can serve you in any information, or curiosity, you will oblige me in commanding me. I have no intention by these lines to put you to the trouble of an answer, for I resolve to wait on you as soon as I go to *London*, which will be some time this month. In the mean time I wish you all happiness, that am

Your most humble servant,

WINCHELSEA.

Eastwell, Sept. 26, 1683.

SIR,

I RECEIVED the honour of yours dated the 20th instant, and am extremely obliged to you for your care of my health. I wish it were well enough to do you any service, whereby I might express, how much I value your friendship, and how gratefully I receive your love and kindness in such repeated instances.

I THANK God, in many respects my health is of late amended, upon which account I have hitherto delayed my intended journey, in hopes it might have been wholly repaired here; but the scurvy in my mouth is so inveterate, that I must be forced to remove out of *England*, except I would hazard all my teeth, one of them being already so loose, that I despair of saving it by any means. I design to take my journey about three weeks hence, or a month at the farthest; and staying but two or three days in *Paris*, to hasten directly to the most southern parts of *France*, and perhaps (if I make such dispatch as to pass the *Alps* before the 10th of November) I may winter at *Pisa*, which is accounted by the duke of *Florence* to be a very good air at that time of year; but as to this particular, I beg the favour of your advice.

I DO not know, how matters stand between *Spain* and *England*, but in my own esteem, I prefer *Barcelona* to any other place, unless I would go so far as *Naples*; but neither must be thought of, unless I had greater assurance of civility from the Spaniards, than at this juncture I can propose.

WHEREVER I am, I beg the honour of your correspondence with me by letters: yours may be left with consul *Rycaut*, to whom likewise I shall direct mine for you: and if I can do you any service in my travels, you shall find me very willing and ready to undertake it.

As to *Muntingius*, what I design is for the publick good; I have sent for the book, and before the extract is published, I shall desire your approbation.

IF I can make any enquiries abroad, which may be useful to you, I intreat you would be pleased to send me instructions in writing; and wherever I come, I will confer with the most learned, and best experienced in each particular.

BEING indisposed myself, I have taken the liberty of an amanuensis, and hope you will use the same freedom with me upon any occasion. I am

Your most humble, and

most obliged servant,

WINCHELSEA.

IF you can direct me where to buy any of that water, which you were formerly pleased to recommend for my teeth, I shall take it as a great favour.

Letters from Dr. Sall *to Mr.* Robert Boyle.

Christ-Church in *Oxford*, Dec. 17, 1678.

Honoured Sir,

I HAVE the honour of yours of the 12th current, and do humbly thank you for your kind remembrance of me, and for helping me to bless God for his good providence over me, in leading me to this religious retirement, so convenient and necessary for me in this conjuncture. I endeavour to make the best use I can of what time and strength God sends me, for his service and the common good. My present work, commended to me by our chief prelates, is, to revise my course of philosophy, controversial and moral, and the fundamental tracts of practical theology, which in my better age and forces I laboured for my publick lectures, but much more for the future profit of my countrymen; my purpose being to deliver to them the system of notions belonging to those faculties, approved by the more creditable authors of this age, in a more clear and brief method, than others going among us, avoiding both extremities of a barren summary, without reasoning my assertions, and of a confused prolix excursion upon unnecessary matters; as also excluding positions opposite to true orthodox doctrine, and suggesting foreign errors, which is now my special study to secure. This much in due

due obedience to your request for letting you know my present tax.

AND whereas you are pleased to give me leave to deliver my opinion touching your design of reprinting the new testament in Irish, and how it may conduce to the conversion of those miserably deluded souls; I bless God for inspiring to you so holy a zeal, and to those worthies, that join with you therein. And I doubt not but it may conduce highly to the glory of God, good of those souls, and credit of our government, if the other prelates and pastors of Ireland did use such endeavours as the good archbishop of *Cashell* does, by communing with the natives, and winning them to hear and read the word of God, and specially if in the college there were a course taken for obliging or inticing such as expect to have * * * * * to read and declare the holy scriptures in Irish, specially the new testament, the historical and proverbial books of the old, together with the old psalms; of want of which I saw good men in both kingdoms give grievous complaints: for me, I am more apt to lament than remedy it. Persons of your rank and authority, and of your honourable relations, may be more proportionable to effect the remedy; and I would offer my obediential concurrence to the utmost of my power.

I DO not remember to have seen more of the scriptures printed in Irish, but the psalms with our common-prayer book in handsom folios for quire, of which I discovered a set to the archbishop of *Cashell*, and his grace appointed a reading of them in his cathedral. Having lived so long abroad, I may not be magisterial in the *Irish* tongue, though by the help of reading I kept such stock of it, as enabled me to preach. But this much in general I shall insinuate, that if I were fit to be the translator, of two ends, men may aim at in such a work, the one, of getting the credit of skill in the primitive ancient Irish, the other, of benefiting common readers by expressions now in use, I would chuse the latter. And I do take it to be as unbecoming a serious and well meaning undertaker of such a work to use obsolete antiquated words, alien from common perception, as may be in a preacher at *Christ-Church* in *Oxford* or *Dublin*, to speak now the language of our good ancestors, the Saxons, in time of king *Edward* the Confessor, to get the credit of pure English; the purpose of nature, by speaking, is, to pass the conception of the speaker to the hearer; to use words unsuitable to this purpose, is to trespass against nature. Let not the grave interpreter cast off common words, while proper, for derived from English, Latin, or other civil languages. In a serious debate upon this subject, with eminent speakers of Irish, I made evident to themselves, that they may not speak much properly in matters relating to philosophy or divinity, by meer Irish words, without recourse to derivatives. For example, they could not shew me one Irish word for *blasphemia*, which themselves would not laugh at, compared with the meaning of that word in schools, *&c.*

I LEAVE to your own better judgment to consider, whether it may be convenient to face the Latin or the English with the Irish, in two columns of the same page, and the Irish to be put in Italick character (as was done in a catechism I saw by *Stapleton* a Romanist) which may be a means of learning the Irish by Latin or English, for those of the college and others. The change of characters is but the same done by our ancestors of the Saxon character (which is the same with the Irish) to that brought in by their conquerors and civiler times: well may the Irish bear the like. It were much to be wished, that, by the help of judicious men, the like reformation of the Irish orthography should be used, as is now going in English and French, cutting off letters, that are not expressed in the prolation; the purpose of writing being to represent exactly the speaking.

You enquire, which is the Irish word for a quail? If I have not forgot, it is * * * * * *giarraguirt*, which (alluding to the common haunt of those birds) signifies a cornfield-cutter. For a chariot, the ordinary word is * * * * *costik*, the same that is for a coach. And having said this much, in answer to your demand, I humbly desire my best and very affectionate respects be presented to my honourable lady *Ranelagh*, my lord and my lady *Burlington*, my lord and my lady *Clifford*, and all the illustrious family, whose health and happiness is the very earnest prayer of,

Honoured Sir,

your most humble

and most obliged servant,

ANDR. SALL.

Christ-College, Oxon, April 5, 1679.

Honoured Sir,

HAVING given account to my lord archbishop of *Cashell* of the pious intention you were pleased to impart to me of reprinting the Irish testament, and desired his grace to let me understand what other parts of the bible he knew printed, or translated to Irish for printing, he gave me the notice thereof, which I send here inclosed (being a piece of his last letter to me) for your further satisfaction.

I PRAY be pleased to present my best respects to my very honourable and good lady *Ranelagh*, with my most humble and hearty thanks for her ladyship's pious and noble care in soliciting my concerns there. I hope so honourable a mediation will avail me, however the present concurrence of weighty cares may cause a delay. I do not abate in my labours for the publick good for all the want of help I have; for I did not begin, neither (by God's help)

help) will I proceed for any worldly inducement.

IF my lord *Burlington* be there, I beſeech you to preſent my moſt affectionate reſpects to his lordſhip, and to all the honourable family. I continue praying heartily for God's bleſſing upon you all, and am,

Honoured Sir,

your moſt affectionate,

and moſt obliged ſervant,

ANDR. SALL.

Chriſt-Church, Oxford, June 29, 1679.

Honourable Sir,

THIS is to let you know, that if thoſe noblemen, who have hindred my returning to Ireland, promiſing to procure me a competent living here, be pleaſed to continue that good will for me, now an opportunity appears for executing it, whereas the oldeſt of the canons here Dr. *Lockie*, above eighty years of age, is fallen ſick, and, as I hear, without appearance of recovery; his place, or another like it here, is the thing moſt convenient that could be for me, to render me ſerviceable to our church and ſchools, and which the biſhop of *Wincheſter* and other worthy men did wiſh for me from the beginning. I beſeech your honour to continue your noble zeal for me, in propoſing the caſe to my lord chancellor, and to the biſhop of *London*, by my good lord *Burlington*, or yourſelf; whereby I hope their lordſhips will be pleaſed to procure for me that ſettlement and conveniency for ſerving our church, which I am ſo long time expecting.

MY courſe of ethicks is half printed, and promiſed to be finiſhed next month. My whole courſe of philoſophy is ready to follow it. That and more, by the help of God, I ſhall be the better able to perform for the publick good, if this my requeſt be granted. I deſire my moſt humble and affectionate reſpects be preſented to my honourable lord and lady of *Burlington*, to my lady *Ranelagh*, my lord *Clifford*, and all your illuſtrious family, whoſe happineſs *in utroque homine* I heartily wiſh and pray for,

Honourable Sir,

your moſt humble, and

moſt affectionate ſervant,

ANDR. SALL.

Dublin, May 20, 1680.

Honourable Sir,

LAST week I gave account to my good lady *Ranelagh* of my arrival here, and my going to *Navan*, and what diſpoſition I ſaw there towards the accompliſhing of her good ladyſhip's godly intention for the inſtruction of the children. Now I am to give yourſelf account of my endeavours to concur with your moſt noble and holy zeal of bringing the word of God to the hands, and hearing of this moſt miſerably blinded people. I conferred with my lord lieutenant, my lord biſhop *Meath*, and with the provoſt of the college upon the ſubject, and I found all three very willing to countenance and further the matter. I doubt not to find the ſame inclination in my lord primate and other worthy perſons. All do accordingly honour and commend your piety in reprinting the Iriſh teſtament, and do rejoice at the notice I gave them of the forwardneſs that work is in already by your means. I find both my lord biſhop of *Meath* and the provoſt willing to contrive the reading of it, and of Iriſh prayers in the college. I hope God will raiſe more of good ſpirits to advance this work for the good of poor ſouls. I pray be pleaſed to let me know, how forward that buſineſs is now in the print, and deſire Mr. *Rely* to give me a large and minute account of the matter, and what courſe he took to continue the work he was on, of altering ſome words improper and exotick of the copy, which I would wiſh may have the inſpection of ſome judicious and learned proteſtant, and without that to let the words go as they be in the copy. I pray ſend his letter incloſed to me in your own, and ſend it directed to Mr. *Fletcher*, or to Mr. *Foley*, fellow of *Trinity-college*, to be furthered after me to *Caſhell*, whither I do intend to ſet forth from hence within three days, God willing: there and elſewhere preaching in Iriſh, I will endeavour to prepare the way for the reading of your Iriſh teſtament. I pray let me know, whether you may think fit to truſt me with the help of other better judgments here to compile the preface to this edition, and what things you may think fit to add in it, to what I judge neceſſary to expreſs of the authors and advancers of that work both now and in the firſt edition.

I WOULD alſo deſire you to ſend to my lord biſhop of *Meath*, or to myſelf, a copy of the project for ſubſcriptions uſed at the printing of the Welſh bible, to be a pattern to us, both in this occaſion, and others, which I hope may happen of printing more of that kind. Now commending you and your noble endeavour to God's protection and guidance, I reſt,

Honoured Sir,

your ever affectionate ſervant,

AND. SALL.

Caſhell, Oct. 16, 1680.

Honoured and dear Sir,

I RECEIVED by this poſt yours dateleſs, but written in Auguſt (as I find by the contents

contents of it) to my great joy for knowing of your health and welfare, being not a little troubled in not having heard from you ſince my coming out of *England*, of which I have from you now the reaſon to my full ſatisfaction. I hear nothing yet from Mr. *Rely*, but am extreme glad for what you are pleaſed to tell me of the forwardneſs of that work about printing the teſtament, which I conſider not to be ſmall for the nature of the work. Since my laſt to you I ſpent my time preaching and catechiſing in Engliſh and Iriſh every Sunday in this city, and in the country near it, when God was pleaſed to viſit me with a dangerous ſickneſs of the country diſeaſe, ſo called here, by looſeneſs and vomit. I was given for dead. But God was pleaſed to reſtore me to my former meaſure of health. May it be for his honour and glory. I am nothing forgetful of your pious deſire, and my lady *Ranelagh*'s, touching a catechiſm to be made in Iriſh; and diſcourſing on the matter with my lord primate, his grace was very earneſt with me to make uſe of that in the common prayer book, as more fit for the capacity and memory of young and ſimple people. So I have done hitherto, finding it printed, and enlarging where I think neceſſary. I find beſides another larger catechiſm with places of ſcripture printed in Iriſh at *Dublin* the year 52. by one *Godfrey Daniel*, with rules for reading the Iriſh tongue, ſhort and excellent, taking up no more than half a ſheet of paper. I greatly wiſh they were affixed to the beginning or end of that book printing now. But only I offer this to your own wiſer conſideration, whether the reading of thoſe rules may not help many for the reading and underſtanding of the book. If this motion ſhould pleaſe, and Mr. *Rely* ſhould not meet with *Daniel*'s book there, I will upon your order ſend over a copy of the rules. I fully approve of your motion to apply in the preface what yourſelf and thoſe other worthies ſhall think fit of that uſed by the Janſeniſts in their French verſion, and am not a little joyed to hear ſo great an advance to right made in the Romiſh church, as to ſuffer the word of God to come unto vulgar tongues. My only intention for intervening in the preface was to ſecure, that the memory of the firſt and preſent patron of that work may not be concealed from grateful poſterity.

THE beſt and greateſt men of this kingdom do highly commend your pious zeal appearing in this work, and do approve of our endeavours to procure the ſpiritual welfare of this miſerably deluded people. But beſide the private oppoſition of the Romiſh clergy, who would have themſelves to be the only teachers, we have a more publick and bolder oppoſition by ſome of our own apparent but very falſe brethren, who are not aſhamed to profeſs a diſlike of our endeavours to convert the natives of this country, upon maxims like thoſe of the American planters, in hindering the converſion of their ſlaves to Chriſtian religion. One of them had the gallantry to tell me in my face, and at my own table, that while I went about to gain the Iriſh (to God I mean) I ſhould loſe the Engliſh. Our good archbiſhop has continual battles with them upon this ſubject. But I hope God will help us to carry on his work againſt oppoſitions, which ſhall never be wanting; and of this unwelcome tiding no more. My lord archbiſhop returns his very affectionate reſpects to you. He is a great honourer of your family, and how great an admirer his grace was of your honourable mother's virtues, you may ſee by an elegy he made on her death, being then fellow in the college of *Dublin*, of which I ſend here incloſed a copy to divertiſe you from the melancholy my narrative of the proceedings of others not ſo noble ſpirits might have ingendred. I perceive your family, among other bleſſings, has this of heroick women; not to ſpeak of the neareſt to you (fearing it ſhould come to her eyes or ears) I reckon your ſiſter *Burlington* among the beſt women, that ever I knew. God bleſs and proſper you all; and I pray excuſe the liberty my pen takes to prate, ſince my tongue is confined to more ſilence with you than I would wiſh. And now with my beſt reſpects preſented to my good lady *Ranelagh*, my lord *Burlington* and my lady, my lord *Clifford*, and the reſt of your honourable company, I reſt,

Honoured and dear Sir,

your moſt affectionate,

and moſt obedient ſervant,

ANDR. SALL.

Dublin, Nov. 8, 1681.

Honourable SIR,

THE letter here incloſed for you from my lord biſhop of *Meath* was ſent to me this morning to view, but now late at night was ſent again to me with order from his lordſhip to ſend it incloſed to you, ſome indiſpoſition having taken himſelf, which diſabled him to diſpatch it. He came much weakned from his journey to *Kilkenny* in bad weather; and though I ſaw his lordſhip better three days ago, I perceive he is turned ill again. I do heartily pray, and I think all may do ſo, that ſo good a man may live long. I have finiſhed the preface, which he ſpeaks of, and when a copy is drawn of it, I will ſend to you ſpeedily the original. I have ſeen the Janſenian preface, and made of it the very uſe you mentioned in your letter to my lord biſhop of *Meath*, both for my readineſs to obey you, and the reaſonableneſs of your command herein.

I AM daily and long time expecting the old teſtament in Iriſh to be ſent to me to ſee what it is, and what it wants, that I may contribute my ſmall endeavour, while thoſe few live, who have any zeal of the converſion of the natives here: how few they be I bemoaned ſadly and ſeriouſly with our lord lieutenant

lieutenant this afternoon, admiring how few they were, that followed your heroick example, even of thoſe, whoſe calling did ſtrictly oblige them to it, and from whom I am to expect little thanks for my endeavours to co-operate herein. His grace would be glad to ſee my preface in Engliſh, to underſtand better the drift and profit of this undertaking; for which cauſe our learned friends do think it convenient, it ſhould be prefixed in both languages to this new edition; and I think no perſon fitter to tranſlate it than Mr. *Rely*, nor any printer fitter than the ſame formerly employed. I have received the book you ordered for me, for which I humbly thank you, and am much ſatisfied with the print. I pray let this ſatisfy Mr. *Rely*, until I ſee the old teſtament to give him more account of it.

I PRAY be pleaſed to preſent my moſt dutiful and hearty reſpects to my good lady *Ranelagh*, with moſt humble thanks to her ladyſhip, and to yourſelf, for your noble and conſtant goodneſs to me in recommending me to our great father here, who has now occaſion to befriend me in not hindring my lord lieutenant's deſire and the king's order to ſee me decently ſettled in theſe vacancies by the death of the biſhop of *Derry*. God's will be done. I am,

Honourable Sir,

your ever faithful ſervant,

ANDR. SALL.

Dublin, 19, Nov. 1681.

Honourable Sir,

HERE I ſend the preface promiſed in my laſt to you. My lord biſhop of *Meath*, the provoſt, and our other learned friends, who ſaw it, do think it appoſite and ſuitable to the genius of the people here, for inducing them to the reading of that book. What is contained in the looſe half ſheet, to be inſerted as noted in the beginning, I have added, in compliance with your direction, to let the people know the ſentiment and practice of learned men in the Roman church, about turning the holy ſcripture into vulgar languages. Our friends now mentioned do think convenient, that this preface ſhould be prefixed to the book both in Engliſh and in Iriſh, that ſuch as cannot read or underſtand the latter, may, by the former, perceive the profit of this undertaking. The duke, in his diſcourſe with me upon the matter, did ſeem to wiſh it were ſo done. If you think fit to order ſo much, I would deſire you to appoint ſome fit perſon to publiſh my Engliſh expreſſions where need is, and to get Mr. *Rely* to turn it to Iriſh, and ſend both printed hither, to join with the book, which is thought very neceſſary for the better ſucceſs and uſe of it. Speed herein is very much deſired by the well-wiſhers of our undertaking, which makes me ſend to you the original of my own hand, not being furniſhed with an amanuenſis to draw a legible copy.

MY lord biſhop of *Meath* continues ſick, which hinders me from ſeeing the old teſtament, which he promiſed to bring to me.

I BEG of you the favour to preſent my moſt humble and affectionate reſpects to my honourable lady *Ranelagh*, my lord *Burlington*, and the reſt of that renowned family.

BUT I am to beg earneſtly of you not to abridge any thing of the very dry and ſpare mention made in the preface of your holy zeal, in providing for the good of ſouls in this country, that it may be an encouragement to others to follow your example, and a confuſion to ſuch, as will not do it. The fear of offending your ſevere modeſty ſtopt my pen from writing much more, which my judgment and inclination would prompt to me; but once again I beg of you not to hinder any thing of the very little that is ſaid. This is all at preſent from,

Honourable Sir,

your moſt affectionate,

and moſt obedient ſervant,

ANDR. SALL.

I PRAY be pleaſed to remember my ſervice to Mr. *Rely*, and tell him, that when I can come by the old teſtament in Iriſh, I will endeavour to ſatisfy his enquiry about it. He ſhall oblige us all much in uſing care and ſpeed in tranſlating and printing the preface ſent herewith, that it may be bound up with the book to be diſperſed.

Dublin, Dec. 13, 1681,

Honourable Sir,

I HAVE the honour of yours, November 29, and am glad you received the preface, and that it pleaſed you, as I was to ſee ſome ingenious Romaniſts, who ſaw it, very much pleaſed with it. I know not, whether you will think fit to have the preface printed and prefixed to the book, both in Engliſh and Iriſh, that being thought by the well-wiſhers of this undertaking very convenient for recommending the book to ſuch, as yet underſtand not the Iriſh, or cannot read it, who are but too many even of the natives. It is much deſired, that the preface may come over with all the ſpeed poſſible, the binding of the books ſent in ſheets being ſuſpended till it arrives.

SOME ten days ago my lord biſhop of *Meath* ſent me the manuſcript of the old teſtament in Iriſh, a confuſed heap, pitifully defaced and broken. It was a work of very great labour, to bring it into ſome order. I ſent for a book-binder to bind up what I could gather, of which and another uncouth bulk, ſent to me from the college, I hope to make up a complete old teſtament, by the help of God, and of Mr. *Higgin* the Iriſh lecturer, if he

he be encouraged by our prelates, wherein I wiſh they may be more zealous than accuſtomed to be.

IT will be a work of great labour, and no little time, to draw up a clear copy of the whole, purged from errors and fooliſh additions or alterations, interlaced by ſome unlucky corrector, pretending to criticiſm in Iriſh. I pray be pleaſed to give notice hereof with my kind ſalutes to Mr. *Rely*, and my earneſt requeſt (if any weight may be thereby added to your command) that he haſten the work of printing the preface.

THE good biſhop of *Meath* continues ſtill very ill, keeping his chamber, though ſometimes up. I ſent now to know of his health, and am told, he was long time aſleep, which often comes upon him.

I BESEECH you, Sir, be pleaſed to preſent my moſt humble and affectionate reſpects to my good lady *Ranelagh*, my lord and my lady of *Burlington*, and the reſt of that moſt honourable family, ſpecially to my lord *Hyde*, who, by your honourable brother's means, was pleaſed generouſly to offer me his favour; and if his lordſhip, or my lord chancellor, my noble favourer, were induced to write a word in my commendation to my lord of *Ormonde*, it would avail much to make him remember the king's order in my behalf, and deal according to it with me. I am,

Honourable Sir,

your truly affectionate,

and moſt faithful ſervant,

ANDR. SALL.

Dublin, Feb. 7, 1681.

Honourable Sir,

AS ſoon as I received yours of January 21, I beſtirred myſelf, with all care poſſible, to effect your pious deſire of having the printing of the old teſtament in Iriſh to begin ſpeedily, and having found out haply a very able perſon to write Iriſh, I brought him to my houſe, and ſet him to work, and already has written out eight chapters of Geneſis, in a very fair letter, as legible as any print, and within four days will have the twelve ſheets, which Mr. *Rely* deſires to be ſent over, and as faſt as the print can go, I hope to ſend over ſheets in the ſame manner; to effect which, I ſent for Mr. *Reeves* this morning, who has promiſed me to find out friends, going hence to *London*, by whom we may ſend the ſheets, to ſave the great charges of ſending them by the poſt. I agreed with the ſcribe for one ſhilling for each ſheet; the provoſt and Mr. *Higgins* think that to be the leaſt he can expect, conſidering the ſpecial difficulty of writing that language. I deſire to know your own opinion, with Mr. *Rely*'s, upon that; as alſo that the ſubſcriptions may be immediately begun and ſent over, whereby to defray the charges of this writing. I wiſh my ſtock were as able as my heart would be willing to bear all myſelf. My labour and induſtry I will not ſpare, and will lay aſide other ſtudies I was engaged in to attend this work, being perſuaded, that none other can be of more importance for the glory of God and the good of ſouls in this poor country. I have been confirmed in this perſuaſion, by the great joy I ſee in the country, for the publiſhing of the teſtament, with many bleſſings on you, and prayers for you, whoſe great piety and bounty procured this happineſs for them. I am glad my good lady *Ranelagh* has that intereſt in the new biſhop of *Meath*, and is pleaſed to improve it for advancing this great ſervice of God. He is the only man: his predeceſſor a little before his death told me, he had gained to join with him in this work. But if my lady interpoſes, his aſſiſtance will be more aſſured. I hope I have gained ſomething upon his ſucceſſor, the dean of *Chriſt-Church*, now biſhop of *Kildare*, to join in the ſame holy deſign. I wiſh theſe two biſhops and the provoſt may be the propoſers and collectors of the ſubſcriptions, and that theſe may be immediately ſet going, both here and among your noble friends in *England*. Sir *Joſeph Williamſon*, meeting with me here laſt ſummer, did enjoin me to haſten the ſetting on the ſubſcriptions, to which himſelf and others there would willingly concur.

I WOULD think it very convenient, to prefix ſome few lines to the papers of ſubſcriptions, importing the benefit of this work to this nation: and none can better perform that than yourſelf, applying thereto ſome of thoſe conſiderations happily expreſſed in your excellent tract of the Stile of Scripture, which I have read with exceeding great pleaſure, praiſing God for thoſe gifts you received from him, and your good uſe made of them; both which I pray may be continued to you, with a long and happy life. What I can offer, is, the drudgery of inſpecting and correcting this confuſed chaos of papers, put into my hands, with ſuch auxiliaries, as God ſhall be pleaſed to provide for me. I write to Mr. *Rely*, the letter I make bold to incloſe here, not knowing how to direct it to him otherwiſe; in which I endeavour to encourage him for continuing the work of correcting the print, as I hope you will more effectually do by your authority; and truly I know none ſo able as he to do that work.

I PRAY be pleaſed to let me know by the next, how you will have the three hundred and fifty teſtaments, now to be bound with the preface, to be diſpoſed; and how many you will be pleaſed I may beſtow on ſuch as ſhall make the beſt uſe of them, for the end pretended to; and whether you think fit, that ſome of them may be expoſed to ſale, at a low rate, that may encourage the people to buy them. Several gentlemen of the country, Romaniſts, came to me this term, earneſtly deſiring to have them for reading to their families; and one promiſed to urge their prieſts to read chapters of it at maſs to the congregation.

gation. For this purpoſe I wiſh, that a great number of the next edition may be expoſed to ſale at a low rate. I crave the favour of preſenting my cordial reſpects to my honourable lady *Ranelagh*, and the reſt of your renowned family; and, praying for all happineſs to you, I remain,

Honourable Sir,

your moſt affectionately devoted

and much obliged ſervant,

ANDR. SALL.

I HAVE little to ſay of my concerns; all the vacancies filled, and no effect appearing of great promiſes given to me. But as reward of that kind did not invite me to begin, I hope the want of it, by God's help, will not hinder me to proſecute.

MY dwelling is next houſe to *Youngs-Caſtle* in *Oxmans* town.

Letters from the lord Maſſereene *to Mr.* Robert Boyle.

Antrim, Dec. 15, 1680.

SIR,

HAVING laſt night been called out of our houſe to view a blaze or faint pale ſtream, which roſe above our horizon, and put us all to great wonder; I took out the celeſtial globe, and my ſon a quadrant, and had ſeveral perſons with us to obſerve the thing and the motion; the deſcription whereof (as well as we could make it) is here offered you, and deſire to know, if it appeared at *London*, or if you have obſerved or heard any thing of it.

I SHALL every night take notice, and in the mornings alſo, if it appear again, as we conclude it will; and ſubmit this incloſed narrative to your ſerious and judicious ſcrutiny. I have ſent the like to Sir *Samuel Morland* by this poſt.

PARDON this haſty and rude addreſs. I am,

Honoured dear Sir,

your very affectionate,

and humble ſervant,

MASSEREENE.

Incloſed in the preceding.

In the north of Ireland, *at* Antrim, *Dec.* 14, 1680.

ABOUT half an hour after four o'clock this afternoon, the evening being clear, and the moon bright, was obſerved at this place (which is in the lat. 54 deg. 30 min.) a ſtrange phænomenon. About ſouth-weſt a ſtar of the fourth magnitude (as we reckoned by its appearance a little above the horizon) emitted a ſtrange luminous body, or ray, which aſcended after the manner of a pillar about 45 degrees towards the Zenith, in a direct line, about ſix o'clock when it was at the longeſt. At the bottom it appeared about a foot broad, compact and fiery, increaſing gradually in breadth, till about the middle, it appeared more than two foot broad, more clear and pale: from thence in its aſcent (by the heel of Antinous through Aquila, to the neck of Cygnus to our obſervation) it grew more rare and ſlender toward the top. Its bright tail or fiery emication followed the motion of the ſtar, and others, which accompanied it, ſtill retaining the ſame poſition, till it came to due weſt, where the ſtar ſet, and its tail grew ſhorter and ſhorter, till at length about eight o'clock it quite diſappeared.

Fiſherwick near *Lichfield*, Oct. 8, 1690.

Much honoured Sir,

WHAT was ſo remarkable in this and divers places adjacent, between the hours of ſeven and eight in the morning yeſterday, I offer to your conſideration, which was undoubtedly true as I relate it, and may poſſibly confirm the ſame account from other places, concerning an earthquake, which happened at that time here, and at *Lichfield*, three miles off, as one of the bailiffs to me this day affirms; and it was at *Aldraws*, a town two miles off, belonging to baron *Turton*, as I was aſſured, and by my wife, my ſon, and daughters, and divers of the ſervants in this houſe obſerved, and by the children in ſeveral rooms taken notice of at the ſame preciſe moment of time yeſterday morning, by the frightful concuſſion of the Rooms, partitions of the houſe, pictures, beds, and other moveables, one door flying open as my ſon Sir *George* ſat near it, and he thought the beams of the houſe had given way. There was no great wind at the time, but the day before thunder and lightning, and ſome ſort of tempeſtuous winds, but at that time none at all. I was in bed aſleep, and did not obſerve it; but all others in bed at that hour, and thoſe who were riſing, agree in one ſort of narrative thereof; and is not unworthy your knowledge, who may from other hands have the ſame intimation. My ſervice to my dear aunt *Ranelagh* and couſins. I am rejoiced to hear, that *Cork* is ſurrendred. I am,

Sir, your moſt affectionate,

humble, and faithful ſervant,

MASSEREENE.

A Letter from Dr. Narciſſus Marſh *to the Biſhop of* Meath, *occaſioned by one from Mr.* Boyle *to that Prelate.*

Aug. 27, 1681.

My lord,

HAVING carefully read over the Janſeniſts preface to the new teſtament, publiſhed by them in French, I make bold

to give your lordſhip my preſent thoughts concerning it; but with that deference and reſpect, which I owe, and always will bear, to your lordſhip's and other better judgments.

THE preface I find to be very well penned, and adapted to the book, whereto it is prefixed, ſerving the deſign of the publiſhers of that tranſlation as properly as can be imagined. But being ſo proper to that tranſlation, I fear it may not ſo well ſerve another, eſpecially one publiſhed by proteſtants, for theſe following reaſons.

1. BECAUSE there are ſome reflections in it a little too ſevere on proteſtant tranſlators, which cannot well be countenanced by us.

2. THERE is a ſentence or two, which I obſerved in the original, to ſavour too much of popery to paſs a proteſtant preſs.

3. PART of the preface is ſpent in ſhewing the imperfections of the old French tranſlation of the new teſtament, and why a new French tranſlation thereof is requiſite; which would be beſides the purpoſe, ſhould this preface be printed with any other tranſlation.

4. MANY paragraphs are written to ſhew, what rules were obſerved in this French tranſlation; ſome whereof cannot, and I believe others do not agree to any other tranſlation; and therefore that alſo would be beſides the purpoſe.

5. THE authors of that preface have beſtowed not a little pains to ſhew, how difficult (if not impoſſible) a thing it is to make an exact tranſlation of the bible; which though true, yet whether it be adviſable, that it ſhould be made known to the commonalty of this kingdom (who are already but too much addicted to the vulgar, which they eſteem as authentick) is worth while to conſider.

Now if all theſe things be let continue in the preface, I fear it will not anſwer the deſign; beſides other inconveniencies, that may follow it: and if they be left out, the preface itſelf will then be both maimed and inconſiderable.

THUS I have freely given my opinion in this caſe; but with due reſpect and ſubmiſſion to your lordſhip's judgment, and with an appeal alſo to your lordſhip's candour and favour for what I have done, whereof it ſtands very much in need; and which, together with your bleſſing, I crave on,

My lord,
your lordſhip's moſt dutiful,
and obedient ſervant,
NARCISSUS MARSH.

I HAVE herewith ſent the tranſlation of the preface, but mended in the firſt page, that your lordſhip may diſcern how imperfectly it is done, and much beſide the original.

Letters from Dr. Narciſſus Marſh *to Mr.* Boyle.

Trinity-College near *Dublin*, Dec. 27, 1681.

Honoured Sir,

THE ſeeming neglect, whereof I have been guilty, in not paying you my humble and hearty thanks for the favour that you did this college and me in ſending the Iriſh teſtaments hither, is crime enough to make me aſhamed now to attempt it. But ſince the delay of this my duty was ſolely cauſed by the biſhop of *Meath*'s indiſpoſition, which rendered (and ſtill does render) him unable to look after the diſpoſal of theſe books, whereof I was deſirous to give you an account; and ſeeing that he is not likely for ſome time yet to be in a condition to do it, I could no longer (without great indecency) forbear the return of my humble acknowledgments in my own behalf for the book, which you were pleaſed to preſent unto me, and in this college's name alſo, for that ſent unto our library, and for the other forty deſigned for the uſe of the college, in inſtructing the young ſtudents of it in the Iriſh tongue. All which are accordingly employed, with good ſucceſs, to the uſe, for which they were intended.

AND here I cannot but take notice, that the whole deſign of teaching Iriſh muſt of neceſſity have fallen to the ground in a very little time, had not you ſeaſonably aſſiſted and encouraged the undertaking by your books, as well as otherwiſe; which has now put life into it again, and ſo ſet it on foot, as that I have hopes it will at length come to maturity; ſince both the young men are willing to learn, and Mr. *Higgins* alſo is induſtrious to teach them, and by his Iriſh ſermons invites many to come to our church, who are of another perſuaſion, his auditors being ſeldom fewer than three hundred, whereof ſeveral papiſts.

In order to the better carrying on of this deſign (which I hope that God will crown with ſucceſs for the good of this nation) I have been at ſome pains in collecting (out of ſuch helps as I could get) and digeſting a very compendious Iriſh grammar, fitted for the uſe of learners, which is almoſt finiſhed, and ſhould be printed, if I knew how to get it done. I believe a brief dialogue in Iriſh and Latin would do well to be annexed to it, ſince it will not ſwell it to any conſiderable bulk, nor ſo much enhance its price, as render it uſeful.

THE reſt of your books (beſides thoſe ordered for particular perſons, and which were given to them accordingly, as I preſume my lord biſhop of *Meath* has informed you) are in my cuſtody undiſpoſed of, though deſired by ſeveral gentlemen abroad, who are lovers or promoters of the Iriſh tongue. But I can do nothing herein, until I may receive my lord biſhop's directions, with whom they were entruſted; unleſs at any time you ſhall pleaſe to ſend yours, which ſhall be punctually obſerved by,

Honoured Sir,
your moſt obliged,
humble ſervant,
NARCISSUS MARSH.

Honoured

Dublin, April 8, 1682.

Honoured Sir,

I HAVE newly received the prefaces to the Iriſh teſtaments, which, as ſoon as bound, ſhall be diſtributed ſo as may beſt anſwer the end of your printing them; but herein I would gladly receive your directions, before I do any thing, if you have any to give in particular. The deſign of printing the old teſtament in the ſame language has received a great (though I hope not a fatal) ſtroke by the death of Dr. *Sall*, who departed this life April 5. in the evening, having been for ſome time a little indiſpoſed (but not at all very ill) of a cold; ſo that his death was almoſt ſudden and unexpected. I intend, that the reviſing of that old tranſlation of the old teſtament, and its tranſcription, ſhall nevertheleſs go on with the help of Mr. *Higgins* and ſome other Iriſhmen, whom I will call in to aſſiſt; if I can but diſcern, that by God's help, I may be able to guide and direct the management of the work, what pains ſoever it may coſt me. And for ſubſcriptions, I doubt not but enough might eaſily be gotten to ſo pious an undertaking, were it put into a due method, for which I ſhould be glad to receive your inſtructions. And in order to the ſetting this on foot ſucceſsfully, I believe it would be convenient, that we ſhould have one ſheet printed off, to exhibit as a ſpecimen of the whole work, and of the real deſign there is to go thorough with it.

I HUMBLY thank you for the encouragement, that you gave in your letter to Dr. *Sall* for the printing my little grammar, which ſhall be put into Engliſh (whereby it will become of more general uſe) as ſoon as I can get a little leiſure to do it, and then I will give you a more perfect account thereof, and of ſuch other things, as may relate to your truly pious and good work, and the end thereof, which is to acquaint the poor ignorant ſouls of this kingdom (who ſit in moſt lamentable darkneſs) with the word of God, whereof they now know nothing. Certainly God will reward what has been done that way already, and will not ſuffer that, which remains yet undone, to come to nought for want of encouragers. In confidence whereof, I reſolve to proſecute this undertaking with all the vigour that may be, and to truſt God with a bleſſing thereupon, who never fails thoſe, that depend on him, eſpecially in buſineſs, that directly tends to the manifeſtation of his will, and thereby the ſalvation of ſouls. I am,

Honoured Sir,
your very humble,
and obliged ſervant,
NARCISSUS MARSH.

Dublin, June 23, 1682.

Honoured Sir,

I LAY hold of the opportunity, which this gentleman affords me, to let you know, that ſince Dr. *Sall*'s death, I have taken upon me the care to ſee the Iriſh bible tranſcribed and fitted for the preſs. The work goes on ſucceſsfully, there being above a hundred and forty ſheets tranſcribed already. All our care at preſent is, how to get the charges of tranſcribing and printing it to be defrayed, which muſt be done by ſubſcriptions; to facilitate which the biſhop of *Meath* and I have upon conſultation thought of this way (if you ſhall approve of it) *viz.* to make this propoſal, that whoſoever will ſubſcribe ſo much money, as upon computation we ſhall find the old teſtament printed will be worth (we gueſs it may be a guinea, or thereabouts) he ſhall have the new teſtament in hand, and the old teſtament, when it comes out. If you think this way may prove prejudicial to your charitable deſign, becauſe haply many men would be glad to have the new teſtament, who cannot ſpare a guinea to purchaſe the old, then the biſhop of *Meath* deſired me to mention another expedient for it, which is, after a hundred and fifty of the copies are freely given to ſuch as are indigent, to expoſe the reſt to ſale, whereby money may be raiſed for the carrying on the other work. I deſire to know, whether you do approve of either of theſe ways, and therewith alſo what the charges of printing the old teſtament may come to. The copies of the new are now almoſt bound, and ready to be diſperſed.

Mr. *Reeves* informed me, that you had ordered five pounds to be paid to Mr. *Higgins*, but before he would do it, made inquiry of me concerning his condition. I gave him the ſame anſwer, that I write unto you, which is, that he does not deſerve it, both becauſe he has gotten good preferment worth at preſent 110 l. per ann. and alſo becauſe he has put himſelf out of a capacity of being farther ſerviceable towards the carrying on my deſign of teaching Iriſh in the college, by getting him a wife as ſoon as he had gotten himſelf preferment; ſo that he is very ſhortly leaving me, and I muſt be at new charges to provide another to ſupply his place; notwithſtanding that his preferment was given him on purpoſe, that he might promote this deſign, and to fix him to the college. If therefore, Sir, you pleaſe, that this five pounds ſhould be paid to the Iriſhman, who tranſcribes the old teſtament, and that it ſhall go in part of payment for that he hath done, I will take care, that it ſhall be truly paid him, and I am ſure it will be better beſtowed by much, than it would be on Mr. *Higgins*, who in other things beſides theſe mentioned has not ſhewed himſelf to be ſo virtuous a man, as I could wiſh him to be.

I HAVE not been able yet to get leiſure to tranſlate the Iriſh grammar, whereof I formerly made mention, and to fit it for the preſs; but ſhortly hope to find leiſure enough for a work of no greater pains than that will be.

SIR, the bearer hereof is one Mr. *Mullan*, bachelor of phyſick of this college, who has been ſucceſsful in ſeveral things, that he has undertaken,

undertaken, eſpecially in anatomy, wherein he has good ſkill; and had an opportunity the laſt ſummer to exerciſe it on an occaſion, that rarely occurs, namely, in diſſecting the elephant, which was burnt here in *Dublin*; whereof he will give you as perfect an account, as can be expected from one in thoſe circumſtances, that he then was, if you deſire it, he having committed all to writing. He will alſo give you ſome account of a caſtor, that he here diſſected.

BUT I have too long troubled you already, and ſhall therefore beg leave here to ſubſcribe myſelf,

Honoured Sir,

your very humble ſervant,

NARCISSUS MARSH.

Mr. Boyle *to Dr.* Marſh.

London, Auguſt 1, 1682.

Worthy SIR,

I AM troubled, and almoſt aſhamed, that I muſt begin this letter with the acknowledgment of a diſaſter, that befel yours before it came to my hands: for it being brought yeſterday from the poſt, not directly to me, but to a ſervant, that was then buſied about the fire, to make a chemical experiment, I had ordered him to attend in my abſence, he having laid it by for a while, a kindled coal unluckily lighted on the letter, and burned it quite thorough in that part, that contained (as I conjectured) ſome of the moſt important paſſages of it. However, being very deſirous to prevent delays, I ſhall venture to anſwer what I gueſs to have been the main contents of it. It ſeems then to me the deſire, both of my lord biſhop of *Meath* and yourſelf, that for expedition's ſake I ſhould advance the money I have here ſet apart for that work, to give it a beginning; and his lordſhip promiſes, that he will procure bills for 50 l. more in few weeks, which added to that money of mine, his lordſhip (reaſonably preſumes) will be a ſufficient encouragement to the printer to begin forthwith, and to engage Mr. *Rely*. I can without reluctancy conſent to this propoſal, it being in effect little, if any thing more, than what I formerly offered myſelf. And in compliance with it, I have already ſent to Mr. *Rely* (to whom I ſhewed your letter) and got him to go to ſeek out the printer, and engage him: of which if he brings me a ſeaſonable account, you may receive it with this paper; but I am loth to loſe this night's poſt upon the uncertain expectation of it. I had yeſterday in the evening the honour to be viſited by the biſhop of St. *Aſaph* and the biſhop of *Kildare*, who both of them together ſeemed much to approve what we are doing. Of the former, becauſe his dioceſe is in *Wales*, I earneſtly deſired a copy of the forms of the ſubſcriptions for the printing of the Welſh bible, which he readily promiſed to do his endeavour to procure. But, though I am confident of his ſincerity, yet (he being this day to leave the town) I much doubt of his ſucceſs, and therefore will not loſe time in waiting for the event. My lord biſhop of *Kildare* did not only ſpeak affectionately of our deſign, but was pleaſed to deſire me to let him know when he is in *Ireland*, wherein he may promote it, which he appears very forward to do. This offer was too advantageous to be refuſed, and accordingly I embraced it with thanks; and hope good uſe of it will be made, as occaſion ſhall require, by my lord of *Meath* and yourſelf; who have both of you been the early and eminent promoters of this work; and therefore will be glad to receive ſo conſiderable an aſſiſtant in carrying it on. The abovementioned diſaſter keeps me from being able to read ſomething towards the cloſe of your letter, that ſeems to relate to ſubſcriptions, and that in a way more honourable for me than is needful. But as to the propoſal, that I would conſent, that the 50 l. I long ſince lodged in Sir *John Champanty*'s hands, ſhould be received at *Dublin*, and employed to defray the charge of tranſcription, *&c.* (by which *&c.* I ſuppoſe you mean ſome other charges, for the ſum, I hope, will bear it) ſince I look upon the having copies duly prepared for the preſs, as a neceſſary part of the work, I am willing the money mentioned ſhould be employed as is deſired, and ſhall (God permitting) ſpeedily take order to have it aſſigned for thoſe uſes.

SINCE I told you I had ſent Mr. *Rely* to the printer, he is come back to me, and brings me word, that he could not poſſibly find him, but preſumes he ſhall do it to morrow; and deſires the aſſiſtance of a ſervant of mine, who is not unacquainted with the law, to help him to draw up the agreement; whereof I hope you may in my next receive a particular account from,

Worthy Sir,

your moſt affectionate,

and moſt humble ſervant.

Dublin, September 30, 1682.

Honoured Sir,

BOTH your laſt of September I have received, and am much of your opinion, that for the reaſons mentioned the marginal renderings ought not at this time to be inſerted, could it conveniently have been done, and had you fit letters for it; chiefly becauſe it would give too great an advantage to the adverſaries againſt this tranſlation, by furniſhing them with an argument, from its ſeeming dubiouſneſs and uncertainty. But the parallel places being of good uſe, and not bringing along with them the ſame inconveniencies, I ſhall take care, that henceforth they be inſerted in all the copy, that ſhall hereafter be ſent; that ſo Mr. *Rely* may not have more laid on him, than needs muſt.

I AM

I AM very ſorry, that Mr. *Rely* has reaſon to make ſuch complaints of the tranſcriber's negligence; whereof I knew nothing before, but have now given him a ſpecial charge about it; and do moreover wonder, how ſo many faults could eſcape the diligence of Dr. *Sall* and Mr. *Higgins*, in examining the copy; moſt of what has been yet ſent being done by them. I have now taken another courſe, which I hope will prevent the like for the future. And indeed this, and the gentleman's falling ſick, whom I chiefly make uſe of for the comparing, examining and adjuſting the copy, has made me the ſlower in ſending over more, than otherwiſe I ſhould have been. Next week I hope to ſend all to the end of the Pentateuch; and after that I dare promiſe, that they ſhall want no more, if I might but know the means how conſtantly to ſend it, as I have it ready; whereof I ſhould be glad to be informed, if you know of any.

MY lord biſhop of *Meath* (as likewiſe the biſhop of *Kildare*) gives you his humble ſervice, and deſires me to inform you, that, in order to the getting ſubſcriptions, he has written unto ſeveral biſhops, whoſe anſwers (which he ſhewed me) generally are, that they will caſt in their mites for the carrying on ſo good a work, when they know what methods will be uſed for the gathering them, and alſo what others give, that they may have ſome pattern to conform unto.

LATELY underſtanding, that my lord archbiſhop of *Canterbury* was very ſolicitous to know, what is become of biſhop *Bedell*'s tranſlation of the old teſtament into Iriſh (becauſe he is now about to write his life) and it being the copy, that I have, I gave his grace an account where it is, and what is doing with it, and likewiſe, that through your care, as well as at your preſent charges, it is begun to be printed. If I may judge by what I have heard concerning his grace's zeal for the work, I cannot doubt, but he would be ready to encourage it, if application were made to him.

I HAVE only this to add, that I have received your fifty pounds from Sir *John Champanty*, whereof you ſhall have a punctual account how I diſburſe it; that one hundred of your Iriſh teſtaments are to be ſent next week to *Caſhell*, to be diſpoſed of by my lord archbiſhop in that province, now that his grace is well enough to do it; and that I am,

Honoured Sir,

your very humble

and obedient ſervant,

NARCISSUS MARSH.

I HAVE been ſo unhappy, as not to be able to make any obſervations on the late comet, nor to ſee it more than twice, when its head appeared to the naked eye much bigger, and its tail much ſhorter than that of the laſt. The virtuoſi in *London*, who are always intent on what is rare, I preſume have not let it eſcape their accurate obſervations.

I HAVE ready tranſcribed as far as Ezra; but intend to have it all examined with a great deal of care, before it be ſent, becauſe ſo many faults have eſcaped in what is gone already.

Dublin, February 17, 1682-3.

Honoured Sir,

I HAVE been but too long ſilent, which I cannot charge upon want of health, I praiſe God, but chiefly upon extraordinary and troubleſom occaſions. Nevertheleſs the tranſcriber goes on with his work, having written as far as the end of *Jeremiah*'s prophecy. I have alſo gotten examined, and ready to be ſent, as much copy, as reaches to the middle of the firſt book of Kings; only I want an opportunity of conveying it to *London*, which I have a long time waited for in vain, but will ſhortly, if poſſible, find one out. I have hitherto found it very troubleſom to get the copy well examined, becauſe it is hard to get thoſe together, who ſhould do it, their other occaſions calling them another way; which is the only reaſon, why the printer has not been better ſupplied. I have urged the biſhop of *Meath* to haſten the ſubſcriptions (who has taken upon himſelf that part of the work, namely, to get ſubſcriptions) but I do not find, that any are yet received by him.

WHAT Mr. *Rely* objects againſt the Iriſh tranſlation, that it follows the Engliſh too much word for word, whereby the phraſe many times is rendered leſs proper and more obſcure, is confeſſed by thoſe, who well underſtand the language, to have much of truth in it, as to the firſt part of the allegation; but they add, that though the Iriſh thereby may be leſs elegant, yet it is proper enough, and never the leſs intelligible by the vulgar people; yea they think it is a good, plain, familiar tranſlation, and that if it were more elegant, it would not be ſo fit, as now it is, for common uſe. This I ſpeak, not as vindicating the tranſlation myſelf, but as dictated to me by ſome others. The gentleman, who corrected the laſt ſheets and inſerted his alterations, I fear, will not get leiſure to do much more after the ſame manner; and for the ſcribe, I put him upon uſing all the care that he can, and the greateſt ſkill that he hath, who is the beſt at that work, that can be gotten here. The tranſlation, I conceive, ought not lightly to be altered, but where it is faulty, out of reſpect to the author of it, biſhop *Bedell*, whoſe memory I know that my lord archbiſhop of *Canterbury* does honour; and with what care he cauſed it to be made by Ulſter-men, is ſufficiently known. The grammar I formerly mentioned, as it is not yet finiſhed, becauſe other buſineſs has conſtantly hindered me from taking it in hand again, ſo neither is it quite laid by, but ſhall ſhortly, God willing, be reſumed and finiſhed, if one difficulty about the verbs, whereat I ſtick can be ſurmounted, whereof I do not

deſpair.

deſpair. But the misfortune is, that I cannot meet with an Iriſhman, who underſtands any thing of the grammar of his own language; ſo that none (or but very little) help is to be had from them, in order to the finiſhing this work, which I hope will nevertheleſs be ſhortly completed by,

Honoured Sir,

your very humble ſervant,

NARCISSUS MARSH.

AN unfortunate fall from my horſe, whereby one of my arms was ſo bruiſed, that I could not, for a long time write, has partly occaſioned both my ſilence and neglect of finiſhing the grammar.

Stapleſtown, near *Catherlaugh*, Aug. 24, 1685.

Honoured Sir,

IT has not been without reaſon, that I have been thus long ſilent. For being removed into the country, I left the remaining part of the Iriſh bible, namely, the apocrypha, in the ſame hands, that reviſed a great part of the reſt, to examine whether it be truly written, or no; it being then all (or very near all) tranſcribed. But not being upon the place to call on him to diſpatch the work, I fear, that he has done little or nothing to it; which yet would not be much material, if the copy could be gotten out of his hands. For he, thinking, that he has an advantage, refuſes to deliver it (as Dr. *Huntington* informs me, he being a maſter of arts of the college) unleſs I will pay him twenty pounds for his labour of reading it over, which I think is very unreaſonable, and that he has had enough already, when I gave him four pounds ten ſhillings for that very work of reading over the tranſcript. The man indeed is very poor, and I believe that is the thing, that makes him ſo unreaſonable in his demands.

BUT it falls out very luckily, that you do not intend to print the apocrypha at this time, as I am informed.

SIR, if this buſineſs had been well over, I ſhould, before now, have given you an account of the diſburſement of your fifty pounds, that I received in *Dublin*, to pay the tranſcriber, &c. with whom Dr. *Sall*, in his life time, agreed for tranſcribing the whole Iriſh bible, at twelve pence per ſheet; which was not very dear, conſidering how difficult a thing it was to read the copy; it being in many places not legible, and in others ſeveral words together quite effaced, either through age, or ill uſage, or both; the book alſo having taken wet, whereupon he was forced to tranſlate paſſages here and there anew. The ſcribe moreover had the advantage of his diet at Dr. *Sall*'s, and of writing in his houſe; neither of which I could grant him in the college; and therefore he was earneſt to have an allowance made for that, beyond his twelve pence per ſheet; which not being part of his bargain, I did not think it reaſonable to yield thereunto; though ſome advantage he did make in another reſpect, by writing in ſmaller paper than he at firſt began upon, becauſe no larger was then to be gotten in the town.

SIR, I have not quite laid aſide the thoughts of an Iriſh grammar; for though ſome difficulties ſeem to me almoſt inſuperable, notwithſtanding the helps both of books and men, that I here meet with for that purpoſe, yet diligence, I hope, will conquer moſt of them, and the reſt muſt be left to be reſolved by ſuch as are well ſkilled in the language. However I have gotten together ſuch a collection of rules and examples, as will be no ſmall help to the learner, both as to the reading and writing of that language, and alſo the true underſtanding of it; moſt of which are already digeſted, and want only to be tranſlated into the Engliſh tongue, as you formerly deſired to have done. Between four and five ſheets, I ſuppoſe, will contain the whole, which ſhall be diſpatched as ſoon as I can; but I can promiſe nothing certain for the time, being daily diverted by other buſineſs. My endeavours ſhall not be wanting, to give it a ſpeedy diſpatch.

THE diſburſement of your money is as follows.

	l.	*s.*	*d.*
	50	00	0
PAID for tranſcribing 719½ ſheets	35	19	6
For pens, ink, and paper (whereof 18 quires were 8 *d.* per quire, the reſt 6 *d.*	00	18	0
For tranſlating 17 pſalms, that were wanting	03	00	0
To Mr. *Mullan*, for reviſing the tranſcript.	04	10	0
At the Cuſtom-houſe, for the Iriſh teſtament	00	09	2
	44	16	8
So that there remains in my hands due to you	05	03	4

Which ſum ſhall be paid as you ſhall order it.

SIR, the charges of tranſcribing, you perceive by the above account, are unreaſonably great, being much more than you computed they would amount to. But if you ſubduct the following ſums, which, I ſuppoſe, was not thought of in your computation, *viz.*

FOR tranſcribing about 157 ſheets of the apocrypha (for I compute it in the tranſcript to be above a fifth part of the whole bible)	35	19	6
	07	17	0
The remaining ſum of ——	28	02	6

will be the charge for tranſcribing the bible; beſides what was paid for paper, reviſing, and tranſlating, as above.

I WILL endeavour to get the apocrypha out of the reviſer's hands, that all that charge may

may not be thrown away. What of your new teſtaments are yet undiſpoſed (and ſome there are, though not many) I think may go along with the old teſtament, to ſuch as have none of it already; wherein, as alſo in any thing elſe, within my power, I ſhall be moſt ready to ſerve you to the outmoſt of it; being very deſirous to approve myſelf,

Honoured Sir,

your very humble

and obedient ſervant,

Narciſſus Fern. & Leighlin.

Stapleſtown, March 22, 1685-6.

Right honourable,

I OWN to have received a letter from you ſometime ſince by the hands of Sir *Paul Ricaut*, wherein you impowered me to beſtow ſomething of your money (yet remaining in my hands) on Mr. *Mullan*, who reviſed the tranſcript of the Iriſh bible, in order to the redeeming from him the tranſcript of the apocryphal books, which he detained. Accordingly, by the advice of Dr. *Huntington*, our worthy provoſt, I gave him ten plate cobs, in your name, and redeemed the copy, which I lodged with Dr. *Huntington*, to be ſent to you, when there ſhall be an opportunity, as you ſhall require. I attribute this manner of acting to have proceeded from Mr. *Mullan*'s miſerable poverty; who, though a divine, a convert, and reaſonably well learned, has not yet been ſo fortunate, as to get any preferment, nor I been able to beſtow any upon him, as I have long deſigned.

UPON the hint in your letter of my lord lieutenant's favourable thoughts of this deſign of publiſhing the bible in the Iriſh tongue, I made bold to addreſs to his excellency about it (and that the rather, becauſe I have gotten a great deal of ill will from ſome great men in this kingdom for what I have done in promoting this good and charitable work, which has been no ſmall diſcouragement to me.) His excellence was pleaſed to promiſe his encouragement and aſſiſtance towards the carrying it on, both by his purſe and otherwiſe; but withal was ſurpriſed to hear what I related of the diſcouragements (and indeed threats) that I have had on this account. The unwelcomeneſs of this undertaking to many in this country, I believe, was the reaſon, why the biſhop of *Meath* flew off from proſecuting what he deſigned and promiſed, and has ever ſince been wholly unconcerned, and ſat neuter. Notwithſtanding all which, I hope to finiſh the deſigned grammar, wherein I find many unexpected difficulties, and no body able to ſolve them. An account of the Iriſh language, as to the original and nature of it, long ſince promiſed to the provoſt, is now coming to me: if any thing in it be material, care ſhall be taken, that it be fitted to be joined with the other. The great charges and care, that you have been at in printing the old teſtament, will, I hope, find that acknowledgment, and the pious work find that acceptance amongſt the generality of this kingdom, as they really do deſerve; and that a means will yet be found out to commit the book of common prayers in the Iriſh tongue to the preſs alſo; that ſo the deſign of the canons of this church, which require every pariſh to have the bible and book of common prayers in Iriſh, may be anſwered. I ſhall at preſent add no more, but that I am,

Honoured Sir,

your very humble ſervant,

Narciſſus Fern. & Leighlin.

YOUR letter directed to me at *Stapleſtown* near *Carlow*, would have come ſafe to me by poſt.

Letters from Dr. William Avery *to Mr.* Robert Boyle.

Boſton, New-England, Nov. 9, 1682.

Honourable Sir,

IT is almoſt an unpardonable boldneſs in ſo mean a perſon as myſelf, to give your honour that trouble, which more than once you have received from me; and the reſpect and condeſcendency which you have already ſhewn me, is that, for which I can never make any ſuitable return.

HONOURABLE Sir, my earneſt deſire to be a comfort to the ſick makes me reſtleſs in my deſires and endeavours to do better for them than yet I can. But ſince the death of that my reverend friend, of whom I have made former mention to yourſelf, I can have but little correſpondence with any ſtudent in phyſic among ourſelves, as to what concerns chemical operations. I have earneſtly endeavoured to find the alcaheſt, and have for that end had an eye upon ☉, upon ☾, upon ♀ — and upon the ſcum, that is found in many places ſwimming on the top of the waters (that I might make my experiments conformed to the ſeveral hints that I have met with in my authors;) but as yet I have been unſucceſsful: and if your honour could ſee cauſe to aſſiſt me in this difficult work, I cannot but hope, that the great God would fully recompence ſuch charity, ſhewn not only to me, but unto the ſick—unto many ſick ones. *Matt.* xxv. 43.

BUT I forbear—

I HAVE,

I HAVE, with my worthy friend, Mr. *Richard Wharton*, ſent your honour a few minerals, with a note of them incloſed in this paper. I have alſo ſent unto your honour, two or three little books, that are a narrative of the afflictions, which a Chriſtian gentlewoman underwent in and by our Indian wars. There were indeed many, whoſe ſufferings were like to hers, but where are the nine? I ſhall juſt give your honour the diverſion of one paſſage here.—There was one, who in a ſkirmiſh with the Indians was ſhot with a bullet in at his right ear, and when the ſurgeon came to dreſs it, that which he injected at the right ear came out at the left eye—and yet the man recovered—is now living—was lately at my houſe—

AND now let your honour give me leave to be emptying of my little rivulets into an ocean, and ſet two or three more of my poor obſervations in your view.

HONOURABLE Sir, it has ſurpriſed me to ſee, how wonderfully the earth brings forth, according to the firſt command, even where there can be no ſuſpicion of any ſeed to be conveyed unto the place, and where the earth perhaps in reaſon would be the moſs unapt for fruitfulneſs, as being digged out of cellars, and out of the bottom of deep wells. There have I ſeen herbs ſpring as thick as they could ſtand well one by another; and taking up divers of them, I have found the huſk of a perfect ſeed, which has divided itſelf in its coming forth of the ground, like the ſeeds of herbs of that kind, that afterwards ſpring from them: but thoſe ſeeds, which the unaſſiſted earth produced of itſelf, were far leſs than others—perhaps by a fourth part—

SIR, Mr. *Wharton* and my ſelf being at the ſhop of a braſier in *Boſton*, we ſaw clay there, that had been brought from an iſland adjacent, called, *Martin*'s Vineyard—Of this clay they uſed to make melting pots. The clay was brought by ſea, in a barrel. They unheaded the barrel, took clay for their preſent uſe, and headed it up again. But the next time they came to open the barrel for more clay, they found a great part of it turned to a black duſt, and the clay next the duſt was become uſeleſs. This Mr. *Wharton* and myſelf were eyewitneſſes of, and ſaw, that there was no ſuſpicion of any deceit in the matter, or of any external cauſe being inſtrumental in the tranſmutation. We have ſent this clay and duſt, ſome of it, to your honour, that it may be conſidered by ſome, that have more underſtanding in the works of nature than ourſelves.

THERE were at a town, with us called *Killingsworth*, divers perſons taken with a violent purging, very like to die. In their diſtreſs they voided ſtrange worms, worms, that had legs, and were like caterpillars, not paſt an inch long. When the worms (of which no perſon, though in extreme danger of death, had above one) came away, the ſick became immediately well.

WHEN the ſmall-pox was very rife, and raging, and mortal too among us, I was put a little upon the conſideration of that diſeaſe's cauſe. And I ſhall be ſo impertinent, as to acquaint your honour, that I never could be ſatisfied with the account, which the excellent *Riverius*, Sir *Kenelm Digby*, and ſome others give. For there are many, of which it may be queſtioned, whether they had any crude menſtrual blood remaining in them (for when new-born they bled ſo at the navel, that they almoſt bled to death) who yet would have that diſtemper ſorely enough. And on the other hand, there are many never ſuffered to bleed at the navel at all, who yet would attend on the ſick, yea lye with them, and for all eſcape the ſickneſs. As further matter of conſideration here, I ſhall mention a couple of paſſages, which in *Boſton* I took notice of. One woman with child was taken with the ſmall-pox, and about the fourth or fifth day fell in travail, and was delivered of a child which had no ſign of the pox about it, yea, wholly eſcaped it. Another woman, that never had felt the mentioned diſeaſe, fell in travail, and brought forth a child full of them, the mother remaining clear.

HONOURABLE Sir, I have read of a great man, a prince, that, when his ſubjects brought every man his preſent to him, one poor man, that had nothing elſe, filled his hands with a little water, kennel water too, and made a preſent of that; yea, a preſent, that the perſon to whom it was offered looked with a very grateful eye upon. I can parallel theſe rude and imperfect communications to your honour from my ſelf unto nothing elſe. Sir, be pleaſed to accept, and I have enough.

I PRAY to the God of heaven, that he would continue ſuch a bleſſing unto mankind, as your honour's life and health; and I take leave to ſubſcribe myſelf,

Honourable Sir,

your unworthy, but

obliged ſervant,

WILL. AVERY.

Boſton, New England, May 1, 1684.

Honourable Sir,

YOUR kind letter (of Oct. 16, 1682.) with the uſeful book that accompanied it, coming to my hands, have laid me under deep obligations, which I cannot otherwiſe expreſs, than by praying to the great God, that he would fully recompenſe all your labour of love towards one ſo undeſerving as myſelf. But I muſt with ſome confuſion reflect on my own impetuoſity and importunity, for your honour's directions, diſcovered in ſome lines written ſince the date of the newly mentioned favour, that I have received from yourſelf; and as I hope, that your candour will excuſe my rudeneſs, ſo I likewiſe hope, that I ſhall never abuſe your charity.

SIR, I did on the occaſion of your letter, ſend my acknowledgments to be delivered by the

the worſhipful Mr. *Dudley* unto yourſelf; but his ſudden coming away from *England* will, I ſuppoſe, cauſe the return thereof to *New England* again; and a late fit of long ſickneſs hath made it thus long, *&c.* I renew the teſtimonies of my gratitude unto your honour; neither have I been willing to venture things of this nature by any but a truſty hand.

SIR, my greateſt ambition, when I firſt ſought after the liquor alkaheſt, was, that I might attain the arcanum corallinum, and be able to prepare the ſtone ludus; but often revolting *Helmont*'s Duelech, *&c.* I have been induced to think, that if this were once attained, we might alſo ſoon get the mercurius diaphoreticus, or horizontal gold. It would be an impertinence in me to acquaint your honour with the proceſs, that I have conceived of it, only thus much; my thoughts have been, that the ☋ of Joannes de Vigo is to be prepared with his Æ, and the fire or ♁ of ♀ out of the colcothar of Hungarian ⊕♅ ſtrongly calcined and dulcified; and being dried, the liquor muſt ſo often be diſtilled from it, till it all come over in the form of a green oil, then digeſt, *&c. Helmont*, page 891, and 987. *Starkye*'s Pyrot. p. 32, 33. The ♀ being ſeparated from the green oil, the oil digeſted a month with ✱, then ſeparate the tincture from the ſalt with √, with this △ tincture, or ♁, the pulv. of Jo. de Vigo is to be impregnated, as much as it will then drink up; cohobate it then with ℞, and next with √ to dulcify it. Wherein I may miſs it, I beg your honour's information; as alſo concerning the ℞ that *Helmont* ſpeaks of, whether it be the common, or the liquor alkaheſt; and what doſe is to be given of it; and how much of the ♁ of ♀ is to be put upon ℥j of the powder?

BUT truly, Sir, partly through illneſs, and partly through ignorance, I am not an adeptiſt yet.

WE took our digeſted, or putrified matter, and in a large iron pot evaporated it, till it would (after the firſt ſpirit and phlegm) yield a ſecond ſpirit, ſharp and ſtrong: we then put it into a cucurbite with an head, and in a ſound furnace cohobated it ſeveral times. When it was cohobated eight or ten times the ſpirit was turned unto an inſipid phlegm. But we went on with our cohobations forty times, to ſee whether it would make any alteration. Finding none, we put it into a retort together with the phlegm, and by degrees of fire diſtilled off the phlegm, and changed the receiver. Then came over a white ſpirit pretty ſalt; after that came over another ſalt cleaving to the ſides of the receiver, as alſo a yellow fatty matter, which ſunk to the bottom of a little dirty ſpirit that came over with it (as we had it in ſome former trials) leaving much fixed ſalt in the caput mortuum. *Helmont* in his Duelech, Ch. III. ſays, that he putrified—in an horſe—belly; and then renewed his diſtillation, and cohobated four times according to *Paracelſus*'s preſcription, and left very little fixed ſalt in the caput mortuum; which diſeaſe of his I have always taken to be of the liquor, becauſe he ſays, when the ſecond ſpirit comes, rejoice!—Then learn to diſſolve the ſtone ludus! I have more matter in digeſtion in large glaſſes, in horſe-dung, with a purpoſe, if the Lord pleaſe, to make further trials. I am ſtill at uncertainties, and therefore do thus addreſs your honour!

SIR, I remember, that *Starkey* (in Pyrotech) gives a very high encomium of the ens of ♀ for the cure of fevers, ſaying, it is prepared out of the dulcified colcothar of ⊕♅ with the volatile ſalt of ⊡ bereaved of its fætor, naming *Helmont* in his tract Butler. I have therefore, as I could underſtand *Helmont*, taken the reſiding ſalt out of the ⊡ of ſea-ſalt, with warm water, and evaporated in part, adding thereto the volatile ſalt, and therewith impregnating the colcothar; which being gently dried, I have often repeated the imbibition. We have a ſublimation that is of ſome uſe, but not ſuch as anſwers deſires. *Helmont* ſays, it was ordained of God for the relief of the poor; and if the moſt High ſhall incline your honour to inſtruct me further in this alſo, I purpoſe, that the poor ſhall freely have the comfort of it.

SIR, there hath been great report concerning the balm of *Gilead*; and I have been careful both to ſee it, and to read the paper concerning it. Doubtleſs it was a forgetfulneſs in the gentleman to ſay, that this was one of the preſents made to *Solomon* by the queen of *Sheba*, as may be collected from Gen. xxxvii. 25. and xliii. 11. And though the word there called balm, may be underſtood of ſome other gum, yet might it alſo be the balm for ought that appears to the contrary. But I fear, that what is now ſold, is another thing; and therefore I have ſent you a little matter much like it, for trial's ſake. It comes out of the fir-trees in the ſpring time, in little bliſters. Perhaps it may be fitly called liquid frankincenſe; its long keeping alſo may have ſomewhat thickned it.

AND now I am objecting, the learned Dr. *Willis* I would be ſo bold as a little to animadvert upon.

HE treating of the ſcurvy, ſays, that it is much of a fixed ſalt gathered in the blood, that makes it ſo thick and black; whereas I have obſerved, that if a fixed ſalt be put into warm blood, it makes it of a more freſh and lively colour, and much more thin and fluid. He ſays too, that wine contracting a fixed ſalt grows ſour, and becomes vinegar; whereas a fixed ſalt keeps wine or beer from being ſour, eſpecially lixivial ſalts, that are the moſt fixed do abate much, if not take away the ſharpneſs of vinegar.

SIR, I had lately ſent me a paper incloſed in a letter from a reverend perſon, that relates to the ſickneſs and death of a woman, together with ſomething very remarkable, which I have entreated my worthy friend Mr. *Thomas Brattle*, to preſent unto your honour, with one of the coagulums therein ſpoken of.

I DID

I DID ſend to your honour laſt year divers ſorts of marchaſites and minerals, and letters concerning them; but I cannot tell, whether any of them ever came to your ſight. And I now intreat your honour to accept of a ſmall book, referring to remarkable providences that have happened, eſpecially among ourſelves, in the peruſing whereof I hope yourſelf will meet with ſomething, that may be not ungrateful.

HAVING thus far treſpaſſed, I do with hearty prayers for your honour's health take leave to ſubſcribe myſelf,

Honourable Sir,

your much obliged ſervant,

WILLIAM AVERY.

POSTSCRIPT.

Honourable Sir,

I THOUGHT it convenient to take this opportunity, further to be ſo rude in my addreſſes to your honour, as to requeſt, that ſince I have a ſon of my own about thirty years of age, a perſon of good repute, and a practitioner in phyſic, and an aſſiduous labourer at the chemical fire, I might have your honour's leave to let him, under due obligations, know what things your honour favours me with the imparting of; the grant of which liberty will be an additional kindneſs to,

SIR,

your devoted ſervant,

W. AVERY.

Letters from Mr. William Mainſton, *to Mr.* Robert Boyle.

London, Eſſex-ſtreet, at the two *Golden Falcons*, Dec. 19, 1682.

SIR,

MY due ſenſe of the great honour, you were lately pleaſed to vouchſafe me, commands not only my preſent acknowledgment, but inſinuates a perpetual obligation; which I ſhall ever be ambitious to teſtify, whenſoever my kind fates or your noble commands may capacitate and animate me by a ſuitable opportunity. In hopes alſo of a ſhort vacation for the conſummation of my Malayan grammar, I humbly beg the return of that impoliſhed ſpecimen; which, when plenarily tranſcribed, ſhall repreſume to implore your gracious cenſure for itſelf, and,

SIR,

your honour's moſt obliged

and faithful ſervant,

WM. MAINSTON.

London, Bell-Savage-yard, on *Ludgate-hill*, May 15, 1683.

SIR,

TO your honour's hands, as the great patron of languages and arts, this impolite grammatical tract of the Malayan Dialect preſumeth to make its ſubmiſſive addreſſes, and to ſtand the fate of your judicious and impartial cenſure; who have judgment enough to correct any faults, and goodneſs enough to pardon all; nor dares this pigmy, without ſuch aſſurance, attempt a publick expoſal in this critical, humorous, and fanciful age. The ſucceſs of this previous manual will much contribute to the animation or abortion of my impregnate intentions for a Malayan Dictionary, and the tranſlation of the ſacred Evangely, *&c.* into thoſe Oriental idioms. But ſince it is your honour's countenance and favour only, that can give life and being to this, or them, I humbly ſubmit it to ſeek its happy or unhappy fortune from your doom, as deeming my ambition gratified, if I may attain a gracious admittance into the catalogue as,

SIR,

your honour's moſt humbly devoted

and faithfull ſervant,

WM. MAINSTON.

Mr. William Huſſey *to Mr.* Boyle.

May 8, Saturday 11 o'clock morning.

Honourable SIR,

I MOST humbly pay my thankful acknowledgments for ſeveral favours, in particular to myſelf, and relatively to Dr. *Huntington*, for ſome *Grotius's* in Arabic lately, which the bookſellers could not furniſh. I have a letter from the doctor, April 28, at *Dublin*, deſiring the Iriſh preface to the Iriſh bible, without which he cannot bind them up. I know no where elſe to addreſs; and therefore moſt humbly beg your commands to ſome ſervant, to acquaint me by the penny poſt, whether it be finiſhed, and whether your favour will extend to furniſh him, and what you ſend ſhall be immediately tranſmitted to him. Honourable Sir, I beg pardon for the preſumption, and wherein I can be accountable for the trouble. I am with all humility,

Your lordſhip's

moſt devoted ſervant,

WILLIAM HUSSEY.

A LETTER directed to me *W. H.* merchant, in *Mark Lane*, will not fail to find me.

Letters from the bishop of Corke *to Mr.* Robert Boyle.

June 12, 1683.

SIR,

COMPUTING with myself, that there is a week expired since I wearied you (as I may presume) with my impertinent company, I begin to hope by this time you have recovered the fatigue: and though I cannot yet afford to reform being troublesom to you, because I should then miss of the valuable benefit I propounded to myself by access to you, yet I will as much as may be shorten your trouble. I therefore humbly desire you will be pleased to morrow, about ten of the clock, when I shall wait on you, to order some servant of yours to shew me your laboratory. By this means you will give me a great satisfaction, and ease yourself of a many pitiful questions, that would be asked of you by,

SIR,

your very affectionate honourer,

and humblest servant,

E. CORKE ROSSE.

Corke, March 22, 1687-8.

Honoured SIR,

I CANNOT but retain a very pleasing memory, and make sweet reflections on that short and little conversation I had with you while in *England*, in the year 83. And I had sooner paid my acknowledgments, but that partly I did not well know how to direct to you, and partly did not think the mere compliment of a person so unserviceable to you as myself worth the postage: but meeting with this fair advantage, I would no longer forbear to give it you under my hand, that I can scarce recollect any time, which I now account better spent, while I was in *London*, than that which I employed in visiting you. Nor can I forget some persons, who had been formerly only retainers to you, from whom I learned divers excellent secrets. But it is sad now to consider, that our condition here, at the ends of the earth, is such, that all those gay thoughts are scattered; and instead of improving knowledge, we think of (whether we will or no) how long and by what means our throats may be secured; or rather we commit all to God, for we can imagine no security (as things go with us) but by his almighty hand.

I MUST break off; I have stumbled on this subject. I intended other things when I began: but it is hard not to bewray a sense of that, which pinches often and severely, only I ought not to have done it to you, who I am sure pity, but I fear cannot help. Some cases are beyond the power of art. If this lady stay till to morrow at eight of the clock, God willing, I will write more comfortably. If not, be pleased to accept of an attempt of gratitude, blasted by pensive and uneasy thoughts invading,

SIR,

your very affectionate servant,

E. CORKE ROSSE.

Letters from Dr. Robert Huntington *to Mr.* Robert Boyle.

Dublin, Jan. 12, 1683.

SIR,

WE are now, after a long, smart, and unusual frost, falling into our old Irish weather again: and it is the moisture and fogginess of the air, which I more dread than any thing else in the country, though, God be thanked, I have not been quite sick since I came; nor am yet dissolved or broken to pieces upon the thaw. But, give me leave, Sir, to ask you, who so well understand all philosophy; whether the mind of man must not suffer by such heavy pressures upon his body? And really I have all along been sensible of so much native dulness and stupidity, that I need not improve it by acquiring more. If the receipt you were pleased to give me, will heal that disease, or prevent any farther infection, I shall then adventure upon usquebaugh. If the *Dublin* Society for the improvement of real knowledge could but follow (though at a mannerly distance) as they endeavour to imitate the Royal Society of *London*, I would then hope to breathe, even in *Ireland*, a better air. And here let me tell you (which perhaps is news) that there is such a company associated; and that they would be extremely proud of your directions and encouragement. You know some of the number, the bishop of *Fernes* and *Laghlin* (who now sends concerning the Irish bible) Sir *William Petty*, Dr. *Willoughby*, and Dr. *Malin*: the latter has been long absent, being sent for a great way off, to cure several persons tormented with the gout; and upon this account perhaps it is, that he writes not to you. But I trespass more, I fear, the other way: and therefore begging your pardon for my many and bold addresses, I commit you to the divine protection, and remain,

Noble Sir,

Your most humble servant,

ROBERT HUNTINGTON.

Jan. 24, 1684-5.

SIR,

I WAS lately spoken to by virtue of a commission from yourself, concerning the Irish translation, whether the emendations of Mr. *Rely*

Rely were properly ſuch. To this I had returned an anſwer upon the firſt receipt of the proof, and told the judgment of ſome here very well verſed in the ſaid language, who approve it as well done. But now, ſince you require new information, I have lodged it in the hands of the biſhop of *Meath*, who promiſes me the opinion of a miniſter in his dioceſe, and as impartial an account as any Romaniſt can be ſuppoſed to give us. As ſoon as I recieve it, it ſhall be ſent with all due care and reſpect by,

SIR,

your moſt obedient ſervant,

ROBERT HUNTINGTON.

Feb. 21, 1684-5.

SIR,

WHEN I laſt anſwered your enquiry concerning the approbation of your corrector's amendments, I intimated, that the biſhop of *Meath* had particularly recommended it to the peruſal of one of his clergy, who generally allows it, and has drawn the incloſed ſcheme of what he thinks would be but in the proof you were pleaſed to ſend: and herein, if it were worth the while, you might take Mr. *Rely*'s judgment of him, as you have his of Mr. *Rely*. The tranſlation was made ſome time ſince; and conſequently there may be ſome variation in the language by this time, though very little comparatively to what is found in the neighbouring tongues, who write and print ſo much, and expreſsly for the improvement of their languages; which I never expect ſhould be done in the behalf of Iriſh. May the inhabitants make uſe of thoſe books, which with ſo much piety and expence you procure for them! and it is the beſt employment the tongue can be put to. As for their legends, both ſacred and civil, the fabulous lives of ſaints, and the rhodomontado's of hiſtory, if they are no better than father *Creſſy* and father *Walſh* affords us, I ſhall hardly think it worth the while to learn Iriſh, that I may read them.

SIR, it is the opportunity I met with to convey the incloſed, which has occaſioned you this preſent trouble from

Your moſt humble ſervant,

ROBERT HUNTINGTON.

March 24, 1684-5.

SIR,

I PERCEIVE you reſolve to engroſs the honour of a gallant work wholly to yourſelf; and may the ſucceſs be as great as the undertaking! If our liturgy were likewiſe tranſlated, we ſhould wholly remove from ourſelves, what we charge the Romaniſts withal, the locking up of our religion in an unknown tongue, and perhaps invite thoſe, who are fond enough of their language, to underſtand our devotion. Now, Sir, whether againſt the accompliſhment of ſuch a laudable deſign, you may not think it conducive, as the pſalms are printing off, to print ſome ſupernumerary hundreds of copies in a leſſer volume, before the letters are diſtributed; which may upon occaſion be appended to the common-prayer book? Or if it ſhould ſo happen, that this be not quickly done in Iriſh, yet is the pſalter of itſelf a pretty manual, and moſt fit for beginners.

How far the publick will intereſt themſelves in the encouragement hereof by any ſolemn act, I cannot determine. And by reaſon of the late alterations in our government, it may not be ſo ſeaſonable at preſent to urge it. As opportunities ſhall offer, I have deſired ſome of better credit to manage the affair, and accordingly you ſhall receive information from,

Noble Sir,

your moſt humble ſervant,

ROBERT HUNTINGTON.

March 20, 1685-6.

SIR,

THE fifty copies of your Iriſh bible arrived but lately; the preface and title page are not yet arrived, though I have heard of them: and till thoſe come, I ſhall defer the preſents you are pleaſed to make, becauſe they will otherwiſe want a viſible part of their ornament. In the mean time, and the firſt that was bound, I carried to my lord lieutenant, and begged his encouragement of ſo good a work; which he readily promiſed, both for its own ſake, and for yours, that the nation may know at preſent, and the generations to come, how much they ſtand indebted to ſuch a noble benefactor.

I HAVE them very well bound in calf's ſkin for fifteen pence a piece, beſides the ſaving of a great cuſtom: ſo that if there ſhall be any occaſion for more, it will ſtill be the beſt way to ſend them in ſheets. We are not under ſuch circumſtances, as may encourage me to believe the Iriſh will be very fond of this tranſlation: however, it muſt be known you have done more for them than all their prieſts ever did; and the reaſon is plain, becauſe your deſign and theirs is mighty different, you intending nothing elſe but to make them knowing and wiſe unto ſalvation. I am, Sir, with all imaginable reſpect,

Your humble and

obedient ſervant,

ROB. HUNTINGTON.

Letters

Letters from Sir James Tyrrell *to Mr.* Robert Boyle.

Okely, Jan. 23, 1684-5.

SIR,

I MUST beg your pardon, if the ſeverity of the ſeaſon, and ſome other employments of the workman have hindered him from digging, and me from ſending thoſe clays you deſired, till now by this bearer. I ſuppoſe theſe are all you deſired, or the place affords, *viz.* the blue, red, and white, and that the laſt is the ſame you meant; and if it ſhould not prove ſo upon trial, I ſhould be ſorry, becauſe the old potter (who I ſuppoſe is the ſame, that ſhewed it you) does not know of any other: there is about ſix or ſeven pound of a ſort, and if you deſire more you may freely command it upon the leaſt notice. I muſt likewiſe aſk your pardon, if the illneſs of the weather, and ſhortneſs of the days, have deterred me as yet from experimenting the weight of the atmoſphere, with a tube inſerted into a vial of water; but when the weather and ways prove more favourable, I will not fail to mount the neighbouring hill I told you of; and having tried it, will let you know the ſucceſs, either by letter, or when I have next the honour of waiting on you. In the mean time I have nothing more of natural productions to acquaint you with hereabouts; but that I have riſing in my land a very ſtrong vitriolick water, which is good for fiſtulas, and ulcerous ſores. A chemiſt of my acquaintance at *Oxford* has tried ſome of it, and finds a great quantity of white vitriol may be extracted out of it; if you pleaſe to command any of it, I ſhall ſend you up what proportion you pleaſe when the weather is drier, it being now too much diluted with the rain water. So with many thanks for your liquid phoſphorus, but above all for the happineſs of your moſt excellent converſation when I was in town, I remain,

SIR,

your moſt humble,

and faithful ſervant

JAMES TYRRELL.

IF you have any occaſion to lay any farther commands upon me, you may direct your letter to be left with *Robert Clarke*, under-butler of *Queen's-College*.

SIR, June 22,

FEARING a ſudden alteration of the weather from dry to moiſt, I have now ſent you a large bottle of my vitriolick water (as you deſired) whilſt it is in its full ſtrength before it be diluted with the rain. I deſire your operator would diligently examine two particulars concerning this water; the one, whether it be at all arſenical: for ſome poor people hereabouts take it, and it makes them both vomit and purge exceedingly; and if there be no arſenick in it, it may prove a very good and ſafe vomit for the poor: the other is, whether or no there may not be extracted out of it a white ſalt of vitriol, which might be made with leſs trouble and charge than that, which the chemiſts uſually prepare: and I myſelf have taken it for a vomit more than once with good ſucceſs. The dry leaves, and banks about this pool, betray a great deal of this white vitriolate ſalt; for it now ſticks upon them concreted in a pretty good quantity, as I could ſhew you, but that I fear it would rub off in a paper; and it were not worth while to ſend you any in a box, unleſs you particularly deſire it. I have likewiſe ſent you ſome few notes upon your titles of the air, which you were pleaſed to truſt me with; in which I do not pretend to give you any thing you do not know already concerning the air in general: and therefore I do rather confine myſelf and ſome particular obſervations I have made concerning the air and weather hereabouts; which I ſuppoſe may hold true of all other places of like ſituation. And if I can tell you nothing new on this ſubject, yet it would be a great ſatisfaction to me to have thought the ſame way with ſo great a genius in natural things, as I ſhould be much prouder, if there be any thing, which may ſeem uſeful to you in the proſecution of this noble deſign you are now upon; in which, as in all other endeavours for promoting of uſeful knowledge, none can wiſh you better ſucceſs than,

SIR,

your moſt humble ſervant,

J. TYRRELL.

IF you pleaſe to lay by your obſervations concerning this water till towards winter, that I come to town, it may ſerve; or elſe if you have any thing further to command me, you may direct your letter to me at *Okely* in *Bucks*, to be left with *Robert Clarke*, under-butler of *Queen's-College*, *Oxon*. I return you many thanks for your excellent treatiſe, which I have peruſed with great ſatisfaction.

Okely, May 25, 1687.

SIR,

IN obedience to your commands, I have here ſent you that part of Mr. *Locke*'s letter, which relates to his opinion concerning Mr. *Burnet*'s new Theory of the Earth, which I hope will anſwer your expectation: and ſince you have been pleaſed to give me encouragement to hold correſpondence with you concerning natural things, and particularly of

the air, I ſhall make bold to remark (if you have not already obſerved it) that the great wind on the late ſtormy Friday did not only break down the arms of divers great trees, but alſo blighted and burnt up the leaves of the trees, and blades of corn in divers places; from whence I obſerved, that thoſe peſtiferous particles, which we call blights, are not only brought upon us by gentle eaſt, or ſouth-eaſt winds, but alſo ſometimes with a weſtern wind, and ſtormy weather, as this then was. Nor have I any thing elſe to add concerning this ſubject, only that this day is alſo very ſtormy weather, often intermixed with ſhowers of rain, ſo that my barometer ſtands now at near about two degrees above much rain, which I beſeech God to grant us, for we have great need of it in the country. I have procured ſome rotten wood, as you deſired, but have deferred to ſend it, becauſe I cannot find that any of it does ſhine in the dark, which I know is the only thing you deſire it for. I cannot tell where the fault lies, whether in the ſort of wood (they being only crab-tree and ſallaw) or elſe in the drineſs of the ſeaſon; but if you pleaſe to command it as it is, and will let me know your pleaſure in a line or two directed to me at *Okely*, near *Brill* in *Bucks*, to be left with *Robert Clarke*, under-butler of *Queen's-College*, *Oxon*, your commands in that, as in all other things, ſhall be exactly obeyed by,

SIR,

Your moſt faithful,

and humble ſervant,

JA. TYRRELL.

MY mother is well, and is much my lady *Ranelagh*'s and your humble ſervant.

Mr. *Locke*'s is as follows.

[THE *New Theory of the Earth* I have read in Engliſh, and cannot but like the ſtyle and way of writing upon thoughts wholly a man's own; but ſince you deſire my opinion, as to the treatiſe itſelf, though it be a good while ſince I read it, and that but curſorily; yet there ſticks with me ſtill ſome of thoſe objections, which roſe in my way as I peruſed it, and which offered themſelves againſt the truth or probability of his hypotheſis, which made me not able then to reconcile it either to philoſophy, ſcripture, or itſelf. In the firſt part (as I remember) he makes the globe of the earth round, both by its ſchemes and hypotheſis of its formation; and in the ſecond part oval, without giving (as I remember) any reaſon for it. He makes the circulation of the water to be drawn up by the ſun as now, but all the clouds to go and empty themſelves at the poles only. How he makes out the phyſical reaſon of this motion, I do not well remember, but this I am ſure of, by this means there could be no rivers; for all the water that ſhould fall in thoſe parts he deſigns for it, muſt needs in that ſtate he puts the world in (the ſun being conſtantly in the equator,) muſt needs have fallen frozen, and ſo remained in mountains of ſnow. But granting water, though without a ſea, where lived the whales mentioned in the creation? But that, which ſeems to be the principle of his deſign, to make out (*viz.*) the hiſtory of the Flood, is that methinks, which he hath leaſt ſucceeded in: for when this cruſt of earth broke, what hindered the broken pieces from ſinking down into the abyſs, and ſo being quite loſt under water? And if the middle of the world, which lay under the ſun, was that, which firſt failed, how comes it, that we find ſo much of the torrid zone above water? But if we may judge by the Andes (one of the higheſt and longeſt tracts of hills in the world) the crack (if there were any) ſeems to run the other way: but that which ſeems moſt incomprehenſible of all is, how the water, that is now in the world, and was in his account no more then, could cover the tops of the higheſt hills, and remain above them ſo long a time as *Moſes* mentions; for the flaſhing of it, upon the falling in of the earth, (which is the cauſe he aſſigns) will be found (if conſidered) impoſſible to raiſe them ſo high, much leſs to continue them there ſo long. I imagine, if I ſhould trouble you with my fancies, I could give you an hypotheſis would explain the deluge without half the difficulties, which ſeem to me to cumber this; but though I tell you, that I am not convinced of his doctrine, and have here ſent you ſome of thoſe doubts, which I had in reading of him, which is now almoſt two years ago; yet I muſt alſo aſſure you, that there are ſome chapters in him, that I cannot enough value, and the book is to be eſteemed were it for thoſe only.]

SIR, I doubt not of your prudence in communicating theſe obſervations without naming the author, ſince I would not have done ſo much without his order, for any but a perſon, for whom I know he has ſo high a reſpect.

Letters from Mr. Ja. Dalrymple, *to Mr.* Robert Boyle.

Leyden, October 29, 1685.

Right honourable,

I HAVE ſent you herewith a treatiſe dedicate to the Royal Society. The meditation of the wonderful work of God in the ſtupendous contrivance of the inſcient powers of nature, hath been the delightful diverſion of my mind for many years. I have been a great admirer of your piety and your parts, ſince I firſt had the honour of a little acquaintance by the mediation of your excellent friend and mine, Sir *Robert Moray*. I have therefore made bold to trouble you to preſent it to your Society, whereof I wiſh to have

have the honour to be a member. If you find ground upon peruſal, recommend it to your friends and to ſtationers, and let me by a line know your thoughts of it: you may deliver your letter to the bearer, who will convey it to,

SIR,

your moſt affectionate,

and moſt humble ſervant,

JA. DALRYMPLE.

Leyden, March 2, 1686.

Right honourable,

I DID in December laſt ſend a philoſophical treatiſe dedicate to the Royal Society, and I wrote a line with it; but the gentleman, to whom I intruſted it (upon miſtake being taken for another perſon by the waiters at *Harwich*, who was ordered to be ſeized) was apprehended, and that book and ſome others ſent to other friends were taken from him, and put in the Cuſtom-houſe at *London*. The gentleman fell ſick, and I heard no more what became of the book or your letter. I was the more confident to preſent it to you, and thereby to the Society, that I have the honour of a little acquaintance of you by your friend and mine Sir *Robert Moray*; and beſide I have ever had a high eſteem of you, and have made much uſe of your experiments; and have not neglected on all occaſious to mention it with that honour, that you do eminently deſerve of the learned world. There is a parcel of them ſent to be ſold at *London*; they have met with good acceptance elſewhere. I ſhall think myſelf happy, if my thoughts fall to quadrate in any meaſure with yours; and the approbation or ſatisfaction of that learned and noble Society will be a great encouragement to me, to proceed in the more ſpecial parts of natural philoſophy, which hath been long the delightful recreation, and now in my retirement the main exerciſe of,

SIR,

your moſt affectionate friend,

and humble ſervant,

JA. DALRYMPLE.

Letters from the counteſs of Warwick *to Mr.* Robert Boyle.

My deareſt, deareſt brother,

I AM extremely ſenſible, that ſo obliging a favour, as your giving me a viſit at *Lees*, deſerves an acknowledgment; but which way to expreſs my ſenſe of it I know not; but I am confident, you are too well acquainted with my dulneſs to expect I ſhould do it handſomly, at a time when I am moſt pleaſed and compoſed; and therefore will not, I hope, do it now, that I have ſo juſt a cauſe of diſorder, as ſo lately parting with a brother, for whom I have ſo great an affection, that the loſing your company is ſo ſenſible an affliction to me, that if I were not comforted with your promiſe of returning to *Lees*, I know not what would become of,

Your affectionate ſiſter,

and moſt humble ſervant,

M. WARWICKE.

CHARLES is your ſervant, and all the young ladies, but eſpecially your miſtreſs, who had two fits the day you left *Lees*. Pray preſent this letter to my fair friend my lady *Roberts*.

My deareſt, deareſt ſquire,

WHEN I hear from you, it brings me too great a joy not to tell it. Really, my dear ſquire, I muſt confeſs myſelf to be guilty of ſo much ſelf-love, as to read of your being pleaſed at *Oxford* with ſome regret, becauſe I am ſo much my own friend, as to deſire with great impatience the ſatisfaction of ſeeing you here, the hopes of which, I may with a great deal of truth ſay, was the greateſt motive I could uſe to myſelf, to perſuade me to be willing to leave the ſweet quiet of the country, for the horrid confuſion of the town, in which, now my dear ſiſter *Ranelagh* and you are out of it, I have very little to pleaſe me in it, though we are like to be very great, for the lad is like to be a ſucceſsful lover. My lady *Devonſhire* is, God be thanked, like to recover. I envy the counteſs, who will be ſo happy as to ſee you, and deſire, when you are together, you will wiſh with you,

My dear ſquire,

your affectionate humble ſervant,

M. RICH.

MR. *Rich* is your ſervant, and my lady *Warwicke* preſents her ſervice to you: my ſervice to my nephew, and pray tell *Dick Jones*, that though I writ a letter to him, I never heard a word from him.

Lees, July 30.

My deareſt, deareſt brother,

MY being laſt week engaged in a viſit to my lady *Barington*'s, made me too weary, when I returned from it, to write that night by *Bellchamp*, and to tell my dear ſquire, how much I was really troubled to find my ſiſter return without you; for though I muſt confeſs, that I was not without ſome fears, that you would not come, yet I had entertained ſuch hopes of it, as made it very uneaſy

eaſy to find myſelf defeated in that, which was ſo really conducive to my happineſs, as your company was; but I was much more ſtruck, when my ſiſter informed me, that your not being well was the reaſon, that kept you from me, and truly was very impatient till the next return to hear how you did, for there is no creature living has a greater deſire for your health and happineſs. This I muſt beg you to do me the juſtice to believe, and to ſtill continue your kindneſs to her, who has as great a one as is poſſible for you, being with all the ſincerity imaginable,

My deareſt brother,

your moſt affectionate ſiſter,

and humble ſervant,

M. WARWICKE.

MY lord and the young ladies are your ſervants.

Lees, Dec. 29.

My deareſt, deareſt brother,

MY lord privy ſeal, as ſoon as he came in hither, told me, (I think to be ſure of being welcome, the good news) that you would be here this Chriſtmas, which was ſo pleaſing to me, that I was thinking with great delight upon that happineſs I hoped ſo ſoon to be poſſeſſed of, when a letter from you was brought me, that I opened with great haſte, hoping to find a promiſe under your own hand of your ſpeedy coming: but alas! to my great grief, I found all my expectations daſht, by your telling me, that your occaſions would not permit you to ſatisfy my longing expectation to ſee you. But my dear ſquire, I hope, and do comfort myſelf what I can with the hopes, that though you could not at this time, yet you will ſuddenly diſpatch all your affairs, that you may come to *Lees* to ſtay ſome time with me; and to encourage you to this, I will aſſure you, that you ſhall be abſolute maſter of your own time, and that no interruption ſhall be given you by,

My deareſt brother,

your affectionate ſiſter,

and moſt humble ſervant,

M. WARWICKE.

I HAVE told my fair friend what you ſaid in your letter to her; but I find her ſo kind to you, that for fear of making you too proud, and her lord too jealous, I will not repeat what kind things ſhe ſays of you. I thank you for my book; I am much pleaſed with what you have added to it; and am very glad my old friend *Tom Murray*'s letter was the cauſe of it. I am confident his letter was worth ſeeing.

Letter from the counteſs of Corke *to Mr.* Robert Boyle.

Liſmore, June 26.

My dear brother,

THOUGH I confeſs I have been a great while ſilent, I ſhall not fear you will conclude me faulty, but rather civil in that forbearance, ſince all that was neceſſary or worthy your knowledge, I know you received weekly by better hands from this place. To trouble you then to anſwer my inſignificant letters, I doubted would be a burthen your civility would impoſe upon yourſelf, and this has been hitherto the true ground of my ſilence. What is now the preſent motive of my writing is, to beg your opinion of your nephews paſſing their times, and whether they improve them to their moſt advantage, where, in the firſt place, it is moſt neceſſary they be well grounded in piety, which is the chief bulwark to preſerve them from thoſe temptations their age, condition, and converſation (too general in the world) is likely to aſſault them withal, eſpecially in their travels, to which my lord before long deſigns them. And therefore I humbly beg you would make choice of ſome good books, and recommend them to their peruſals, and to the doctor to ſuperviſe and clear, what may ſeem obſcure to them in that ſtudy, to which all their other ſtudies ought to ſtrike ſail, and to that chiefly intend; in order to which, I know nothing more probable to perſuade them, than your good precepts ſeconded with your example and practice. This ſhall be the chief intent of this letter, though I could much inlarge it with reſentments of my near approaching unhappineſs in parting with my deareſt ſiſter, did I not conſider, that this deprivation reſtores to you a happineſs I muſt not grudge you, but ſtudy rather the means to haſten over to be a ſharer in your mutual ſatisfactions, till when my complaints muſt keep home; and I ſhall only here trouble you with the inſignificant, yet very ſincere and hearty profeſſions of my ever remaining,

Dear brother,

your moſt affectionate, faithful,

and obliged ſervant,

E. CORKE.

I BEG you to preſent my ſervice to Dr. *Willis*, when you ſee him.

Letter of Mr. Charles Boyle, *afterwards earl of* Orrery, *to Mr.* R. Boyle.

SIR, July 31.

I WOULD have paid my reſpects to you before now, but I have not long been ſettled here in *Oxford*. I am at *Chriſt-church* under the care of Dr. *Aldrich*, who is dean of the college, an extraordinary man, a great ſcholar,

ſcholar, and of a very good temper. I do not queſtion but I ſhall get what I aim at here, which is a competent ſtock of learning and good ſenſe: I will do my endeavour. I hope you will pardon this rudeneſs in troubling you with this my impertinence, for I thought it my duty to ſhow you, that I am,

SIR,

your obedient nephew and ſervant,

CHARLES BOYLE.

I MUST trouble you with my duty to my aunt *Ranelagh*.

The lady Clancartie *to Mr.* Ro. Boyle.

Nov. 19.

Dear uncle,

IF it had been poſſible for any thing to have made an addition to the great proportion of ſorrow, your letter found me under for the greateſt of cauſes, it would have been to find thereby, that you were indiſpoſed. But I hope your indiſpoſition of body will not be of ſo long continuance as mine of mind will, God having pleaſed to lay me under a ſevere exerciſe of my patience, by taking from me the greateſt comfort. And indeed I cannot be juſt to his memory, without ſaying he was in all reſpects qualified to make me and mine happy, and very capable to have ſerved his country and the proteſtant intereſt, which I am ſure he had real reſolutions to have done to the utmoſt of his power; and therefore you are very juſt in the opinion you had of him, who had a very great reſentment of the kindneſs you were pleaſed to ſhow him, when he was in *England*, and would often ſpeak with great reverence for your judgment in every thing; and was faithfully your ſervant, and ſo good a man in all reſpects, that I am ſure he is perfectly happy, which is the only thought, that affords any conſolement under the ſad circumſtances of,

Dear uncle,

your moſt obliged humble ſervant,

and affectionate niece,

E. CLANCARTIE.

I BEG my moſt humble ſervice to my aunt *Ranelagh*.

Letters from Dr. Burnet *to Mr.* Robert Boyle.

At the *Hague*, Jan. 3, [1686. O. S.]

Honourable Sir,

SINCE I know this noble bearer will have the pleaſure of waiting ſometimes on you and on my lady *Ranelagh*, I could not ſatisfy myſelf with charging him to make you both all the expreſſions poſſible of my duty and eſteem for you, which I hope he will perform with that grace, that accompanies him in every thing, that he either ſays or does; but I took the liberty to write by him, and ſince I am upon a ſubject that pleaſes me ſo much as Mr. *Cutts* does, I crave leave to tell your ſiſter, that if I durſt ſay it, I am almoſt angry with her, for having known ſo worthy a gentleman without giving me a ſhare of it, ſince I find he has had the honour of being known to her a great many years; but quarrels of this nature do not go very far. I am ſure I ought to have none with you, after you have obliged me by the preſent of your excellent book of nature. No man knows her ſo well as you do, and ſo no man ought to have undertaken her ſo boldly; and indeed you have managed it ſo, as to maintain the noble character of a Chriſtian philoſopher, which I am ſorry is ſo peculiar to yourſelf, ſince moſt of our philoſophers ſeem to forget, that they are Chriſtians. I wiſh you and your incomparable ſiſter a good new year, together with a great many to come after this, that mankind may be ſtill made better and wiſer by your means. I am with as much reſpect and veneration, as I can pay to any mortal,

Honourable Sir,

your moſt humble

and moſt obedient ſervant,

G. BURNET.

Hague, June 4, [1686.]

Honourable Sir,

THOUGH I have not during ſo long and ſo uneaſy an abſence from a perſon, whoſe converſation was always equally delighting and advantageous to me, taken the liberty to write to you, yet as I have often procured to myſelf the ſatisfaction of hearing concerning you, ſo you will ſee by a bundle of papers, that the bearer brings you, that I had you always in my thoughts; and that therefore I have writ as full an account, as I thought was neceſſary, of every thing, that occurred to me in my travels, in five long letters, which you will ſee by the concluſion of the fourth, are addreſſed particularly to yourſelf. I ordered my man to carry them firſt to the dean of *Pauls*, who, I know, will very ſoon diſpatch them, and then he will bring them to you; and if they give any agreeable entertainment to you or your noble ſiſter, I will attain one of my main ends in writing them. I am extreme ſorry to hear, that my lady *Ranelagh* has of late had ill health; but I hope the ſeaſon of the year will ſet her up again. Her life is ſo important, and has been of late of ſuch uſefulneſs to a great many, who have felt the effects of her univerſal and active charity ſo ſenſibly, that I hope God will yet continue ſo great a bleſſing to an age, that may very ill want ſuch patterns. I give her my moſt humble ſervice in the moſt particular

ticular manner, that can be imagined. But having condemned you to the reading ſo many ſheets, it were very unjuſt to add a farther impoſition upon your time; therefore I do only beg of you to ſend theſe ſheets, when you have done with them, to my lady *Eſſex*, who is to ſend them to my lady *Ruſſel*, and after they have made a little turn, they will return them back to you, to be diſpoſed of as abſolutely by you as the author of them, who will ever be in a manner beyond expreſſion,

Honourable Sir,

Your moſt humble,

moſt obedient, and

moſt obliged ſervant,

G. BURNET.

MR. *de Tournes* of *Geneva*, who reprints all the Latin tranſlation of your works, gave me the incloſed memorandum, which I take the liberty to ſend you, for he is a very worthy man.

Mr. Boyle's *anſwer to Dr.* Burnet's *letter of June* 14, 1686.

SIR,

A GOOD while ſince I received the letter your domeſtick delivered to me: I received a greater favour in that of a roll of excellent papers, that was ſent me a few days ago by the dean of *Paul*'s. They ſhould at any time have been very welcome, but are more ſo by being very ſeaſonable too, to divert, as well as inform me, whilſt my ſiſter is kept in her chamber by the remains of a feveriſh diſtemper, and am I laid up by ſomething, that though ſeemed to be an effect of the ſcurvy, does very much emulate the gout: by which melancholy juncture of circumſtances, ſhe and I, though in the ſame houſe, and neither of us (thanks be to God) confined to a bed, have not ſeen one another theſe four or five days. Though your delightful travels have much alleviated the troubleſomneſs of a diſtemper, that keeps me from ſtirring, yet they have left me pain enough to keep me from being able to make you thoſe returns for them; I ſay not, that they deſerve, but that in other circumſtances I ſhould not perhaps be uncapable of doing. Your excellent manuſcript making me lay aſide almoſt all printed books, was my entertainment morning, noon, and night, becauſe I found I could travel through your letters, as well with more pleaſure, as with more quietneſs, than you did through the countries ſo judiciouſly deſcribed in them. Having viſited many of thoſe places in my youth, the lively mention you make of them does ſo revive my decayed ideas, that they make me think myſelf young again. I am glad to find, that all men do not travel as moſt do, to obſerve buildings, and gardens, and modes, and other amuſements of a ſuperficial and almoſt inſignificant curioſity: for your judicious remarks and reflections may not a little improve both a ſtateſman, a critic, and a divine, as well as they will make the writer paſs for all three.

* * * * * a work, that may hereafter ſerve for a faithful mirror of the times and places it was written in. As for the diſpoſal of thoſe letters, which you are obligingly pleaſed to leave me, though I be very ſenſible of the favour you do me, yet I cannot think myſelf qualified to accept ſo great a truſt, eſpecially being not ſo well acquainted with your preſent circumſtances abroad as to judge, whether ſome of your friends here have as much reaſon, as I perceive they think they have, to apprehend, that at this time (though not perhaps at another) the publication of theſe curious papers, particularly of your laſt letter, may be almoſt as prejudicial to the author, as grateful to his reader. The compliments and more kind paſſages you are pleaſed to conclude with, I dare no more pretend to anſwer, than deſerve; and therefore think the fitteſt return I can make of them is, not to permit them to make me offer you an intereſſed advice: and the beſt uſe I can make of the power you give me is, not ſo much to conſider the benefit of being ſo advantageouſly repreſented by ſuch a pen, as the ſafety and juſt intereſts of a perſon, that has ſo handſomly obliged,

SIR,

Your moſt humble, and

moſt affectionate ſervant,

&c.

THE date will inform you, that this letter was written long ſince; but a German, that brought me a compliment from you, by undertaking (without performance) to deliver this paper to you at his return from *Oxford*, has been the occaſion of this delay, which therefore I hope you will eaſily pardon. I ſhewed my ſiſter what you writ of her, and ſhe is very ſenſible of your kind, though ſhe takes exceptions at the complimental part.

Superſcribed,

A monſieur monſieur Burnet in de Hoege, &c.

Biſhop Burnet *to Mr.* Boyle.

Saliſbury, January 20.

Honourable Sir,

IT was very uneaſy to me to leave the town, without giving myſelf the honour of waiting on you according as you were pleaſed to deſire me; and I firmly intended to do it on Monday laſt. But the meſſages between the two houſes held us ſo late, that I being under engagements to go into *London* that night upon buſineſs, was kept there ſo long, that it was not poſſible for me to get back, before your time,

time of going to bed was past. I was the more uneasy at this, because I knew the affliction that you were under by reason of my lady *Burlington*'s condition, of whose death I have heard nothing; so I conclude, that she must be recovered, at which I very much rejoice. I do therefore most humbly beg your pardon for not having obeyed those obliging commands, that you were pleased to lay upon me, when I saw you last. It is my inclination, as well as my duty, to delight in being often with the person in the world, that I esteem the most, and to whom I stand so highly engaged; and therefore I hope you will impute my not attending you to any thing, rather than to a slowness in obeying your commands. But if there is any thing, in which the opinion of so mean a person as I am, can add to the satisfaction of so great a person as I know you to be, I will not fail to send you a very particular account of my thoughts in any matter, that you may think fit to communicate to me, and will be sure to lose no time in it. I pray God to continue you long to be a publick blessing to the age, which you have hitherto been in all respects more than any man I know; which must needs engage all, that have any regard either to religion or virtue, to pay you a most particular esteem; and as there are not many, who know more of your worth than has fallen to my happy share, so I am sure there is not any one person, that honours you with a more profound respect than,

Honourable Sir,

your most humble,

most obedient, and

most obliged servant,

G. SARUM.

Letters from Mr. Benjamin Denham *to Mr.* Robert Boyle.

Honoured Sir,

THOSE courtesies are to be highest in estimation, which come without a petition, *jus enim precarium fert secum obligationem*, says the Civilian. If I should reveal my thoughts, that I have of your piety and worth, you would think I flatter, therefore I will be silent.

Omne agens naturale necessario operatur; the sun cannot but distribute his beams, and so are good men; morality and grace so effectually operate in them, that as it were they must be courteous and good, and almost contradict the maxim, *Omne agens morale est liberum et indifferens.*

I HAVE here presented to your censure and reading some of my unconcocted notions and inventions; some I say of many, *multa in paucis*; in one word I render your honour an hecatomb of thanks for speaking to the lord chancellor; but if on some occasion the bishop of *Winchester*, who recommended me to *Constantinople*, had but one word from you, my cares would cease, and then I might study without distraction. The lord bishop of *Winchester* hath now always his lodgings at *Whitehall*, and is constantly to be found before and after chapel at noon. Your goodness is such, that if I crave pardon, presently I am forgiven. Your honour knows the story of *David*, confession and absolution hardly had a moment's difference at least. I will comment so at this present,

Your honour's most affectionate,

and humble servant,

BENJAMIN DENHAM.

SIR,

AMONG some of mine inventions and enquiries, one was about titles of honour to the clergy; but pray do not think I flatter or lye, if I enquire what title I might contribute to your worth and affable kindness, for I have found no person so disinterest in the world's honours and profits as your honoured self, and it was that, which made me so desirous of your acquaintance.

THE world, they say, turns round, but I am as the pole, fixed in my condition. I have received my book and your letter, which I did, as the grand visier doth to his emperor's letter, kiss and adore; and if there be any idolatry, I hope God and you will pardon. I hate popular applause, but I have preached in divers places in *London*, and in the duke of *York*'s chapel, but still—*haud facile emergunt, &c.* It is the first step and second in nature's philosophy, that helps the most to the progress. My lord keeper speaks very kindly; and I would willingly contribute my endeavours to the composure of an universal catechism in such principles, in which all the Christians do agree; and Dr. *Pocock* will inform you, that if it were made in Italian, Latin, vulgar grammatical Greek and Turkish, it would at least confirm the poor Greeks in Christianity, if not convert the Turks and barbarous. I render you thanks for those divine benefits, that I have received from your divine book of occasional Meditations. I have an honest accusation against your honour, because you force me either to buy or borrow of others, which I would yourself had displayed. When I receive any revenues from the church, then I will bestow some money and pains to recover that Arabic book out of captain *Kempthorne*'s hands, now returned from the seas, for the use of Dr. *Pocock*, to whom I sent it; for hitherto I have only bestowed my money, as well as my pains, when I preach or officiate for others, either in or out of town. My landlord Mr. *Thomas Francis*, one of the king's life-guard, hath his house at the sign of the Sun almost against the *New Exchange*, where I now live; but I hope *Poeta* and *Vates* will prove the same as Mr. *Mede*

Mede testifies—*Nil mihi rescribas, attamen ipse veni*; but yet a few lines from your honour will be more valued by me than the χρυσεᾶ ἔπη of *Pythagoras*. Let me meet with them either at the religious house of the devout lady *Ranelagh*, or at mine own lodging. I will rest content, yea μακροθυμος, and satisfied with longanimity, until your honour shall find an occasion to come to *London*, to speak with any bishop in my behalf.

Your most obliged servant,

BENJAMIN DENHAM.

Letters from bishop Fell *to Mr.* Robert Boyle.

June 10.

Honoured Sir,

THE bearer hereof Mr. *Guise*, a gentleman of very good parts and acquisitions, has undertaken the description of *India*, for the Atlas, which is printing in this place; and being desirous not to transcribe relations and journals already published, now takes a journey to *London*, to receive those helps and notices, which our present commerce in those parts can give him. As I am well assured, that no patronage and assistance can be of greater moment in this affair than yours; so I persuade myself, that none will be with greater readiness afforded. I shall not therefore go about to excuse the confidence of this address, or the trouble it will give you; but recommending Mr. *Guise* to your favour, and yourself to the blessing of almighty God, I remain with great respect,

Honoured Sir,

Your most humble,

and faithful servant,

Jo. OXON.

July 19.

Honoured Sir,

BEING informed by Mr. *Guise*, that upon your recommendation the company has been pleased so far to own his design, as to order his having the liberty to survey such relations and papers of theirs, which may assist him in his design; I am to return my acknowledgments in his behalf, and I am very confident, that neither yourself nor the company will have cause to regret the encouragement, which you are pleased to give him. In my last I told you, that Mr. *Guise* would not satisfy himself with putting together printed narratives, and the stories of extravagant travellers, but took a journey to *London*, there to receive more particular and sober instructions: but such is his courage and desire to do his work to all possible advantage, that he purposes himself to go into the *Indies*, and only trust to his own eyes, and certain knowledge. It is an extraordinary thing, that a gentleman as he is, who is not pressed by want, and whose parts and friends would not fail to prefer him at home, should so espouse this affair, as to prefer it before his ease and interests. Whatever is possible to be done by one man, the company may expect from his parts and industry. His skill in mathematics will enable him to make his own geographical and astronomical observations; his skill in draught and designing will qualify him taking the prospects of cities, havens, and forts, and all remarkable appearances: and his genius towards the acquiring of languages will let him in not only to such a correspondence with the natives, as may forward his undertaking, but possibly advance your Christian and noble design of propagating religion, which I pray God succeed. You will be pleased to continue your patronage, and thereby oblige the publick, and also,

Honoured Sir,

your most affectionate,

and faithful servant,

Jo. OXON.

Letters from Mr. Joseph Glanvill *to Mr.* Robert Boyle.

Honourable Sir,

I KNOW it is not usual for strangers of no name or consideration, thus boldly to address to those of your quality; and persons of the rank you hold of such great worth and accomplishments are as uncommon as such addresses. But you have disclosed so many eminent excellencies to the world, that it is impossible to know any thing of you without respect and wonder; and unjust not to pay some of the tribute due to so great a virtue. You have a nobleness, that invites affection, as well, as that which commands distance; and I shall not dishonour the splendor of your extraction and family by saying, that you do more honour your birth, than you are honoured by it; and are less illustrious by the nobility of your blood, than by that you derive from your proper perfections. Therefore, had I not had an assurance of your goodness, equal to my apprehensions of your quality and merit, I had suffered my ambition to prefer this little trifle to your eyes, to have languished without the relief of so criminal a boldness. But, Sir, your native sweetness is my excuse for this fault, as it was the motive; and you cannot expect to be free from such troublesom importunities, except you had less worth to occasion them, or less goodness to encourage such applications. This small discourse, that now begs the favour of your acceptance, can acquaint you with nothing new but the respects of the author. Nor hath it any thing

to

to excuse its aspiring to such hands, but the devotion, wherewith it is offered you. I am confident your free and enquiring genius is no enemy to pre-existence, or at least to a modest proposal of those Platonick notions. Your mind is too great and generous to boggle at uncommon opinions; and I am secure, that you will appoint no other judge of those theories, but an uninteressed and impartial reason. If such as you cherish those beams of restored Platonism, they will shine more and more to a perfect day; otherwise this light will sneak back to its forgotten darkness, and be buried again in its old obscurity. I beg no favour for any of my mistakes or errors; if you use them roughly, it is no more than myself would do, did I know them. I intreat you therefore to be just to the notions, but candid to the management. Upon the credit of those great men, that have owned them, I dare be a little confident of the former; though for the latter I despair of any tolerable treatment, but from ingenuity and sweetness. What my motives were to this engagement, I cannot acquaint you without being uncivil to your patience; nor can I detain you any longer by my impertinencies for fear of unmannerly distressing it: wherefore least my intended civilities should prove rudenesses, and my respects, injuries, I dare add no more, but the assurance, that I am,

SIR,

an eternal honourer of your virtues.

Bath, Oct. 7.

SIR,

I HAVE lately received a letter from Mr. *Jo. How*, the minister, in which he tells me, that he acquainted you with a design I am now upon, which is to collect some modern well attested relations of fact, to prove the existence of witches and apparitions; and that you thereupon were pleased to mention a notable narrative in your hands of Sir *George Mansfield*'s case, which he saith you are willing to oblige me with. That will be a very great favour, and I most humbly desire it of you.

I HAVE of a long time been exceedingly importuned to reprint the story of Mr. *Mompesson*, which hath been so industriously run down by contrived tales, that have no manner of truth in them, and some of them not the least appearance of any. But having not been very willing to intermeddle further in things of this nature, I have till of late contented myself to satisfy the enquiries, that have been made me about it, either by letter, or word of mouth. But those are now so many, and so vexatious, that I have at last resolved upon a new edition of my book of witchcraft, and the reinforcement of that certain relation, as well for mine own ease, as the satisfaction of those, that have so earnestly desired it. And because some books have come out since mine, that very confidently oppose, and scorn the belief of witches and apparitions, and particularly one lately written by Mr. *Webster*, licensed by Sir *Jonas Moore*, your vice-president of the Royal Society (at which I a little wonder) I have therefore determined not only to confirm what I have writ formerly on this subject, but to endeavour fully to prove the main business by a collection of the best modern evidences I can get.

To which purpose I have written to divers of my friends to assist me with such relations, as they have good assurance of, and particularly to Mr. *Hunt* of this county, who hath had so much to do in those matters, and from whom I had the story of the witch of *Shepton*, printed in my book. He hath been pleased to lend me his book of examinations of those witches, with whom he was concerned, and from that I have got such a collection, as I believe will be as good evidence, as any hath ever yet been given in the case of witches. Last night he was here with me at my house (being now in this place judge of the quarter sessions) and told me, that he once related those passages to the late most worthy bishop of *Chester*, who said, that you desired an account from him of the same, but his occasions would not permit him so much stay in town as to wait on you. I hope I shall shortly give it you as fully, with divers other relations, that may be worth perusal. I am very careful to inform myself of all particulars of those stories I use, to prevent cavils; and that occasions many letters and enquiries, which have much retarded my business: but I make what haste I safely can, and take care not to make too much, knowing what severe judges and censurers I am to expect. If you shall please, Sir, to afford me the honour and encouragement of your assistance, by permitting me the narrative Mr. *How* mentioned, it will very much both credit and further my design. I hope shorty to wait on you at *London*, and am very sorry I was so unhappy as to miss of you when I was last in town. I intended to have sought other opportunities of paying you that duty, but I was called out of town sooner than I expected. I do not desire, that the relation should be ventured by the post, or carrier; but if you shall please to order a servant to acquaint me with your receipt of this, it will be a satisfaction to,

Honourable Sir,

your most humble,

most obedient, and most

faithful honourer and servant,

JOS. GLANVILL.

Bath, Jan. 25.

SIR,

WHEN I had last the honour of waiting on you, you were pleased to promise me further assistance in my design, *viz.* the proof of witches and apparitions. I have

got a collection very conſiderable, for plainneſs and ſtrength of evidence, and I hope ſuch as will be enough to ſhame all the atheiſts, ſcepticks, Sadducees, and witch-advocates in the world: but yet a few well atteſted relations may be of uſe for further confirmation; for ſuch I am yet ſoliciting divers friends, and have promiſe of conſiderable aſſiſtance by the duke of *Lauderdale*'s and Sir *George Mackenzy*'s means out of *Scotland*. There is no doubt but *Ireland* will afford as much, which, if you have opportunity, and it be not too troubleſom, I moſt humbly deſire through your means.

I HAVE been often told of late, that you do now diſown the ſtory of the *Devils of Maſcon*, and that a clear impoſture hath been diſcovered in it. The like hath very falſely been reported of Mr. *Mompeſſon* and myſelf, in relation to that ſtory; ſo that I am apt to think, that this alſo concerning you may be a contrived falſhood (for by ſuch ſome men endeavour to run down all things of this kind) and therefore I moſt humbly beg you would pleaſe to let me know, if there be any truth in this ſo confident a report.

I GO hence Wedneſday next towards *Worceſter*, where I ſtay during the whole next month: any letter you ſhall pleaſe to order me, will find me at my houſe in the college there. I am,

Moſt honoured Sir,

your moſt affectionate honourer,

and moſt humble ſervant,

JOS. GLANVILL.

Worceſter, Feb. 24.

SIR,

I MOST humbly thank you for the honour and favour of yours; and am extremely ſatisfied with the account you are pleaſed to give me of your not having diſclaimed the relation of the ſpirit of *Maſcon*: it is confidently ſo reported in divers places; for men will ſay any thing to rid themſelves of the evidence of ſuch things; and therefore I make it my buſineſs to be very careful in the ſtrict examination of all the relations of the kind, that I admit into my collection, and I hope, that which you have already ſent me, and the other Mr. *How* hath for me, will not be diſcredited by their company. I ſhall not ſtay in this place (where I am one of the prebendaries of the church) much above a week longer: when I am ſettled at home, I ſhall write to Mr. *How* for it; and deſire you would accept of my moſt humble thanks for this and your other favours. The great caution I uſe in examining the relations makes my book go on very ſlowly, yet I hope it will be finiſhed this ſpring. I am in expectation of ſome notable ſtories from *Scotland*. Sir, I pray God to keep you in health, and preſerve you long among us, for the inſtruction and benefit of mankind. I am,

SIR,

your moſt obliged, and

moſt humble honourer and ſervant,

JOS. GLANVILL.

Bath, Nov. 2.

Honourable Sir,

THERE is nothing can come from you, but what is very obliging; and your laſt favour I received with the greateſt veneration and acknowledgment. Through the neglect of the carrier it came but juſt now to my hands; ſo that I can ſay no more, but that I implicitly honour it, as I do all the iſſues of your excellent pen, with the higheſt reſpect and affection. I am very ſorry, that I can make you no return ſuitable to this, and the grand obligation of a former favour of this kind; but I ſhall ſtudy to ſhew myſelf acknowledging. And becauſe I find you ſo ready to oblige, I am bold to deſire your acceptance of a ſmall thing of mine, which I have ordered my bookſeller to convey to your hands with this. I have ſomething elſe preparing for the preſs, which is more in the way of your generous deſigns, and will at leaſt ſignify my affection to thoſe noble proſecutions. As ſoon as it is abroad, I ſhall crave leave to preſent it to you, and in the interim beg your candid reception of the aſſurance, that I am,

Honourable Sir,

the moſt affectionate honourer

of your incomparable virtues,

JOS. GLANVILL.

Dr. Wilkins *to Mr.* Robert Boyle.

Wadham-College, Sept. 6, 1653.

Honoured Sir,

YOU have ſo well acted the part, which belongs to me, of returning acknowledgments for the favours recieved at *London*, that I am as much aſhamed, as unable to imitate you. But I have known, Sir, that you are a great maſter of civilities as well as learning, and therefore ſhall in all things moſt willingly ſubmit. I had thought you had gone out of town ſhortly after the time I waited upon you, which was the reaſon I did not attempt to trouble you with a viſit.

THIS bearer is the young man, whom I recommended to you. I am apt to believe, that upon trial you will approve of him. But if it ſhould happen otherwiſe, it is my deſire he may be returned, it being not my aim ſo much

much to prefer him, as to serve you, which your own eminent worth will always oblige me unto with my utmost zeal and fidelity. If it be not, Sir, prejudicial to your other affairs, I should exceedingly rejoice in your being stayed in *England* this winter, and the advantage of your conversation at *Oxford*, where you will be a means to quicken and direct us in our enquiries. And though a person so well accomplished as yourself, cannot expect to learn any thing amongst pedants, yet you will here meet with divers persons, who will truly love and honour you. And it is the more generous kind of felicity to teach and do good, than to learn and receive it. If I knew with what art to heighten those inclinations, which you intimate of coming to *Oxford*, into full resolutions, I would improve my utmost skill to that purpose; and shall be most ready to provide the best accommodations for you, that this place will afford. I am,

SIR,

your true honourer, and

most faithful servant,

JO. WILKINS.

Mr. John Mallet *to Mr.* Robert Boyle.

Pointington, March 27, 1655.

SIR,

YOUR sickness in *London* some months since gave me too much sadness, either to be silenced on that occasion, or to be expressed with less trouble to you, than in those few syllables, wherein I ventured to confine my grief, in only telling you, I was in no small measure sensible of one on that score: and now, Sir, having lately understood the much advanced hope of your regaining health, which if it please God to perfect, by a total remove of all those lingring attendances on sickness, and speedily to redouble your strength, which I most zealously beseech him to grant you, my revived joy will be as now my hope of it is already, beyond the expression of a letter: and I longingly wish for the happy opportunity of performing my congratulating duties, when I may have the honour of waiting on you at *Stalbridge*, where I understand you are shortly expected. But, Sir, in the mean time I could not withhold these lines, which yet I should have assumed the confidence to have sent you two or three weeks sooner, had not *Parthenissa* required some of my time to entertain her with most serious observance of her excellent beauties, which are so illustriously delightful, that even the ashes and funeral flames of that Phœnix obscure the brightest princesses and their romances: yet her author must be petitioned not to leave her there, but to revive and prosecute her oracle's engagement, as much for the readers, as can be imagined for her servant's satisfaction; unless possibly, and very truly too, it may be thought a greater happiness to have such a monument, as your honourable brother hath given her, than any other fruition could be; and a high recompence of those virtues, for all their persecutions to be placed in so serene a sphere as that admired story, which, were not that way of writing warranted by some sacred presidents, and by ever being the clearest arguments and trials of the most able genius's, and the choicest favours they bestow to enlighten the world with, my lord *Broghill* is authority enough to make romances need no other, and to prove, that none can so well write of such excellencies as are the mysteries of love, of state, and military glory, but such an excellent person, who is as much replenished with the knowledge, as highly renowned for his management of them: and certainly nothing can be said against romances, after his owning them, whereby they are rendered as safe in his being their sanctuary, as in their own virtue. And if ever they must be excelled by any thing more serious or divine, it can only come from the same hand, or his noble brother's publishing his own seraphick treatises, which heretofore I have been honoured with the sight of, as also by the many other high favours, which have infinitely rendred me,

SIR,

your most obliged,

most humble, and

faithful servant,

JOHN MALLET.

Dr. Worsley *to Mr.* Robert Boyle.

Dublin, Oct. 14, 1657.

Dearest Sir,

I HAVE had the honour of two from you since my last coming into *Ireland*, for both which I have been somewhat too long, and too unjustly your debtor.

I AM very glad of your success in the two experiments you mention about copper and antimony, though the former seems to be the more noble, the other being more familiar, if not by the same, yet by other menstrua. But that of copper may perhaps be useful, if we can guess the ground of that rightly, and can reduce it unto or demonstrate it from some principles of nature. Though I should account it also much more useful and luciferous, if part of the copper were so separated, and the rest of the body of it were some other definite and similar substance, than if the whole body be made inflammable.

FOR experiments, I have been able to make none since I came, but one or two œconomical about drinks; and about a more perfect way of conserving of green flowers and fruit, than

than those I did the last year, by observing some error in the former.

FOR the plot, that was laid at the Rhenish wine-house, I look upon it like the story of *Columbus*, who having satisfied himself, was not discouraged in his attempt from the unusualness of the undertaking or difficulty he found in the entertainments of it; but waited with patience until a seasonable time to effect it. And I am told, that this also, which you mention was there discoursed of, was not taken out of any old manuscript, or found by chance under an altar-stone obscured by a dark hieroglyphical character, which might be taken in I know not how many senses like the Delphick oracles. But it is in part real experiment; the grounds of it solid; the law of it nature; the method of it certainty, or rather necessity. That it is not a thing framed in the will of any man, or upheld by the opinion of antiquity; but it is a real door, a key, a light to things visible, and to the harmony between them and other things invisible. But the times, seasons, and opportunities for all things are in the hand and dispose only of the Lord.

YOU are pleased to mention a book lately come forth, endeavouring the reconciliation of the Dogmatist with the Helmontian, which I would be glad to receive your opinion further of.

I AM much affected with the generality of your late contagious feverish distemper, but am able to offer little that is peculiar, having made no observations peculiarly of it. The best general remedy I have yet had an opinion of is your Radix Virginiana, which as it is an effectual and potent alexipharmacon against the virulent poison of the rattle snake or adder, so it is looked upon by some as one of the best simples of many to resist all contagious putrefaction. I think it however a safer and more innocent medicine than many other.

IF you thought that large letter worth the communication to our learned friend with you there at *Oxford*, I would be glad to receive something, that might offer a further occasion for discussion and debate, being no way tied to this or that opinion or expression. I am,

Dear Sir,

your hearty affectionate servant,

B. WORSELEY.

Dr. Pope *to Mr.* Robert Boyle.

Paris, Sept. 10, 1659.

Honoured Sir,

I HAVE been long balancing with myself, whether it were more pardonable in me, to omit writing, or to write nothing to you. In the one I should forget myself and my obligations; in the other the respect, that is due to you, who, I presume, are not used to receive empty letters. The receipt of that letter you were pleased to honour me with, put it past question, that I ought to trouble you with an answer. Though I am very much ashamed to tell you, that I have spent most of my leisure time in reading romances, which we hire like horses, and monsieur *Corneille*'s plays, and in visiting the eminent places in and about this city. And that as yet for want of language, or boldness, or recommendation, I am not acquainted with any whom you enquire after, except monsieur *Petit*, who pretends to know very much in glasses, and mechanicks; and, if you will believe him, there is neither prince nor prelate in *France* minds any thing, that is curious, besides himself. Sir, here is publickly shewed in *Paris* a kind of a wooden stone, found betwixt this and *Rouen* by an odd accident. A fisherman took it up, and tied it to his boat, thinking to stop his boat with it, which it did not do, but followed the boat, swimming upon the top of the water. It weighs 54 lb. it is very hard, though full of little holes, as those stones are, with which they make grotto's. It is of an irregular figure, something above a foot long, near half as broad, and about a third in thickness. It swims without fraud, and thrust down a hundred times to the bottom mounts as often. Sir, I humbly desire your pardon for filling this letter with such trivial intelligence; if any thing better come to my knowledge, you shall be informed of it by,

SIR,

your most humble,

and obliged servant,

WALT. POPE.

Mr. Codrington *to Mr.* Robert Boyle.

October 2, 1660.

SIR,

BEFORE I suffer this pen to pass any further, I must return you my most humble thanks for the gratuity, which about ten years since I received for the book, which I then dedicated to you. What here inclosed I have now preferred to your observance, I must beseech you to grace with your acceptance. It is a poem in Latin on a grateful subject; I have taken some pains in the composure of it, and have been induced by some worthy friends, who truly honour you, to devote this service unto you, unto whom all learning oweth for a patron, and the world for an example. I doubt not but you have seen many books extant under this hand in prose. I am now printing all my poems, a great part whereof I have dedicated to many eminent personages amongst our nobility, and gentry, and to some doctors, as famous for their learning and their piety beyond the seas, as

as in our own univerſities. I muſt beſeech you with the ſame candor, that you will be pleaſed to accept of this, which moſt preciſely doth devote itſelf to you, and is proud to wear the honour of your name on the forehead of it: may it return me any teſtimony of worth from your accurate judgment; the many laurels, which the world hath given me, ſhall not ſo much crown me, as the honour I ſhall receive to have pleaſed you, and to expreſs my ſelf,

SIR,

your moſt humble

and devoted ſervant,

ROBERT CODRINGTON.

SIR, I have lately rendred into Engliſh a book of my lord biſhop of *Lincoln*'s, intituled, the Obligation of Conſcience; it is in the original dedicated to you. I was, indeed, offered to dedicate the tranſlation to whom I pleaſed, but I have followed the doctor's example, and it continues in the tranſlation ſtill unto you, and in the doctor's own words, as may appear by the book, which is now newly extant, and to be ſold by Mr. *James Alleſtry*, at the ſign of the Bell in *Paul*'s church-yard; I thought fit in this place to acquaint you with it, becauſe I do find it to be well pleaſing to the doctor, who (I thank him) prefers the tranſlation; and I hope it will prove as acceptable to you, for I am aſſured it had been impoſſible for me to give it to a more noble or a more lettered perſonage.

Mr. Thomas Povey *to Mr.* Robert Boyle.

Lincoln's-Inn-Fields, May 8, 1661.

SIR,

I CONSIDER my ſelf to be very unhappy, that I was not at home to receive you, as well as your book; for, although I eſteem your eſſays according to the value, which is given them by ſuch as are beſt able to judge; yet you being in your ſelf a full and noble library, and my way of reading, and my improvements (if I have been capable of any) being by converſation, and by the living diſcourſes of ſuch as are worthy to be ſtudied; I have reaſon to prefer what I loſt by my abſence to what I found, when at my return your excellent volume was delivered to me by my ſervant; which nevertheleſs I thank you for, as for a thing rare and precious, although not ſo deſirable, or ſo beneficial to me and to mankind, as your own ſociety and example; by which it is more eaſy and more delightful to advance towards learning and virtue; the qualifications by which you are as eminently known to the world as by your name. Much of this I had ſaid to you, if I had found you, where I intend to leave this in your abſence; with which you will receive a ſmall quantity of pepper of *Jamaica*. I can only ſay of it, that it exceedingly ſatisfies my ſmell and taſte; and ſeems a proper ſeaſoning to any that affect cloves, nutmegs or mace; the aromatick richneſs of all which ſpices being plainly imparted by this generous berry. I could wiſh you would throughly examine it, by making ſuch experiments, that the qualities of it may be well diſcovered and underſtood; for I am ready to believe, that it is not of a low or ordinary degree. I have prayed Sir *Robert Moray*, that he alſo will attempt ſomething upon it. And, if you ſhall hold it worthy of your favour and approbation, I ſhall ſerve you with a greater quantity. I am,

SIR,

your moſt humble ſervant,

THO. POVEY.

Dr. Boyle *biſhop of* Corke *to Mr.* Robert Boyle.

Dublin, Aug. 13, 1662.

Honoured Sir,

I RECEIVED the honour of two of your letters ſince I left *England*, and both upon the ſame account. I had long ſince made you my acknowledgments for that noble favour attended with ſome return to the particulars of thoſe letters, had not my deſires to acquaint the earl of *Orrery* with them (who being then in *Dublin*, and I in the country) occaſioned my delay all this time; for which I humbly beg your pardon. As to the buſineſs itſelf, I am perfectly ſatisfied, that your deſign (if you had any, for I cannot yet imagine you to be any otherwiſe than paſſive in the whole matter) in acquiring thoſe impropriations was charitable and religious; for you cannot do any thing that is otherwiſe. I muſt likewiſe very much applaud your pious intendments for the advancement of real learning, and eſpecially for the extenſiveneſs of your charity towards the poor Heathen natives in *New-England*: but yet I muſt humbly take leave to acknowledge myſelf unſatisfied, why that additional revenue, which his majeſty deſigned and promiſed for the better ſupport of the clergy here, that they may with greater comfort attend the cures of their ſeveral churches, ſhould be diverted to any other uſe, though in itſelf it be generous and handſom; eſpecially when I conſider, how many congregations depend upon the ſervice of thoſe pariſhes; how deſtitute they will be of a church to reſort unto; how the poor people will be compelled to wander through the country to find out an opportune place for the performance of their publick duties and devotions unto God; for although at preſent your piety provides all that poſſibly you may, to prevent theſe ſad conſequences, yet you know not how they ſhall be minded, who ſucceed you; nor are you certain, that thoſe other perſons (whoever they be) that have obtained this grant under your patronage, will be as inclinable

upon that account as you are. If they be not, (as it is great odds on your ſide againſt moſt men living) it will not then be unworthy your conſideration, whether ſomething of their fault will not be chargeable upon you, by whoſe only means they were inabled to do the prejudice.

As to that advice and reſolve, which was given you by that moſt excellent prelate (whoſe piety and learning makes him deſervedly honoured by all, that have either known or read him) I muſt neceſſarily believe it was founded on a very great miſtake; for in caſe the difference be otherwiſe than it is ſtated in your letter, if that bleſſed martyr *Charles* the firſt did in his life time ſolemnly devote all impropriations unto the church, that ſhould be any way inveſted in him; if his moſt gracious majeſty, that now is, ſhould as an early evidence of his gratitude to God for his miraculous reſtoration, immediately after his acceſs into his kingdom, engage himſelf in the like bounty to this church of *Ireland*; if his majeſty had not only promiſed, but actually granted them under his privy ſignet, before any conceſſion (of what your grant contains) was made unto you (whereof each particular may, as I ſuppoſe, be made ſomewhat conſpicuous) then certainly you will think it worthy ſome farther conſideration, whether you will inſiſt upon that grant, or no.

DEAR Sir, I humbly beg your pardon for this freedom, having no other obligation thereunto, but my faithfulneſs to the truth and to your ſelf. I am now freed from that publick truſt, which was incumbent on me, while I was in *England*, and have not the leaſt pretence to any of thoſe particulars included in your proviſo, which, I preſume, will ſecure me from any miſinterpretation of being leſs than I am obliged to be, or leſs than I profeſs to be,

Dear Sir,

your moſt faithful

and moſt affectionate

humble ſervant,

MICH. CORKE.

Dr. Collins *to Mr.* Robert Boyle.

Colmogoro, 60 werſts from *Archangel*, Sept. 1. 1663.

SIR,

THE noble preſent of your learned book has extremely obliged me. Indeed the defects and difficulties, which I have found in our profeſſion, have ſo much diſheartened me, that I had quite deſerted that deſign, if my narrow eſtate had not neceſſitated me to make uſe of that art to an honeſt ſubſiſtence. Not to inſtance in the grand reproaches of the gout and quartans, and ſome other horrid monſters; I could never find any author, that gives an account of ſome ſorts of ſtinking breaths, nor of the cure. The rectifying of that one diſtemper ſurely were enough to make a man richly famous. Another is, the cure of red faces, in which I have known methodiſts travail a long time, without ſucceſs. To be quit of either, I know ſome perſons would part with the better half of their eſtates. We grope alſo in the cure of *Lues Venerea*, both in that tedious mild way of decoctions, *&c.* and that other ſlovenly, uncertain, dangerous way of ſalivation. I have had ſeveral times unexpected ſucceſs in ten or twelve days by that ſlight preparation of mercurius cum ſulphure. And for giving eaſe to thoſe ſharp nocturnal pains, I have uſed only an infuſion of mercury nitre (in ſpirit of wine) well made almoſt your way, by drying it and a proportion of tinctura opii exhibited at night going to bed, which hath gently ſweated the patient, and in two nights taken away thoſe torments; and finding it ſucceed ſo well, I proceeded to fifteen or twenty nights ſucceſſively, to which I aſcribe moſt of the cure. As to the cure of quartans, methodiſts and others uſe vomits, diaphoreticks, and an ecphractick courſe, chalybiate *&c.* fruſtra, when it is eaſily effected by reſtringents, as tormentile with gentian in electuaries, decoctions, which ſtrengthen the relaxed parts, and given before the fit, with a grain of well prepared mercurius nitre; it vomits not, but is as valid as the pulvis patrum, which I can affirm experimentally. But not to trouble the ſun with a candle, I ſhall only beg your aſſiſtance at your beſt leiſure, *de cauſis & cura fœtoris oris*; I mean not that, which is ſo manifeſt, as in ulcers of the lungs, or crudities, but in one, that ſeems to be every way ſound, *&c.* A nobleman very near the emperor has a red face, who is often upbraided with drunkenneſs, and none will believe but he drinks in private (for publickly he does not) has confeſſed to me, he hath been, and ſtill is, the moſt abſtemious perſon in the world, and has run a courſe with the German doctor now in *Moſcow* for ſix weeks; and after much blood-letting and purging hath been a little paled, but *naturam expellas furca licet &c.* Now to come to what concerns your commands; in theſe cold parts, I can only promiſe my beſt endeavours, when the froſt comes. I fear, I ſhall not have the conveniencies, that I would have, if I am confined to the embaſſador's quarters, which I ſhall be, till I conclude, whether I will engage to ſerve his majeſty, or not; in which I ſhall uſe ſome demur, till I ſee, whether there will be a good concluſion in our embaſſy about the reſtoration of the privileges, and what hopes of peace in theſe parts; for as yet they are embroiled with Pole, Tartar, and Swede.

You may pleaſe to remember, we were at *Lets* talking of their witchcraft, in which the Ruſſe are very ſtudious (eſpecially the nuns) whether imaginary or real, I know not, only what men have confeſſed to me has been acted upon themſelves in viſible wens and bladders ſet upon ſome, on their foreheads; on others ſopra'l cazzo, others diſabled for months and years, and then reſtored, as one of my friends a Ruſs does now acknowledge at *Archangel*,

Archangel, I say, to those I am bound in civility to give credit; nay, they will so disable a woman, as her husband for some time shall find her uncapable. They are nevertheless too credulous as to the business of witchcraft, that they ascribe all unusual accidents to fascination; and if they have any about them, that they suspect (especially old women, who are most obnoxious) they torment them worse than *Hopkins* the witch-finder in *Essex*, till they extort their queries out of the old wretches, to their utter ruin. An instance of which I have newly received from *Moscow*, where the empress's father * lately married to a second wife, not finding himself so vigorous in his amorous engagements as formerly, or rather as he desired (forgetting, that now he is not far from seventy) he conceived, that a former mistress his menial slave (who was shadowed by a husband, to prevent inconveniencies) I say, he suspected she might in reason malign his lady, that came to eclipse her happiness, and so had contrived this suspected fascination, which was attended also with some distempers broken out in his legs, nocturnal lassitudes, and his lady surprised with an angina, all which conspired to rivet their jealousies on both sides, so that she sustained all the exquisite torments of *Russia*, in which also her husband was concerned, and all the old wives thereabouts, that had any deformity, or disposed to look sourly or melancholick. I fear at my arrival in *Moscow* I shall be tormented with the relation, as much as they with the whip, and my opinion must be asked, which will not give satisfaction, if not compliant with their vain fantasies.

* *Elias Danelourdge.*

SINCE I began writing I heard from *Moscow*, that a Tartar, a friend of mine, hath procured me out of *Siberia* the skin of that beast, which affords us the musk out of *Siberia*; the musk is the navel, as they say, but when I have it, I will give you a true account, and the rarity itself. If your leisure permit to write the latter end of December, or beginning of January, pray give your letter to Mr. *Butterfby* at the great Helmet in *Fenchurch-street*, who does provide our medicaments for us, and is a very honest man and able apothecary. My humble salutes to my lady *Warwick*, lord *Rich*'s lady, with my humble petition to your self for this trouble I give you in the reading so much ill writing. *Adio e viva vita d'oro.*

Your humble servant,

SAMUEL COLLINS.

SIR, I beg your pardon once more for this trouble, which may very much tend to my advancement, if you can assist me in the whitening of copper, that may abide the fire and hammer: it is no matter, whether it will the water of separation; for I was desired by a great favourite here to procure such a slight, to get a fictitious counterfeit plate made, which no doubt would be gainful in these parts, or any other; not to design a cheat, but certainly it might be a great saving of silver, which lies dead in noblemens houses. I went thus far by purifying the copper with powder of glass, that it became ponderous and fine, like silver; for the glass served to wash her ladyship's foul smock, which was taken off as oft as it became black with its fusion together; now when we came to the blanching, either we knew not the proportion of arsenic, or the preparation, for it was either white enough and brittle, or yellowish and not brittle. I desire your advice about fixing of arsenic a ready cheap way. One *Smart*, that dwells in *Dorchester-house*, a drudging operator, made me pay ten pence for an ounce, but it was well fixed, and may be given inwardly, in a dose of three, four, or five grains, and decocted loses no weight, but imparts a balsamick virtue. Now I talk of balsams, methinks some better use might be made of the film or husk, that covers the shell of pistachios: it hath an excellent balsamical odor, and is clammy, and a handful being close griped, leaves many resplendent crystal parcels in plicis palmæ; this I made trial upon the way, they were very new. I intend to try it for a vulnerary. There are some things used by the Russes experimentally, which I shall impart; they come out of *Siberia*; by which way they bring radix Chinæ teuh, or chayè anisum Indicum stellatum, which the Persians here drink with their teuh, and is scented just like our anisum, but methinks more grateful and very oleaginous. Here is a certain wooden ware, which the Russe call capua, the Dutch Mazer, the gummy droppings from birch, which, as they say, lies many years consolidating in the ground, of which they make cups, very thin, light, and almost transparent; being put into warm water will turn inside out, like leather, and are sold the weight of silver for wood, and according to their largeness, the larger the dearer, twice, thrice, or more the weight of silver. I bought three at *Archangel*, with intent to send them to you, but I find by one skilful in that trade, that I was deceived, and they were counterfeits, with the feet cunningly set on and glewed, and patched up in several places with varnish; so I was discouraged from sending them, but shall procure some at a place called *Totma*, on the river above *Ustiga*, where they have mineral salt waters. Sir, if I stay here, pray assist me with some rarities in our art. I shall be remote enough to do no man injury by the use of them. What I shall find worthy of a person of your learning and experience, I shall contribute, as an humble acknowledgment of your civilities.

I HAVE forgotten to mind your opinion about the Irish slate, which abounding with so much salt, I suppose may serve to many uses in physick, besides the vulgar, *viz.* contusions, which how it poisons, I know not, but it is much used for that purpose in the West of *England*; and I have given it with ecphracticks, and I think it hath done well.

WHEREAS you hint in your book about a farther enquiry and use of the pulvis patrum, I did, upon my own fantasy, give a dose of it to

to *Knez Peter Broforoffky*, the Ruffe embaffador, when he was very fick of a very violent fever, and thought in himfelf he fhould die; it gave him fudden relief the third day, and we expected no other crifis; I fuppofe it may do good in the gout, ftrengthening the parts, and ftopping the fermentation.

IF I had time, I would give you an account of their dreffing their hides here; the odd fmell, which Ruffia leather has, it takes from the deogat, which is a kind of tar made of the roots of birch, and ferves for many ufes, *&c.*

THAT operator *Smart* at *Dorchefter-houfe* fold me a ftinking fulphurous balfam, that I have ufed with miraculous fuccefs in fore eyes. I forget what he calls it; Mr. *Butterfby* can help you to it. He makes fulphur martis. If you know the making of fulphur martis, pray impart it.

Vologda, Nov. 20, 1663.

Honourable Sir,

I CANNOT get a larger room than this in my lord embaffador's packet, which may befpeak my endeavours. The winter has hitherto been fo mild, that I have not yet given myfelf any fatfsfaction concerning thofe experiments of cold. I do not well underftand the way of fome things in your note of enquiry, being but hinted in fhort; however I fhall do my beft to obferve as much variety as I can of freezing, and the divers effects of cold, which may be done here (where we are) better than in *Mofcow*, being more northward. We are frighted with the alarms of the Poles, Coffacks, and Tartars, who are faid to be between *Smolenfko* and *Wafma*, twice ninety werfts from *Mofcow*, all which hath happened by the confidence of the Ruffe of a ceffation, being tired with a long tedious war, and willing to difband their army, to fave charges, had no ftanding army to refift the invafion of a great army of horfe under general *Sapega* and general *Pattz*; the king in the mean time with a royal army attending the motion of the imperial forces about *Bealogorod*. What the iffue will be, God knows, for certainly the Ruffe have been cruel to the borders, while they were conquerors, and divers fatal figns have forwarned the Ruffe to make an honourable peace, when they might have done it in the time of the wars between the Pole and Swede, *fed quos Deus vult perdere, &c.* To omit many, which I have formerly noted in my Adverfaria, with a fhort account of thefe parts, which I fhould offer to your view, if I thought it worthy; there was laft December, about the beginning, a dreadful blazing ftar feen here by many, and at the fame time an earthquake (hardly ever known in thefe parts) with which fome people were caft down to the earth, and one woman ftricken blind, deaf and dumb for fome days, and recovering her fenfes and fpeech, foretold a vifion, which the hearers ftopped their ears at, or tongues, at leaft, as being of too dangerous confequence to be revealed. All which things amaze the graver fort of people, and want only the event to make them either authentick or fabulous. I forgot to tell you what was obferved concerning the general *Knez Jocov' Coodanickowich Chircafkoy*, who twenty days fince marching forth to ftop the enemy's incurfion, the *Mofcow* bridge broke under the cannon; and attempting another bridge, that broke alfo. It is very like the timbers were difproportionate to the weight of the cannon. *Sed Deus det pacem in diebus noftris.*

I EXPECT fome letters from a friend in *Siberia*, to whom I wrote two years fince, defiring an account of the animal, that yields the mufk, and a fkin of that beaft; which, and what rarities elfe I obtain, fhall fend or bring to you. My fervice to lord and lady *Warwick* and your felf, and lady *Anne Berkley*. *Adio e viva vita d'oro.*

Your moft humble fervant,
S. COLLINS.

Mr. Cooke *to Mr.* Robert Boyle.

Aug. 13, 1664.

SIR,

I AM unknown to your honour, but not unknowing of your excellencies and the renown you have juftly thereby gained amongft all the literati and ingenious. I know your parts and endowments are far above the talent of other perfons, and yet no lefs inferior to your charity: the firft gets you the admiration of the intelligent, and the latter the importunity of the indigent. I confefs, I would willingly afpire to the nobler qualification, but having greater need to be a beggar, than pretence to be an admirer, I make bold to implore your favour on the behalf of a poor child of mine, whom I vehemently fufpect of the infirmity we call the king's evil. I have, Sir, in reading your incomparable books met with the mention of a namelefs, and (as you are pleafed to fay) defpicable herb, endued with a fpecifick quality for the cure of that difeafe. The difcovery of that fimple I prefume not to afk, though fecrecy be part of my profeffion, and I fhould in this cafe readily confirm it with the double bond of oath and honour; but help for my child being the end of my defires in this particular, I only beg the ufe of that herb difguifed or prefented as you fhall think fit and direct: and however it may continue a fecret to me, yet I fhall not forbear to publifh the fame of my benefactor to all the world; and amongft other high advantages, which I may receive, reckon this for none of the leaft, that this addrefs gives me the honour and opportunity of profeffing myfelf,

SIR,
your honour's moft humble,
and moft obedient fervant,
JO. COOKE.

YOUR

YOUR honour's commands will find me at Mr. ſecretary *Morice*'s office in *Whitehall.*

Mr. Endicott *to Mr.* Robert Boyle.

From *Boſton* in *New England*, Nov. 9, 1665.

Honourable Sir,

THE occaſion of our giving you the trouble, is from the confidence we have of your favour and care of theſe his majeſty's colonies in *New England*, manifeſted by your continual endeavours, as in promoting that good work of the native's converſion, ſo in taking opportunities for ingratiating us with his majeſty and the right honourable the lord chancellor, as we underſtand by your letter to Mr. *Winthrop*, whereby you have given us that comfortable information of his majeſty's grace towards us, expreſſing himſelf in a very favourable manner; and that the lord chancellor did aſſure you (with giving you commiſſion to aſſure our friends in the city) that the king intends not any injury to our charter, or the diſſolution of our civil government, or the infringement of our liberty of conſcience; and that the doing of thoſe things is none of the buſineſs of the commiſſioners; the truth of which we believe as we ought, having the word of ſo gracious a king.

BUT alas, Sir, the commiſſion impowering thoſe commiſſioners to hear and determine all caſes, whether military, criminal, or civil, what they have further by inſtruction at preſent we know not; ſhould this take place, what would become of our civil government, which hath been under God the hedge to that liberty for our conſciences; for which the firſt adventurers paſſed through and bore up againſt all difficulties and diſcouragements, that encountered them, as in the way to, ſo in their continuance in this wilderneſs?

SIR, we return unto you our true and hearty thanks for your former favours, and crave the continuance thereof as opportunity ſhall offer, and the great mover of hearts ſhall incline you in appearing our friend ſtill, that, if poſſible, the commiſſion may be recalled, for which end we have made our humble ſupplication to his majeſty, in whoſe eyes may we find favour, we and our poſterity ſhall have cauſe to bleſs the Lord; but if the decree be paſt, ſo that it may not be recalled, we ſhall wait the Lord's iſſue with us; and whatever may be the conjectures of any rendring alterations here adviſable, the iſſue will ſpeak them to be the ſubverſion of all that, which makes this place or our abode therein deſirable, or if the envy of thoſe, that deſire a dominion over us (not to ſerve his majeſty's intereſt in advancing plantation work with the continuance of godlineſs, but to ſerve themſelves by his majeſty's authority and our ruin) ſhall prevail, it will to poſterity be rendered a diſſervice to his majeſty's honour, and ſuch a damage, as the procurers will not be able to repair. We can ſooner leave our place, and all our pleaſant outward enjoyments, than leave that, which was the firſt ground of wandering from our native country; nor are we thereby made ſuch ſtrangers thereto, but we can rather chooſe to return, and take our lot with our brethren, than abide here under the deprivement of the end of our travels; our way is with the Lord. Craving your honour's pardon for this boldneſs, lifting up our beſt deſires to the Lord for you, we remain,

SIR,

Your humble ſervant,

JO. ENDECOTT, governor, in the name and with the conſent of the general court.

Mr. Nath. Foxcroft *to Mr.* Ro. Boyle.

From my father's at *Finſbury Court-houſe*, over-againſt the *New-Artillery* near *Moorfields*, Nov. 29, 1664.

Moſt honoured Sir,

PURSUANT to your commands, and in compliance with my own ambitions to ſerve (though this inſtance be but a very ſmall hint of my promiſed future endeavours) ſo obliging and excellent a perſon as yourſelf, I have ventured the preſumption of this, whereby to let you underſtand the ſucceſs of an enquiry you were pleaſed to engage me to concerning a carbuncle; ſo ſtiled by an acquaintance of mine, in whoſe hands it was depoſited, untill the determination of a ſuit at law about it; though his deſcription, I believe, will incline you rather to conclude it a diamond, being of the ſame colour, or water therewith, of a tablet cut, and better than half an inch ſquare. That part of the relation I made of it to you was true, that it being laid on the ground in a dark night (without the circumſtances of rubbing, which you have obſerved neceſſary to ſome) would appear very luſtrous at the diſtance of about threeſcore paces, not imputable to the reflection of ſome lights or ſtars ſhining thereon; ſince it would do the ſame alſo in a dark room, where ſuch cauſes were not admitted. I made a diligent ſearch after it, that, if poſſible, I might have given you the entertainment to have viewed it yourſelf; but found its worth was ſo extraordinary, that it exceeded the purchaſe of a private purſe: wherefore it was tranſported, and at laſt ſold to the Infanta of *Spain*, in whoſe poſſeſſion it now remains.

THERE is another part of your injunctions, which I hope will prove an argument to plead my pardon for this boldneſs, which you will readily remember, when you ſhall underſtand, that within theſe ten days I am deſigned for Fort *St. George* in the *Eaſt-Indies*; not a little glad of the occaſion, if in any thing I may

may be inſtructed to be tributary to learning, in being ſerviceable to ſo great a maſter thereof as you, whoſe directions I ſhall with much obſequious diligence make it my buſineſs to obſerve; and where my unaccompliſhments render me defective, I beg you to impute it to my incapacities, and not want of will or affection to be otherwiſe.

AND, Sir, though I muſt confeſs myſelf a very bad and unconfident beggar, yet (encouraged by your offer, and my own hopes to make ſome not unacceptable eſſays therewith) I now preſume to requeſt the favour of ſome fluxing powders, with directions from firſt to laſt how to uſe them. My non-experience deſires you will be a little particular on a ground-work, whereon my deſigns flatter me with a promiſe of no contemptible ſuperſtructures or ungrateful conſequences. The command of any, which attainment (if meriting your diverſions) I will promiſe ſhall never be out of your reach, ſince it was you firſt fired me unto ſuch attempts. And as a farther endearment of this favour, be pleaſed to add, by what ſigns you would diſtinguiſh thoſe earths, which encourage to ſuch experiments, and are moſt probable to afford ſuch metals, as may not be unworthy the like ſearches: for, if I miſtake not, you only hint in ſome of your writings to have found in certain earths (not particularly deſcribing any) no inconſiderable quantities of gold, and go no farther.

BUT I fear I have tranſgreſſed too much againſt what a ſtranger modeſtly ought to allow him in his firſt deſires, which ſhould be ſparing: if mine exceed thoſe limits, I requeſt you to believe them not occaſioned by the impudence of the beggar, but rather from the conſideration of the largeneſs and bounty of your mind, which has every where given abundant teſtimonies of your contentments to oblige all ingenuous to an inquiſitiveneſs into nature's myſteries, which is my deſign. In the proſecution of which if I ever attain unto any thing worthy, I muſt acknowledge the reading of you begot thoſe aſpirings; whilſt I confeſs myſelf therefore ever obliged

Your in all humble returns
of thanks and ſervice,
NATH. FOXCROFT.

MY mother returns her gratitude in all humble acknowledgments of thanks for the medicine you preſented her at *Oxon*; and deſires you will ſignify, whether it was ſpirit of hart's-horn or not, as likewiſe when you deſign to be in *London*.

Mr. Ra. Auſten *to Mr.* Robert Boyle.

Oxon, Jan. 14, 1664.

Honoured Sir,

I SHALL at this time make bold to acquaint you with my purpoſe, in reference to a buſineſs of ſome concernment, much deſiring your favour, counſel, and directions therein: and where you perceive I have preſumed too much with you, that therein I may receive a friendly rebuke, together with your pardon. I was lately diſcourſing with a ſtationer (newly ſet up here in *Oxford*) who diſcovered to me his deſire to have another impreſſion of my treatiſe of fruit trees; for that this ſecond impreſſion is even ſold off. I told him, that I would conſider of it, and give him a further anſwer. The truth is, I have ſeveral additions to make unto it, intending (God willing) to communicate them in due time: it may be, it is now not unſeaſonable.

AND in order thereunto I have made bold to compoſe a brief epiſtle dedicatory unto your worthy ſelf, humbly craving your leave ſo to do: a copy whereof I thought it meet to incloſe herein, that you might ſee my deſign, and that I might obtain your advice upon the whole matter. I now intend only the firſt part, that is, the natural part, about the propagation and ordering of divers kinds of foreſt trees, with fruit trees, and fruit.

As for the ſpiritual part (the ſimilitudes between natural and ſpiritual fruit trees) I conceive it beſt upon ſome accounts, to let it reſt (at preſent) both what hath been made publick formerly, and what I have prepared to add thereunto: and (worthy Sir) by your countenancing of the work, it will be more profitable to myſelf, and more acceptable to others. Your name and worthineſs is had in high eſteem among men, who know you, or have heard of you; God having (viſibly) ſtamped his image upon you, in knowledge, wiſdom, and holineſs; it commands reverence and reſpect, where it appears, eſpecially when we conſider, what the apoſtle ſaith, that not many wiſe men after the fleſh, not many noble are called. Thoſe therefore among them, that are called, are as precious jewels and pearls among pebbles; or as the lily among thorns; ſuch being doubly noble, not only by a natural birth, but alſo (and infinitely more) by a ſpiritual birth; a birth from above, born of God, without which a man had better never to have been born.

SIR, theſe things I ſpeak in ſincerity and truth.

I SHALL not further trouble you at preſent, more than to deſire (at your next opportunity) a few words of counſel, and advice from you (much honoured Sir) unto

Your unworthy ſervant,
RA. AUSTEN.

The biſhop of Limerick *to Mr.* R. Boyle.

Farnham-Caſtle, Dec. 3, 1665.

Honoured and dear Sir,

THOUGH I cannot give you a church preferment, I do give you a church employment. For I dare venture on your goedneſs,

goodneſs, and flatter myſelf, that you will not be diſpleaſed for my ſo doing.

THIS act, which you receive with this letter, I ſhewed to my lord chancellor at *Saliſbury*, for his approbation; but he liked it not as to the form and drawing up: yet withal adviſed me, that it ſhould not be preſented to the council, until the form thereof were altered, in a new bill from *Dublin*. And that the archbiſhop of *Dublin* might know how it might be amended; his lordſhip was pleaſed to ſay, that he would give by the next poſt the reaſons of his diſlike to my lord lieutenant, which reaſons are not yet come to his grace.

THE favour I beg of you is this, that after my humbleſt ſervice is preſented to my good lord chancellor, you will deſire of his lordſhip to impart to you the faults of that bill, that it may be amended in the next.

I GIVE you, Sir, this trouble, the rather becauſe I know you have a fair reception from his lordſhip, and will therefore obtain this favour the eaſier.

WHAT anſwer you receive from his lordſhip, if you pleaſe to ſend to Mr. *Wyat*, vice-principal of St. *Mary-hall*, you will further oblige,

Your moſt affectionate,

and real ſervant,

GUIL. LIMERIC.

MY lord of *Wincheſter* remembers him very kindly to you.

Dr. Edm. King *to Mr.* Robert Boyle.

London, from *Boſwell Court*, Nov. 25, 1667.

Honoured Sir,

PERHAPS at firſt ſight you will wonder at my confidence in preſuming to preſent you with a letter; but if you pleaſe to conſider my great obligations to love and honour you, I hope I need make no apology for it, unleſs for want of language to expreſs your worth, and my deep ſenſe of it: for in earneſt, Sir, I find by experience, that great thoughts are of difficult birth, and I do bluſh at the defects of my expreſſive faculty; yet I will encourage myſelf with this, that the account of the following experiments will (for this time) purchaſe my pardon for giving you the trouble of it. Dr. *Lower* procured a man about thirty two years of age, willing to receive ſome ſheep's blood (they call him Dr. *Cogie*, he ſpeaks Latin well, when he is in that company he likes) his brain is ſometimes a little too warm. On Saturday morning laſt at eleven at *Arundel* houſe we met, and having prepared the carotid of ſheep, I opened a vein in the doctor's arm at once, as expreſſed in the laſt Tranſactions but one; and uſed juſt that method, without any alteration (only one pipe more convenient) after we had taken away about ℥vii. of the doctor's blood, we infuſed (as near as we could gueſs) about x. or ℥xi. of the ſheep's blood, with very little trouble to him, three quills length beſide the pipe; yet when we took it out, after near two minutes, it ran as freſh as at firſt, which was an infallible ſign; it did not ſtop, but beſides we felt a pulſe in the arm; when we had done, we bound up the arm as after blood-letting, and he well and merry, and drank a glaſs or two of Canary, and took a pipe of tobacco in the preſence of forty or more perſons; ſo went home, and continued well all day, having three or four ſtools as he did uſe to have; his pulſe ſtronger and fuller than before; and he very ſober and quiet, more than before, as the people in the houſe tell us that think he was only let blood; in the night he ſlept well, but ſweat two or three hours, and next day was very well, and ſo remains, and is very willing to have it repeated (we gave him a guinea for his willingneſs) for his arm, he ſays, is well. This is a general account of it; I did intend to be more particular, but am forced to break off abruptly, for which I moſt humbly intreat your pardon, which will farther oblige,

Honoured Sir,

your moſt obedient, faithful,

and affectionate ſervant,

EDM. KING.

ONE aſked him, why he had not ſome other creature's blood, he told them, that *ſanguis ovis ſymbolicam quamdam facultatem habet cum ſanguine Chriſti; quia Chriſtus eſt agnus Dei.* You would have ſmiled, if you had heard him.

Mr. Anthony Smith *to Mr.* Ro. Boyle.

Exon, Feb. 28, 1667.

Truly honoured Sir,

THE unqueſtionable aſſurance you have given the world, that it is your work to glorify your Maker, and manifeſt true love to mankind in your indefatigable pains, vaſt expence, and benevolent mind, ſo freely to communicate what your unparallel induſtry by ſearch, your judicious obſervation by trial, and your capacious mind by improvement, have found beneficial to mankind: theſe with the advantages I have had by your eſſays, and other writings (which you ought to have the comfort of) and my preſent neceſſity, have levelled all the mountains, that were in my way to you. Worthy Sir, this is the caſe. Here is a gentlewoman of *Woodbury*, ſix miles diſtant, who hath laboured with a cancer in her right breaſt theſe eight or nine years, in the uſe of variety of means to ſmall purpoſe, at length nature ſeemed to make a ſeparation between the cancerated and ſound breaſt,

breast, such as you often see where a caustick hath been applied, the eschar divides between the living and the dead; this was taken off by a certain empirick in *Somersetshire*, but a few months after it riseth again with renewed strength, and then the whole breast was taken off by my hand, with some portion of the musculus pectoralis, upon which it is placed; the most suspicious places cauterised with actual and potential cauteries. Upon this she continues well some years, brings forth a child, nursed it with the other breast, weans her child, has the benefit of nature monthly, conceives again, brings forth a second birth, sends this babe to nurse abroad; after a year or two the old cicatrix begins to heave up with a hard compact body, like the kidney of an ox, which made haste to shew itself, and began to heave up the cutis (which did adhere fast to the ribs before) and though loose under, yet began to pain. Address being made to me, I opened the part, and took it out, which was in a few months grown as big as any ordinary fist: this also was well in a short time, and so continued for two years and upward: but about last Whitsuntide she felt a little pain, and found a small collection very hard and deep in, as if it lay between the ribs in the intercostal muscles; this we observed, and often stirred to keep it from fixing, which was hard to do. At length it became very painful, and grew like a fungus, and spread every way up under the armpit to a vast magnitude; so that we were forced Saturday the 15th instant, in the presence of Dr. *Thruston*, to take it off, which is the fourth time she hath felt this dreadful operation. I have applied oleum vitriolum to the roots; the eschars are deep, for I began them with lixivium saponis, and touch them over with caustick oils every day. Now honoured Sir, having read in your Essays, Part II. pag. 112. that you have a friend, that hath some arcanum in the case, give me leave to beg your help. I have heard, that you have some rare elective vomit, that frees the body from this noxious humour: such things you have helped me to believe there are, by what I have experimented in your Essays, and did I not fear I should be denied all by asking too much at once, I would pray for some light into your ens Veneris, but I forbear, hoping to live to see you once more. Let me beg leave to tell you what must needs delight you. I have had the greatest and most undeniable success with the use of your paronychia rutæ foliis, (I suppose) that ever you saw, upon a person of some quality, who had a very great tumour in the pharynx, filling up all that capacity under the tonsillæ from side to side, even externally to the parotydes hindring speech, breath, and swallowing too; which to admiration, to my great comfort, and profit, are all vanished; and although they were some years collecting, they came to suppuration like a common natural phlegmon, and wanted little more than dry lint to heal them. But I suppose the gentlewoman used more than a bushel of that small plant, for I made syrup of it to use in the latter part of the summer and winter when the plant cannot be had; and I am confident those, that fail of a cure, it is because they are weary of the medicine, before the mass of blood hath received any considerable alteration from it. I could say a great deal of this and your res. jalapii, pil. lunares, &c. But I am too bold, I beseech you excuse me. I shall beg the bearer to receive a line or two from you; for our eyes are upon you, under God, for some relief in this great case; mean while rest,

SIR,

your real servant (were I able)

ANTHONY SMITH.

Dr. Sydenham *to Mr.* Robert Boyle.

Pall-Mall, April 2, 1668.

SIR,

IT had becomed me to have begged your acceptance, when I took the boldness to tender to you the second edition of my book; but partly business, and partly an unwillingness in me to give you two troubles at once, diverted me from writing. But now that you are pleased to give yourself the pains of a thanks, which I never thought my self capable of deserving from you, I hold myself obliged to return you my humble thanks, that you take in good part my weak endeavours, and are pleased to have a concern (as you always have done) for me. I perceive my friend, Mr. *Locke*, hath troubled you with an account of my practice, as he hath done himself in visiting with me very many of my variolous patients especially. It is a disease, wherein as I have been more exercised this year than ever I thought I could have been, so I have discovered more of its days than ever I thought I should have done. It would be too large for a letter, to give you an account of its history; only in general I find no cause, from my best observation, to repent of any thing said by me in my tract *De Variolis*, but do greatly, that I did not say, that, considering the practices, that obtain, both amongst learned and ignorant physicians, it had been happy for mankind, that either the art of physick had never been exercised, or the notion of malignity never stumbled upon. As it is palpable to all the world, how fatal that disease proves to many of all ages, so it is most clear to me, from all the observations that I can possibly make, that if no mischief be done, either by physician or nurse, it is the most slight and safe of all other diseases. If it shall be your hap to be seized of that disease (as probably you never may) I should recommend to you, upon the word of a friend, the practice mentioned in the 155th page of my book. I confess, some accidents there are incident

incident to that diſeaſe, which I never was able to maſter, till towards the end of the laſt ſummer, and which therefore could not be mentioned by me, as a phrenitis coming on the eighth day, where the patient is in the vigour of his youth, hath not been blooded, and hath been kept in a doſe from his firſt decumbiture; as likewiſe (which is wont to be no leſs fatal) a great doſing, accompanied with a choaking reſpiration, coming on from the tenth day (reckoning from the rigour and horror, which is my way of accounting) and occaſioned by the matter of a ptyaliſm in a flux-pox, baking and growing thick, as it declines and comes to a concoction in thoſe days. But, which is obſervable, the ſmall-pox never fluxes or runs together, but it hath been thruſt out before the fourth day; and where you ſee any eruption the firſt, ſecond, or third day from the decumbiture, you may ſafely pronounce, it will be a flux-pox, or a meaſle, for that ſort in its firſt appearance is like it; and, which is likewiſe obſervable, in the higheſt flux of all, as that which comes out the firſt or ſecond day, it is in vain to endeavour the raiſing them to an height, for it is both impoſſible and unſafe to attempt, but all the diſcharge, that can be, muſt be either from a ptyaliſm, in a grown perſon, or a diarrhœa, in an infant, to whom the ſame is no more dangerous than the other to the former. And wherever they flux, their diſcharge muſt be made one of thoſe two ways. But of theſe things I ſhall diſcourſe to you more at large, when I ſhall have the happineſs to ſee you, which I hope may be ſuddenly. The town ſtands well in health, and at our end not any body ſick, that I hear, of the ſmall-pox. I have much buſineſs about other things, and more than I can do, who yet am not idle. I have the happineſs of curing my patients, at leaſt of having it ſaid concerning me, that few miſcarry under me; but cannot brag of my correſpondency with ſome other of my faculty, who, notwithſtanding my profoundneſs in palmiſtry and chemiſtry, impeach me of great inſufficiency, as I ſhall likewiſe do my taylor, when he makes my doublet like a hop-ſack, and not before, let him adhere to what hypotheſis he will. Though yet in taking fire at my attempts to reduce practice to a greater eaſineſs and plainneſs, and in the mean time letting the mountebank at *Charing-Croſs* paſs unrailed at, they contradict themſelves, and would make the world believe I may prove more conſiderable than they would have me. But to let theſe men alone to their books, I have again taken breath, and am purſuing my deſign of ſpecificks, which, if but a deluſion, ſo cloſely haunts me, that I could not but indulge the ſpending of a little money and time at it once more. I have made a great progreſs in the thing, and have reaſon to hope not to be diſappointed. My occaſions will not ſuffer me to give you more trouble, and therefore be pleaſed to accept of the tender of thoſe very unfeigned thanks, which I here make you, for all the ſingular kindneſſes and favours whereby you have obliged me to be very uncomplimentally,

SIR,

Your moſt humble ſervant,

T. SYDENHAM.

G. Agricola *to Mr.* Robert Boyle.

Tonningen, April 6, 1668.

Noble Sir,

I PRAY you excuſe my boldneſs, for troubling you with this letter, but I hope your civility will pardon my fault. It is almoſt ten years ago, ſince I went out of *England*, and as I dwelt with Mr. *Frederick Clodius*, I had the happineſs and honour to ſee your nobleneſs, and to wait upon you in our laboratory, and afterwards coming into *Holſatiam*, I have ſeveral times, very honourably, remembered your great ſkill in philoſophia experimentali to our learned doctors and noblemen; but as I got one of your books, *viz. Chemiſta Septicus*, I performed that ſame, which I had ſpoken of you, and every one learned man deſireth to read your learned books, and wiſheth, that the Lord in heaven may ſave you long to ſerve *in publicum bonum*. Some of your writings we have got more, *viz. Experimenta Phyſico-Mechanica, et defenſionem contra Linum; tractatum de Coloribus: Tentamina quædam Phyſiologica; Hiſtoriam fluiditatis et firmitatis*; Some Conſideration touching the Uſefulneſs of Experimental Natural Phlioſophy; and daily we read in the *Journal des Scavans* of your great experiments; ſo that your nobleneſs cauſeth, that the lord *Jean Samuel Heiſterman de Vilberg* (which being by our highneſs the duke of *Holſtein*, his ſecret counſellor and of ſtate, and præfectus provinciarum, *Eideroſtadæ*, *Everſhap*, and *Utholm*, a very noble man, and a great ſcholar, loving phyſick, chemiſtry, and many other gallant experiences) did deſire of me to take the boldneſs to write to you, and to remember his duty to you, though yet unknown to you, and to tell you a ſtrange accident, as followeth.

ONE of his greyhounds being tormented ſuddenly three days together with great pains in his guts with vomiting, he died the third day of this month *April*, and this nobleman deſired of the hangman's ſervant, that he might open this dog in a ſtable of the court at *Tonningen*, where this dog did die, and there were preſent by this opening, 1. myſelf. 2. our *Secretarius Provincialis frater germanus domini Heiſtermanni*. 3. his ſteward. 4. his hunting-man. and 5. his coachman. But *conſiliarius Heiſterman* was called for *Gottorp* to the duke. And all the internal parts of this dog's body were found very wholeſom, and every part was cut in pieces with a knife, and there was no where yet, neither in the brain, found any

cause of his great torments and suddenly, except *in vesicula fellis, quæ totaliter bile erat repleta, et valde transparens, in medio autem vesiciæ transparebat corpus quoddam candidum; itaque jussi incidere vesicam fellis, et ecce prodibat frustulum de testa ostreæ recens adhuc, ac interne splendens more solito; magnitudo ejus parum excedebat nummum Anglicanum* a six-pence, *eratque in margine valde acutum.* Now I remember, that doctor *Needham* writeth (in his book called *Disquisitio Anatomica de formato fœtus*, and which he hath dedicated unto you) *contra Bilsium, quod nullus chylus deferatur per venas meseraicas vulgares et lacteas ad hepar; et hic quæritur, per quas vias transiverit frustulum de testa ostreæ ad vesicam fellis. D. Van Hoorne professor in academia Lugdunensi scribit quidem in suo prodromo observationum de partibus generationis hæc verba; Coronidis loco hoc addam, oculari demonstratione me exhibere posse ingressum chyli in venas meseraicas vulgares. Hactenus Van Hoorne: quod si hoc verum esset, tum statica daretur via per ramum venæ portæ ad hepar, et sic ad vesicam fellis, quamvis nulla tam ampla vasa in mesenterio reperiantur; sed hæc, nobilissime domine, tuo judicio et acutissimo ingenio subjicimus.* Moreover desireth the lord *Heisterman*, if your nobleness would be pleased to send an answer upon this question, and he wisheth to be so happy, and to be hence acquainted with you by letters: lastly he desireth (because he did read it in the *Journal des Sçavans*, that in *England* should be very good magnifying glasses or microscopia) and beggeth, if possible, to have the honour of your nobleness, and to be instructed of you, where the best magnifying glasses are to be got in *London*, and so soon as I get an answer of you, where such microscopia are to be sold, and what they cost, then Dom. Præfectus will give presently order to a certain merchant in *London*, which shall buy one or two for him. But, Sir, I beseech you not to take it unkindly, that we are troublesom to you; and if we can do you any favour or service in our countries, we shall be not only willing, but always expedient to serve you. No more for this time, but that the Lord in heaven may bless you for ever.

SIR,

Your most humble servant,

Johannes Christianus Agricola,

med. doct. et poliater Tonningensis.

POSTSCRIPT.

I PRAY you, Sir, not to take it evil, that I do write to you in English, though it be not written according to the rules of your English masters; but the reason is, I would not forget my English; and if I shall have the honour to expect an answer of you, I pray you would be pleased to add where you dwell now at this present time in *London*. *Vale.*

Mr. Thomas Coxe *to Mr.* Robert Boyle.

Rome, May 2, 1670. N. S.

Honoured Sir,

IN that application I ventured to make to you from *Venice*, I had not the vanity to pretend, that so small an expression of my duty should receive so noble a reward, as that of your letter by this last post: but since you are pleased so favourably, and with so great condescension to encourage my zeal to your service and patronage; I cannot be so unconcerned to my own advantage, as not to make much of your present favours, and wish the continuation of them for the future.

I HUMBLY thank you for the honour you have done me, of communicating to me his majesty's curiosity to see and know some of your own experiments, performed in his presence by your own hand; and that the king is like to be so great a patron of the virtuosi, as to bring their concerns into his house, and to list them of his family. I pray God Almighty confirm his majesty in these generous resolutions, of encouraging the young nobility of the nation to virtue, true gallantry of mind, and all excellent knowledge, by the powerful motive of his royal example.

WE have been for some months in great expectation of what the conclave would produce, which hath been shut up ever since December 20, N. S. 1669, and were in great danger either of leaving *Rome* without a pope, or of being forced to expect the creation of one all this summer, to the hazard of our health, and disappointment of our future designs in other parts; the two great opposite factions of *France* and *Spain*, and the third of the squadrone volante (unable either to balance or reconcile the former) remaining so stiff and unalterable in their different parties, as gave us little hopes of any timely agreement.

BUT on Tuesday last, April 29, N. S. we were most unexpectedly surprised at dinner, with the news of the election of cardinal *Altieri*, a *Roman*, who was the very first person proposed after the entry into the conclave. About five in the afternoon the same day, he was proclaimed to the people, by the name of *Clemens* X. and presently after received the keys and adoration of the cardinals in St. *Peter*'s. He is a man of eighty one years of age, of the last pope's promotion to the cap, and was some time his M^r^o. di Camera: His election passed with the votes of all the cardinals but one, as a convenient person, because of his age, and indifferency to all factions, to depositе the popedom with, for some little time.

HE hath no nephew, but has resolved upon monsieur *Pallutti* (his near relation) for cardinal patron, upon monsieur *Carpegno* for secretary; but is yet uncertain in the choice of his M^r^o. di Camera, and Datario. It is hoped we may

may ſee his coronation on Sunday next, and the grand cavalcade on that day ſevennight.

FATHER *Kercher*, the marcheſe *d'Olivala Maleſpina*, ſignior *Carlo Mancini*, and other virtuoſi in this city, do me the honour to ſpeak to me often of your name, and of your excellent treatiſes and experiments. I humbly pray the favour of you to give order, that ſome of thoſe you have lately ſhewn the king, be communicated to me, that I may do myſelf the credit with theſe gentlemen of giving them the account and relation of them. I have no other requeſt to add, but to beg the tender of my moſt humble duty and ſervice to my lady *Ranelagh*, and the young ladies; with my acknowledgments for this noble favour conferred upon,

Honoured Sir,

Your moſt humble,

and moſt obedient ſervant,

THOMAS COXE.

Honoured Sir,

As I am putting up this letter, I hear, that this parola (or morning-audience) the pope hath declared monſieur *Borromeo* (at preſent nuncio in *Spain*) his ſecretary of ſtate; monſieur *Maſſimi* his M^ro^. di Camera; and monſieur *Carpegno* his pro-datario.

Mr. Leonard Hoar *to Mr.* Robert Boyle.

Cambridge, New-England, December the 13th, 1672.

Right honourable,

YOUR freedom and courteous treating me, when hither coming, giveth me the hardineſs to preſent you with my acknowledgments, although it be but your interpellation; judging it better, that I were cenſured for troubleſomneſs, than for ingratitude. Yea the chiefeſt of this colony, a poor, but yet pious and induſtrious people, know and acknowledge your kindneſs often and on conſiderable occaſions expreſſed towards them, in their juſt defences, *&c.* although they know not where or how to publiſh their tabula votiva, or memorials of it unto your acceptation, but ſtill do gratefully recommend you and your well-devoted labours in their prayers to God; and any publick affair them concerning, that ſhall unexpectedly emerge unto your prudence, love and candor, hoping, that nothing ſhall ever be believed or concluded againſt them before that they be heard.

NOBLE Sir, I am not unmindful of your deſires to ſee what rarities the country might yield; and have taken courſe, that now be preſented to you, firſt, a ſort of berries, that grow cloſely conglomerated unto the ſtalk of a ſhrub, in its leaf, ſmell and taſte, like the broadeſt leaved myrtle, or to a dwarf-bay; which, by plain diſtillation, yields an almoſt unctuous matter; and by decoction, not a reſina, nor oil, but a kind of ſerum, ſuch as I have not known ordinarily for any vegetables. I believe it excels for the wind-colick.

THOUGH I thought myſelf an indifferent botaniſt for any thing could grow in *England*, yet here in our wild plants I am preſently [at a loſs] but I hope I ſhall in ſeaſon ſearch out their pedigrees; and would be free to gratify any perſon valuing them with their ſeeds, or bodies dried. Mr. *Alexander Balaam*, my maſter in thoſe ſtudies, and a perſon well known to Mr. *Charles Howard* and Dr. *Morriſon*, are now in your land.

ALSO (pardon, I beſeech you, the confidence) I make bold to preſent your honour with a model of our natives ſhips. With one of them twenty foot long they will carry ſix or eight perſons, their houſe and furniture and proviſions, by one padling her forwards in the ſtern, ſwifter than any ſculler. And when they come to falls, or would go over the land, [the paſſengers] load themſelves away with the ſhip and her freight too.

I DOUBT they are not for the wars; for if you but ſtamp hard, you may ſtrike out the bottom; and if you lay your tongue on one ſide of your mouth, it may over-ſet.

ALSO Sir, a piece of their plate, a fiſh I call the ſea-ſpider, and ſome ſtones, I doubt more ponderous than precious; but that your honour will prove.

IT hath pleaſed even all to aſſign the college for my Sparta. I deſire I may adorn it; and thereby encourage the country in its utmoſt throws for its reſuſcitation from its ruins. And we ſtill hope ſome helpers from our native land; of which your honoured ſelf, Mr. *A.* and ſome others have given a pledge.

A LARGE well-ſheltered garden and orchard for ſtudents addicted to planting; an ergaſterium for mechanick fancies; and a laboratory chemical for thoſe philoſophers, that by their ſenſes would culture their underſtandings, are in our deſign, for the ſtudents to ſpend their times of recreation in them; for readings or notions only are but huſky provender.

AND, Sir, if you will pleaſe of your mature judgment and great experience to deign us any other advice or device, by which we may become not only nominal, but real ſcholars, it ſhall, I hope, be as precious ſeed, of which both you and me and many by us ſhall have uberous provent at the great day of reckoning, which I know you do reſpect above all.

IF I durſt, I would beg one of a ſort of all your printed monuments, to enrich our library, and encourage our attempts this way.

I KNOW nothing ſo ſtunting our hopes and labours in this way, as that we want one of a ſort of the books of the learned, that come forth daily in *Europe*, of whoſe very names we are therefore ignorant.

To Mr. *Aſhhurſt* I have written more. Let not, I beſeech you, my prolixity tire or deter your

your acception of things hinted, or your honour's condonation of

Your devoted humble servant,

LEONARD HOAR.

Dr. Robert Plot *to Mr.* Robert Boyle.

Oxon, July 21, 1674.

Honoured Sir,

HAD I not met with something in my travels like to prove considerable, I should not have presumed to trouble you with these, though few lines. About three weeks since being in quest of a salt spring I heard of near *Deddington* in *Oxfordshire*, I happily made enquiry of a person, who told me, that beside the salt one, they had another in the town of an unusual and very ill smell; whereupon I went with him, and found its scent to come nearest that of water, which has been used in the cleansing of a very foul gun, of any thing I can yet speak of; this smell, though somewhat offensive, yet the water is clear and potable enough. Next day I made some experiment of it, and found after several trials, that two grains of the powder of galls would turn a whole gallon of a reddish colour inclining a little to blue; which after a quarter of an hour would of itself (which I much wondered at) as it were curdle, and then changing colour to a deep purple, fall to the bottom of the vial. This sediment, after filtration and exsiccation, I put upon a red hot iron, and found it after a while to take fire with a quiet scintillation, by which I gathered there might be some small quantity of nitre, but wondered (as I do still) that no sulphur (which sufficiently shewed itself in the odour of the water) did not also betray itself in this operation. On another parcel of this sediment I put aqua fortis, which do work (though but weakly) upon it, by which I collected there might be something also of iron. Next day I distilled it with an easy heat, and neither that, which came over, or which remained in the glass body, after half a pint was distilled, retained any smell, taste, or other properties, that might distinguish it from ordinary spring-water distilled; for permitting the fire to extinguish to try what kind of precipitate would fall; and filtring the remaining part of the water to get the sediment, I found, that neither that, which came over, or what remained, kept the same smell, or would give any tincture with galls, as it did before separation from the sediment, which being dried, was nothing neither but an insipid pale red calx. This I could have tried several ways, but the town yielding neither spirits or oils fit for the purpose, I left the place, and continued my journey, but with this contentation from what I then saw, that it comes very near (that I say not wholly up) to the German Spa water, if its anatomy, that I have met with in some authors, be rightly laid down. However, I think I should scarce have given you the trouble of this account, but that I hear since it has so far prevailed, that several persons, and that of quality, have left Astrop waters for this, and that of all sorts, there have been to the number of forty persons drinking at a time. Several other natural things of use and value I have met with in this county, which in short are these: a spungy white earth, which from its use we may call native lime, for without the help of fire it has been used not only to point walls, but to white ceilings with good success: it does not slake like lime in the water, and therefore I take it to be the gypsum nativum of *Eusebius*, or rather the same sort of gypsum, which *Pliny*, Lib. XXXVI. cap. 24. calls gypsum Tymphaicum, which he says is digged, e summâ tellure, and so is this. 2. I have met with a sort of sand so indistinguishable from that we call Calais sand, that it has been sold for as much (because for uses as good) as that commonly is, that is by retale for one penny per pound, which amounts to about 1 l. 5 s. the bushel. 3. A tolerable good umber, which the glovers like pretty well to colour their wares with. 4. The hooping bird, and a linnet perfectly white. 5. A Roman pavement, called by Pliny, Lib. XXXVI. cap. 25. Lithostratum: these pavements he says were made parvis e testulis, tinctisque in varios colores, and so is this ploughed up in this county of *Oxon*. I have not forgotten to observe the variation of the compass, according to your desire, but fear I have been less accurate in this, because I find the cabin compass, which you advised me to buy, to be much too little; and by reason of its roundness, unfit to lay to the meridian line, when found. I believe therefore, that a compass might be continued purposely for this use, with a needle of five or six inches long, set in an oblong box, whose side should be exactly parallel to the line of north and south: the needle need not play above thirteen or fourteen degrees on each side the points, the variation never being more. I would have the needle also to be taken off and put on at pleasure, to prevent spoiling in my journies. I have met with several other curiosities in husbandry, plants, stones, antiquities, *&c.* too long to trouble you with now. I shall therefore add no more, but that I am,

SIR,

your most faithful servant,

ROB. PLOT.

Dr. Thomas Marshall *to Mr.* R. Boyle.

Lincoln-College, Oxon, Oct. 24, 1676.

Honoured Sir,

YESTERDAY I received from Mr. *Davis*, our bookseller, an unexpected token of your favour, which is so much the greater,

greater, as being conferred upon one, who hath never had the opportunity to deserve any part of that honour. Sir, as you have been thus pleased to bring me into a new debt, so my humble request is, you will help me to discharge it, by commanding my poor endeavours in your Malayan, or any other noble design; wherein I may express myself to be,

Worthy Sir,

yours ever obliged

to serve and honour you,

THO. MARSHALL.

Mr. Luke Hodgson *to Mr.* Robert Boyle.

SIR,

IN my last to my cousin *Killingworth*, I desired him (not knowing, who is present secretary to the Royal Society) to give you a letter long since sent to Mr. *Oldenburg*, in answer to some doubts concerning our subterraneal fire near *Newcastle*; and I waited my friend's answer (in which I expected to understand, how satisfactory my reasons therein were to the Royal Society) had not the ingenious Mr. *Samuel Hutchinson*, now residing with us, persuaded me rather to write more immediately to yourself, and to acquaint you, that it is not altogether the many businesses he has to do, that prevents his writing; but the desire he hath first to be able to present you with such various sorts of lead and other sorts of ores he hath melted down in the first furnace he hath built, and then he intends at large to give you an account of the success of his undertakings. Only at present he desired me to inform you, that the salts of the fire, and other salts to be had in great plenty here, are sufficient to furnish him with fluxes at the rate of a farthing a pound, which will do his business as well as tartar peter, or potashes. He gave me also the two following certificates from persons of good credit, who were present, when he melted down several sorts of lead ores, and slag of lead ores, into good malleable lead, several of which I saw myself; and suppose by what small trial I made to be as ductile, malleable, and as unapt to crack as any lead we have here; so that if it succeed at the same rate in larger quantities as it doth in this furnace, there are none with us doubt of the success of his undertaking. Neither is that any scruple with me, but rather, that his larger furnaces may spend coal to no purpose, for want of sufficient quantity of ore to supply them. Sir, I doubt not but when Mr. *Hutchinson*'s business is settled, we may be able to furnish you with an account of such various experiments, as may be useful to all, who desire to penetrate into the dark recesses of nature, which will collaterally fall out in this work. What remains is to beg your pardon for this trouble, and to desire as a token thereof, you will please vouchsafe two or three lines to

your much humble servant,

LUKE HODGSON.

MEMORANDUM. That this 5th of April 1678, we were at *Sam. Hutchinson*'s house at *Walsende* near *Newcastle*, where he had built a furnace in his brewhouse, and there saw him melt down both lead ore and slag of lead into good and malleable lead, with sea-coal, without any wood, or wood-coal, and do conceive it may be a good and profitable invention, especially in this country, where coals are so cheap and plentiful.

HENRY BLAND,
CHRISTOPHER HUTCHINSON,
THOMAS HALL,
WILLIAM HINDMARSH,
HECTOR GILLROY.

WE, whose names are here subscribed, were present at the house of *Samuel Hutchinson* at *Walsende* near *Newcastle*, where he had built a furnace in his brewhouse, and there saw him make an effectual demonstration in melting down lead-ore with sea-coal, only without any wood or wood-coal, into good malleable lead, rather better and closer, and more soft than we have seen in their ordinary way, and conceive the same to be a very profitable invention. Dated this of April 1678.

ROBERT DELAVAL,
RICHARD HINDMARSH,
RICHARD COLE.

The earl of Burlington *to Mr.* Ro. Boyle.

Londesburgh, Aug. 24, 1681.

My dearest brother,

I SHALL in this enquire after your health, in which I heartily wish you may find a constant improvement, and that the violence of the small pox may be so much abated, that you may return to your *London* apartment, where I hope about the end of the next month, or very soon after, to wait upon you; though I must confess unto you, that my residence here is not at all displeasing unto me. We long to hear to what place or country the French king will this summer address his armies: if to *Casall* he will certainly alarm all *Italy*, if they be not in a deep lethargy: if he intends only to enlarge his conquests by meering and bounding, *Flanders* is the most proper place for that kind of acquisition, since he has nothing to do but to ask, threaten, and have what he pleases to demand, which is certainly a very easy way of getting, as it is a new one. I am heartily sorry he extends his power against the poor protestants with so much vigour; but God, who puts a bound to the

raging of the ſeas, can put a hook into his noſtrils when it is his good pleaſure. My wife and grandchildren are your moſt humble ſervants, and I am

Yours moſt faithfully,

BURLINGTON.

Dr. Hutton *to Mr.* Robert Boyle.

Paris, Sept. 1, 1682.

SIR,

THE incloſed is from monſieur *Lemery*, who ſends you his book of the fourth edition, with a preface of a conſiderable work in anatomy by two phyſicians of *Geneva*, an account of whom you may have at large from my worthy and learned friend Dr. *Hamilton*, governor to my lord *Gorenbury*, who hath been intimate with the authors, and witneſs to much of their labour theſe four years paſt, and pleaſed to favour himſelf and me to carry this to your hands. It is like, I am out of your remembrance, it being ſome few years ago ſince I had the honour to be with you at your houſe in the *Pall-Mall*, *London*: however, I will think myſelf happy, if I could render any ſervice to you here, or when elſewhere. The bearer can give you my addreſs, if you think fit to ſend a return to monſieur *Lemery*. I continue,

SIR,

Your moſt humble ſervant,

HUTTON.

Incloſed in the preceding.

A Paris, ce 17 *Aouſt*, 1682.

Monſieur,

PArdonnez, s'il vous plaiſt, a la liberté, que je prends de vous eſcrire, ſans avoir l'honneur d'eſtre connu de vous. Je n'ignore point la grande reputation, que vous vous eſtre acquiſe, & je ſerois venu de l'autre monde, ſi je ne ſcavois que vous eſtre l'oracle des ſciences. Il y auroit long temps que j'aurois pris cette hardieſſe, ſi je n'euſſe eſperé avoir l'honneur de vous voir a Londres, mais preſentement je ne ſcay pas ſi j'iray, j'ay trouvé l'occaſion d'un ami, qui s'eſt bien voulu charger de ce petit paquet. Vous y trouverez dedans la preface d'un grand ouvrage anatomique, qu'ont entrepris deux medecins de Geneve; ils demandent avis a tous les ſcavans de France, d'Angleterre, & d'Hollande ſur leur deſſein; je l'ay accompagnée d'un exemplaire d'un traité de chymie, que j'ay compoſé. Vous en aurez, peut eſtre oui parler, puis qu'on la traduit en Anglois: c'eſt une 4. *edition, où j'ay adjouſté beaucoup de choſes: il ſera bien heureux, s'il trouve place dans voſtre bibliotheque: ce ſera un grand honneur pour luy, & l'autheur vous en aura beaucoup d'obligation. Je ſuis avec reſpect*,

Monſieur,

Voſtre tres humble, &

tres obeiſſant ſerviteur,

LEMERY.

Dr. Robert Toope *to Mr.* Robert Boyle.

Bath, April 5, 1683.

Honoured Sir,

SINCE my return into the country, I have been very ill in a fever, or elſe this had (to promiſe) flown ſooner to your hands. In the year 1678 about the latter end of February (I then lived in *Marlborough*) I was ſent for to one Mrs. *Corle* of *Freſhford* near *Bath*, who laboured in a fever; and I took in my pocket a whole ounce of Spaniſh flies pulveriſed *groſſo modo*, for I uſually draw bliſters with little bags; and after I had filled two or three bags, which could not contain above a drachm, I lapped all up in a double paper, and ſtuck it between an iron bar and the glaſs in the gentlewoman's chamber window, the window looking towards the ſouth, and I went off and left my flies as before. About thirteen or fourteen months after, April or May come twelve month, I was ſent for to one Mr. *Sloper* of *Tunbridge* (three miles from *Freſhford*) brother to the gentlewoman Mrs. *Corle*; and when I came I found my patient Mrs. *Corle* there, I told her I muſt bliſter her brother, and ſpoke to have the apothecary ſent for, on which ſhe told me ſhe could have brought old ones, if not young ones enough; for ſaid ſhe, cleaning my chamber window two days ſince, I took down a paper of Spaniſh flies you left there ever ſince my laſt ſickneſs; and when I opened your paper, there was multitudes of little flies like your old ones; and being afraid of their motion, I haſtily and rudely lapped it up again, and put the paper where I had it. Then I grew warm and impatient to ſee the phœnix from its aſhes; ſhe freely offered her man to fetch me the paper, which I accepted of, and then ſaw with my own eyes, and many others beſides myſelf, thouſands of them creeping and crawling about moſt exactly ſhaped to the old flies, long and ſmall their wings, as long as their bodies, but of a very faint glittering and ſhining colour. I kept ſome of them in boxes with fruit and leaves, and they waxed bigger; and the bigger they grew, various colours came on. My children obſerving my often viſiting and feeding my little fry, in my abſence deſtroyed my ſtock.

I PRAY, Sir, give me a taſte of that bleſſed oil, of which you promiſed the way of confecting; and that of refining tin given you by one *Wilden* as I take it, for I reſolve to work upon that body, ſo much have I ſeen to encourage me; and when I am at a loſs or ſtand, I ſhall beg your aſſiſtance, and whatever I do in this kind or any other way, I will communicate and return it back again, as the little rivulets pays the main ocean.

SIR, you muſt pardon the rudeneſs of my long nonſenſical ſtory; but, if I miſtake not, ſuch ſtories as theſe ought ſo to be told, that no ſuch circumſtances be omitted, for many times the whole matter lies couched under circumſtances (though the caſe does not here ſo

ſo appear) you may give it what philoſophical dreſs you pleaſe. Worthy and honoured Sir, I am

Yours to command,

ROBERT TOOPE.

To me at the poſt-houſe in *Bath*, *Somerſetſhire*.

Viſe remitte vale.

Mr. William Penn *to Mr.* Robert Boyle.

Philadelphia, Aug. 5, 1683.

My worthy friend,

I COULD not let my agent go without a letter directed to ſo worthy and ingenious a friend; though I can ſay little, that may add to the ſmall account I gave in another letter: only the natives, ſome oar, and ſome flowers and plants I will touch upon. I find them a people rude, to Europeans, in dreſs, geſture, and food; but of a deep natural ſagacity. Say little, but what they ſpeak is fervent and elegant; if they pleaſe, cloſe to the point, and can be as evaſive. In treaties, about land, or traffick, I find them, deliberate in council, and as deſigning, as I have ever obſerved among the politeſt of our Europeans. I have bought two large tracts, and had two preſented me, which coſt me alike. However, in this they are happy, and even with us, they care and want for little; and if they have not had their paſſions raiſed to the ſame degree after the luxury of *Europe*, by like enjoyments, neither have they the anxieties, that follow thoſe pleaſures. They trouble not themſelves about bills of lading, or exchange; nor are they moleſted with chancery ſuits and exchequer accounts. Their reſt is not diſturbed for maintenance; they live by their pleaſures, fowling and fiſhing; the ſons of providence; better without tradition, unleſs that they have got had been better; for the Dutch, Engliſh, and Swedes have taught them drunkenneſs. Thus they are the worſe for thoſe they ſhould have been the better for; and this they are not ſo dark as not to ſee, and ſay. So that the low diſpenſation of the poor Indian out-ſhines the lives of thoſe Chriſtians, that pretend an higher.

OF oar, here are divers ſorts. I have ſent a little, to ſpend thy judgement upon, which I have delivered to my kinſman, captain *Markham*, to put into thy own hands.

OF plants, here are excellent for medicine and cure of wounds. Some chemiſts intend an obſervation upon them. But immediate cures have been wrought moſt certainly.

OF flowers, I may ſay, I never ſaw larger, more variety, richer colours, in the curious gardens of *England*. Of theſe I have ordered my gardener to make a collection againſt the next year. I have a garden prepared by kitchen-ſtuff this year, of two acres, for that and other ſervices. Our town goes on apace; twenty houſes got up ſince my laſt, I ſuppoſe. God has preſerved our health, during the greateſt heats and rains, the oldeſt inhabitant remembers. But the corn, which was plentiful, was firſt in; they reap about ſix weeks before us in *England*; I might ſay two months; for I ſaw barley cut on the third of May laſt.

I ADD no more, but if any thing from theſe parts may be agreeable to thee, uſe me freely; for of thy numerous friendſhips, no body is more ſenſible of thy worth, nor more affectionately than I am, without all reſerve,

Worthy friend,

thy cordial friend,

WILLIAM PENN.

PRAY give my reſpects to the lady *Ranelagh*.

LET the bearer have thy favour and advice.

Vale.

Mr. John Clayton *to Mr.* Robert Boyle.

Virginia, *James-City*, June 23, 1684.

Honoured and worthy Sir,

IN *England*, having peruſed, among the reſt of your admirable treatiſes, that ingenious diſcourſe of the Noctiluca, wherein, as I remember, you gave an account of ſeveral nocturnal irradiations; having therefore met with the relation of a ſtrange accident in that nature, from very good hands, I preſumed this might not prove unwelcome; for the fuller confirmation of which, I have encloſed the very paper colonel *Diggs* gave me thereof, under his own hand and name to atteſt the truth, the ſame being likewiſe aſſerted to me by madam *Diggs* his lady, ſiſter to the ſaid *Suſanna Sewall*, daughter to the lord *Baltimore*, lately gone for *England*, who I ſuppoſe may give you fuller ſatisfaction of ſuch particulars, as you may be deſirous to be informed of. I cannot but admire the ſtrangeneſs of ſuch a complicated ſpirit of a volatile ſalt and exalted oil, as I deem it to be, from its crepitation and ſhining flame: how it ſhould tranſpire through the pores, and not be inflamed by the joint motion and heat of the body, and afterwards ſo ſuddenly to be actuated into ſparks by the ſhaking or bruſhing of her coats, raiſes much my wonder.

ANOTHER thing I am confident your honour would be much pleaſed at the ſight of, a fly we have here, called, the fire-fly, about the bigneſs of the cantharides; its body of a dark colour, the tail of it a deep yellow by day, which by night ſhines brighter than the glow-worm; which bright ſhining ebbs and flows, as if the fly breathed with a ſhining ſpirit. I pulled the tail of the fly into ſeveral pieces, and every part thereof would ſhine for ſeveral hours after, and caſt a light round it. Be pleaſed favourably to interpret this fond impertinency of a ſtranger. All your works

works have to the world evidenced your goodneſs, which has encouraged the preſumption, and it is that, which bids me hope its pardon. If there be any thing in this country I may pleaſe you in, be pleaſed to command; it will be my ambition to ſerve you, nor ſhall I ſcruple to ride two or three hundred miles to ſatisfy any query you ſhall propound. If you honour me with your commands, you may direct your letter to Mr. *John Clayton*, parſon of *James* city, *Virginia*.

Your humble ſervant, and,

though unknown, your friend,

JOHN CLAYTON.

Mr. John Percival *to Mr.* Robert Boyle.

Dublin, Oct. 28, 1684.

Honoured Sir,

I DID about a month ſince receive incloſed in a letter from Sir *Robert Southwell*, a bill of exchange for the ſum of two hundred and fifty pounds, drawn by you upon a gentleman in this kingdom, and payable to me, to be diſtributed to ſuch pious uſes (as Sir *Robert Southwell* informed) as you ſhould direct. Sir *Robert* told me alſo, that you intended ſhortly after to ſend me your inſtructions concerning the diſpoſal thereof. In expectation of which, I have the rather forbore to get the bill accepted, being willing to receive your orders, how to diſpoſe of the money, before I received it.

SINCE my coming to this place, I am informed, that according to the practice of merchants concerning bills of exchange, it may be a hazard unto the drawer of it, to let the bill lie long unaccepted; but which way I myſelf do not well underſtand, unleſs by the breaking of the party, who was to accept it, whereof I ſuppoſe there is in this caſe no danger. However, I am thinking as ſoon as I return home, to receive the money, and keep it ſealed up, till you pleaſe to order how it ſhall be diſpoſed of, wherein I deſire your inſtructions, which ſhall be very punctually obſerved by,

Honoured Sir,

your moſt faithful,

and very affectionate

humble ſervant,

JOHN PERCIVAL.

The earl of Perth *to Mr.* Robert Boyle.

Edinburgh, April 15, 1685.

Right honourable,

I SHOULD be aſhamed to acknowledge, that I know myſelf to be ſo much obliged to you, ſeeing I am ſo little able to demonſtrate my gratitude: but it is a matter of reputation for one to be in your eſteem, and I deſerved very little to have any ſhare in it, if I were ſo ungrate as not once to ſay, that I glory in having the honour to be ſomewhat conſidered by you. I muſt confeſs, that you are one of the perſons in the world I have the greateſt veneration for; that I never am with you, but it gives me a turn of thoughts, that are not ſo ordinary to me; and that I either feel myſelf the better by it, or am ſenſible, that it is my own fault I am not ſo. All I ſhall ſay then is, that I wiſh you a long life to be a good example and a bleſſing to this age; and that you may ſtill better your great character of being the beſt, the moſt knowing, the moſt charitable, and every way the moſt accompliſhed man of quality of the age, in which we live; for the longer you live, the greater you appear, which is not the uſual courſe of mankind. What I promiſed to ſatisfy your deſires in concerning this country ſhall be done with all poſſible diligence, for I would court any occaſion, by which I could demonſtrate the leaſt of that great deſire I have to be conſidered by you, as,

Right honourable,

your moſt obedient, and moſt

faithful affectionate ſervant,

PERTH.

WILL you forgive me, if I preſume in this paper to preſent my humble ſervice to my lady *Ranelagh*?

Mr. Joſeph Hill *to Mr.* Robert Boyle.

Rotterdam, April 20, 1685.

SIR,

IT is not ſo much the honour I have had of being a little, though but a little known to you, as your innate candour and ingenuity, that makes me preſume to trouble you with this addreſs. And ſo much the rather, becauſe I am well aſſured you will think yourſelf as happy in your acquaintance with this gentleman, as he is ambitious to be known to you, whoſe juſt character of merit is above his quality, though that is very ſufficient, being the eldeſt ſon of Monſieur *Saſburch*, the State's reſident theſe many years at *Bruſſels*, and brother-in-law to the king of *Denmark*'s envoy, Monſieur *Lent*, now reſiding with you at *London*. Being ſkilled in many ſeveral languages, and kinds of learning, as the French, Spaniſh, German, and Italian tongues, a great lover of chemiſtry, who, by your books, having known your great perfection therein, hath no ſmall ambition to wait upon you. And having never been in *England*, and knowing none here, that hath ſo much as ſeen you, requeſting this of me, I have rather preſumed upon your goodneſs, than deny him the writing of a few lines, that may lead him

him to you. If in any thing I can ſerve your honour here, in books or any other kind of ſervice, you may freely command him, who again deſires to beg your excuſe for this boldneſs, and always to approve himſelf,

Your honour's moſt humble,

and faithful ſervant,

JOSEPH HILL.

The earl of Winchelſea *to Mr.* R. Boyle.

Eaſtwell, Oct. 13, 1685.

SIR,

ONE Monſieur *Bouquet*, the bearer hereof, having ſuffered very much lately for his religion ſake, came hither to ſee a couſin of his, that ſerves me. He is eſteemed one of the greateſt chirurgeons in *France* for the king's evil, which he pretends to cure in ſix days, without leaving any ſcars. And he is eſteemed for an admirable receipt he hath for all agues without the Jeſuit's powder, which he cures in a few days; as alſo for all ſorts of cancers. If you pleaſe to ſee him and his atteſtations at your leiſure, I am of the opinion you will find him an able man; and if you give me encouragement, I will endeavour to ſet him up. He hath loſt to the value of ſeventy thouſand livres for his conſcience ſake, which is a great eſtate in *France*. I know you are willing always to do good, and therefore I recommend this poor man to you as far as he deſerves. He was fain with his ſons to run out of the back door of his houſe, as the dragoons came in at the other, and to walk on foot through *France* to *Ypres* in *Flanders*, and ſo to eſcape hither. I am ever

Your moſt humble, and

moſt faithful ſervant,

WINCHELSEA.

Dr. Guidott *to Mr.* Robert Boyle.

Bath, October 14, 1685.

Noble Sir,

HAVING under my hands, almoſt finiſhed, a diſcourſe in Latin, concerning the nature and virtues of the baths of *Bath*, and accidentally lighting on a ſmall diſcourſe of yours lately printed concerning the way of probation of mineral waters, in order to an experimental natural hiſtory of the ſame, I could not but give you my hearty thanks for the good ſervice you have done the publick, as well as the aſſiſtance I have particularly received in the ſubject I am upon, which, as I ſhall gratefully acknowledge, ſo may have an opportunity of communicating ſome other diſcoveries, that (perhaps) may not be unacceptable to your curioſity.

HOWEVER, finding many things there, that unexpectedly did confirm what I had written before, as well as ſuggeſt ſome things I had not attempted, I muſt, in this knowing age, come no nearer that child, that makes ignorance the mother of devotion, than to pay this grateful acknowledgment; or, in terms a little higher, leſs than divine adoration, to an unknown God, which, if it pleaſe, will be followed with greater ſacrifice.

IN the mean time, to treat ſo intelligent a being a perſon with his own viands, I crave leave to remind you, that you are pleaſed to ſay, you never yet met with a water predominately alcalizate. I ſuppoſe on good grounds I have aſſerted this to be ſo, though different from the ſentiments of all before me; to which I have been the more encouraged, in regard, beſides other arguments I have, with ſyrup of violets it turns very green.

I MUST likewiſe remind you what ſervice you have done in dethroning that uſurping opinion, that wherever a water turns with galls, there muſt be either iron or vitriol; in ſhort, that it is a certain ſign of acidity, when * ſulphur and alcalizate ſalts do the ſame, and a compoſition may be made, wherein undoubtedly nothing elſe is, that, on a mixture with galls, will preſently become of an inky complexion. To illuſtrate this, and confirm what you have firſt obſerved, a neighbour gentleman has now encouragement to dig for coal, a mile diſtant, where I waited on him, and found, among other things, that the workmen had lighted on a bed of marcaſites, ſome of which will ſhortly be at your ſervice. Theſe very much reſemble the pyrites, which I cauſed to be powdered and calcined with ſome alkalies, in which I obſerved ſo much brimſtone, that the ſubſtance itſelf could not be more convincing. A lixivium made of the calx, the filtered water with galls gave an inky colour in a minute, and the lee of the calcined powder without the ſalts a faint purple. The ſalts I put to the fireſtones were petre, common ſalt, and an alkali, called ſcendover. How near this comes to the aqua ſulphurata, you may pleaſe to conſider, as well as how much that aſſertion is confirmed, that an acid is not abſolutely requiſite in water to a purple colour with galls, which hereafter may, by my means, receive further illuſtration, who, with the tender of my hearty thanks, and humble ſervice, remain,

* If that be not acid, as the ſp. p. c. ſeems to atteſt.

Honoured Sir,

A great admirer

of your piety,

learning, and virtue,

P. GUIDOTT.

I SHALL ſhortly be in town, and then ſhall wait on you.

Mr. Thomas Brattle *to Mr.* Robert Boyle.

London, Dec. 18, 1685.

SIR,

THE underwritten is the copy of what I yeſterday read you out of Dr. *Avery*'s letter to me, dated in *Boſton, New-England*, December 5, 1684.

" THERE was a boy, called *John Symonds*, " ſervant to captain *Jacobs*, of *Hingham*, who, " when he was about ten or twelve years old, " was with a man at plough, and, as the man " was diſcourſing with ſome other perſons, ſat " down upon the ground before the oxen, " which, being affrighted, leaped over the " boy, and with the ploughſhare took hold " of the boy's ribs, and rent a hole in his " breaſt, at leaſt four fingers broad, on the left " ſide, ſo that Mr. *Joſiah Winſlow* and *Martha* " *Beedle*, a diſcreet woman, ſaid, that they " could ſee his heart, and the left lobe of his " lungs would fly out at the orifice, as he drew " his breath, two or three inches, when the " orifice was open, and did ſo work againſt " the pledget it was dreſſed with, that it " fretted off the ſkin, and made the lungs " very ſore. They were forced to turn him " to his left ſide, when they opened the ſore " to dreſs it, to pour out the watery and " bloody matter, that was gathered in his " breaſt; but his maſter told me, that they " could not ſee his heart after the firſt time " of dreſſing, and in ſeven or eight weeks " he became whole; and though that part " of the lungs, which uſed to ſlip or fly out, " did at laſt grow to the fleſh, and cloſe up " the orifice together, yet he felt no incon- " venience, but was well and ſound the laſt " year, at leaſt twelve years ſince the hurt " happened.

" THERE was alſo a child of one *Robert* " *Parkers*, of *Barnſtable*, that had a ſwelling " riſe upon the ſhin, a little below the knee; " the ſore broke, and continued about three " quarters of a year; then was the child about " one year and half old. Then they brought " it to *Hingham*, and in time they felt the " bone looſe at the upper end, and thought " to make inciſion, but found a hard callous: " then they took hold of the bone at the ori- " fice, and the whole ſhin bone came out as " far as the inſtep. There was a callous co- " vered the bone, like a caſe, or ſocket, " which now ſerves inſtead of a ſhin-bone, " only is ſomething bigger, as if the calf " were upon the ſhin, but is no impediment " to the child, who is nimble and ſtrong, and " now about ten years old." Thus far the letter.

SIR, enquiring of a maſter, that had been ſeveral times at *New-England*, he told me, the variation of the compaſs on St. *George*'s Banks, on the coaſt of *New-England*, is between ſeven and eight degrees eaſterly; and that at ſpring-tides the ſea in *Boſton* harbour riſes to about twelve foot; but hereof ſhall endeavour in time to give a more certain and exact account, who am,

SIR,

Your humble ſervant,

THOMAS BRATTLE.

Mr. Thomas Mackrith *to Mr.* Robert Boyle.

Hugly, February 5, 1685-6.

Honourable Sir,

WITHOUT being ungrateful, I cannot but acknowledge the honour I had of your acquaintance by Mr. *Glover*, immediately upon my departure, and the favours received from thence, in your inſtructions and directions to me in ſeverals relating to my voyage to and at *India*, which proved very uſeful and pleaſant to me in the ſaid paſſage, though my ſhort abode here has not as yet given me occaſion to improve the reſt to any advantage, but what occurred in my voyage (of which I kept a journal) I ſhall give your honour as particular an account, as my mean capacity will afford; and that,

FIRST, in relation to the ſaltneſs of waters, and the differences in ſeveral latitudes and places. The reaſons of the great quantity of ſalt in the ſame, and how it becomes ſo, I leave to the learned to explore; only ſhall give you what account I have had of it by relation, and my own experiments on the ſame. If I am not miſtaken, you told me, that ſalt water was generally $\frac{1}{42}$ part heavier than freſh; but I found it in all my experiments, that the ſalt water in ſeveral places was about $\frac{1}{32}$ or $\frac{1}{33}$ part heavier than *Thames* water, which probably may agree with what you told me, conſidering there may be that difference of ſaltneſs betwixt latitude 51 deg. in the *Downs*, which is much mingled with freſh rivers, and the places, where I took the other water up; which gives me much reaſon to be of a contrary opinion with captain *Wood*, who affirmed, that the nearer the pole, the ſalter the water; which I had occaſion to confute by experiments this voyage, as alſo by the credible relation of our third mate, who had uſed the *Newfoundland* trade all his days till now, and did aver, that the ſeas in thoſe parts, cloſe on board the ſhore, where they could find no ground, the water was only brackiſh, and not by many degrees ſo ſalt, as that near *England*, though he never was ſo curious to compare one with the other, by weight, or otherwiſe. The truth of this did ſeveral others on board affirm, whom I particularly enquired of.

BUT to the experiments, that I made in ſeveral latitudes, I give this account:

	grains
That having a vial of about half a pint, which I could fill exactly almost to a drop, in the same I weighed *Thames* water at St. *Jago*, 14 deg. N. lat. ☉ in ♍, and it weighed	3111
The same quantity of fresh water taken in at St. *Jago* weighed	3133
And the like quantity of salt water taken up there weighed	3204
Under the equinox, on Jan. 5, ☉ in ♒, the said quantity of salt water weighed	3226
Under the tropick ♍, on Jan. 21. ☉ in ♒, the aforesaid quantity weighed	3200
On March 10, ☉ entering ♈, in lat. 36 deg. S. a-breast of Cape *Bon. Sperance*, I weighed the aforesaid quantity of salt water, and it was	3186
Returning again to the equinox, on April, ☉ in ♉, the same quantity weighed	3210
On April 24, ☉ in ♉, in lat. 10 deg. S. entering into the Bay of *Bengal*, I weighed the aforesaid quantity of salt water, and it was	3206

Here I went down into the hole of the hold of the ship, and caused one of the bungs of the fresh water cask to be opened, to which we no sooner held a candle, but it took fire, and being desirous to see, if it would burn, it singed some of our fingers, and gave fire to chips. I weighed this water in my usual glass, and found it to weigh thirty five grains heavier than the same sort of *Thames* water did at St. *Jago*, upon first coming out; the reason of which I am altogether ignorant of, only when we first opened the bung, there came out a steam, like a thick smoke, and it stunk.

For the more exactness in my weighing of all the aforesaid waters, I brought a bottle of each out of every latitude ashore, and weighed them over again (lest the motion of the ship might have made some difference) and I did not find them to differ above two or three grains one with another; by all which I am convinced, that the chief cause of the saltness of the seas is from the sun, and the nearer it, or the equinox, so much the salter, that is (excepting accidents of lands, *&c.*)

I have presumed to recommend to your acquaintance Mr. *Gualter Goddard*, now chief-mate of our ship, next voyage, I suppose, commander: he is a very ingenious gentleman, and curious in such experiments, and has promised me to carry home for you a bottle of salt water, out of several latitudes, for your further satisfaction.

I have said nothing as yet of the difference of saltness of water on the surface and that at the bottom, which will be very hard ever to explode, though you have directed me the making of a very ingenious engine, for the bringing up of water out of any depth, which I exactly made, and found it would have done something, that would have been curious, but that the happiness of our voyage was such, in a quick passage, that I could have no opportunity of a calm, to try it in; which was the same reason also, that I lost several good experiments I intended to have made, by trying the power and pressure of the water in several depths. But I have returned the engine with the said Mr. *Goddard*, homeward bound, to see what may be done: but that engine wants not its own difficulties; for supposing it to be full of water, two hundred fathom down, and brought up within fifty fathom of the surface, should then the said box sink again one foot, or less, it would evacuate all the water of two hundred fathom deep, and take in that of fifty; which will be a very hard matter to prevent, considering that the sea at the calmest has always some motion or other on the ship or boat you are in.

As to the shining of the sea, before or after storms, and upon particular winds, I did narrowly observe the same throughout the voyage, but never could find any influence, that one wind had over the same more than another, either before or after storms; for the sea shineth at all times in the dark, when moved; though, I must confess, at some times more than at another, in which I could find no certainty; for having some salt water in a calm brought me into the dark, I moving the same with my hand, it shined extremely.

As for the magnetick vertue of the load-stone, and the variation of the compass sometimes from that, I could make but little improvement in the knowledge of the reason thereof, though in my journal I kept an exact account of our daily variation, taken by the Azimuth compass, to give us some insight into our longitude; but take these following observations: About lat. 10 deg. S. and 7 deg. merid. distance from St. *Jago*, we began to make a variation easterly, and run it up to 9 deg. 30 m. in lat. 28 deg. S. 10 deg. merid. distance from St. *Jago*; after which it falls away again to nothing in lat. 35 deg. S. and 31 merid. distance form St. *Jago*; where begins a westerly variation, which runs up to 9 deg. on breast of *Cape Bon. Sperance*, and so on to 26 deg. variation in lat. 34 deg. S. and 32 deg. merid. distance E. from *Cape B. Sper.* and so it falls away again to 7 deg. and 6 deg. in the Bay of *Bengal*. The aforementioned Mr. *Goddard* told me, that being near the Isle of St. *Laurence*, their needle went round all the points of the compass, and would stand no where; this not only in one, but in several compasses, which continued near the space of a day; after which they traversed again, as formerly. When we came into *Ballasore* road, in the cod of the Bay of *Bengal*, I was an eye-witness to a ship, that came to anchor in a distressed condition, having met with a storm at sea, in which a clap of thunder broke upon her, and brought down her main and mizen-topmasts, and shivered her main-mast and one of her pumps, but no damage done to the hulk of the ship in the hold; but what was remarkable, at the same instant of the clap, the virtue of the needle of the compass in the

the binnacle (by which they had steered that voyage) was altered, and it traversed directly to the opposite points, and so continued, till that day that I saw it, and could not be put from it, but traversed as true in opposite points, as any of the rest, that were not thunderstruck. It is strange, and I thought worth your noticing.

NEXT followeth some particular passages, and observations taken out of my journal of the said voyage; and first, concerning the weather, which proved very variable all the way till we came within 3 deg. N. of the equinoctial, about 6 deg. merid. distance from St. *Jago*, at which time and place (as we expected) there fell great rains and constant, accompanied with dreadful lightening generally all night, and continued so, till we were got 2 deg. S. of the line, which was a great while first, considering that we had little or no winds all the while; and sultry hot weather, which is the occasion sometimes of great sickness here. It is supposed, that about this place of the world it rains always, for I never heard of any, that did not meet with those rains, let the ☉ be where it will; at this time ☉ was within a degree of ♎; and it is a common proverb amongst seamen, "When we come at "the rains." If any clothes be wet with the said rains, and lye so thirty six hours, there grows great numbers of large maggots immediately. This I have seen amongst the poor seamen. And when we come on breast of the *Cape B. Sper.* especially if we run up into 38 deg. or 39 deg. S. which oft-times ships are forced to do, to weather the cape; they are certain of very stormy weather: this is as constant as the other, and as much to be expected.

IN lat. 2 deg. N. I saw a spout, which being at some distance, I was not capable to make any observation on the same, but it appeared to be a sucking spout.

IN lat. 31 deg. S. on Feb. 4, about ten o'clock at night, appeared a rainbow in the N. E. directly opposite to the monsoon. I have several times seen two rainbows at once of this form ◠◠; some affirm, that they have seen them thus)(; which I much doubt.

IN lat. 35 deg. S. on February 16, at two o'clock in the morning, the wind at S. I perceived a star in the N. to shoot the length of three imaginary yards in the heavens, and left a large train behind it all that length, which continued visible above a full minute by the glass, to the admiration of all that saw it.

I LIKEWISE did particularly observe those commonly called the Magellanick clouds, which consist of a greater and a lesser; and are to my judgment compounded of a great number of small invisible stars, much of the nature of via lactea; they seem to be distance ten imaginary yards in the heavens, and have a due course, as other constellations; they both make one constellation (as I suppose) seeing they always appeared to me to be of one and the same distance; and constantly the lesser followed the greater in rising and setting. It was impossible to make any observation of them, for their right ascension or declination, considering we were running through so many latitudes, and were not on terra firma.

ANOTHER thing I observed very strange in the middle of the crossiers, and now southerly constellation: there, at sundry times, as oft as the heavens were clear, appeared to me a very little, but extremely dark cloud, darker than any thing I have seen in the heavens; this I did suppose only to be a vacancy of small stars, that were through all the rest of the constellation.

THIS is all what offered worth the noticing in our passage to *India*, which we performed in 5½ months: for fishes and fowls, we saw none, but such as are common to all who travel that way. As for the rest of your articles of enquiry, I shall answer, as occasion offers; and concerning a natural history of these parts, it will take up some time to be thoroughly informed of all the circumstances of the same. But it is possible, that next year (if it please God) I may give you some general account of the same, seeing I already perceive, it will admit of great variety. Nought else, but that you would be pleased to command him, who is ambitious of serving you in any thing here, or elsewhere, and does unfeignedly rest,

Honoured Sir,

Your honour's most humble servant,

THOMAS MACKRITH.

SIR, a medicine for the gravel in the kidneys would be very acceptable, I being oft troubled with it still.

IN a calm the sea stinks extremely; and if it had not pleased God to send a breeze, it had been very hurtful.

Newton, April 8, 1686.

SIR,

FIRST then I must tell you, I made my observation in my father's grounds, within two miles of *Newcastle* (though the like may be seen in many other places) in a pit near threescore yards deep, and the coal about five quarters high; the bottom, or hill (as we call it) of those pits (as of most others) is a black slate stone, not unlike some pieces of slate you may frequently meet with in some sort of your common burning coal. As to the time, when the figures (I told you of) were first observed, I cannot resolve you. For the eldest workmen I can meet with cannot give any account, when nature first began to paint after that manner. Neither will it be much more easy to tell you, in what time these figures come to their full perfection, our workmen not having been critical in the observance of it; but some say in a few months in the spring season, others allot a longer time; so that

that in this particular, I can give you no certainty. But I am informed the puncheons or prop-wood (as we term it) muſt be freſh, green cut, and placed in moiſture, and the bark on, if it ſend forth the figure of its own ſpecies upon the roof, which is ſo exact when it doth, that no pencil guided by the ſkilfullest artiſt can draw nature more to the life, colour only excepted. For that is whitiſh, inclinable to yellow or cream colour, not very unlike ſome ſort of painting, which I have ſeen in freſco, with dead colours. The branch, leaves, and every particular fibre are of the ſame, only diſtinguiſhed by ſhape, and the ſhades, which make the reſemblance of each part to nature itſelf in that exact proportion I have before deſcribed. This I am told may be ſeen in holly or birch, the only wood we uſe for props or puncheons in theſe parts; but from the latter only I ſaw this effect produced. The moiſture, which thus works out of the trunk, puncheon, or prop-wood, does not make any other impreſſion upon the ſtone, or ſlate, that is the roof of the coal (where it fixes itſelf in the form aboveſaid) than paint upon ſome hard wood, or metal, before it be dry, and into which it cannot ſink, and may as eaſily be wiped off and defaced, as that I never heard of any part of the ſlate thus painted, brought above ground: the reaſon ſeems to be, becauſe ſuch prop-wood as produces this effect, being ſet for a ſtay or ſupport to ſome faulty or cracked part of the roof, or ſlate ſtone, it might endanger any workman, that ſhould attempt to take any part of it away.

THUS, Sir, I think I have made ſome return to every one of the queries, though not ſo diſtinctly and orderly as you propoſed them; I am ſure not ſo fully and particularly, as I could have wiſhed for your ſatisfaction. But that has not been altogether my fault, but the little exactneſs, with which thoſe (that converſe frequently under ground, and daily behold the wonders of that deep) obſerve them.

Mr. Leuwenhoek *to Mr.* Robert Boyle.

Auguſt 6, 1687.

Moſt noble Sir,

I MAKE bold to ſend you under cover theſe my ſmall obſervations, about which I alſo did write to the Royal Society. Firſt, becauſe I fancy they will be not unacceptable to your honour. Secondly, becauſe I know, that the Royal Society do not meet at this time.

I HAVE written four diſtinct letters to the Royal Society; and although I have not received any anſwer hitherto, yet I do not doubt but the ſame have been duly delivered.

To wit, one I did write on the fourth of April 1687, in which I treat about the ſtructure of the teeth.

ANOTHER on the ninth of May, in which I write about coffee: the third is of the thirteenth of June, in which I ſpeak of plants: a fourth is of the ſecond of July, in which I treat of procreation of ſilk worms.

I DO hope, that in theſe foregoing, as alſo in this preſent, ſomething may be found, which may pleaſe your honour, remaining in the mean while,

Moſt noble Sir,

your moſt humble ſervant,

&c.

Delft in *Holland*, Aug. 6, 1687.

To the noble lords, gentleman, and members of the Royal Society.

MY laſt was of the ſecond of July, which do not doubt but was duly delivered; at preſent, I ſend further ſome of my ſmall obſervations.

SOME have endeavoured over and above to perſuade me, that the klander and wolf do not procreate (the klander is a running vermin ſomething bigger than a full grown louſe) being two ſorts of vermin, that are often found in wheat and corn, and prove very prejudicial to the ſame, too well known by the corn merchants and bakers in theſe parts.

THE chiefeſt reaſons they did produce were theſe, that the wheat being lodged in a new granary, where never before any wheat had lain, the klander, notwithſtanding, in time would grow in it, which therefore happened without procreation.

SECONDLY, They alledge, that much wheat is found, which as to the outſide is ſo entire, that not the leaſt hole or opening can be perceived; yet when you come to open it, you ſhall meet with a full grown and living klander. I did endeavour to convince them to the contrary, by alledging, that the workmen may probably, and without their knowledge, carry along with them from an infected granary, either the grains infected, or the vermin itſelf ſticking to his clothes, ſtockings, or ſhoes, and ſo infect a granary, where before none of this vermin was found.

THE ſame may be alledged of any ſhip, waggon, or cart, which formerly has been made uſe of for the tranſportation of grains. I further deſired, that the firſt klanders, that could be procured (it being in the midſt of winter) might be ſent to me. On the 13th of March 1687, I obtained ſome wheat, of which ſome grains were made hollow, and others filled and intermixed with this klander.

I TOOK three divers glaſſes, and in them I put ſix, eight, and nine clanders, and eight, ten, and twelve grains of ſound wheat as near as I could judge, having purpoſely kept the ſame in a box.

IN a fourth glaſs I put ſome klanders without any wheat, but this I found would not do

do, the klanders dying after the twelfth day. Now by reason of the cold finding these animals most part of the time without motion, I did carry the glasses about me in my pocket, I had no other thoughts but clearly to convince, that the klander was produced from a worm, and for that purpose I often viewed the klander through the microscope, but the excrements of the klander, which copiously did stick to the glass very much, prejudiced my observation. The figure of these excrements was long and taper; those as were shorter had the figure of an egg, and were also transparent. I had some thoughts, that the klanders did not eat like unto those flying creatures of the silk-worm, and some of the caterpillars; but I found to the contrary, to wit, that the klander devours corn, and makes a sound grain of wheat entirely hollow, and lodges himself within it; and that with their snout (which is lodged at the fore part of their heads) and which is very long in proportion of their body, they do bore through the hulls of the wheat, and that by the help of little tools in the form of teeth, with which the snout is provided at its end.

FOURTEEN days after, being the 27th of March, I saw that some of the klanders were closed by copulation one with another; and that they did stick close together a great while, the female carrying the male, running thus along with him; and also I did often toss and tumble them, yet they remained closely united. After this I opened some of the klanders to take out their eggs, but I could not fully satisfy myself with any certainty. After this I went to search the masculin seed of the klander, and I collected of it about the bigness of a big grain of sand together, and I placed it to the eye through a very good and much magnifying microscope, and discovered a prodigious great number of living animals in this small parcel of matter, insomuch that it would seem incredible to those, who have not seen it themselves. I am persuaded no general surveying two armies consisting of 50,000 men, and fully enaged, could observe such manifold motions in them, as I did see in this small parcel of the masculin seed, and that so long until my eyes were tired. I lastly did kill these little animals, because among these great and various motions I could discern nothing but their heads, or upper part of their bodies. These little animals being dead, and thus lying asunder, I saw with admiration their long and slender bodies, being some of them somewhat more bulky towards the upper part of their bodies further, as often as I had occasion. I viewed these klanders that were shut up in the glass, and observed them all couple, but no life in them till the 10th of June, as when I spied among the klander and wheat two short, thick, and small worms, one about the bigness of a big grain of sand, the other four times as big. Whereupon I opened the glass, in which six klanders had been shut up, and also did examine the grains of wheat, that had lain all the while amongst them, of which two I found that were empty. Out of another grain, which as to the outside appeared least of all wasted, but notwithstanding had many little holes, which with the bare eye could not be discerned, I took out a full grown klander, which had a fair red colour, but those as were old, and had been shut up for about three months together, were of a dark brown red, and to the eye blackish. In another grain of wheat I saw a klander, which was very white, lying with his legs, horns, and snout in so proper an order, that I fancied to behold a silk-worm so far changed, as to be speedily turned into a flying animal, only with this difference, that this white and imperfect klander was not wrapped about with a skin or husk, as the silk-worm. Out of another grain of wheat I took a short thick worm about the length of a klander, so that I judge, that these worms in few days would assume the form of klanders. I went further to open other glasses, and took out of a grain of wheat a klander, which did begin to change his white into a red colour: this was constantly moving his posteriors. I took also out of other grains worms of different bigness: my design was to cut open the klander, which thus long had been shut up; but whereas at that time some gentleman came to see me, it happened, that at the interim these klanders made their escape. I also observed, that klanders do lay so still in a cold season, that one cannot perceive the least motion in them. But to find out the living among the dead, I breathed upon them, and so the living began to move. Now I had still a fourth glass, in which I had shut up eight klanders, and fourteen grains of wheat, which I also had carried about me in my pocket; some of these grains had little holes, and three others half spent. I did open all these grains, but could not discern any living creature or any eggs in them. I did open three or four of these klanders, and took out their bowels, and found, that two were females, for out of one of them I took out five perfect white eggs, which I fancied to have their full growth; out of the rest I took more: after that I opened several other klanders, and discovered in them a complete ovarium, some eggs having their full bigness, others gradually were lesser: by this I concluded, that as the flying moth of the silk-worm, within the space of two or three days, lays many eggs, and after that suddenly dies, that to the contrary the klanders lay but few or one egg a day, and that, for that reason, the klander remains a life so long, that they might multiply proportionally to the silk-worm and other creatures; for the klanders, of which I speak, have been alive ever since last summer.

Mr. John Love *to Mr.* Robert Boyle.

Torbeby, near *Michaelstown* in *Ireland*, Feb. 21, 1687.

SIR,

MY lord of *Orrery*, your brother, for the last seven years of his life, gave me bread,

bread, together with the benefit of hearing his real wiſdom, which conſiſted only in the conſequence of his lordſhip's having employed that number of years in the duties of religion. His lordſhip did often in that time expreſs a concern for a body of reformed Chriſtians in *Piedmont*, whoſe piety he much admired. A little before his death he ſpoke much of them, quoting monſieur *Aubigné*, whom he commanded me to endeavour to tranſlate, at leaſt that part, that related to thoſe Chriſtians; but before I did any thing in it, God was pleaſed to take my lord to his eternal mercy.

THE impreſſion his lordſhip's commands left on me, has ever ſince forced my enquiring into their circumſtances, of which, by the means of one Mr. *Francis Quaile*, a worthy clergyman (who going with my lord *Kingſton* into *France*, met with a complete hiſtory of them) I have fully informed myſelf.

I HAVE for five or ſix years paſt expected its publication in *Engliſh*, Mr. *Quaile* and I both in all that time concluding a thing ſo neceſſary in the church could not be untranſlated; but finding, by my frequent converſe with clergymen (who, through God's mercy, are in this kingdom both very good and very numerous; a bleſſing our predeceſſors here could not boaſt of) that none had yet diſcovered his undertaking to inform our countrymen, I did employ thoſe hours of the laſt winter, my country labours would allow, in epitomiſing and tranſlating that hiſtory into *Engliſh*.

I HAVE, for ſeveral months paſt, expoſed it to the cenſures of ſuch prelates, and other clergymen, as well of the church of *England*, as nonconformiſts, as I could come near, whoſe general objection is, that the epitome is not ſatisfactory to learned men, though it may be of great uſe to others. I do now therefore, by the bleſſing of God, reſolve upon tranſlating the whole, for the ſatisfaction of ſome, and edification of others.

BUT here I ſeem to queſtion, wherefore I, who never had the honour of being known to you, ſhould in this caſe preſume to addreſs. I confeſs I do but ſeem, for in reality I cannot doubt your forwarding any work, that tends to the glory of God, and the good of thoſe creatures he has bleſſed with rational and immortal ſouls. Your late care of the ſouls of the ungrateful natives of this iſland (had there been no other evidences) is ſufficient to encourage this preſumption.

I AM ſenſible it were impertinence to trouble you (who cannot be a ſtranger to the original) with an Engliſh compendium of the book, or to ſay more on that point, than that it is monſieur *Jean Leger*'s general hiſtory of the (Vaudois or) Waldenſes, printed at *Leyden*, anno domini 1669, which I have endeavoured to tranſlate out of French into Engliſh. I do not hear of more than three of the books in this kingdom, but am well aſſured, were there but one of them in *England*, it could not be unſeen by you.

THE ſubſtance of my moſt humble requeſt to you is, that you will command your ſervant to put your ſtationer upon enquiry, whether any ſuch tranſlation is either licenſed, or propoſed to be printed in *London*. But the chief and only end of this my preſumption is, that I may have the honour of your opinion, whether, or no, monſieur *Leger* in Engliſh may be of uſe in the reformed church of Chriſt in theſe kingdoms; which if you pleaſe to vouchſafe, my ſiſter will take care to ſend it to

Your honour's
moſt humble and
moſt obedient ſervant,
JOHN LOVE.

Mr. Ellys *to Mr.* Robert Boyle.

Caius College, in *Cambridge*, Oct. 26, 1688.

SIR,

ACCORDING to Mr. *Henry Wharton*'s direction, *Maimonides*'s *More Nevochim*, waits upon you with this. I am ſorry, I could procure for you no other edition. Of the Arabick original I cannot hear at all. The Hebrew tranſlation, with a comment, all in that tongue, in folio, belongs to *Emanuel* College Library; and of that perhaps I might obtain the uſe for you, if you pleaſe to deſire it, on my giving ſecurity for its reſtitution ſafe and entire. My beſt ſervices, Sir, are moſt freely at your command; for however unknown I have hitherto been to you, the moſt hearty veneration, which I have for ſuch a benefactor to all men, but to the ſtudious more eſpecially, will always inſpire me with deſires, as far as poſſible, to approve myſelf,

SIR,

Your moſt faithful ſervant,
and true honourer,
JO. ELLYS.

I MUST add, by Mr. *Wharton*'s order, that this book coſt me ſix ſhillings.

Mr. Joſiah Woodward *to Mr.* Robert Boyle.

Cooperſale, May 16,

SIR,

IN obedience to your pleaſure, of having a full account of the maid's caſe, who vomited the ſtone, which I lately left in your hands, I here humbly preſent you with a brief relation of it, which I take from her own mouth.

SHE is now about forty five years of age, very crooked, and ſhort; and being unable to get a livelihood by labour, was taken in charity by the lady *Archer*, about eleven years ſince,

ſince, to weed the gardens. About nine years before ſhe vomited the ſtone, ſhe was knocked by a blow on her head, given her by her paſſionate brother with his fiſt, which occaſioned the firſt fit, that ſhe was obſerved to have; after which, every ſudden fright caſt her into the like; into which ſhe uſually ſunk ſilently, and lay on her back or ſide, without ſtruggling or foaming. She could perceive ſomething riſe up in her throat, which ſtopped her breath, and ſo ſhe fell. The malady encreaſed by duration. Her fits came more and more frequently, and continued longer, without any fright or apparent occaſion. Sometimes the fit continued an hour, and after a little raiſing of herſelf on her knees, ſhe fell into another. About two years before ſhe vomited the ſtone, ſhe perceived ſomething like a little bean (as ſhe often told me) riſe up into her throat. About this time ſhe had ſometimes ſix or ſeven fits in a day, ſometimes falling into them in her bed, and being very ſick after them, was inclined to vomit, till at laſt ſhe vomited blood ſeveral times, yet the ſtone remained: at length vomiting blood, ſhe brought the ſtone into her mouth, and made ſhift to ſpeak to a ſervant near her to take it, who inſtantly brought it to me; which is now about ſix years ago, after which ſhe was exempted from her fits, but now of late ſhe ſays a ſudden fright makes her ſwoon away, but nothing ſo bad as her former fits. She tells me, that, about a year before ſhe vomited this ſtone, ſhe vomited ſomething of the ſame ſize and figure of the ſtone now in your hands, but of a bloody colour, and not ſo perfect a ſtone, yet very hard, which ſhe threw into a baſket of weeds, and ſo loſt it. But ſhe had but little (though ſome) eaſe by the diſgorging of it.

THIS, Sir, is the moſt perfect ſtate of her caſe that I can give: which, though a wonder to my ſhallow capacity, may probably be eaſily ſolvable to your great judgment, which has made ſo many ſecrets of nature loſe their name.

MAY it pleaſe Almighty God to preſerve your life and health, as a common bleſſing to the world, to which his infinite goodneſs has made you a general benefactor, and at laſt crown all your virtuous and elaborate ſtudies in the bleſſed ſtate of perfect piety and knowledge. In which wiſh I am ſure the learned and ſenſible part of the world will concur with,

SIR,

Your moſt humble ſervant,

JOSIAH WOODWARD.

AN

APPENDIX

To the firſt part of the

CHRISTIAN VIRTUOSO.

* * * * A FOURTH advantage the virtuoſo has above other perſons, is, that when he is once convinced of the truth of the Chriſtian religion, he is better qualified than other men to adhere ſtrictly to it, in ſpite of the ſophiſtry and other oppoſitions of its adverſaries, whoſe grand objections are theſe four.

I. THAT the hiſtorical part of the ſcripture contains the relation of ſome things incredible; I mean, the miracles, and ſome promiſes of things impoſſible to be accompliſhed.

II. THAT the doctrinal part delivers pretended myſteries, that are not to be comprehended.

III. THAT the proofs alledged in behalf of the Chriſtian religion are not demonſtrative, but on the contrary.

IV. THAT divers things, whoſe belief is enjoined by the Chriſtian religion, are repugnant to the principles, or the dictates of philoſophy.

AN anſwer to which objections is contained in the following dialogues, or conferences.

CONFERENCE I.

Justinus. TIME is a thing so precious, and so useful, that it were pity we should mispend much of the little, that is allotted for this day's meeting, upon the needless ceremonies, that too ordinarily do more than begin the conferences of gentlemen. And therefore, with your leave, I shall take the freedom to decline preambles, and hasten to put you in mind, that, according to the method of our debates, the things, that we are this evening to consider, are some of the chief objections, urged by *Authades*, against the Christian religion.

Eusebius. I so well like your design of husbanding time, that, in compliance with it, I shall rather follow your example, than the dictates of customary civility: and, presuming, that these gentlemen, who have too well improved time, not to have a great value for it, will not disavow me, I shall desire you to name, without delay, the first objection, that is couched in the list, of those I presume you have set down, in the paper I see in your hand.

Justin. IN obedience to your order, I shall acquaint you, that it is this: "That there "are in the new testament divers strange "things, there called miracles, recorded; "that are impossible to be done: and divers "promises, menaces, and other things, de-"livered, as from God, of which it may "justly be said, that it is incredible they can "ever be made good."

Eleutherius. I DO not wonder, that *Authades* should lay much stress upon the objection; since one can scarcely have a stronger motive to deny his assent to a history, than that the thing related is impossible; or to refuse his reliance on a promise, than that it is not possible to be made good.

Argument I. *Justin.* I SHALL not now examine, whether these allegations be absolutely and unreservedly true. But that they are not rightly applied to the relations and promises of the Gospel, I shall endeavour to manifest, by the ensuing reflections.

AND first, I consider, that possible, credible, and their contraries, are not absolute, but relative, or respective things; and consequently, that, to determine safely of them, we must consider as well the power of the agent, as the nature of the thing recorded to have been done, or the effect promised to be produced. If it be related, that a whale, or an elephant, did fly for an hour together in the air, that action ascribed to such agents may well be judged physically impossible, and consequently incredible. But if the same action be ascribed to an eagle, or faulcon, every one will confess it may be true. So if a boy had been recorded to have wielded a spear, "whose staff was "like a weaver's beam," and furnished with "an iron head, that weighed six hundred "sheckles" (that is above sixteen or seventeen pounds) the narrative had been incredible. But when this stupendous force is attributed to a giant, as *Goliah* is said to have done, who wore a coat of mail, weighing near about "an hundred and fifty pounds of brass," so weighty a weapon will not be judged incredibly disproportionate to so great and strong a champion. Thus also, if an American fisherman, that is acquainted but with a canoe, should undertake, that the sun should be eclipsed on such a day seven years after, and that he will steer a vessel into this or that part of *France*, or *England*, his promises would be very unfit to be relied on, as being made by an illiterate fellow, unfurnished with abilities to make them good. But if the same things should be undertaken, though in the same space of time, by an European pilot, skilled in astronomy, and the art of navigation, it would be no credulity, to think, that he may perform his promises. You will easily believe, Gentlemen, that it were not difficult to add many instances, in confirmation of those, that I have named.

1 Samuel, xvii. 7.

Eusebius. I READILY grant it, *Justinus*, and therefore desire you to proceed.

Justinus. I SHOULD presently do it, *Eusebius*, but that I think it requisite to premise, that I hope you forget not, that in our present conference, it is supposed, that the historical part of the Gospel is recommended to us by the authority of such witnesses, as are abundantly sufficient, in the capacity of witnesses; that is, that their testimony would be without exception, if they bore witness only to things, that were (in their own nature) possible and credible. Argument II.

Manlius. AUTHADES himself would not, I presume, deny your supposition, in the equitable and cautious terms, wherein you have expressed it. And, indeed, divers learned men, that have written in behalf of the Christian religion, have sufficiently made out, that the evangelists, and other writers of the new testament, were sincere men, that delivered bonâ fide to posterity the things they believed, they saw and heard. But then *Authades* will say, that the personal qualifications of the witnesses ought not to inforce an assent to narratives repugnant to the possibility of things: and that therefore, though the witnesses may deserve to be believed on all other occasions, yet no human testimony can oblige us to believe things incredible; as all things must be, that are impossible.

Justinus. WHAT you propose, *Manlius*, as the plea of *Authades*, is, I confess, very specious. For I readily acknowledge, that the miracles and divers promises recorded in the new testament, might some of them be judged impossible, and others not credible, if they were related as passages of a natural or civil history; such as those of *Pliny*, *Tacitus*, *Thucydides*, or the like. But then we are here to consider, that both in the stupendous matters of fact recorded, and in the future events, predicted by way of promise, or menace, a divine agent is introduced, as interposing his uncontrolable power and unsearchable wisdom. And therefore we are not to pronounce the matters of fact impossible, or incredible, unless we can make it appear, that they surpass

the power of God himself, as well as that of other agents. And as for him, not only the scripture witnesseth, that Christ said, "that "with God all things are possible;" and an angel pronounces, "that with God nothing "is impossible;" but the very notion of a Being infinitely perfect, which seems to be the best idea we are able to frame of God, includes omnipotency, that is, as great and unlimited a power, as it is possible for any being to possess. And accordingly, divers of the Heathen philosophers and others were led, by the light of nature, to acknowledge in the Deity so immense a power, that one of them sticks not to say,

Matt. xix. 26. Luke i. 37.

——*Finemque potentia cœli,*
Non habet, & quicquid superi voluere, peractum est.

To which purpose, another, speaking almost in a scripture phrase, thus expresses his mind:

Esse Deum si noris, & hoc tibi scire necesse est,
Nil non posse Deum.

And *Virgil* gives God the very title the Christian creed attributes to him, where he says,

Tum pater omnipotens, &c. Virg. Georg. lib. II.

Eleuth. I think your distinction, *Justinus*, to be both well grounded and pertinent; and it may be authorised by a clause of that text you lately cited out of the Gospel. For when the disciples asked their divine master a question, which implied an objection, he answered the ground of it, by saying, that, though to the mere power of man, the thing in question was impossible, yet it was not so to God, since to him all things are possible. And the apostle *Paul* seems to have had his eye upon this distinction, when he said to king *Agrippa*, "Why should it be thought "a thing incredible with you, that God "should raise the dead?" intimating, by naming the Almighty Agent, that it was a sufficient reason, why so difficult an article, as the resurrection of the dead, ought not to be judged incredible, by those, that believed its having been revealed, or by (otherwise) most credible testimony affirmed, or brought to pass by God; as he declares, he knew that king *Agrippa* did.

Matt. xix. 26. Acts xxvi. 8. Ver. 27.

Euseb. I think this discourse of the apostle *Paul* to be no way repugnant to right reason. For he supposes the miracles he speaks of to be granted, as having been so recent and notorious; and that what the prophets delivered in the holy scriptures, was grounded on such arguments, of the same kind, and other collateral proofs, as deservedly made their authority acknowledged by *Agrippa*. So that the veracity, power, and wisdom of God were concerned to verify the truth of the resurrection. Which things being supposed, I shall not scruple to add, for confirming and compleating the argument proposed by *Eleutherius*, that it is extremely difficult for us dim-sighted mortals, to discern the utmost extent of the divine power and knowledge; and that it is therefore unfit and unsafe for us to determine it negatively.

Just. You are much in the right, *Eusebius*; for power, as we now consider it, is a relative thing, not only in reference to the effects to be produced by it, but in reference to the faculty, that is to take measure, or make an estimate of it. And in such cases as we are speaking of, I think we may look upon knowledge, or wisdom itself, as a kind of power; since a man is justly reputed able to do, not only what he can perform by his strength, or force, properly so called, but also what he can bring to pass by means of his knowledge, skill, or wisdom, guiding and regulating his force. Thus, as has been already noted, there are many things, that surpass the power of one agent, that yet are easily performed by another; nay perhaps by the same, when its potency increases. And on the other side, we plainly see, that the estimates, that are made by ignorant judges, of the power of agents of higher orders, are much too scant and derogatory. A child, that can build a house of cards, will not conceive, how an architect can build such a structure as the capitol, or *Nebuchadnezzar*'s palace; nor can he imagine, how a man can, without stirring out of his chamber, *&c.* * * * * *

But we need not descend so low as children, for instances fit for our present purpose, since even amongst men of ripe years, though of the same species, and perhaps of natural capacities very little differing, that power, which accrues to man through knowledge, enables some Europeans to do such things, as the savages of the American islands (to say nothing of thousands of country people nearer home) looked upon as to be beyond the power of men; and therefore, when they saw some, even of the least difficult sort, of those things, performed by the Spaniards, that first came among them, they took them to be beings of an order superior to men, and worshiped them as Gods. And without travelling so far as the savage and ignorant inhabitants of America, how few are they (besides those few, that are acquainted with the mathematicks) that can conceive, how an astronomer can measure the distance between the earth and the moon, or the sun; and how he can, many years before, know to an hour the time of an eclipse of the sun or moon? An inferior degree of which skill the learned and inquisitive Greeks themselves were strangers to, till *Thales*, the first of their seven wise-men, to their general admiration, gave an instance of it.

Euseb. You may, *Justinus*, add to these queries, how one, that is no gnomonist, though otherwise, perhaps, no ignorant man, but a learned one, can so skilfully place a piece of wire upon a board, as to oblige the sun, who is computed to be remote from it [21600 semidiameters of the earth, or 86051398 English miles, according to modern astronomers,] to give him an account, as often as he shines forth, of his motions and his gesses, his distance from the horizon, and many other things? and how, which is yet a more difficult question,

[See *Derham*'s Astron. Theolog.]

on, a man that never was near, or perhaps within a thousand leagues of, the country he was to go to (nor, perchance, ever was at sea before) should be able to steer a ship through the vast ocean, to a determinate port, possibly in the *East*, or in the *West-Indies*, that is not a quarter of a league broad.

Just. YOUR instances, *Eusebius*, are pertinent, and should be backed with many others, if I did not think, that those, that have been named already, may allow me to make this application of them: that since one man can so little make estimates of what another, who himself is but a man, can perform; we pur-blind mortals, that are not of the highest order of God's creatures, may justly think ourselves but incompetent judges of the extent of the power and knowledge of God, that is, of a being, that is essentially as perfect, as it is possible that any being should be, and consequently, whose power may justly be supposed to reach farther, than our limited intellects can apprehend, or for that reason, without a saucy rashness, can presume to bound. Argument III.

Euseb. THAT what you come from saying, *Justinus*, is rational, may perhaps be made appear so the better to *Torquatus*, if it be represented to him, that, though it be true, what some of his philosophical friends believe, that in the idea of a being infinitely perfect, all possible excellencies, and consequently an immense power and knowledge, are included; yet it is also true, that as to us, they are so contained there, that we men have but general and confused notions of them, and are not wont to estimate their extent, but according to the productions of them, that we observe. And experience shews those, that are attentive to it, that the most enlarged and affecting notions we have of the divine attributes, flow not from the simple idea we have of God, but from the consideration of those works and actings of his, wherein he has displayed those attributes, and from the greater or lesser capacity of our intellects, to discover and apprehend them. And for my part, the bare knowledge of this truth, that it is essential to God, to be perfectly powerful, wise, and beneficent, would never have given me such enlarged conceptions of his excellencies, as the effects of his power, in producing of his wisdom, in framing and governing the world, and of his goodness, in so richly providing for the temporal welfare and eternal happiness of men, have justly produced in me. And since, as *Justinus* has lately well observed, men, that are eminently knowing and skilful, may perform things, that unskilful men would judge unfeasible, I think it may well be supposed, that angels, who are of a higher order than men, may, by their intellectual advantages, have a far more reaching prospect of the extent of the divine power and knowledge, than we pur-blind mortals have: which, being granted, will discover more and more presumption in them, that adventure, upon the authority of their narrow notices, to circumscribe God's omnipotence, and his omniscience. * * * *

Manlius. BUT can you really think, *Justinus*, that there ought to be no limits placed to the divine power; and that there are not any things, that God himself cannot do? Argument IV.

Just. THOUGH I be much of the mind of a great person, that thought it more fit and respectful to say, that such or such things cannot be done, than that God cannot do them; yet I do not deny, that some things, that men may call bounds, may be assigned to the divine power. But then I allow these boundaries (if they may be properly so called) to be no others, than such as cannot but be admitted, unless we will teach what is manifestly repugnant to the nature either of things, or of God.

Man. I SHALL be glad to learn from you the explication and the grounds of your assertion.

Just. THERE are some notions and propositions, that are therefore impossible to be true, because they are repugnant, I say, not to the changes of the textures, or other modifications of things, but to their essential ideas, if I may so call them. As for instance, that a sphere of silver should be turned into a sphere of gold, is a thing, which though extremely difficult to be performed, yet doth not appear to be impossible absolutely speaking; because a merely mechanical change of the texture and other modifications of the small parts that compose the metal, may suffice for such a change. And so a sphere of ice may, by being thawed in a bullet-mold, be reduced into such a fluid body, as is a sphere of water. But that there can be made a cylindrical sphere of gold is impossible, because the essential ideas of those two bodies are evidently incompatible: and to give gold the necessary properties of a cylinder, the matter to be transformed must necessarily lose those of a sphere; and to make a spherical cylinder is as impossible, as to make an odd number, that may be divided into two even whole numbers, or to make a square triangle, the ideas of the subject and the attribute being manifestly inconsistent.

Eleu. GIVE me leave to add, gentlemen, that besides such notions as these, wherein the incompatibility of the subject and the attribute is manifest upon the first attentive view of them; there are other repugnancies to the nature of things, that are not so obvious, and therefore require, besides attention, some discourse to discover them, at least to others, if not to a man's self; the irreconcileable disagreement of their ideas needing now and then some little ratiocination to be discerned, or to be declared. * * *

I PROCEED now to an argument, which, though in some sense subordinate to the former, will not only strengthen it, but perhaps will by itself make a more powerful impression than it, on many, if not most, persons, as it is a sensible proof, and grounded on matters of fact. For there were divers wonders actually performed in favour of the Christian religion, by the first promulgers of it, and by some of the prophets, that of old Argument V.

made predictions, that may bear witness to the same religion, which recorded wonders already performed seem as incredible, as divers of those strange and unlikely events, some foretold, and others promising the Gospel, can justly be pretended to be, which upon that account our infidels object against as altogether unfit to be believed.

THE evangelical history records divers things relating either to God's power or his knowledge, that seem plainly supernatural, and are undoubtedly stupendous, upon the score either of the nature of the thing performed, or of the manner or circumstances of the performance. Jesus Christ is recorded to have healed the sick, cured the lame, restored sight to the blind (though born so) cleansed the lepers, and in short to have cured all manner of diseases and sicknesses among the people; and (which is much more than all that) to have raised the dead. And this he did without proper means, by his bare will, sometimes expressed by words, as when he said to the leper, "I will, be thou clean;" and when he told the centurion, "Go thy "way, and as thou hast believed, so be it "done unto thee;" upon which his servant (who was then absent) was immediately made whole: and when he said to a dead man, "Lazarus come forth:" and sometimes by means not only insufficient, but according to human estimate, contrary to the effect to be produced, as when he healed the blind man with clay and spittle: and to such instances of his power over men, we may add others of that he exercised, or that was exercised on his account over other beings. Thus he made the sea not to yield under his feet, when he walked on it himself, and made *Peter* for a while to do so: he blasted the fig-tree by his curse: he drew, without natural means, multitudes of fishes, to a place they would not come to before: and by rebuking the tempestuous winds and swelling sea, he suddenly calmed them both: he in a trice turned common water into choice wine at a feast: and more than once so feasted some thousands of people with a very few loaves and small fishes, that the fragments amounted to much more than the victuals did before he multiplied them. On his account there was such an earthquake near *Jerusalem*, as rent the rocks, in which his body was laid. In the air loud voices were heard, which in articulate words bare witness to him. And there appeared a new star, refulgent and elevated enough to draw the admiration of the eastern sages, and engage them to make a long voyage to *Jerusalem*. And in the heavens his birth was celebrated by a celestial host; and his death signalized by an eclipse of the sun, when the moon was at full. Nor was it only over inanimate creatures, that Christ's power was exercised, but also over beings of a higher order. For when he was tempted in the wilderness, good angels ministred to him; and as for the bad ones, he often ejected them in spite of their reluctancy: he restrained them from speaking, when he thought not fit to permit it: and even when numbers of them had possessed one unhappy person, he forcibly dislodged them; as when out of *Mary Magdalen* he cast seven devils; and out of a frantic man so many, that their crowd made them take upon them the name of Legion; which when expelled, were not able to enter so much as into a hog; though when they had his permission, they were able to hurry a herd of two thousand swine into the sea. Nor were the effects of Christ's knowledge less stupendous than those of his power. For he declared what was done in places he was not near; as when he told *Nathaniel* of his being under the fig-tree. He declared things past, which he had no human means to know; as when he told the Samaritan woman, (to omit other particulars which she owned to her neighbours, he had declared to her) that she had had so many husbands, and lived now with one as her husband, that was not so. He discerned the thoughts of men's hearts; and foretold such contingencies, as that such a particular disciple of his own should betray him; and that the Jews and Gentiles should conspire his death, and make it such an one as was not threatned by the Jewish laws. He foretold the destruction of *Jerusalem*, and divers forerunners and other circumstances of it. He foretold the particular manner of *Peter*'s death; and that when he had cast his angle into the sea, a fish should bite at it, which should have such a determinate piece of money in its mouth: which puts me in mind to add one circumstance of some of his predictions, which in my opinion doth wonderfully argue the greatness of his prescience, as well as of the divine power. For he foretold several things, that not only seemed to be very contingent, but were in themselves miraculous, and therefore could not have been produced by the course of human affairs, or by chance, as it is pretended of divers other things foretold by astrologers and Heathen oracles. For a mere, though strangely lucky, concourse of natural causes and accidents, might possibly produce the proposed effect. But such effects as were beyond the power of natural causes, could not be foreseen in them: such as were his own resurrection, the gift of tongues, and of curing diseases without medicines; and, which is more, of ejecting devils, *&c.* which being effects supernatural, could not be foreseen, but by the help of one, that was also able, by a supernatural power, to produce them: and therefore the Heathen astrologers and renderers of oracles wisely forbore to venture on such predictions. * * * * *

Mark i. 41, 42. Matt. viii. 13. John xi. 43. John ix. 6, 7. Matt. xiv. 25, 29. Matt. xxi. 19. John xxi. 6. Matt. viii. 26. John ii. 8, 9, 10. Matt. xiv. 17, 18, 19, 20, 21. xv. 3, 4, 5, 6, 7, 8. Matt. xxviii, 2. Matt. iii. 17. John xii. 28. Matt. ii. 1, 2. Luke ii. 13, 14. xxiii. 44, 45. Matt. iv. 11. Luke iv. 41. Luke viii. 2. Mark v. 2, 3, &c. John i. 48. John iv. 18. John xiii. 26. Mark x. 33, 34. Luk. xxiv. 7. Mat. xxiv. Mark xiii. Luke xxi. John xxi. 18, 19. Matt. xvii. 27.

Euseb. SOME of the arguments you have employed, and the very way of reasoning you have made use of, will be very acceptable to some virtuosi, that you and I are acquainted with; who think, that though such as they are liable to some particular temptations to be infidels, yet that inconvenience is more than compensated, by some peculiar advantages they have, towards believing the wonders, and expecting the promises, delivered in the Gospel. Argument VI.

Eleuch. For my part, I do not wonder, that the gentlemen you speak of should be of that mind; for in my opinion, a virtuoso, that knows how to put nature to her plunges, and can skilfully reduce her to shew her subtilty and power, must oftentimes see such things performed by her, as make him think the vulgar catalogue of impossible or incredible things to be far greater than it ought to be; he being ascertained, by trials and observations, that she is more powerful and subtil in her operations, than any thing but experience would persuade men. And yet all the admirable productions and phænomena of nature, being but the effects and results of local motion, and two or three other mechanical affections of the small parts of the universal matter, acting on one another according to settled laws; it were unreasonable to deny, that the grand author of nature, who freely, or arbitrarily established those laws, may, either by suspending, or altering them, or by a more immediate guidance of the motions of the minute parts, or greater portions of matter, or by ways as unknown to us, as those, by which he, being an incorporeal substance, can give motion to matter: a virtuoso, I say, that knows and considers these things, will easily grant, that this divine agent may, by divers ways, some of them imaginable by us, and others inconceivable to us, bring such things to pass, as the ordinary course of nature would never produce, and surpassing those, which her unassisted power could ever reach to. * * * * *

Much more should be said to confirm what has been said, if I were not afraid it would appear a digression; and therefore I shall now only add, that the observation of the various, and oftentimes admirable contrivances, and surprising fetches, whereby some created agents, or second causes, are able to pursue their ends, and bring very unlikely things to pass, does prepare the heedful naturalist to believe, that the divine and omniscient author of nature may exercise, when he thinks fit, a far more manifold and admirable wisdom, and, if I may so speak, skill, in the compassing of whatever he designs to effect or bring about. And therefore, if our experimentarian be once satisfied, that God has declared, that he will do such a thing, or that it shall come to pass, he will make no doubt, but that God will be able to make good his word.

As for the first of these objections then he will be kept from being much staggered by it, by the consideration of those supernatural experiments, commonly called miracles, that are recorded in the new testament, and were not only attested by most faithful eye-witnesses, but were so real and conspicuous, that many of them were done before the enemies of the religion, they bore witness to; and turned many of those enemies into proselytes. Now these miracles being not to be done, but by a power, that was able to controul the course of nature, or surpass her power; those supernatural phænomena are not only seals to attest the doctrine to be from God, but such instances of his power, as contained sufficient grounds to believe him able to perform what that doctrine engaged its hearers to expect. And whether or no it may be absolutely affirmed, that neither the promises, nor the menaces of the Gospel, oblige us to believe more incredible things, than the miracles that confirmed it, shew the author of it able to perform; yet at least it may be said, that what he has done is more strange, than divers of those things, that infidels would have it impossible, that he should do. * * * *

In answer to the first objection it was considered,

1. That possible, credible, and their contraries, are not absolute, but relative or respective things, and consequently, that to determine safely of them, we must consider, as well the power of the agent, as the nature of the thing recorded to have been done, or the effect promised to be produced.

2. That the historical part of the Gospel is justly supposed to have for it the authority of witnesses, abundantly sufficient in the capacity of witnesses.

3. That indeed the miracles, *&c.* recorded in the new testament would not some of them be possible, nor the rest credible, unless ascribed to the power of God, but to that they are not impossible.

4. That it is very difficult for us dim-sighted mortals to discern the extent of the divine power and knowledge, and therefore unfit and unsafe to determine it negatively.

5. [That the matters of fact recorded in the new testament do make the belief of its miracles and traditions justifiable.]

6. That a virtuoso has a peculiar disposition to believe, that things incredible to others may be possible, and that promises and menaces very unlikely may be made good.

To these things is added an answer to the surmise, that a virtuoso is inclined to refer all strange things to nature and art.

Occasional Thoughts

Belonging to the preceding conference, intended by the noble author to have been inserted in their proper places, had he completed it.

Though matter can do nothing in reference to matter, but variously move it, or stop or determine its motion, yet it will not follow, that an immaterial substance can do no more; and what it can do, must not be estimated merely by the effects of one body or portion of matter upon another; as the human soul can determine the motions of the human body, and by its union with the body (which union depends on God's arbitrary constitution) it can receive impressions from the body; so that by the divine appointment a soul and a body have each of them a power transcending that which belongs to it, on the account of its

its own nature; and consequently, it is like, that he, that gave them that power, may have a far greater.

DEISTS must, to maintain their negative creed, swallow greater improbablilities, than Christians, to maintain the positive creed of the apostles. And they must think it fitter to believe, that chance, or nature, or superstition, should perform wonderful and hardly credible things, than that the great author of nature, God, should be able to do so.

CONFERENCE II.

Justinus. I PRESUME, gentlemen, you have not forgot, that at our last meeting, we went no farther than the Examen of the first of *Authades*'s four objections: and therefore we shall now, if you think fit, proceed to the second, and without further ceremony call upon his and our friends *Manlius* for it.

Manlius. I SHALL not make you wait for it, gentlemen, but propose it thus. That the choice of a man's religion being the most important action of his life, he ought not to make it upon a less firm ground than a manifest demonstration of the truth of that, which he choses: and yet the Christian religion does not afford, or scarce dares pretend to any clear demonstrative proof of its truth, or however cannot evidence it, as may appear by this, that it is gain-sayed and disbelieved by a far greater part of mankind, than that which embraces it.

I DO not wonder, that we find not all the prime articles of our religion as clear as common notions, nor the conclusions, by which they are proved, as cogent as mathematical demonstrations. For, in my apprehensions, God, who meant, that men's faith and obedience should be, though not meritorious, yet rewardable virtues, thought fit to propose the Christian religion in such a way as may rationally satisfy honest, though prudent persons, without necessarily convincing vicious and obstinate cavillers; giving light enough to those, that are willing to walk by it in his paths, without taking away their misused liberty from those, that are resolved to shut their eyes against it; as the star, that appeared at the author of Christianity's birth, guided the wise men, that are willing to follow its directions, but could do no service to the priests and Pharisees. In short, I think the Gospel was designed to be accompanied with an evidence, that should be sufficient, without being irresistible.

To the second objection it was answered.

1. THAT since all things are not capable of being demonstrated, it is not just to require other proofs of a thing, than such, as, in case it be true, the nature of it will bear.

2. THAT if this consideration be allowable in matters physical or moral, it ought to take place much more, when the things treated of, are of a sublime, abstruse, and supernatural order.

3. THAT perhaps several points of the Christian religion would be found capable of higher proofs, than are usually urged for them, even by divines, if the Christian cause were skilfully managed.

4. THAT besides the nature of the things themselves, it is to be considered, that the design of the Christian religion ought to keep the truths from being incontestible, because God would keep faith a rewardable virtue.

5. THAT when a thing proposed to our assent is not merely speculative, but an object of choice, about which we are obliged to determine some one way, then we are not chiefly to consider, whether the proposition be convincingly proved, but whether it have great advantage of the opposite, since that, which is not sufficient to make a man sure that he chooses the truth, may yet be sufficient to satisfy him, that he makes a prudent choice.

6. THAT the plain truths of the Gospel are as plainly proveable, as, the premises considered, it is necessary (or perhaps fit) that they should be.

OCCASIONAL THOUGHTS.

THERE are some bad men, that, though very studious, may be compared to those flies, that seem very fond of courting the light, that shines in the flame of a candle, but striking it with their wings, they do things, that really tend to the extinguishing of it, but with such ill success, that instead of destroying the flame, themselves, or at least their wings, are destroyed by it.

MOST things are not so demonstrable to most men, but that arguments may be framed, as well to impugn or question, as to evince them: so that if a man have a strong aversion from such or such a truth, or a great proneness to embrace the contrary error, his corrupt affections may prevail to make his intellect afford so much attention to all the proofs, that favour an error, and may so take him off from sufficiently attending to the arguments, that shew it to be an error, or that manifest the opinion, that opposeth it to be true, that his undertakings thus biassed may really for the time assent to the error, and reject the truth, though when the mind comes to be *sui juris* again, it cannot rest in an erroneous assent, but must at length close with and submit to a light, that it cannot always resist.

SOME admirable mysteries of religion are in vain sought by those, that endeavour to find them, that they may debase or prevent them to mean or vicious purposes: as the angels, notwithstanding their distinguishing loveliness, could not be discovered by all the endeavours of the Sodomites, that sought for them to abuse them.

CON-

CONFERENCE III.

Argument I. *Justinus.* AFTER what has been said, gentlemen, before our late recess, to *Authades*'s second objection, I presume you will allow me, without spending more time upon that, to pass on to his third; which I shall therefore in your name, and with your permission, desire *Manlius* to propose.

Manlius. I SHALL do it in a few words, *Justinus*, by telling you, that, according to him, the doctrinal part of the Christian religion delivers pretended mysteries, that are not to be comprehended: which assertion, if it be true, cannot but amount to a very strong, if not insuperable, objection. For since assent, which comprehends faith, is an act of the human intellect, *Authades*, think it not reasonable, that men should believe any thing, which is not intelligible to the assenting faculty, and consequently cannot be rationally believed by it.

Justinus. I SHOULD be very little acquainted with the great propension, that our self-love and imperfections give us, to flatter ourselves, if I did not acknowledge the objection newly urged very like to be thought considerable by most, to whom it shall be proposed. But there are several things, that keep me from thinking the argument unanswerable.

AND first it may be considered, that our understandings are but dim-sighted, and our knowledge very perfect, even when they are conversant but about natural things.

Eleu. I AM apt, *Justinus*, to think, that those, who shall deny what you have asserted, have not made much trial of their skill upon difficult subjects. For though I dare not estimate the success of others in such attempts, by the discouraging one, that I have met with in those I have ventured to make; yet by the frequent confessions and complaints even of excellent writers, when their modesty is not much inferior to their learning; I find, that the best philosophers have upon full trials been made sensible, that the darkness of many things is too thick to be discussed by the dim light of their reason * * * * *

OCCASIONAL THOUGHTS.

As much as we pride ourselves in our understanding, we may daily observe, that the actions and performances of a senseless grain of corn for instance, or of a kernel of an apple, surpass our comprehension.

IT is no wonder we should be nonplussed by the creatures of God's making, or by his supernatural revelations, when we are nonplussed even by creatures of our own making, and propositions of our own devising, such as are the asymptotes of the *Hyperbola*, the *Linea Nicomedis*, &c.

Argument II. *Justinus.* WHEN I shall have advanced a little further, gentlemen, it will not be difficult to perceive, that what has been discoursed in the first argument, may well be judged to have made way for the second, the latter being little more than an application of the former. My next consideration therefore shall be this; that if there be scarce surmountable difficulties in the conception of things corporeal, it ought not to be denied, that there may be greater in the conception of things spiritual and supernatural.

Eleuther. THOUGH what you say, *Justinus*, appears very probable in itself, yet it contains something of that importance, that it may deserve to be established by a few arguments (and many it will not need.

Justinus. I AM much of your mind, *Eleutherius*, in both the things contained in what you come from saying: and therefore, as on the one side I shall propose a couple of arguments to confirm my lately mentioned consideration, so I shall confine myself to that small number too; whereof the first shall be drawn from the consideration of the abstruse nature of divers articles of religion; and the other from that of the depravedness of men. As for the first of these, there are certain natural imperfections, that belong to men as such, or at least to the generality of men, on whose account their faculties, especially as men usually employ them, are disproportionate to divers notions and propositions, that belong to theology, either natural or revealed. In the mention I just now made of our discerning faculties, I purposely said, as men usually employ them, because I have observed, that the cause of divers of the mistakes and others, that alienate many otherwise ingenious men from assenting to some sublime theological truths, and from so much as hoping to understand them, is, that they unskilfully confound two faculties, that, as they are very different, so should be very carefully distinguished, and misemploy imagination, to conceive such things, as are the proper objects of the pure intellect. But since it is like there will be occasion to say more of this hereafter, I shall now proceed in what I intended to say about the indisposition, that most men have, to understand things, that fall not under the senses, nor do appear explicable by mechanical principles. This those, that have exercised themselves in researches about the more sublime or abstruse kinds of subjects, cannot but be sensible of: and even abstracting from those theological notions and dogms, that the schools have borrowed from Christianity, and interwoven with their metaphysicks, the merely philosophical part of that science obliges the critical studiers of it to take notice of several beings, and perhaps several orders of them, that differ from the whole variety of bodies considered as bodies. In the more accurate metaphysicks, we may take notice of the great difference there is between stable and permanent beings, such as have what is essential to them all at once, and successive ones, as local motion, flames, streams, and divers other things, which being in a continual flux, enjoy their beings but as it were by parcels, being never two minutes the

the same. There we may also take notice of privations, negations, extrinsical denominations, *entia rationis* (if these be not, as some will have them, of a generical nature, comprising the three others) not to name any other metaphysical entities; in discoursing about which we are often obliged to make use of peculiar ratiocinations.

Eleuther. Give me leave, *Justinus*, to add a couple of entities, that though we do not owe to metaphysical speculations, required to be discoursed of in a peculiar way, because of their peculiar nature. Perhaps I need not tell you, that these are place and time, to which we cannot safely apply several of those ratiocinations, that hold good in bodies, and some of them in some other beings too. And yet time and place, though they exceedingly differ from each other, has each of them properties so peculiar, that the famous *Gassendus*, and divers other learned men, will not only have them to differ from all the works of nature, but to be antecedent to them; and to be of so anomalous an order, and of such vast extent, that all the ten predicaments cannot comprise them; and they are properly neither substances nor accidents, having been antecedent to the first formation of the universe; so that the world itself may be said to be but accidental to time and place, which would retain their own natures, though God should think fit to annihilate all the productions of the six days creation.

Justinus. Without entering into the Examen of the learned *Gassendus*'s particular sentiments, I think one may say, that it is manifest enough to considerers, that in mentioning time and place, you have supplied me with a couple of heteroclite beings, that may be pertinently alledged to my present purpose. And therefore I shall now proceed to speak of spirits, intelligences, or, as they are more usually called, good and bad angels, which are confessedly of an order widely differing from bodies, and superior to them, how curiously soever they are contrived, and how nobly soever they be qualified.

Now as to this kind of beings, one, that reads the numerous questions and determinations of them, that several metaphysical writers and school-divines have delivered, even about niceties and particular circumstances relating to spirits more properly so called, would indeed think, that men, who descend to such minute particularities, had clear and penetrating notions of at least the essential nature, and the principal attributes of spirits. But yet though I will not say, that these things were to the mental eyes of these writers, almost as invisible as the spirits themselves were to their bodily ones; yet I shall venture to own to you, gentlemen, that I think, that of these abstracted objects their knowledge was, and ours is, very dim and imperfect; and that we might easily discover it to be so, if we would employ about these subjects such an attention, as their sublime nature, and the properties, that distinguish them from bodies, require. Men are wont to think, that they have sufficiently declared the nature of a spirit, by defining it an immaterial substance. But this is but a negative definition, which tells you indeed, that it is not corporeal, but gives you no positive idea of so much as the principal attributes of the thing. It teaches something, but nothing near enough: and a man, that knows, that a spirit is not a body, may be as little able to form to himself an adequate or satisfying idea of an intelligence, a good angel, or a demon, as he that only knows, that a crooked line is not a strait one, can give himself a rational account of the peculiar and strange differences and affections of particular curves, such as make the ellipsis, the hyperbola, the parabola, and others.

Eusebius. He, that considers what the holy scriptures deliver about angels, good and bad, and their actions and performances, will find, that those spirits are subjects of speculation little less abstruse than they are sublime.

Justinus. You are much in the right, *Eusebius*; for a man, that will give himself the leisure and trouble of making an attentive inspection into such difficult subjects, as the nature, properties and operations of immaterial spirits, and will not acquiesce, but in clear conceptions of them, will find the difficulties of framing such conceptions scarce superable by his intellect itself, and altogether insuperable by his imagination. For since that faculty, which is called fantasy or imagination, is a corporeal faculty, and is exercised but about such things, as were introduced into the mind by the senses, or are compounded of such images, or derived from them; how can those, that will employ but their imagination, frame a conception of an immaterial spirit, which not being a corporeal substance, cannot be conveyed by the senses to the fantasy, nor truly represented by a corporeal image? But if the very nature of a spirit be not truly imaginable, how little will they be able to conceive divers properties, that belong to it, and the manner how divers of its actions are performed, whilst they employ but their imagination to frame their conceptions? And even when we speak of men in general, without confining ourselves to the over-valuers of imagination, it is very difficult for a man to conceive, how an angel, or a demon, being an incorporeal substance, can declare his thoughts to another angel? How he can, out of the air, or some other as invisible body, frame to himself, at pleasure, somewhat, that is so like a human body, that it has often been not so much as suspected to be any thing else? How he can make this assumed body appear and disappear at pleasure? How, whilst he is in some manner scarce explicable by us men united to it, he can move from place to place, and speak, and descend, like a body devoid of gravity, and put this body into a flame, without being injured by it, as happened in the case of the angel, that appeared to *Manoah?* How he can perform things, that require so much power, as an angel exercised, when in one night he destroyed about 180000 soldiers in the Assyrian camp; and

and Satan, when God permitted him, displayed in the great fire, that fell from heaven, and consumed *Job*'s cattle, and those that kept and guarded them; and the prodigious storm, that overthrew the house, where all his children were feasting, and buried them in its ruins?

Eusebius. THOUGH these are unaccountable things, that you have mentioned, about angels and demons, yet the scripture delivers many others, either by way of history, or dogmatically, that are disproportionate to our discerning faculties. And if we should but take notice of the many passages, that are to be met with in the book of *Daniel*, and in the Apocalypse, that speak wonderful things of angels, it would abundantly evince what *Justinus* has asserted.

Eleuther. YOU may, I think, save yourself that trouble, *Eusebius*, since those, that read the scriptures with any kind of attention, and make reflections on the passages, that speak of angels and their operations, will easily find their faculties distressed by such inexplicable things. And therefore, though *Torquatus* admitting the authority of the holy scripture, it was allowable for *Justinus* and *Eusebius* to make use of the passages in it, that relate to angels good and bad; yet perhaps it will be more proper, to consider a little that order of beings we call spirits, as it has been acknowledged by Heathen philosophers, instructed only by the light of natural reason. And because *Aristotle* may be justly looked upon as a philosopher, that whatever he do in his exoteric, or more popular writings, does, at least in his acroamatic or accurate ones, ascribe almost all to nature, and very little to God, as an agent distinct from her; I wave the mention of the opinions of the Platonists and Pythagoreans, who were much more inquisitive than he into the nature and kinds of spirits, and have treated more distinctly of them: I shall only take notice of some things, that *Aristotle* himself teaches about them. For you know he admits invisible beings, that he calls intelligences, which he makes to be separated from matter, and to be the movers of the celestial orbs. And if he did indeed acknowledge one supreme God, as most of his interpreters, and some other learned men, maintain he did, I shall take the liberty to add, to the intelligences, that moved the planets, a sort of rational beings, that he seems to place above them, and indeed beyond the utmost limits of the world. *Demonstratum est*, says he, referring to the precedent discourse, *extra cœlum nec esse corpus, nec etiam esse posse. Patet ergo* (he continues) *neque locum extra cœlum esse, neque vacuum, neque tempus.* To which perplexing passage he subjoins an inference, which he seems to me to apply plainly enough to a kind of beings, differing, at least in order and nobleness, from such intelligences as his followers are wont to mean, when they speak of the Aristotelian spirits. For these are mundane intelligences (if I may so call them for distinction sake,) whose constant, and, for ought appears, only work it is, incessantly to move the celestial orbs; whereas those ultra-mundane intelligences, or rather divine spirits, of which I am going to give you his words, are above the highest heaven, and are not busied in keeping bodies in motion. *Quocirca* (which word shews the connexion of the following inference with the words above recited out of him) *neque apta sunt ea, quæ illic sunt, esse in loco, neque tempus senescere ipsa facit, neque ullius eorum ulla est mutatio, quæ super extima disposita sunt latione: sed nullis alterationibus, nullis passionibus prorsus subjecta optimam in universa sempiternitate vitam & sufficientissimam habent.*

Arist. de Cælo, L. 1. c. 10.

AND now, I suppose, you will allow, that I might observe, that by his way of mentioning the newly named ultra-mundane beings, *Aristotle* sufficiently intimates, that there are substances, which should be discoursed of, in a particular way, that is not required, when we discourse of the other beings of the universe; especially since he not only makes them unchangable, but will not allow them to be so much as subject to time. But without too far pressing these difficulties, I shall represent to you, that partly concerning celestial intelligences, and partly about his superceleſtial spirits, *Aristotle* delivered such things, as are no less difficult to be conceived, than almost any of the mysterious articles of religion, that *Torquatus* reproaches as incredible, on the account of their being inconceptible.

Manlius. I SHALL be glad to hear your reasons for this assertion.

Eleuth. I WAS just going to subjoin some of the principal of them.

AND first, since these intelligences are separate beings, and on this account immaterial, as on the former rational, all the puzzling difficulties, that attend the notion of an incorporeal and intelligent spirit, as such, must be accounted for by him, that will maintain *Aristotle*'s doctrine. And how great and perplexing these difficulties are, especially to those that think we can understand but what we can imagine, has partly been intimated already, and may, if it be required, be farther shewn.

ANOTHER of these difficulties is afforded by the consideration of what I am next to mention. For *Aristotle* will have his intelligences to be the movers of the celestial orbs. But how an immaterial substance, that is, one that has no parts, wherewith it can lay hold on or touch a body, and either impel or draw it, can set it a moving, and keep it for many ages in a constant and regular, though stupendously rapid, motion, is a thing, that I fear will long remain unconceivable, at least to those, that expect to have clear ideas and proofs of what they are to acquiesce in. Not to add to this difficulty, that of believing, that a single intelligence should have so stupendous a power, as to move with an amazing swiftness so vast an orb, as that, for instance, of Saturn; which orb may be I know not how many millions of times bigger than the terraqueous globe, to which we usually give the title of world.

If it were not to be too boldly inquisitive, I would gladly demand; whether these intelligences had any origin or not? and if they had, when, and from whom they had it? For since *Aristotle* will have the universe, and consequently the heavens, to be eternal, and the celestial orbs to be moved from west to east, but by these intelligences, these spirits must have been eternal too: and if so, they seem to be self-existent beings; and being also immortal, intelligent, and of vast power, what should hinder, but that *Aristotle*, and those that espouse his sentiments, must look on them as so many gods? And then not only polytheism must be allowed, but all the difficulties, how insuperable soever, that have been, or may be objected against the plurality of gods, must be surmounted; and an account must be given, by whom an eternal, wise, and powerful spirit, could have limits placed to its excellencies? And why it should be confined to a province, like that of the conduct of a single orb, and to do nothing in this orb it self, but to keep it in a constant and unvaried motion? But if it be said, that these intelligences were not self-existent beings, they must have been created by a higher being; and how so noble a substance as an intelligence, which far surpasses in excellency the noblest parts of all the corporeal universe, can be produced out of nothing, what proof soever may be brought for it, who can conceive?

In the third place, not to mention, that *Aristotle* will not allow, that without the visible heavens there is either place or vacuum, (though how both these together can be excluded, is somewhat difficult to conceive,) I observe, that he will have it, that his ultramundane spirits are not in any place; which prerogative belonging to them upon the account of their being immaterial spirits, ought not to be denied to those intelligences, that move the orbs, and consequently the planets, which being sometimes above the earth, and sometimes beneath it, and having very differing aspects, as trine, quadrate, opposition, *&c.* in reference to one another, either the spirits must move together with the planets they keep a moving, and so be sometimes in one place, and sometimes in another, which argues them subject to locality; or else they must move the celestial bodies, without being present with them, and operate where they are not; which, how they should be capable of doing, he that is able to conceive, may, if he set his mind to it, find less obscurity in divers of the mysteries of religion. * * * *

Just. I doubt not, *Eleutherius*, but you can make further reflections, on the difficulties, that are involved in this doctrine of *Aristotle*, concerning intelligences celestial or divine. But perhaps our friend *Manlius* may be easier convinced of the abstruse nature and actions of immaterial spirits, if we give him an instance of it in that rank or order of these beings, that is generally looked upon as not the most sublime, and which we have the greatest opportunities to be well acquainted with.

Eluther. I shall need to express my approbation of the expedient you propose, only by desiring you, as I earnestly do, to enlarge upon it.

Just. Encouraged then by so favourable a permission, I shall represent to *Manlius* two things. The first is, that, as you just now truly hinted, the rational soul or human mind is, of all the incorporeal substances, that which we have the means, as well as interest, to know the best; since it is not only a familiar object, but so intimate, as to be the noblest part of ourselves; and that the chief, not to say the only thing, that is essential to it, and in a sound sense constitutes its nature, is, that it is conscious to its own actions and operations, and that, at least for the most part, not as it knows the circulation of the blood in the veins, or the secretion of gall in the liver, by a ratiocination upon sensible phænomena, but immediately by an internal sense or perception.

And to this first I shall add my second reflection, whose nature makes it require a longer discourse; that, notwithstanding these great and peculiar advantages, we have for the knowledge of the faculties and operations of our own minds, yet the human soul is a mystery even to herself, and in the speculation of it, she is easily able to discover difficulties, which she is very little able to clear. * * * *

OCCASIONAL THOUGHTS.

When I say, that a spirit is incorporeal substance, he that I speak to needs not employ (nor indeed properly can employ) his imagination, to form the notion or idea I would excite in his mind. And if he should answer, that when he hears the words incorporeal substance, he imagines some aerial or other very thin subtil and transparent body, I shall reply, that this comes from a vicious custom he has brought himself to, of imagining something whenever he will conceive any thing, though of a nature uncapable of being truly represented by any image in the fancy. But if I shall add, that a spirit is a substance indivisible, the portion of air or æther, by which he lately endeavoured to represent to himself a spirit, will be altogether improper; since neither the air, nor any other body, can be imagined without extension, and therefore without divisibility (actual or mental); and consequently this phantasm, whatever it be, cannot (in sound philosophy) be a true notion or idea of a spirit, which is (or as it is) a substance indivisible into parts. [Whether there be any necessity that a corporeal idea, or an image drawn on the fancy, should intervene to frame the conception, when we say, *ex nihilo nihil fit?*]

Because the use of imagining, whenever we would conceive things, is so stubborn an impediment to the free actings of the mind, in cases that require pure intellection; it will be very useful, if not necessary, to accustom ourselves not to be startled or frighted with every thing, that exceeds, or confounds, the imagina-

imagination; but by degrees to train up the mind (if I may so speak) to consider notions, that surpass the imagination, and yet are demonstrable by reason. Thus, though we can scarce represent to ourselves the sun much bigger than he is wont to appear to our eyes, yet astronomy compels us to have a quite other idea of its magnitude, by shewing us, that it many times exceeds that of the whole earth. And so, when looking upon the side and diagonal of a square, we are wont to imagine it an easy thing, to assign some known measure, that being so many times taken, will exactly measure both those lines, and shew their rational proportion: and yet a mind accustomed to geometrical demonstrations will be convinced, that among a million of different quantities, no one, that can adequately measure the shorter of these two lines, will likewise measure the longer; though this proposition be a paradox, that quite puzzles and surpasses the imaginative faculty.

When we discourse of infiniteness, or of almost any thing or any subject, to which it may belong, we usually deceive ourselves, and mistake the first grand objection we meet with, for the only we are to surmount: whereas we shall often find, that the solution of one difficulty about infinity starts others, and new ones, which may perhaps be found more perplexing, than that we first encountered.

Divers (for I cannot say all) of those school philosophers, and others, that plead so earnestly for the necessity of the rational souls (or the minds) contemplating, or making use of phantasms in all its intellectual operations, have not perhaps well considered, that themselves deny not, that, in extacies, the mind does (at least sometimes) act without turning herself to corporeal phantasms. And since both *Aristotle* and his followers allowed immaterial intelligences, such as they supposed to move the celestial orbs, it would be hard for them to deny, that these incorporeal spirits can act without the help of corporeal images. And this consideration will hold against those Christian philosophers and divines, who, whether or no they admit the celestial motors, newly mentioned, do believe, that there are angels, in the received notion of that name.

Argument III.

Eleuth. I presume, *Justinus*, that your concern for the truth you maintain, will keep you from being offended, if I add, in favour of it, that, in my opinion, divers things are thought unintelligible; only because they are not clearly proposed, and dexterously explicated.

Just. You need not doubt, *Eleutherius*, that I shall willingly admit, or rather welcome, so good a second; and I have great disposition to assent to the judicious reflection you have offered: which therefore you have not only my consent, but my desire, to illustrate.

Eleuth. I conceive then, that divers mysteries and other articles of the Christian religion would meet with much less opposition among men of parts, if they were warily and dextrously proposed. For oftentimes the difficulty does not lie so much in the thing itself that is revealed, as in the additions of schoolmen, and others, that pass for men versed in philosophy or other learning, have unskilfully or needlessly affixed to it. Thus they have given us such notions of eternity, as it will be very hard for considerative men to comprehend or admit, and which are incumbered with difficulties, that I doubt are scarcely, if at all, superable: and yet these may be avoided, if without affecting mysteries unwarranted by scripture, and nice speculations, that are as well unnecessary as perplexing; it were simply declared, what, without incongruity to revelation, right reason may lead us to think of the true notion of eternity. And how much the skilful or unskilful way of proposing a doctrine, may help to recommend or discommend it to a discerning man, I think may be guessed at by some things purely physical; as when the Peripatetics tells us of a *materia prima*, that is devoid of all forms, nay, and is *neque quid, neque quale, neque quantum, &c.* they would impose upon the understanding a thing, that is liable to insuperable difficulties and objections. Whereas if we look upon matter, as being only a substance extended and impenetrable, which by means of motion is capable of being divided and variously modified, those puzzling difficulties may easily be avoided. And so when vulgar philosophers assert, that particular bodies, as a plant, a meteor, a metal, *&c.* does each of them consist of the common matter and a peculiar form, they say nothing, that may not be admitted, even by true philosophers. But when they will have these forms, that are but essential, to be substantial, as they call them, and yet neither material nor incorporeal substances; and when they will attribute to them such ways of being produced, and of inexisting, and of operating, as the schools lay so much stress on, they incumber the notion of a form with superfluous things, that make it not only unintelligible, but inconsistent with some of their own doctrines, or with the obvious dictates of reason. Divers intricate questions in theology about man's free will, and the operations of the intellect upon the will, and of the will upon the intellect, may probably, as I have elsewhere shewn, be avoided, by giving such a notion of the freedom of the rational soul, as justly owns its dependance on the first cause, but does not suppose the understanding and the will to be true faculties, really distinct from each other, and from the mind they belong to, which may determine itself from within immediately, or without the intervention of faculties, as the generality of divines think it necessary to acknowledge God to do.

* * * *

The second of the two things I formerly mentioned, as those, that induced some men of parts to quarrel with the Christian religion, as delivering some things, that are unconceivable, is a moral indisposition to admit the religion in general, and especially those mysterious articles of it, that they complain of, as not

not intelligible. To this indisposition many more things may contribute, than I have now time to mention; for which reason I shall take notice, and that but very briefly of three, that seem to be the most ordinary, and may be reckoned too among the principal.

And first, it is but too easy to observe, that many, that complain of the obscurity of several points of the Christian religion, are such, as will not give themselves the trouble of such a serious application of mind, as is for the most part necessary to the successful study of difficult truths. For these require both attention and patience to persevere long enough in that attention, which are things, whereto the lazy or fastidious enquirers I speak of, are generally strangers, being of *Pilate*'s temper, who, when he had disdainfully enquired of him, that was abler than any man in the world to inform him, what is truth, applied himself to other things without staying for an answer. These and the like reflections may keep us from concluding, that every article of religion is unconceivable, that is censured as such, by men, that do not think it worth their pains to exercise that application of mind in the scrutiny of them, that is necessary to discover, whether they be really intelligible or not. And this conclusion will appear very reasonable to him, that having had the patience and skill to examine the demonstrations of the tenth book of *Euclid*, and those of some propositions delivered by *Archimedes*, *Apollonius*, *Pergæus*, and *Pappus*, shall consider what great and lasting application of mind was necessary even to those sublime wits, to attain to such uncommon truths; and how unreasonable it is to think, that nothing can be a truth, that may not be easily discovered to be so, especially by such men, as like too many of those I have been speaking of, have so accustomed themselves to study nothing but historical, poetical, or such other kinds of books, that do as much recreate as exercise the mind, have by an ill habit made themselves no less unfit for difficult speculations, than they are unwilling to go through with them; which it cannot well be hoped such men should do, that undervaluing the plain and perspicuous doctrines of religion, show, that they think the abstruse ones not worth the trouble of a laborious scrutiny. * * * *

Justinus. The other thing, that I had to represent about the objection of those, that censure some articles of our religion on this account, that they cannot conceive them, is, that divers of these articles are not unconceivable to them, that are duly qualified to penetrate the darker sort of truths: and that one main reason (for others are mentioned in this conference) why these censorious persons find themselves unable to conceive, is, because they will needs attempt to do it, without acquainting themselves with those disciplines, or being furnished with those previous notices, that are necessary by way of preparation, to fit the mind for the understanding of such abstruse things.

Euseb. I think your reflection so just, that I have often considered, not without some indignation, the arrogance of several superficial wits, whose presumption and laziness so far exceeds their patience and industry, that they think they have a right to pronounce all truths, whether theological or philosophical, unintelligible, that cannot at the first attempt be comprehended, by the mere effort of their intellects, without being previously assisted by proper informations. * * * *

Justinus. I think we may, not unusefully with regard to our present purpose, distinguish truths into two sorts. For there are some, that are of a more obvious, or at least a more easily attainable kind, as lying nearer to the principles, from which they may be deduced, or to some other collateral proofs, from whence they may be inferred. And there are other truths of a more difficult discovery and penetration, because they either lye much more remote from the spring head, if I may so speak, or the fundamental principles they depend on, and therefore require a chain of mediums to infer them by, or else require to be expressed in such terms of art, as a man will not understand without previous instruction, and an intellect capable of comprehending more than obvious or easy truths.

To illustrate this a little, by what is observed about the noblest and most conspicuous inanimate body in the world; when a man desires to understand, how the sun comes to be sometimes eclipsed, one may quickly satisfy him, by telling him, that at those times the opacous body of the moon, happening to be interposed between the sun and the earth, keeps those beams of his, by which it should be enlightened, from falling on it. And if the enquirer will further know, why the sun never, without a miracle, suffers eclipses but at the new moon, the answer needs be but short, namely, that she can never at other times directly interpose between the sun and the earth. But if the same enquirer would understand, how it comes to pass, that within the compass of a year, there are but few months, wherein eclipses happen at the new moon, in comparison of those, wherein the conjunction of the sun and moon produces no eclipses; the querist cannot be so easily resolved about this question, as about either of the foregoing; because the solution of the difficulty depends upon some knowledge of the motions of the moon with relation to the ecliptic, which is peculiar to astronomers. And if he further desire to understand, why the days are so much longer in June than they are in December? Why at the same times of the year they are much longer in some countries than in others? Why the crepusculum or twilight lasts very much longer in the midst of June, than in that of September? Why in some countries the sun by his presence and absence makes the days and nights always equal throughout the year; whereas in some others it makes a day of one, two, or three months long, and a night of the same duration? If I say, our enquirer

enquirer would understand these and the like things, or any of them, he cannot be made to do it by a short answer, expressed in the common forms of speech, but he must take the pains to learn the elements of astronomy, and the terms employed by those that teach it. * * * * *

* * * It is far from being all one, to consider a proposition as an absolute one, and to consider it as part of a system, where it is linked, and as it were enchaced with others, that are manifestly true, or granted, or demonstrable: as also there is a great difference, whether a proposition have premised to it what mathematicians call lemmata (that is truths previously demonstrated) purposely to clear it or not. For a thing considered in itself may seem false, or very unfit to be believed; which yet, when it is legitimately deduced from other truths, or is shown to have a strict connexion with them, ought for their sakes to be freely admitted. So that though it might be credulity to have assented to the solitary proposition, yet it is not credulity, but a rational belief, to assent to the proposition, when it is contained in manifest truths, or deducible from them. We must indeed judge first of the touchstone; but if we acquiesce in that, we must then judge by it. * * *

Argument IV. * * * If to what I have hitherto discoursed it be objected, that if any article of faith surpass our reason, however we may pretend to believe it, we really do not consider what we say. For faith is an assent to a revealed proposition upon the authority of the revealer: and since every assent (at least every rational one) either is, or includes an act of the understanding, which presupposes a knowledge of the thing assented to, we cannot possibly assent to, nor consequently believe any thing, that we do not understand, or have not a notion of.

This objection, I confess, is specious and considerable, but does not overthrow the discourse it oppugns. And to invalidate it, I must take leave to propose a distinction, which, though perhaps it may seem new, will not, I hope, appear either groundless or useless. I think then, that there are two kinds of notion, that men have of the same thing, or two degrees of knowledge about it: the first I call superficial or popular, the other accurate and satisfying.

Vid. reflect. on a Theolog. Distinct. §. 14.

By the former I mean such a conception of a thing, as suffices to discriminate it from other things, and give it a distinguishing appellation; though really the person, that has this notion, may not have attentively considered the object of it, and much less have fully penetrated its nature, and become able to give himself a well grounded satisfaction concerning the difficulties, that may occur about it.

And by the latter kind of notions, I mean those, that are accompanied with a great insight into the nature of the thing, one contemplates, together with the ability to give a rational account of the difficulties, wherewith the conception one embraces, appears, or may be shewn to be incumbered. These differing conceptions of the same thing may, I think, be illustrated and exemplified by the conceptions we have of time, place, local motion, continual quantity, and some few other things, that may be called primordial or primary, in respect of almost all the other things we are wont to treat of. For when, for instance, we talk of space, or place, we do not speak like parrots, in whom the words are not accompanied with any idea answerable to the thing spoken of. For we have a superficial notion of it, by which we distinguish it from time and motion, and convey the like notion to those that hear us; and so are able to understand one another, and make use of these popular, though but confused conceptions, to divers useful purposes. But then, if we go about to pry narrowly, and dive deep into the matter, we shall find the nature of space to be a very abstruse thing, and even the most received notions about it, to be liable to such difficulties and objections as are exceeding hard to be solved, if they be not altogether unanswerable by our imperfect reason; as those will scarce deny, that have, with me, attentively and impartially considered this subject. * * *

Vid. reflect. on a Theolog. Distinct. §. 16.

And I must here take leave to consider what is not wont to be observed, even by philosophers or divines; that there are two senses, if I may so call them, in which it may be said, that a thing is unconceivable, or implies things repugnant to the dictates of reason. For some things, &c. [Vide Reflect. upon a Theolog. Distinct. Sect. XII.]

* * * * And I shall add, that as for that most familiar thing, local motion, though modern, as well as ancient philosophers, and mathematicians have bestowed much time, and great pains, to explicate the nature of it; yet by arguing even about a thing, that those, who have not examined it, presume they know very well, we may bring our understandings into perplexities, from whence they will scarce be able to extricate themselves, &c. [Vide Reflections on a Theolog. Dictinction, &c. Sect. XXVII.]

* * * * Though in common discourse, it is usual enough to employ promiscuously the words unintelligible or inconceivable, incomprehensible, and incredible; and though I also do not always scruple to comply with custom in use of these terms, where there is no need of accurateness or nicety: yet on occasions, that require, that a man be critical in his expressions, I think it very fit and useful, to avoid confounding these terms; which on such occasions challenge distinct notions. By the word therefore inconceivable, or unintelligible, may be understood such a thing, as we cannot frame an idea or conception of, that is not either self-destructive (as having one part inconsistent with another); or else clearly repugnant to some manifest and acknowledged truth, whether taught us by meer reason, or by natural reason assisted by revelation. By incomprehensible may be meant such a thing, as, though

though we may frame symmetrical ideas of it (*i. e.*) such as are consistent within themselves, and not repugnant to any known truth; do yet contain or involve divers things, that we are not able throughly to penetrate, and perfectly to understand. And by incredible things, may be understood those, which, whether or no they belong to either of the former sorts, are not accompanied with such evidence of reason, as either do not probably, or at least do not sufficiently prove their truth, notwithstanding the objections, that seem to make them altogether unfit to be assented to. * * *

THE other, and indeed the grand objection, by which philosophical adversaries endeavour to shake the faith of Christian philosophers, is, that the Christian religion enjoins the belief of some mysteries, that are incomprehensible. " For first, a man can scarce have been very well versed in the mysteries of nature, without having met with some things, if not many, so abstruse, as to reduce him to a sense or internal confession, of his being unable fully to comprehend them. And though a skilful mechanical philosopher may plausibly explicate many of these difficult phænomena in a general way, so as to shew, that they may be possibly produced, according to mechanical principles; yet the particular modus continues in the dark; and even the general explications suppose such a fabrick of the world, and such an origin, and such laws of motion, as involve difficulties, that confound our weak understandings."

BUT without further pressing this, let me add in the next place, " that if a free and impartial philosophiser have given his understanding the noble exercise of endeavouring to penetrate the obscurity and difficulties, that attend what opinion soever is pitched upon, about the endless divisibility of quantity, the infinity of space or extension, and the eternity either of God or of matter, he will (as far as I can judge, by what has happened to me, and divers others) sufficiently be convinced by his own experience, that they are disproportionate to our understandings. And he may also sensibly find, by studying the sacred writings, that it was fit, that some things of that sort should be declared by God, concerning his own nature, and his unparallelled manner of existing and of operating. And therefore he will not be seduced from believing a mystery, by its being incomprehensible, if the force of the proofs, that recommend it to his belief, be not so, but on the contrary be clear and cogent; such as the proofs of a doctrine perspicuously delivered in the holy scripture must appear to all those unbiassed men, that are satisfied of that book's having a truly divine authority. So that, on one hand, a man's own experience may assure him, that there may be truths incomprehensible to his reason: and on the other hand, the most authentically conveyed testimony of others, who wrought or recorded the miracles mentioned in the Gospel, may assure him, that he may safely, notwithstanding their incomprehensibleness, believe those mysteries, that such supernatural experiments bear witness to." * * *

* * * THOUGH we know the more of any object, and so of God, the more of his properties or attributes we are acquainted with; yet this augmentation of knowledge is itself a mark and effect of the imperfection of it: since those differing conceptions of a divine object, whose nature is most simple, flow from the incapacity of our limited and imperfect understandings, to frame a conception, that shall comprehend the infinitely perfect nature of God in one single and simple idea; and therefore we are reduced to consider and represent him, as it were in parts; contemplating him sometimes as omnipotent, and sometimes as wise, and sometimes as just, *&c.*

THERE are divers definitions, which, as they are commonly framed, are taken from the things defined, as they are found in the creatures; and on that score these definitions are not to be accounted true, full, and absolute ones, and are often erroneously applied to God and to divine things. But if the definition were made in its due and full extent, it might perhaps be applicable, though not adequate, to God, *&c.* * * *

AND on this occasion give me leave to tell you, that even setting aside God (whom those, that acknowledge him, will confess to be incomprehensible) I fear, we men have too good a conceit of ourselves, when we think, that no such thing can have an existence, or at least have a nature or being, as we are not able to comprehend. For if we believe God to be the author of things, it is rational to conceive, that he may have made them commensurate, rather to his own designs in them, than to the notions we men may best be able to frame of them. On which occasion I would crave leave to represent, that it appears by the history of the creation, that the world itself was first made before the contemplator of it, man: whence we may learn, that the author of nature consulted not, in the production of things, with human capacities; but first made things in such manner, as he was pleased to think fit, and afterwards left human understandings to speculate as well as they could upon those corporeal, as well as other things. And if the world were not made by God, but was eternal, as the old Peripateticks thought it; or was made by chance, as the Epicureans held; there is yet less reason to believe, that there is any necessity, that the nature of primitive things must be commensurate to our understandings; or that in the origin of other things any regard was had, whether they would, or would not, prove comprehensible to men. * * * *

* * * * * THERE is no necessity, that intelligibility to a human understanding should be necessary to the truth or existence of a thing, any more than that visibility to a human eye should be necessary to the existence of an atom, or of a corpuscle of air, or of the effluviums of a loadstone, or of the fragrant exhalations of a rose. And here we may Argument V.

may observe, that even by the same sense some creatures may discern things, that may not be perceptible to others: as no attention or application of the organ (or the nose) will enable a man to perceive the effluvia expiring from the stale footsteps of a hunted and unseen hare, or deer; though hounds, and especially blood-hounds, will have a vivid perception of such odours, and by their help trace and persue the flying and unseen beast. * * * *

THERE are, as I conceive, two differing accounts, upon which things may be said to be incomprehensible. For first, some things there are, which seem not in their own nature to be beyond the comprehension of a human intellect absolutely considered, or in its full extent; and which are not comprehended by us, but either because they are not propounded and declared in as intelligible a way as they might be; or else because we want fit mediums to raise and enlighten the mind, as far as it is capable of being assisted, and as far as the sublimity or abstrusenes of the object requires. Thus the satellites of Jupiter, and the separate stars, that all of them together make the milky way, are not discernible by our naked eye, only because they are not qualified to receive beams enough of light to make the particular stars visible, and yet the same eyes can manifestly and distinctly see them, when they are assisted by a good telescope; which medium those that are destitute of, can no otherwise than in vain strive to discern such remote though luminous objects. But there is also, I conceive, another sort of things incomprehensible, which are so, not out of a want of means to declare them to us, as far as we are able to be informed, but out of a want or capacity, or, if you please, of extent and penetration, that belongs to the mind itself, as it is of no higher an order of intellectual beings than human souls are. So that whatever pains be taken to instruct the understanding about some mysteries, its own limited and imperfect nature will keep it from a full comprehension of them. An analogical instance of this may be taken from the limitedness of our power to discern sensible objects, what attention or application soever we employ about them. Thus for instance, if a marble cube (or dye) of an inch every way be brought me, I can easily by my fingers, though my eyes are shut, perceive the figure of it to be cubical: and so I can, if a cube of but half, or perhaps a quarter, as great a bulk, be put into my hands, that I may find the figure of it. But if a heap of very fine powder of marble be brought me, I can by no attention and diligence in feeling, discern the figure of those very minute grains of stone, that may chance to be cubical, or that of these other single grains of powder, that are not so; because I cannot grasp one of these with my hands, as I could do the first or second entire cube, nor apply my fingers to its little faces and angles, so as to perceive what distinct shape it is of. And thus, though the eye cannot without help discern the eggs of a cheese mite, or the hair, that grows on the moving speck; and though by the help of a good microscope the eye may plainly discover them; yet no microscope will enable it to see the minutest corpuscles, that compose a great part of the air, nor the eel-like particles, that the Cartesians think water to consist of; because the fibres, or other parts of the retina, or of the principal part of that organ that vision is made upon, are not fine and tender enough to be moved and affected by such very minute particles, as those we are speaking of. So that the invisibility of these does not proceed from the want of instruments, or helps of vision, but from the original imperfection or disability of the eye itself, which in its own natural constitution, though industriously assisted, is disproportionate to the objects attempted to be clearly discovered by it. * * * * *

OCCASIONAL THOUGHTS.

IN my opinion it is both strange and unjust, that our quarrellers with religion should require, that we, that embrace it, should give them clear and direct solutions of all the difficulties, which (perhaps not without racking their wits to find them) they are able to object against theological mysteries, whilst in the mean time themselves are not able to give a satisfactory account of the difficulties, that attend the distinct explication of merely corporeal, and perhaps too very familiar subjects. Insomuch, that those very men rigorously exact, that we should explain to them the mysteries of the Trinity, or the incarnation of the second person of it, that cannot clearly shew, what keeps the parts of the least portion of matter together, or how, when they have a mind to speak, their own souls can direct the animal spirits to all the little organs, that are necessary to the formation of a vocal discourse, without knowing, how the vocal organs are framed and seated, or perhaps so much as, whether they have this or that particular muscle (for instance) in their body or not.

THOUGH God may oblige us to believe propositions, that contain something, that is incomprehensible to us, yet he obliges us but to believe, not to understand them, that is to assent to a proposition as true, because he asserts it, but not to have a clear and determinate notion of the nature of the subject; or at least such a one as is free from perplexing, if not insuperable difficulties.

BECAUSE there belongs to numbers a kind of infinity, or somewhat, that is near of kin to it, we must, if we want not attention or skill, discover by the incompetency of our utmost endeavours the boundedness of our human understandings; since when we have proposed a determinate number as great as we are able to ascend to, yet we are sensible, that it is not absolutely the greatest of numbers, since it may be augmented by the addition of an unite, or an aggregate of unites.

We must not suppose, that at least in our present state, our reason and other faculties are given us, to reach all things, that are knowable, even as to corporeal creatures; but only things, that are in such a sphere of intelligibility, that they are proportioned to our present faculties, and convenient for our notice in our present state or condition. As our eyes are not given us to see all that is visible, and might be discovered by us, in case they were framed, sometimes like telescopes, and sometimes like microscopes; but to discover those visible objects which are not so very minute, or so remote from us, but that it may concern us in point of safety or welfare, to discern and distinguish their bulk, distance, figure, colour, *&c.*

Argument VI. *Justinus.* There is, gentlemen, another reflection, that I must by no means leave unmentioned, before I dismiss *Authades*'s third objection. For whereas most of the grand difficulties in Christianity, whose abstruseness is wont to offend such as he, are afforded by some things, that are in the holy scripture delivered about God's nature, and some of his attributes; and about some ways of acting, that are, together with their strange effects, ascribed to him: to remove, I say, or lessen these difficulties, I consider and represent, that, "since God is a most singular being, it "may be justly thought, that many things "may belong to him, or may be truly said of "his attributes and operations, that are in-"explicable and unmatched."

This will appear the more probable, if we consider, that though we have abundant cause to believe, that God is by unmeasurable degrees superior to his works; yet there are many of his creatures, and things, that depend on him, that have a very peculiar, and (if I may so call it) monadical nature, which makes them very different from all the other beings we are acquainted with. * * * *

* * * That some rules, that reach to all the creatures they are capable of being applied to, will not hold in God, may appear by this, that though essence and existence are different or separable things in created beings, they are not so in God. And though even the rational soul (or mind) is, according to divines and philosophers, indowed with faculties properly so called, and distinguishable from its essence, yet in God it is generally acknowledged to be otherwise, according to that received axiom; *Quicquid est in Deo, Deus est.*

* * * And therefore we are not to wonder or be startled, if a nature so sublime, and in divers points so unparallel as that of God, cannot be thoroughly explained or illustrated by any other, upon the score of a competent resemblance; and cannot be fully comprehended by a faculty so disproportionate unto it, as is our human intellect; which yet is so much more limited in its nature, than it is usually in its presumption, that in most men, what it is not able clearly to understand, it is forward to reject and cavil at. And the same sublimity and abstruseness of the divine nature, which provokes this arrogance of the intellect, does supply it with very plausible arguments to make this arrogance appear rea-reasonable; since the difficulties, that incumber the theories of monadical and primary beings, whose nature is much less remote from, and far less disproportionate to our faculties, than that of God is, have some of them proved insuperable to human reason.

I come now to the last consideration I shall employ to induce you to think, that divine mysteries, such as Christians acknowledge to be here and there recorded in the scripture, are to be assented to, though we cannot fully conceive them. For since we have lately seen that even the best philosophers themselves confess, that there are some truths, which our bounded reason is not able fully to comprehend, we ought not to think it incongruous, or incredible, that divers things relating to God's nature, and some others relating to his attributes, decrees and actings, should not be fully comprehended by us; for here I consider, that, before it pleased God, out of his exuberant goodness, to make some communications of himself *ad extra*, he was not only a singular, but the single being, there being no real one, besides himself. And so when he was pleased to create other beings, as he did it freely and uncompelled, so he gave to each of those he created such a nature, and such determinate faculties and powers as he pleased. And of the beings, which he created intelligent, among which are the rational minds of men, he endowed each sort or order with such a measure or degree of the intellectual faculty, as he thought fit, for the ends and purposes, for which in his infinite wisdom he created them; but to none of these did he impart a knowledge boundless as his own, that infinite knowledge being the essential prerogative of God, and not communicable to any mere creature.

By what Jesus Christ, speaking of the precise time of his coming to judge either the Jews, or the world, pronounces, that no man knows it, no, not the angels in heaven, nor the Son of man, that is, the Messiah himself, but the Father only; from this gradation, I say, and the exaggeration, that accompanies it, we may very probably gather, first, that there are different orders of intellectual beings (which may be confirmed by what the apostles teach of angels and archangels, and also of thrones, principalities, and powers, *&c.*) Secondly, that these different orders are indowed with differing measures of knowledge. And thirdly, which makes principally for our purpose, that none of these are such degrees of illumination, as to enjoy a knowledge equal to that God.

Upon how many accounts God is a most singular being, our dim and bounded intellects are not able to enumerate or discern, but *some* prerogatives are manifest enough: As 1. God's self-existence, and his having his actual existence included in the idea of his essence. Next, his independency from the other beings

ings whatsoever. 3. His eternity. 4. His self-sufficiency. 5. His omniscience. 6. His immensity and omnipresence. 7. His simplicity, or immunity from all composition. 8. His being the cause of the universe, and all the created substances that compose it. So that, indeed, he is the only substance, in the strict sense of that word, as it is taken in, when it is defined a being that subsists of itself; since no being but God can subsist by its own power, but must be continually upheld by the constant influx of the conserving power of God. There are divers other properties, that distinguish God from all other beings, and exalt him far above them. It would lead us into an obscure maze, if I should attempt to enlarge upon each of the newly mentioned particulars, and the simplicity alone and infinity, that are unanimously ascribed to the Divine Nature, when they came to be somewhat attentively looked into by theologisers, reduced them to confess, that though justice and mercy, and many other attributes, that some of them seem to be contrary to one another, may be truly ascribed to God, yet in effect they are but inadequate notions of the same most simple being, and that reason of teaching such attributes to be found in God, is that by reason of the imperfection of our understandings, which cannot at one view give us an entire idea of that perfect being, we are reduced to frame inadequate notions of his perfections, that we may, as far as we can, have an idea in parcels of what we cannot comprehend at once: but I must not lose my self by further prosecuting this discourse, but desiring you to recal to mind, what was not long since delivered about those, that philosophers themselves acknowledge not to be sufficiently comprehensible by our limited intellects; I shall hasten to make some short application of the past discourse.

To the third objection, it was answered.

1. That our knowledge is very imperfect, even of natural things.

2. That if there be scarce surmountable difficulties in the conceptions of things corporeal, it ought to be granted, that there are greater in things spiritual and supernatural.

3. That divers things are thought unintelligible, only because they are not clearly proposed and dextrously explicated.

4. That of divers things, we can have an idea, which, though somewhat dim and indistinct, may yet be true, and to some good purposes useful, though it be not clear and satisfactory. And that of other things we may have a true conception, that is produced by illation, though not by intuition, or clear and direct view.

5. That reason ought to acknowledge, that there are or may be some things not comprehensible by her, whilst left to her own natural light; and that *Aristotle*, *Cartesius* and *Gassendus*, have confessed it.

6. That God being a most wise and singular being, many things may be justly thought to belong to him, that are inexplicable and unmatched.

OCCASIONAL THOUGHTS.

To judge any thing well of some sublime truths, that relate to God's nature and perfections, a man must first descend into himself, that is, into his own mind; which being created after the image of God, he may there discover, both many things, that God is not nor can be; and divers things, that God may in a sound sense be said to be. But then he must not stay there, but raise himself above himself, by contemplating less mediately and more directly the attributes of the Deity, as they belong to the true idea of the supremely perfect being; and differ from the notions we frame of the creatures; some of them in the very kind, as being no where to be found out of God; and the rest (which are in some sort participated by the creatures) in the infinitely superior degrees of perfection, and an immunity from all detracting or lessening limitations.

If it be urged, that there are some things belonging to the notion of the Deity, that are unconceivable; I answer, that we ought not to think it strange, that a spiritual being of an incomparably more excellent nature than ours, should have some attributes, and be able to perform some things, that we men do not comprehend; since there are natures and phænomena even in the corporeal world, that distress and baffle our reason.

Socrates might perhaps justly be commended, for drawing down philosophy from heaven to earth; but I much doubt, whether they do as well deserve our praise, who draw down speculative theology, and the notions of divine attributes, to resemblances to the inferior natures of created beings.

Since men themselves can mathematically demonstrate the infinite divisibility of quantity, as for instance, of a line; God, who has an infinite intellect, may justly be supposed to have a distinct view of the manner of it, and not only know, that the line is divisible, without end, but comprehend how it is so, and must necessarily be so.

CONFERENCE IV.

Eleutherius. I PRESUME, gentlemen, that we shall the more chearfully fall upon the work of this meeting, because we have now made such a progress in *Authades*'s objections, that we are arrived at the last of the four, that we were told, at the beginning, he mainly relies on. And therefore it will be seasonable to desire *Manlius* to help us to dispatch the remaining part of our work, by giving us occasion to answer *Authades*'s fourth argument.

Manlius. It may be easily proposed, gentlemen; but if *Authades* be not much mistaken, it will not be so easily answered; for he takes it for granted, and thinks all rational men do so too, that truth can never be contrary to itself, and consequently, that there is so perfect an agreement

agreement betwixt all truths, that any doctrine, that is contrary to any truth, must itself be no truth, but ought to pass for an absurdity, a falsity, or an error. This being supposed as manifest by its own light, he considers, that reason is the faculty, that God has given men whereby to discern the settled relations and respects of things, and so to judge of the consistency and incompatibility of notions and dogms, and the agreement or contrariety of propositions, which is done especially when reason is assisted by philosophy, which being but reason improved by meditations, disciplines, and experience, he resolutely concludes, that divers ideas, dogms, and historical passages, that are proposed as articles of the Christian religion, cannot be rationally assented to, because they are repugnant to the dictates of philosophy.

Justinus. The objection, I frankly confess, would be a very weighty one, if it could be as solidly proved, as it is specious, when proposed. It would perhaps appear, even to the proposer of it, to be sufficiently enervated, if I were allowed to produce here a couple of dialogues, made on different occasions, by our common friend, Mr. *B.* to discuss *ex professo*, the two questions; in what sense faith may, and in what it may not, be said to be contrary to reason; and whether theology and philosophy do really contradict each other. And though I will not, without his permission, dispose of those writings, yet I know him to be so affectionate to the cause, that *Authades*'s objection strikes at, that since it is uncertain, when that discourse will be made publick, if ever it be so; he will easily forgive me, if I borrow some passages of his dialogues, to mingle with, and strengthen those considerations, that on this occasion I shall offer in answer to the objection newly proposed by *Manlius*.

Argument I. I shall then, in the first place, desire, it may be considered, that the word philosophy being on several accounts ambiguous, and particularly being sometimes employed in a more large and comprehensive, and sometimes in a narrower and more restrained sense; it is very possible, and perchance not very rare, that a proposition, or notion, may be looked upon as contrary to philosophy, without being so in reality. For those, that pass for philosophers, are divided into divers famous sects; such as the Peripateticks and Pythagoreans, the Eclectics, the Epicureans, the Stoics, the Platonists, the Hermetics, and the Cartesians: and divers of those, as the Platonists, are also subdivided into several schools, as those of the ancients, the new and middle sort of academics: and yet it is not unusual for each of these sects or parties to be so fond of its own opinions, as to adorn the system, or aggregate of them, with the glorious title of philosophy, and its professors with that of philosophers, and that oftentimes exclusively to all others. And so when a Peripatetic, or an Epicurean, pronounces, though never so confidently, that this or that opinion is repugnant to philosophy, he means, that it is so to his. And an impartial, judicious by-stander will take the assertion in no other sense, and will not think it safe to conclude, that it is therefore repugnant to sound philosophy itself.

Eleuth. And he acts but rationally, when he thus proceeds. For true philosophy is not to be sought for, only in the walks of *Aristotle*, nor the porch of *Zeno*, nor the gardens of *Epicurus*; for it is a thing of a more noble nature, and of greater extent, than the hypothesis of any one sect of philosophers, being indeed a comprehension of all the sciences, arts, disciplines, and other considerable parts of useful knowledge, that the rational mind can attain to, without supernatural revelation, by reason, that is improved by meditation, literature, exercise, experience, and any other help to knowledge. By which notion of philosophy one may easily discern, that it is unfit to confound Peripateticism, Platonism, Stoicism, or the peculiar dictates of any other particular sect, with philosophy itself, as if they were terms of the same import and extent. Though that sect seems to lay the most probable claim to the title of philosophy, that some call the Potamonian sect, others the Eclectic; since the professors of it did not confine themselves to the notions and dictates of any one sect, but in a manner include them all, by selecting and picking out of each that, which seemed most consonant to truth and reason, and leaving the rest to their particular authors and abettors. So that in my opinion, one may compare the particular sects of philosophers to so many meadows, where flowers grow thinly and dispersedly, and the Eclectic party, or Potamonian sect, to a posy, that consists only of those several flowers gathered out of the several meadows, and united in one bundle.

Eusebius. To be convinced, that there is a great difference between philosophy, absolutely considered, or in its full extent, and the philosophy of a particular sect, as the Peripatetics, Epicureans, or Stoics, though it appropriate that name to the system of its own doctrines; we need but consider, how often, and how directly these several parties contradict one another, even about dogms of great importance. I will not urge, that the felicity or supreme good of man is, except God himself, the noblest object of human speculations, or at least that, which is of the highest concern to men; yet even about this so very important subject, philosophers have been so strangely divided in their opinions, that an ancient writer informs us, that there were in or before his time, no less, if I mis-remember not the number, than two hundred eighty eight differing opinions of philosophisers, concerning the *summum bonum*. This I shall not insist on. But perhaps it will be more proper to take notice of a few instances of the repugnant dogms of philosophic sects, about the efficient, the nature or principles, and some grand affections of things corporeal.

The Peripateticks held the world, such for the main as it now is, to be eternal. *Anaxagoras* and

and his disciples held, that the world, as such, was preceded by a rude mass of matter, which by an intelligent mind (which was his famous νοῦς) was divided, and had its parts put into motion, and contrived into the world. And the Epicureans, together with *Leucippus*, *Democritus*, and other atomists, were so far from allowing the world to be either eternal, or made by a divine being, that they held it to be but recent; and maintained, that it was formed only by the casual concourse and justlings of atoms. The *Aristotelians*, and divers other sects of philosophers, believed, that the world, as it had no beginning, so it shall have no end; whereas the Stoics held, that this present world of ours will be in the capacity of such a world, destroyed by fire. And the atomical philosophers, as *Democritus*, *Epicurus*, *&c.* taught, that this world of ours, as it was casually framed, so it may by several accidents happen to be dissolved. The Aristotelians asserted, that the three principles of all natural bodies are, matter, form, and privation. These the Epicureans slighted, and few, if any, of the other sects fully approved. The Peripateticks maintained, that *Quicquid movetur, ab alio movetur*, which dogm the Epicureans were so far from admitting, that they maintained, that every the least parcel of matter, that is found in the world, that is, every atom, has not only an intrinsic power of moving itself, but has it in so essential a way, that it can never lose it, though when it is joined with other atoms in concretions, that combination may suspend the prevalent exertion of it. The Aristotelians, Epicureans, and most of the other sects of philosophers, as well as the generality of mankind, held the terraqueous globe to be immoveable, in the middle of the world: but *Pythagoras* and his sect, and, as I find by *Aristotle* himself, several Italian philosophers, held the sun to be in the middle of the universe, and that the earth is a planet, which, together with the other planets, does continually move about it. I might add that famous controversy about vacuum, in which the Aristotelians were great champions for the affirmative, which is also embraced by most of the other philosophers. And yet *Epicurus* and the rest of the atomists, did not only assert vacuum, both interspersum and (as they speak) coacervatum, but maintained, that without admitting at least the former, it was impossible there should be any motion among bodies. But it were too tedious to enumerate the repugnant dogms of the several sects of philosophers, even about principles, and other very weighty points. And I think, I have said more than is sufficient to shew, that, if we would shun acting either rashly or unskilfully, we must not be forward to conclude a mystery of faith, or other article of religion, to be contradictory to philosophy, absolutely taken, because it is so to the Peripatetick philosophy, or to that of some other particular sect.

Justin. I READILY grant, *Eusebius*, that you, that, I know, have read *Laertius* of the lives, and *Plutarch* of the dogms of the philosophers, besides other authors, that have treated of those subjects, may easily multiply instances of the contradictions, that may be met with among the famous sects of philosophers; nor do I doubt, that these you have already mentioned may sufficiently warrant you to infer, as I presume you intend, that it is not allowable to conclude, that, because this or that mystery of faith, or article of religion, is repugnant to the doctrine of this or that particular sect of philosophers, though perhaps appoved by some others, it is therefore repugnant to philosophy itself. And as I readily grant you this, so I scarce doubt, but you will allow me, not only to make use of the repugnant sentiments of the several sects of philosophisers, to throw off or weaken the objections grounded on their authority, but to take advantage of the credit of the dissenting parties, and the arguments they employ, one against another, for the defence of the articles of religion.

THUS the arguments employed by the Epicureans for the novelty, as they express it, of this world of ours, may be very serviceable to a divine, for the confutation of the Aristotelian dogm of the eternity of the world, which is more unfriendly to religion, than its modern embraces seem to be aware of. And on the other side the doctrine of *Aristotle* and the Platonists too, (to mention no others about intelligent substances, that are immaterial, may be of good use against the Epicureans,) who flatly denied all incorporeal substances. One may also oppose the authority and doctrine of *Anaxagoras*, who asserted matter to be of itself moveless, and originally put into motion by a divine intellect, which out of that shapeless mass framed this beautiful world, to the contrary tenet of almost all the Peripateticks, and those other sects, that held the world to be unmade. And the same *Anaxagoras* may be made a champion against the Epicureans, who asserted the world to be produced by chance, and not by any intelligent and designing agent. Against the same Epicureans, who taught, that every atom had in it an essential and unlosable principle of motion, one may oppose the reputation and the arguments of *Aristotle* and his followers, who taught, that *quicquid movetur, ab alio movetur*. * * *

Justinus. That it is one thing to contradict the sentiments of this or that church, and (*à fortiori*) of this or that school, or particular divine; and another to contradict an article of faith really delivered in the scripture. Argumen III.

As we did lately upon good grounds make a difference between philosophers and philosophy, so we may now with as good reason distinguish between theologers and theology; by the former appellation understanding those that assume, or have obtained the title of divines, preferable to other men of the same religion; and by the latter the body or system of these truths, that have been communicated to men by supernatural revelation, whose grand repository is that book we call the bible.

I PRESUME

I PRESUME it will not be difficult to induce you to allow of this distinction: for one needs not be half so well acquainted, as those I speak to are, with ecclesiastical history, and the present state of the church in the world, to know, that ever since the first ages of Christianity, and in them too, as much as in others, the professors of that religion have been distinguished into various parties and sects, such as Gnostics, Ebionites, Carpocratians, Manichees, Arians, Photinians, Eutychians, Nestorians, and divers others, whose names are famous, and whose dogms, as to divers of them, have found approvers even to this day. Now these sects differing almost as much in dogms, as in affections, so that the embraces of the one called itself orthodox or catholick, and those of the other hereticks, and on that account they persecuted, and as much as in them lay, damned their opponents, and sometimes (which was more certainly mischievous) killed them; it is obvious to conclude, that we may justly distinguish between an article, which this or that church holds to be of faith, and an article, that is indeed a part of theology, by being a supernaturally revealed truth; and consequently, that a tenet of this or that church may be contracted by some philosophical principle or dogm; and yet sound philosophy, and orthodox divinity, continue good friends.

AND I shall by your permission, *Justinus*, presume to add, that though not only two or three churches or schools, but almost all those of Christendom, should agree in a dogm, such as it may be, that would not keep me from thinking, that even in this case, what you have been saying will hold good. For besides those revealed dogms, that are expressly, and as it were immediately delivered in the holy scripture, and may, on that account for distinction's sake, be called primary, or more immediate ones, there are divers others, that may be stiled derivative, or less immediate dogms of divinity; because they are not so clearly taught in the sacred writings, but are (whether justly or not) presumed to be drawn thence by discourses and a chain of inferences grounded on principles of mere philosophy, and because they have been drawn by divines, and were subservient to some hypothesis of theirs; they were by them adopted into the family of theological verities, and many of them are to this day embraced on their authority by their admirers, as articles of faith. Now, little to the advantage of the Christian church, it has frequently happened, that these foreign doctrines have been deduced from the principles and tenets of particular sects, and especially those of the Peripateticks, many of whose dogms, that serve for foundations to the articles we speak of, may be discovered by mere natural light to want solidity themselves. Wherefore since in conclusions, that are drawn from premises of different kinds, such as in our case are supernatural truths and philosophical dogms, the conclusion must be of the nature of the weakest of the premises (according to that known rule in logicks, *Conclusio sequitur debiliorem partem*; we have no more certainty of the truth of these resulting doctrines, than we have of the truth of the philosophical principle or dogm. And the conclusion of this sort, though by divines received into the list of theological truths, may be repugnant to a genuine article of faith, without inferring a real contradiction between philosophy and theology. Since true theology does not appear to be so concerned in the case, and all the contradiction is between a dogm of sound and one of erroneous philosophy.

Justinus. ANOTHER thing there is, which, if it be well considered and applied, may in several cases take off the repugnancy, that is pretended to be irreconcileable between some doctrines taught by the scripture, and some dictates of philosophy, if not also of right reason itself. Argument IV.

Euseb. I SHALL be glad to learn what so desirable an expedient may be.

Justin. IT is (in short) this, that many do not know, and more do not duly consider, and rightly apply the several conditions, that are requisite to make a true, and properly so called, contradiction, betwixt propositions or doctrines.

Eleuth. THESE conditions are not wont to be mentioned by the writers of logick; but by most of them, as far as I have observed, either lamely or obscurely, or perfunctorily enough. And therefore it may conduce to the clearing of the subject you are upon, to take a distinct notice of them.

Justin. IF you will have it so, I shall obey you, by telling you, though not to inform either you or these gentlemen, but to refresh our memories, that to make a contradiction, strictly so called, between two propositions, there must concur four things as necessary conditions.

THE first is, that both the affirmation and the negation, that are opposite, be taken or understood *similiter*, that is in like manner: as if it be said by one man, that the sun or a star, when it is come to the meridian, necessarily moves downwards, and by another, that it does not move downwards; there may be no contradiction between them, in case the latter pretends only, that the sun or star does not move downwards in a strait line, as if it fell directly towards the centre of the earth, (in such a line, as mechanicians call the line of direction) and the other means, that in respect of its meridian height, it moves downwards towards the horizon in an oblique line. So to say, that "man is an animal necessarily produced by the congress of a man and a woman;" and that it is "not true, that man must necessarily be so produced," are propositions not irreconcileably repugnant, because the former speaks of production by generation properly so called, or made according to the course of nature, whereas the latter speaks of production made by creation, which is a supernatural way, as in the case of *Adam* and *Eve*, that were both formed without the concourse of man and woman.

Manlius. If I misremember not, *Justinus*, this first condition is left unmentioned by several of the writers of logic.

Justin. I shall not, *Manlius*, contend with you about that, not that I think the condition superfluous; but because it is possible the omitters of it presumed it to be referable to one of the three other conditions, that remain to be mentioned.

The first of these, which is the second of the four, is, that the opposition be made *secundum idem*, as they speak, that is according to the same part, or somewhat that is analogous to a part of the subject, that is spoken of. For some things are as it were composed of several natures, and very many things consist of several parts separable, either really, or at least mentally. And that may be true, as to one part, which is not so as to another, or as to the whole subject, that consists of those parts properly or analogically so called. Thus man, who consists of a rational soul and a human body, may be said without contradiction to be mortal, and immortal; the latter in respect of his soul, and the former in respect of his body. Thus the earth may, without a true contradiction, be said to be naturally incorruptible, and yet to be subject to corruption, if the former proposition be meant of the whole globe, and the other of several particular parts of it. And in the vulgar hypothesis of philosophers and astronomers, it may be said to be immoveable as to its entire body, but moveable as to some considerable parts of it, as has been manifested by the local changes made of great masses of terrestrial matter, in some very notable earthquakes; and so it may without a contradiction be said, that a negro is black, and that a negro is not black, if the former proposition be made of his skin, and the latter of his teeth, which are usually very white.

The third condition is, that the opposition be *eodem tempore*, that is, that the repugnant propositions speak not only of the same subject, and part of the subject, but of the same time. Thus it is no contradiction to say, that a rose bush flourishes, and a rose bush does not flourish, if in the former assertion one means in summer, and in the latter in the middle of winter.

The fourth and last condition of a true contradiction is, that the proposition, wherein it is said to be found, be meant of the thing spoken of in the same regard, that is in comparison of, or with relation to the same third thing: as a man of ordinary stature may without contradiction be said to be tall, namely in respect of a dwarf, and low, that is not tall, if he be compared to a giant.

Euseb. It will not be difficult, *Justinus*, to foresee, what use you may make of what you come from saying.

Justin. True, for it is obvious enough, that we may thereupon make this reflection, that since the concourse of all these four conditions is requisite to make a contradiction properly so called; there may be several revealed doctrines, which are pretended to be contradictory to sound philosophy or right reason, without being so in reality, because in the opposition between these doctrines and the dictates, whereto they are presumed to be repugnant, there wants some one, if not more of the conditions, that have been made appear, to be necessary to a true and irreconcileable contradiction.

Justinus. There is another consideration, gentlemen, which, I presume, it may not be impertinent to propose on the present occasion. And it is this: There may be a current dictate of philosophers, and even such a one as passes for an unquestioned theorem of philosophy itself, which yet cannot be safely relied on, if it be applied, either to things, for which it was not made, and is not proper, or to such as are not clearly understood. And that therefore it is not necessary, that whatever article of religion is repugnant to such a dictate or theorem, must be also repugnant to philosophy and to right reason. Argument V.

Eleuth. Though I see nothing, that startles me in what you have delivered, *Justinus*, yet since it seems to relish of a paradox, it will not misbecome you to acquaint us with, at least, some of the reasons, whereon you ground it.

Justin. Your expectation is just, *Eleutherius*, and therefore to answer it, I shall desire the company to consider with me, that languages, at least those we commonly use, have been introduced by the vulgar sort of men, whose apprehensions of things are but narrow and superficial; the natural weakness of their faculties, and their assiduous conversation with only sensible or familiar things, that it concerned them to speak of to one another, keeping them from extending their thoughts to the great variety of things, and from making deep inspections into the nature of almost any. But it is not only the unthinking vulgar, but learned men, and even famous philosophers, that have presumed to give us general axioms upon insufficient inductions, and without thoroughly penetrating the differing natures of the things included in those comprehensive axioms. Whence it is come to pass, that divers theological truths are held to be repugnant to philosophy, because they are so to these ill framed or misapplied notions or dictates.

Eleuth. In favour of your sentiments, *Justinus*, I shall represent to *Manlius*, that, as children by reason of the infirmity of their understandings, and their fondness of the objects, that are proportioned to their present state and affections, mind little or nothing, but those objects, that gratify or offend their senses, or their imagination; so when men began to speculate a little, and were, as it were, in the infancy of philosophy, their reasonings and discourses were probably but narrow and superficial, and as they were suggested by, so they did not rise much higher, or reach much farther than those objects, that were usually conversant about, and were conducive to their welfare, as they led an animal life, and were engaged in civil communities.

And

And if this were the case of the generality of the first philosophers, it may well be presumed, that the theories they proposed, and to which their novelty and the authority of the propounders procured a ready assent among their unskilful disciples, were but narrow and superficial, and far from reaching to the vast extent, or penetrating into the hidden recesses of the nature of things. And though I deny not, that divers of the succeeding discourses did from time to time laudably improve the stock of knowledge left them by their predecessors; yet most of their improvements consisted rather in commenting upon the writings or sentiments of the first authors, or making some little supplements to the very defective systems of the founders of the doctrines they embraced. So that these additions were still made with a great regard to the sentiments of the founders, or early promoters of these doctrines, and not in full endeavours to lay more comprehensive and solid principles, and correct the methods themselves of philosophising, that were too often erroneous or defective, or both, and on these accounts very insufficient to elevate and enlarge the human understanding, which, without their higher improvements, must needs remain unfit for the nobler and more abstracted sort of metaphysical speculations.

Euseb. I AM glad, *Eleutherius*, to find the sentiments I have long had strengthened by their conformity to yours; for it seems to me, that most of the heathen philosophers, and several whole sects themselves, have in their framing their philosophical principles and tenents, and the natural theology, that was grafted on them, considered the more obvious and familiar things, about which they were conversant, such as those corporeal objects, that affect the senses, and others that may be of importance, whether good or bad, to human life and welfare. And I do not wonder, that a philosophy, that had such a beginning, should participate of the imperfection of its origin, and should not sufficiently elevate the mind, and qualify it for the contemplation and discernment of immaterial substances and abstracted beings, which perhaps were scarce so much as thought of, when the theories, that should reach them as well as other subjects, were framed and established. And it were to be wished, that a great number of Christian philosophisers were less liable to the like censure. But I fear, that almost all, that have left us discourses of natural theology, whether after or before the preaching of the gospel, have given us what, if you will pardon a rude expression, I shall venture to call a Creaturian theology; by which I mean a system of such definitions, notions, and articles, as has been suggested by the consideration of the creatures, and chiefly, if not only, adapted to them, without being large enough to comprehend immmaterial substances and abstracted beings, especially God himself and his divine perfections, to which probably little or no regard was had in the framing of those systems.

Eleutherius. PERHAPS, *Eusebius*, it may be opportune enough, to add to what you have been saying, that the Peripateticks, whose sect has for many ages afforded the greatest number of Christian philosophers, having taken most of their speculative doctrines relating to natural theology from their master *Aristotle*'s metaphysicks, and partly also from his physical writings; it need be no wonder, that many, not to say most of the Aristotelian Christians, that have written of natural religion, have given great occasion to the opinion, that philosophy and theology are incompatible. For *Aristotle* was a Heathen, and destitute of divine revelation, which does not only disclose to a well disposed mind truths undiscoverable by its own mere abilities, but on several accounts affords much light to divers objects, that, though not quite beyond the sphere of reason, would, without that supernatural help, be but dimly discerned by it. And I must now make bold to say, that *Aristotle* was not only a Heathen, but was far enough from being one of the best of the Heathen philosphisers about God and divine things, there being several of the ancient philosophers, as *Plato* and *Pythagoras* (to name no others) whose discourses about the Deity and its attributes were much more sound, and less unsuitable to that infinitely perfect being, and his actions, than were those of *Aristotle*, of whom the excellent *Grotius* somewhere judiciously observes, that his sentiments appeared much more favourable to religion, in his exoterical writings, where he was to keep fair with popular readers, than in his acroamatical, where he delivers his sense as a philosopher. And yet the notions of this author, who was so ignorant of the principles of true religion, and so unfavourable to divers articles of it, has, by his own good, and by the church's bad fortune, had the luck to be for many ages taken for the great guide of Christian, and partly of Jewish philosophisers. For as I find the justly famous *Maimonides*, who has been long acknowledged the most learned and judicious of the rabbis, to have been very conversant in *Aristotle*'s philosophy, and (as I could easily justify, if it were proper, by many of his Peripatetic notions and tenents) was much addicted to it; so it is too notorious, that, till the last century, the generality of the Literati, among the Christians themselves, were bred up in a high veneration for *Aristotle*'s sentiments, and entertained them with little less than an implicit faith, though some of them not only were repugnant to several truths of the Christian religion, but (as our friend Mr. *B.* has somewhere shewn) manifestly tended to subvert the very foundation of natural religion, as far forth as this is grounded on an obligation to love and obey God, as the creator, or at least the immediate author of human nature, and the supreme rector of men and their affairs. But this is not a time and place to inlarge upon the ill aspect, that some of *Aristotle*'s dogms have upon religion, whether revealed, or even natural; what I have been obliged to menti-

on

on being but to justify the (lately proposed) consideration, that since the opinions of a Heathen, whose notions of God were very obscure and defective, and divers of them very erroneous too, has had the luck for many ages to be cried up for the oracle of philosophy, we ought not to be much surprised, if we find divers sentiments, commonly received for philosophical notions and dogms, repugnant to those, which the holy scriptures teach as theological truths: nor ought it to dissettle our minds, that a man, who ascribed a great deal too much to nature (whose works yet he did not throughly understand) and nothing to divine revelation, should assert, as universal axioms, things, that cannot warrantably be extended beyond created beings.

Eusebius. You will, I presume, *Justinus*, allow me to put you in mind, that you lately intimated, that another consideration should accompany that, which you come from discoursing of.

Justinus. I did not forget it, *Eusebius*, but was just ready to tell you, that safely to rely upon divers things, that philosophers deliver, as definitions or dogms, it ought to appear, that they had clear and duly limited conceptions of the subjects, that are treated of, as well as that their notions and dictates are applied but to such subjects, as were sufficiently taken into consideration, when they were framed.

N. N. To the several considerations or arguments, that have been hitherto discoursed of, I must now propose one reflection, that I think to be of too great moment, in our present controversy, to be either wholly pretermitted, or but slightly considered.

N. T. Such a preamble gives me some impatience to know, what this important reflection is.

N. N. It is in short this, that supposing, rather than granting, that there are some cases, wherein the dictates of philosophy, taken even in a large and favourable sense of that name, are repugnant to some articles truly grounded on divine revelation; in these cases, I say, one may, and ought to distinguish between human philosophy, and right reason, so that a doctrine may be flatly repugnant to the former, and yet be very reconcileable to the latter.

N. T. I am willing to grant, that sound philosophy is, as * * * hath favourably described it, an aggregate, or, if you please, a system of the arts, sciences, and in short of all the disciplines, that men have been able to attain to by the natural light of reason. But then I must also represent, that mere philosophy is not the adequate instrument of knowledge, nor of equal extent with it. For philosophy, as such, can furnish the mind with no knowledge, but that, which is attainable by the light of merely natural reason; whereas the mind of man is capable of being endowed with many notices of a supernatural order, which it may receive from revelations contained in that book, which is commonly called the Bible.

To this observation, whose truth is manifest enough without farther proof, I shall add another, that I take to be no less evident; and it is, that, as reason is the proper judge of the agreement and disagreement, as well as of the truth and falshood of propositions and doctrines, so the judgments of reason are the more or less authentick, and fit to be relied on, according as the informations they are grounded on are the more or less certain and full. So that those judgments are (at least in comparison of others) to be looked upon as the judgments of right reason, which the rational faculty passes, when it is perfectly informed, or at least as fully as it is necessary it should be, to enable it to determine rightly in the particular questions proposed to it.

From the two foregoing considerations laid together, I presume, I may infer, that mere human philosophy is not the adequate standard of human knowledge; and that the boundaries of the former may be much narrower than the limits of the latter; since all the knowledge, that mere philosophy can afford us, has been attained by the mere light of nature, whereas divine revelation is able to furnish the understanding with many ideas and notices of a supernatural order, and of great use, not only to increase our knowledge by discoveries wholly new, but, in divers occasions, to improve our former knowledge; the light of revelation doing to the intellect, what the sun beams do to the air, which they at once enlighten and expand.

N. N. To speak freely, gentlemen, I look upon philosophy, even that which is sound, but as an effect or production of right reason, and not the thing itself, and therefore not fit to be confounded with it, or as being, or to be looked upon as an adequate standard of truth, or so much as of human knowledge, whereby one may safely and exactly measure the extent of either.

N. T. You may add if you please, * * * that our philosophy is so little fit to be taken for a sure and adequate standard of truth, I mean of that knowledge, that is attainable by right reason, that we can have no certain and stable standard of philosophy itself. For human knowledge, and by consequence philosophy but a part of it, must not be compared to *Adam*, who was at his full and compleat stature at his first production, but may be justly compared to an ordinary descendant of *Adam*, who at his first coming into the world is but a babe, and is reduced to pass through childhood and youth, *&c.* before he arrives at the full state of manhood. So that philosophy, as well as knowledge, being a growing thing, we can as little take stable measure of it, as a taylor can take such measures of a child of seven years old, as will continue to fit him during his whole life.

Since natural philosophy, or physicks, for example, is grounded, or at least should be, upon natural history, the discoveries made in latter ages of the *East* and *West-Indies*, besides

many other countries have so enlarged the historical knowledge of the phænomena of nature, and disclosed so great a number and variety of her productions, that were not known to the Greek and Roman philosophers, that these discoveries cannot but have given ground to several alterations in physick. * * *

For my part, I look upon mere philosophy as a thing much inferior to mere reason, and upon mere reason as no less inferior to right reason; for that intellectual faculty we call reason, neither needs nor ought to confine itself to the dictates of philosophy, which, as * * * * lately and truly noted, is a production of reason, which this faculty by acting freely by the same or the like ways with those it made use of in framing the disciplines, that constitute philosophy, and by the help of further notices, with which the new discoveries of natural things, that the happy industry of the moderns frequently supplies it with, may considerably both enlarge and correct the philosophy hitherto received. But all the improvements of this kind being afforded but by natural and human helps, the intellect cannot by them be furnished with all the notices it is very capable of receiving, for there are a great many truths and notions of a higher order than natural, which God may (if he pleases) in a supernatural manner reveal to men, and a considerable number of such, we Christians believe he has actually revealed to us in those books we call the holy scriptures. These contain several mysteries and other truths, that human reason left to itself would never have attained to the knowledge of, especially concerning the peculiar manner of God's existing, the nature of some of his attributes and decrees, and many things about unbodied spirits good and bad, and in a word the peculiar articles, that the Christian theology has added to the natural.

These discoveries being so new, and several of them so noble, it will scarce be denied, but that an intellect, advantaged by the knowledge of them, must be (*cæteris paribus*) much better qualified to frame right conceptions, and make just estimates of several doctrines relating to philosophy and divinity, than an intellect not furnished with these excellent helps. Let me add, gentlemen, that since these divine patefactions are made to a rational creature, that is indowed with faculties, not only apprehensive, but discursive, whereby he is able to infer one thing from another, an intellect informed by the scriptures may easily enough attain to many more notices, than are in those books delivered in express terms, those, that are obtained by legitimate illations, being divine truths, as well as the texts themselves, when they are clearly deduced. * * * *

Manlius. I know, gentlemen, that it is not very difficult for subtil wits to devise nice and plausible distinctions, fit to lay a fine varnish over sentiments, that are not sound. But when you have said all that can be said, you must confess, that one truth cannot contradict another, since this is an axiom self-evident, or at least is one of the principal foundations of all our reasonings; one of the most usual and most effectual ways of proving a thing to be false, being this, to manifest that it is repugnant to somewhat, that is acknowledged to be true. Wherefore since it is notorious, that philosophy teaches us many truths, to conclude, that whatever doctrine contradicts any of those truths, though it be proposed by a divine, and stiled a mystery, is indeed an error, is to discourse as consonantly to right reason as to philosophy.

Eleuther. It may perhaps, gentlemen, clear the way for an answer to this specious objection, if instead of employing the distinction of the word truth, or terms equivalent, which may be easily found in the writings of metaphysicians, and which may be of good use on fit occasions, I, that have no need of them at this time, venture to propose a couple of other distinctions, that I think more pertinent to my present purpose. Give me leave then to represent, that a truth, taking the term in a lax sense, may be considered either as but gradual, or as compleat. By gradual truths, I mean such propositions or doctrines, as even to a good reasoner appear to be true, whilst he is furnished but with such a degree of light or information, though that be the highest he is able to procure: and by compleat truths I mean the judgments, that are duly formed upon a perfect information, or at least such a one, as is sufficient to ground a right judgment upon. The former member of of this distinction * * * * *

The latter member of our first distinction needs no examples to declare or prove it, and therefore I shall proceed to my second distinction, which puts a difference between respective and probationary truths (still taking that term in a lax sense) and truths, that are absolute or eternal; this distinction of truths may in some cases be coincident with the former; but because there are more cases, wherein they are not coincident, it may be proper to speak of it separately.

By absolute truths then (to begin with that member of our distinction, because it may be dispatched in few words) I understand in the first place those theoretical principles and axioms, which are the foundations of our reasonings, such as are two contradictories cannot both be true, every thing is, or is not, every line is either strait or crooked, every number (whole and finite) is either even or odd. Two quantities, that are each of them equal to a third, are themselves equal, and from truth nothing but truth can be legimately deduced. And to this sort of primary truths may be referred the definitions of our more simple mental ideas, such as the clear conceptions we have of a triangle, a square, a circle, a cube, a cylinder, &c. And because there neither has, nor will be any time, wherein these principles of knowledge and ratiocinations may not be safely assented to, without any relation to contingent circumstances, these self-evident principles may be called eternal truths; whereas for those of the second member of our last distinction, though a man

a man may rationally look upon them as truths, as long as he sees just cause to believe them, or no sufficient cause to question them, yet he cannot safely judge them to be more than truths upon supposition, or to express it shorter, conditional. *N. B.* I call them probationary truths, not only because I am in part authorised by the example of our illustrious *Verulam*, who gives to several of his physiological rules or theorems the modest title of *Canones Mobiles*, but chiefly because I am warranted by the nature of the thing. For there are many doctrines and assertions, that for a long time (amounting perhaps to many ages) were generally received by philosophers themselves for true, which yet, by the happy discoveries of latter times, appear to unprejudiced judges to be errors.

Manlius. I WILL not now, *Eleutherius*, dispute the instances you have alledged, but I expect to hear, how you will apply your distinctions to the objection they should enable you to answer.

Eleuth. I SHALL immediately endeavour to satisfy your expectation, *Manlius*, by representing to you, that since several dogms and assertions may be received for truths, by a person that reasons well, according to the best information he is able to obtain from mere philosophy, and yet may, by so doing, assent to that, which, absolutely speaking, is an error in the judgment of right reason, that is, of reason fully or competently informed; and since also what I have now asserted holds true as to many things, that are judged to be within the sphere and jurisdiction of mere philosophy; it seems very rational to think, that divers theological dogms may be rejected, and perhaps too oppugned, by a man, that judges as a mere philosopher; which yet may be assented to by a Christian, without at all acting unconformably to right reason. For nothing can be more rational, than to believe that to be true, which is taught by God, who can neither be himself deceived, nor deceive us.

Euseb. YOU will, I hope, *Eleutherius*, permit me to add, that since many doctrines are expressly delivered in the sacred books, which human philosophy could never have taught us, I think you may, at least as to these truths, turn the latter part of *Manlius*'s objection upon himself; for if one truth cannot be contradictory to another, we have more reason to believe those theological truths, that are delivered in the holy scriptures, and consequently recommended by divine authority, than the philosophical dogms, that thwart them; since as it is oftentimes more easy to understand the words of God clearly set down in the inspired books, than the voice of nature, which her interpreters do frequently mistake themselves, and not seldom deliver, but darkly, or unsincerely unto us: so when philosophy and the scripture seem to disagree, it is always the safest course to believe what is taught by God, whose exact veracity is included in his most perfect nature, who possesses an intellect, not only of a superior order to ours, but truly omniscient, and who does most clearly know, not only all gradual verities, and all those, that are but conditional truths, or grounded upon suppositions, but all the complete, absolute and eternal truths, that our philosophy and reasonings are built on: and most probably, many more, neither attained, nor so much as attainable, by natural reason; though never so well improved by merely human philosophy.

Eleuth. THE mention, which *Eusebius* has made of the differing orders of intellects, and the immense superiority of God's understanding above man's, seems to me very pertinent to our disquisition, since the divine intellect being omniscient, can at once look through the whole aggregate of things knowable, and have a perfect prospect of all truths, both singly, and in their connexion, dependency, and (in a word) their entire system: upon which account it is reasonable to suppose, that some things may be irreconcilable in our understandings, that are not so in God's.

FOR I have more than once observed, that as there are some contradictions, that appear plainly to be such, by a clear and direct view of the rational faculty, so there are others (though not so many) whose contrariety, though it be thought manifest of it self, yet really, as it stands in our judgment, is a work or effect of the rational faculty; not as it is barely apprehensive, but as it is discussive. For sometimes in framing a judgment, that certain things are contradictory, we make a supposition, or an inference, or perhaps both, though because we are wont to pass judgments in the like cases very easily, and without hesitancy, we are not usually aware, that we do so, but presume, that our judgment is grounded only upon a clear view of a manifest repugnancy between the things collated. Now it is very possible, that the supposition or the illation, that we make use of in judging two things to be contradictory, may be erroneous, and that an intellect, that has far more light and penetration than ours, may discern that weakness in the grounds of our judgment, that we did not suspect. And this I am the more persuaded of, because, even in affairs merely physical, many things are judged to be contrary to the true laws or dictates of right reason; because men do either presume something to be manifestly true, that is not so, or do not know, or perhaps so much as suspect, the differing ways, by which a thing may be produced, or brought to pass, or may have a right to the title of true. * * *

Manlius. I HOPE, gentlemen, that notwithstanding all you have said in derogation of philosophy, you do not mean to reject its authority universally; as if in no cases it may be employed as a norma, or rule, according to which we may safely judge of divine things. For unless you grant some fundamental and eternal truths, I see not how it is possible for us to confute divers theological errors of Pagans and other infidels, whose rejection of the authority of the scriptures does not allow us, without indiscretion, to impugn them with arguments from thence. To which I may add.

Eleuth.

Eleuth. —— I PRESUME, *Manlius*, that you will not think your additions necessary, when I shall have acquainted you with my thoughts, which I doubt not are agreeable to these gentlemen's too, about the matter under consideration. I conceive then, that there are two kinds or orders of principles and dictates of reason; the one comprises those primary and universal notices and axioms, that are applicable to all kinds of subjects; such as are the first metaphysical and mathematical verities, as that "contradictories cannot both be "true, *non entis nulla sunt accidentia*; the "whole is greater than a part of it; if to "equal quantities equal quantities be added, "the totals also will be equal; every line is "strait or cooked; from truth nothing but "truth can be legitimately inferred." These and the like self-evident principles hold on all occasions; and therefore may be distinguished from other rules or dictates of philosophy, which, though they will hold in most cases, do not hold in all cases, and are, on that account, subordinate, or at least of an inferior nature, to the primary and catholick principles lately mentioned.

Now to apply this to our present purpose, if the philosophical dogm, that seems repugnant to the holy scriptures, be grounded upon a truth, that is but of an inferior order, I shall, to avoid repetition, refer the consideration of this case to those passages of this present conference, that may be pertinently applied to it: especially if the philosophical tenet concern a subject, which natural reason ought to discern herself to be an incompetent judge of, at least, as she is at present informed.

Manlius. BUT what if a text of scripture be repugnant to a dogm in philosophy, that is grounded upon one of those metaphysical or mathematical axioms, that you mention, as verities of the highest order? Must you not, in that case, confess, both that philosophy and theology may contradict each other; and that, without bidding defiance to reason, we cannot forbear to embrace that philosophical dogm, that is built upon the first and highest principles of reason?

Eleuth. IN answer to this weighty objection, I must advertise you, that I look upon the metaphysical and mathematical principles, we have been speaking of, to be truths of a transcendent kind, that do not properly, and exclusively to the other, belong either to philosophy or theology; but are universal foundations, and instruments of all the knowledge we mortals can acquire.

THAT part of the metaphysicks, that treats of universal and immutable truths, is far superior to, and ought to be distinguished from, that which applies those catholick rules and primary notions to particular, or at least to determinate subjects. The first sort of truths are not to be denied or rejected, upon the account of an alledged revelation, because they are the principles, upon which, or with congruity to them, our assent to that revelation it self, if it be a true one, must be grounded; and therefore the texts, supposed to contain that revelation, must be so interpreted, as not to contradict those principles. For God, being infinitely knowing, and being the author of our reason, cannot be supposed to oblige us to believe contradictions: and since truth cannot be repugnant to truth, we can easily be much more sure, that such a metaphysical principle is true, than that a sense contrary to it can be the true meaning of the divine author: as men of every sect acknowledge, in effect, by the answers and expositions they are fain to adjust to divers passages, where things are delivered in popular expressions, and not suitable to exact truths in astronomy, geography, *&c.*

IN answer to the fourth objection it was said,

1. THAT a proposition may be contrary to this or that particular philosophy, as the Epicurean, Peripatetick, *&c.* without being contrary to philosophy in general.

2. THAT a proposition may be contrary to all the several sects of philosophers now in repute, without being contrary to true philosophy.

3. THAT it is one thing to contradict the articles or sentiments of this or that church, and *(à fortiori)* of this or that school, or particular divine; and another thing, to contradict an article of faith, really delivered in the scripture.

4. THERE are divers occasions, on which theology and philosophy seem to contradict each other, only because men do not sufficiently know, or else do overlook the requisites of a true contradiction.

5. THAT a theorem or dictate of philosophy cannot be safely relied on, if either it be not clearly understood, or if it be applied to things, for which it was not made, or is not proper.

6. THAT a thing may be contrary to philosophy, as founded merely in the light of nature, without being contrary to right reason, taken in its full extent.

7. THAT the foregoing truths being admitted, there is not any thing in the Christian Religion, that does really contradict any principle of right reason; if the principle be found, and the article rightly proposed, and duly grounded on scripture, well interpreted.

OCCASIONAL THOUGHTS.

IT is a sad, as well as shameful thing to consider, that the intellect of man, which should be so capacious and so unbiassed a faculty, is so far from being so in effect, that most men have a local motion (if I may so speak) and a great many have a Sectarian reason, and others a mercenary one. Thus usually, such as are born in such a place, espouse the opinions true or false, that obtain there; as those, that are born in *Arabia*, are generally Mahometans; and those, that are born in *Spain*, are generally (and many of them perhaps upon not much better grounds) Christians

tians and catholicks. And so the Jesuits dispersed all the world over usually maintain some opinions about the helps of grace, and the Dominicans quite opposite ones. In *Italy* the pope's infallibility and power over kings are generally maintained, which are heterodox tenets in *France*, especially at the Sorbonne. And the absolute authority of princes is defended in some monarchies, as generally by mercenary pens, or other unbiassed writers, as it is opposed in divers other countries by persons, some of whom, it is to be feared, are swayed by the same motives of interest or hope, to maintain sentiments quite opposite to those.

If revealed theology obliges us to believe things incomprehensible, or above reason, natural theology does the like.

Infinity can be but figuratively affirmed of God's perfections; but yet they may well be called infinite, because they are boundless, which is all the infinity they are capable of: and God being the first cause, hath not only perfections absolutely so called, that exclude a greater or an equal perfection, but possess also all the possible degrees, as well as kinds, of true perfection, *&c.*

We men cannot conceive or explain, either by example, or any thing truly analogical, how God can create either matter or a human soul, *&c.*

We know so few properties and analogies of *infinitum*, that, when we apply to it the rules or measures, that were made to finite things, we are subject to make very defective reasonings, and leave the question obscure, because the object is so; and the clear data we have are insufficient to enlighten it.

I do not think my self obliged to have the same regard, and respect for the explications, that the schoolmen and many other divines give us of the mysteries of Christianity, that I have for the articles themselves; since for the mysteries I have the divine authority of the revealer, who can oblige my faith to assent even to dark truths; but for the expositions and consequences, I have but human authority: and though clearness is not always necessary to divine mysteries, yet it may be justly exacted in a good explication, since to explicate a thing, is to render it at least intelligible.

Sometimes reason signifies the superior faculty of the mind, furnished with its own original notions and axioms, and with vulgar or popular notices; and sometimes it is used to signify a kind of organical thing; and is considered not as a faculty acting immediately upon her own stock of congenite truths, and of vulgar notices, but as she manages a frame or system of ideas and propositions, wherewith she is furnished by sciences and arts; which, though as it were tools or instruments of her own framing, yet are such, as being once made, her operations are regulated by them; as when the eye and the hand make rulers, compasses, and telescopes; but are afterwards in their operations guided, as well as assisted by these instruments; and such instruments I take the liberal disciplines (under which name, for brevity sake, I comprise both arts and sciences) to be in reference to the mind; and the intellect and rational faculty, informed by these disciplines, and judging according to their informations, I think we may call philosophical (or merely natural) reason. Besides these two acceptions of the word reason, there may be also a third; in which, as in the last named, she is considered as acting organically, but yet with a more noble and comprehensive organ or instrument. For the reason of man, besides the utmost information, she is able to give herself by the mere light of nature, is capable of receiving a higher and more excellent information, by supernatural discoveries or revelations.

Though reason essentially considered is the same in speculations of all kinds, yet organically considered, or as acting in and by such notions and other instruments, she is a more limited and a less catholick agent, in reference to some kinds of objects; and must make use of other notions and instruments, when she is conversant about them: as she must have one set of notions for infinite, and another for finite things, and also one for things stable or permanent, and another for things of a successive nature, as time, streams, flame, *&c.*

Right reason may be looked upon as a catholick principle, of which philosophy is but an application, and the dictates of particular philosophies, such as the Peripatetick, the Platonick, the Epicurean, *&c.* are but particular corollaries, which are not always truly drawn, and on that account may always be questioned or examined, and may, I fear, oftentimes be justly rejected; and this holds, especially, when, in the examen, he that makes it is assisted by the discoveries made by revelation, from whose heavenly light, in reference to divers subjects, the intellect may receive such a benefit, as the air does in a clear day from the beams of the sun, by which it is both enlightened and expanded.

It is one thing to contradict a catholick or metaphysical principle, or dictate of reason, and another to contradict a physical one; since the laws of nature, as they were at first arbitrarily instituted by God, so, in reference to him, they are but arbitrary still.

Theology, or revealed religion, never obliges us to forsake (much less renounce) the dictates of reason, considered in its full extent, as it is a comprehension of true notions or propositions, both universal and particular. For the primary and most catholick laws or rules of reason are never to be forsaken, upon any occasion; since their truth is supposed in the best arguments, that can be brought for revelation itself: and no particular truth can be made out, which, if perused home, cannot be at last resolved into, or reduced to, one of those primary and general truths. And therefore if any other dogma be proposed as a truth (as for instance, some [that is proposed as a] revealed article of the Christian religion) if the article be clearly evinced to be divinely revealed, to embrace [assent to] it, is not to act against

against reason. For this will teach us to interpret the words, that express the revelation, so as not to contradict any primary and catholick rule of reason. And if the article be contrary but to some subordinate dictate of reason, or to some gradual truth, then also we may embrace it without forsaking right reason. For her own catholick dictates determine, both that there are some things above our comprehension revealable by God; and that a proposition inferred from a subordinate [or inferior] rule, or dictate, may be judged false, when another medium of probation, as experience or divine testimony, that is of a stronger, or of a higher order, shall manifest the contrary [to be true.]

Reason has two uses, upon which two differing significations of it have been founded. And these ought to be carefully distinguished, because the promiscuous use of them has bred confusion in the actions and reasonings of many. For sometimes it is to be considered as a norma, a rule, or a standard, whereto we apply ratiocinations, *&c.* to judge of their validity or erroneousness. And sometimes also it is considered as a principle, by which notions and axioms, and even the norma above spoken of, may be framed, on which account it is sometimes looked on as the rational faculty itself, that may act antecedently to what we call a norma.

The proper duty and office of reason is not to teach us supernatural things; but first to lead us to a supernatural teacher, that is, to God; and next to defend the things he teaches against the unjust imputation of being contradictious or impossible: and this latter office of reason would not be necessary (since the teacher is supposed infallible) but because it is so, to maintain, that we do not misapprehend the meaning of what we receive as taught by him, which must be a mistake of ours, if he, that cannot mistake or deceive, is said to have taught what is impossible to be true.

Reason herself commands us to believe sense in divers cases, against what would otherwise be rational, *&c.*

Those, that think their own reason, because it can raise them a little above other men, can enable them to soar into heaven, and without the assistance of revelation discover the sublimest truths of religion, fall as much short of their design, as flying fishes do, whose wings (or broad fins) do indeed enable them to rise above other fishes, and fly a while in the air, but are able to carry them to no great height, nor keep them long from descending again.

Both philosophical and revealed truths proceed equally (though not so directly the one as the other) from the same Father of lights; as we receive from the sun, not only those immediate beams, that come in strait lines to us in a clear day, but that light of his, which is reflected to the earth in a moonshine night.

True philosophy being but reason improved by meditation, conferences, observations, and experiments, and the arts and disciplines produced by them; those things, that may be said of the consistency of reason with theology, and its usefulness to it, may justly be applied to the friendly agreement of true philosophy and divinity, and to the utilities of the former to the latter.

Philosophy does for the most part but more clearly display and expose the object; but divine revelation assisted by divine grace may serve both for a light, a telescope, and a collyrium; since it both illustrates the object, and furnishes the beholder with an excellent instrument of discovery, and clears the eye or visive faculty from those distempers, that render it unfit to exercise the best and difficultest acts of vision.

Divine revelation, when it is made known, being part of the rule of right reason, cannot be contrary to it.

Reason might seem to be an unkind gift of heaven, in case inquisitiveness into matters of religion, if it be exercised with sincerity, diligence, and humility, were either so criminal or so dangerous, as many think it; and if it were forbidden to exercise itself upon the noblest and most important objects it can contemplate.

Though no truth can really contradict another truth, yet that, which is but a gradual truth, may not by us be reconcileable to a superior and absolute truth. And in that case we need not destroy a dictate of reason, but only give it a limitation, and restrain it to those sorts of things, on which it was at first grounded, and to which it was, because of men's ignorance or inconsiderateness, that it was not confined.

They will often miss of truth, that seek for it with other aims than those of finding and using it.

As a good fruit tree being grafted upon a crab or thorn, the wild plant is enabled to bear a fruit much nobler than that, which is properly its own; and on the other side the graft prospers better, than if it grew immediately out of the ground: so when theology is as it were grafted upon human learning, it both prospers better itself, and makes the stock bear better than its own natural fruits.

Advertiſement of the author's concerning ſome papers belonging to the ſecond part of the Chriſtian Virtuoſo, (*which will in ſome meaſure account for the defects and diſorder of the following diſcourſe*,) probably ſent to his friend *H. O.* Eſq;

ACCORDING to the menace I made you, without being at all diſcouraged by you to execute it, I ſend you a collection of fragments to put in order, which your dexterity and kindneſs will, I know, make as good as the particulars, which are not capable of an exact method, can bear. Perhaps it may ſomewhat apologize for their being ſo confuſed, and alſo afford you ſome aſſiſtance, though but a ſmall one, to range and diſpoſe theſe ſhuffled papers, if I acquaint you with what it was, that occaſioned the diſorder you find theſe fragments in.

* * * * To ſhun which inconvenience, as I committed moſt of my thoughts to looſe leaves or leſſer portions of paper, ſometimes according as they came into my mind, and often as I preſumed I might have more or leſs time to commit things to writing. Even in theſe papers I was ſometimes, by the ſudden forerunners, or actual coming in of company, obliged either to break off abruptly before I had finiſhed what I had to ſay, or to cloſe it very haſtily, and give the laſt part of it a more contracted form, than it ought to have had; that I might timely enough diſpatch it, and in theſe looſe ſnips of paper not having often, much leſs always, when I was writing one, the others already written, to caſt my eye upon. I could not give them the form of parts or portions of a coherent diſcourſe, but was fain to ſet each of them down, as a ſeparate ſentence, or a compariſon, or an argument independent from the reſt, only caſting them into little bundles, as I thought them the moſt referable to this, or that part of the main ſubject. * * *

THESE things may give you ſome account, how theſe papers come to you ſo diſordered, and why I rather wiſh than expect, that you ſhould give yourſelf the trouble, by tranſpoſitions of ſome, and retrenchments in others, to link them into a coherent diſcourſe; but yet I hope ſo dextrous a perſon, as you, will be pleaſed to lay them in that order, that you ſhall think the moſt natural, and the leaſt remote from that they ſhould have been writ in; ſelecting out of the other papers what you think may be not unuſefully added in the margin to illuſtrate or corroborate the paſſage it is affixed to; and if among the adventitious papers, whoſe pertinency, I newly told you, I had not time to conſider, you find any long ones worth referring, they may, if you think fit, be annexed at the end by way of annotations, on this or that paſſage of the foregoing collection.

THE CHRISTIAN VIRTUOSO.

The SECOND PART.

I HOPE the past discourse has persuaded you, that a man addicted to experience, may, by being so, have some peculiar advantages to be convinced of the truth of the Christian religion. Wherefore it now remains to be manifested, that the same person may have also great dispositions to embrace the practice of it. * *

AND, for my part, when I am employed about the duties and functions of a Christian, methinks I do not much recede from my old practice; and that I am still but *trying an experiment*, namely this; *Whether by constantly endeavouring to lead a Christian Life, and perform the condition of the gospel, a man may obtain peace of conscience and contentment of mind in this life, and endless felicity in the next.* * *

As I presume you do not expect, that I should particularly treat of all the several things, that may be pertinent to my present subject, I shall confine my discourse to those main things, that may be conveniently referred to the six following heads, or propositions.

The six heads or propositions, viz.

I. THAT an experimental knowledge of God's wisdom, and other attributes, discoverable in his visible works, is a great help to rational piety and devotion.

II. FOR a man's own experience may discover unto him the excellency, satisfactorinesS, and the advantageousness of those graces and virtues, that are recommended by Christianity.

III. THAT personal experience may convince a man of the evils of differing kinds, that attend a vicious course of life, and even particular sins, and of the resistibleness of temptations to them.

IV. THAT the same kind of experience may assure him of the practical possibility of performing the duties and functions of a Christian, by the help of those assistances, that God gives the faithful implorers, to enable them to obey and please him.

V. THAT both a man's own, and other mens experience, may oblige his assent to the truth of what the scripture teacheth of the good and bad estate of the pious and the wicked.

VI. THAT heedful observations may satisfy a man of the vanity of the world, and the transitorinesS of external, and especially sinful engagements, and of the emptiness of those things, for which men refuse the ways of piety and virtue.

IN the first proposition are two sections, the first section consists of four parts, and shews the use, that the Christian Virtuoso may make of the contemplation of the *Macrocosm*, and especially of the later discoveries made in the *cœlestial* part of it. As 1. The order, substance, magnitudes, distances and motions of the stars, particularly the planets, primary and secondary; and among them the earth and the sea, by no means forgetting the commodious situation and motions of the sun. 2. Those bodies, that are called *elementary*, which together with the cœlestial are commonly thought to make up the system of the world. 3. Inanimate minerals, such as metals, gems, and the loadstone, to which third head belong glass and other artificial bodies. 4. *Bodies*, that are called *living* ones, such as plants and brutes; whether quadrupeds, birds, fishes, insects or reptiles, and bodies, which partake of both natures, such as zoophytes, lythodendrons. Sect. I. Sub-sect. (1.) Sub-sect. (2.) Sub-sect. (3.) Sub-sect. (4.)

II. THE second section shews the religious use a Christian *Virtuoso* may make of the contemplation of the *Microcosm*, which consists of four parts. The 1st relates to the anatomy of a dead human body, and the mechanism of a living one. The 2d relates to the human mind or rational soul, and the faculties and powers it has within itself, as belonging to its own distinct nature. And the 3d relates to a man, as he is a being integrated by a human mind and living body, strictly associated by certain laws of union or consociation, established by God in this monadical creature. To which sub-sections there are joined fourthly some applicatory reflections on the whole. Sub-sect. (1.) Sub-sect. (2.) Sub-sect. (3.) Sub-sect. (4.)

The first PROPOSITION.

That *an experimental knowledge of God's wisdom and other attributes discoverable in his visible works, is a great help to rational piety and devotion.*

NATURAL religion, as it is the first, that is embraced by the mind, so it is the foundation, upon which revealed religion ought to be superstructed, and is as it were the stock, upon which Christianity must be ingrafted. For though I readily acknowledge natural religion to be *insufficient*, yet I think it very *necessary*. It will be to little purpose to press an infidel with arguments drawn from the

the worthiness, that appears in the Christian doctrine to have been revealed by God, and from the miracles its first preachers wrought to confirm it; if the unbeliever be not already persuaded, upon the account of natural religion, that *there is a God*; that *he is a rewarder of them that diligently seek him*; and that he has some attributes, as justice, mercy, wisdom, &c. to which the Christian doctrine is very congruous; and to which (attributes) it were highly incongruous, that he should set his seal of miraculous power, to authorise a doctrine falsly pretending to be promulgated to mankind by his command.

But that natural religion is highly serviceable, if not also necessary, to that of Christians, I have endeavoured to manifest partly in the foregoing part of this paper, and more solemnly in another discourse. And therefore remitting you to that for further proof, in case you think it needful, I shall proceed to observe, that the chief argument, which engaged the heathen philosophers, and other men of parts, to exercise the nobler acts of natural religion, by *admiring*, *thanking*, and *praising* the deity, was suggested to them by the knowledge and consideration of the macrocosm and microcosm, that is, (to use a more familiar and yet equivalent expression) the universe and man. And to the attainment of this knowledge, and to the making of the reflections, that naturally accompany it, the experimental philosopher has divers considerable advantages (and dispositions:) because his way of conversing with the works of nature does both oblige and accustom him to consider them very heedfully; *to* view them round about; *to* take many of them to pieces; *to* look upon them in their several capacities (if I may so speak;) and in short, *to* investigate their properties by the help of all those sciences and arts, that may help us to discover them.

God having made the world with intention, not only to *communicate*, but to *express* his goodness, and display some other of his attributes, as his divine power and wisdom; he hath been pleased so to frame this great machine of the world, that in *some* parts of it, the impresses of those divine perfections are *so manifest*, if not *conspicuous*, that to use a scriptural phrase, he that *runs may read them*; and a slight attention and superficial consideration may suffice to make them be taken notice of. But there are other things in the fabrick of an engine, as exquisite as it is vast, (such as the world, and the creatures that make it up) the symmetry of whose parts, and the curiousness of whose structures, cannot be discerned, but by a very attentive and intelligent contemplator, furnished with considerable skill in mathematicks, physicks, anatomy, opticks, and divers other disciplines. And though even these will not enable a man to discover *all* the curiosity, that God hath employed in the contrivance of his admirable works; yet still he, that considers them with the most fixed and piercing eyes, will discover *more and more* of that exquisiteness, in proportion to the measure of his attention and philosophical knowledge; as when men sail in in the midst of the ocean, though none of them are so quick sighted, as to be able to see any shore, or look into the bottom of the sea; yet some men will see farther and deeper than others, according as they look more earnestly, and have better eyes.

There are divers accounts, wherein the curiosity of a Christian Virtuoso may be made serviceable to his piety. But in compliance with my intended brevity, I shall pitch but upon one of them, which is the study, that, as an experimental philosopher, he concerns himself to make of the macrocosm and microcosm; as I, to comply with new received forms of speech, shall often stile the world and man. About each of which objects of his contemplation, I shall, though but very briefly, set down some observations in a pecular section.

SECTION I.

Shewing the use the Christian Virtuoso may make of the macrocosm, consists of four parts or sub-sections.

(1.) Of the order, substance, magnitudes, distances and motions of the stars, particularly the planets, primary and secondary, and among them the earth and the sea, not forgetting the commodious situation and motions of the sun.

(2.) Of those bodies, that are called elementary; which, together with the celestial, are commonly thought to make up the system of the world.

(3.) Of inanimate minerals, such as metals, gems, and the loadstone; to which third head belong glass and other artificial bodies.

(4.) Of bodies called *living* ones, such as plants and brutes, whether quadrupeds, birds, fishes, insects or reptiles, and bodies, which partake of both natures, as *Zoophytes*, *Lythodendrons*.

The discoveries of the modern *Virtuosi* do not only represent the æthereal part of the world considered in itself, as a body incomparably more vast than it was wont to be thought, but they likewise manifest, that the cœlestial lights, that adorn it, are very much more numerous, than former philosophers and astronomers took them to be. For, according to the vulgar computation, there are but seven planets, reckoning the *Sun* (who yet seems to be rather a fixed star) for one, and a thousand twenty odd firmamentary stars. But *Galilæo* detected four new planets, that move in distinct orbs about *Jupiter*; and since him divers others (for the precise number is not fully agreed on) have been added, belonging to *Saturn*. And as for the fixed stars, our glasses have discovered multitudes of them unobserved by the ancients; the *Pleiades*, for instance, that formerly were supposed to contain seven stars, (though now many observers affirm they can see but six) have been discovered to be a constellation, whereto a surprising number of formerly

formerly inconspicuous stars may be referred. The *galaxy* or *milky way*, which vulgar philosophers would have to be but a meteor, is by our better tubes discovered to be a diffused aggregate of singly undiscernible stars, whose number is scarce credible. And I little doubt, but that, if our glasses shall be further improved, there will be still more and more numerous stars detected, to increase the number of those, that are so already; which I am the rather induced to think, because, having for a time been furnished with a telescope, which perhaps not two in Europe exceeded, and taking great pleasure, in a serene and dark night, to look upon the *belt* or *girdle of Orion*, and some of those whitish plashes of the sky, that are called *Nubilosæ*, I could scarce turn my tube to any part, where I did not make a surprising discovery of I know not how many little stars I had not seen before; and those too had such an appearance, as invited me to think, that I might have seen a great many more, if the telescope (which was soon after stoln from me) had been as perfect a one, as I had then hopes to procure.

The ideas, that the modern virtuosi are, partly by their telescopes, and partly by their *hypotheses*, assisted to frame of the magnitude of the celestial part of the world, represent it very much more vast, than vulgar philosophers and astronomers have thought it to be. For *though* later artists, that have employed better instruments, and made more accurate observations, teach, both that the terrestrial globe is more in compass by some thousands of miles, than it has hitherto been computed to be; and yet that the sun is many more times than one hundred sixty six times (which is the received estimate of his bigness) greater than the earth; insomuch that that justly famous and accurate observer Signior *Cassini* extends its magnitude so far, as to make it exceed some thousands of times that of the terrestrial globe, from which, though the sun be esteemed at a moderate distance, to be removed 1165 semi-diameters of the earth, each of which the learned astronomer *Gassendus* computes to be 4177 miles, so that the whole distance amounts to 4866205: *yet*, according to the Copernican hypothesis, embraced by the greatest part by far of the modern virtuosi, *as* other astronomers are content to teach, that the globe of the earth is but as it were a physical point in respect of the firmament, *so* the Copernicans assert, that the great orb itself (as they call that, wherein the earth annually moves about the sun) to be no more but a physical point in regard of the firmament; since the fixed stars appear of the same magnitude, even to mathematical observers, whether they be looked upon, when the earth is betwixt the sun and them, or when the earth is in an opposite situation, and has the sun between them and it. But without laying the whole stress of our argument upon *hypotheses*, it is plain, that by good telescopes, we may discover in the eighth heaven many hundreds of fixed stars, that the ancients never saw there, nor are to be found on the vulgar cœlestial globes. And for ought we know, the smallness, that many of these stars appear to have, may proceed but from their being at a greater distance from us, than those commonly taken notice of. For to say with vulgar philosophers, that all the fixed stars are in the same sphere, and equally removed from the earth, being like nails fastened in a piece of wood, is precarious, and to them that are convinced, by the motions of cœlestial comets and other proofs, of the fluidity of the upper part of the universe, improbable. And indeed if we consider, that, as I among others, have more than once had occasion to observe, as our telescopes come to be more and more improved, so we discover more and more stars in what we call the firmament; it will be difficult for us men to know, to what extent the vastness of the universe may not reach: which consideration may naturally enough *both* give a *Virtuoso* far more large ideas or conceptions than men commonly have of his greatness, who is able to make a fabrick, that is so stupendously vast; *and* oblige him to give a full assent to that of the Psalmist, *Great is the Lord, and greatly to be praised, and his greatness is unsearchable* *. * Psalm. cxlv. 3.

The wisdom of God in the system of the heavens, and their various and yet regular motions, is so conspicuous, that in almost all ages and nations, the consideration of the cœlestial bodies has led the contemplators of them, to ascribe them to a divine author or moderator. And indeed, as the miraculous star led the Eastern sages to the son of God, so the natural stars of heaven were the chief lights and guides, that led the heathen philosophers to the acknowledgment and worship of God. About which there is an excellent testimony of *Aristotle* preserved us, if I mistake not, by *Cicero*. Wherefore since divers even of the heathen philosophers made it unnecessary for me to enlarge upon this subject, I shall content myself to offer you a couple of short remarks or advertisements about it.

The first of these shall be this; that you need not be kept from acknowledging the wisdom of God, in the frame and conduct of the cœlestial bodies, by the differing *Hypotheses* of astronomers about their order and motions. For it is not upon the truth of this or that particular explication of the cœlestial *Phænomena*, but upon the consideration of the *Phænomena* themselves, that the persuasion we have of the divine wisdom is grounded, or at least needs to be so. For, *whether* you suppose, with the *Pythagoreans* add divers ancients (mentioned by *Aristotle* and others) whose opinion has in later times been revived by *Copernicus*, that the sun is in the middle of our world, and the earth as well as other planets move about it; *or* that, with *Ptolemy* and the generality of astronomers, who would have the earth to remain unmoved, and all the planets and fixed stars to perform their courses about it, as the physicial centre of their motions; or *whether* you will with *Tycho* and his followers, prefer an *Hypothesis* differing from each of the others, and yet partaking of both:

both: which soever, I say, of these and the like theories is the best, yet all agree in this, that the motions of the heavenly lights are divers of them scarce conceivably swift, and, notwithstanding their variety, have an admirable regularity, which has lasted, for ought appears, as long as the world, and is like to persevere to the end of it; which made *Aristotle*, who was seldom too forward to have recourse to divine beings, think it necessary to ascribe so great a regularity and harmoniousness in the incredibly swift motions of such vast bodies, to the agency and conduct of distinct intelligences, presiding over the distinct cœlestial spheres; wherein he did not much deviate from divers other heathen philosophers, who were therein followed by whole sects, and some of them by nations, that, as I have elsewhere shown, thought each planet to harbour, and be guided by, not only a rational, but a divine being. So that, as I was formerly saying, it is not upon a disputable *Hypothesis*, but on an attentive inspection, that our *Virtuoso* may ground his veneration of the divine wisdom expressed in the disposition and conduct of the cœlestial bodies: which assertion may be in some measure illustrated by this comparison. Suppose a man of parts heedfully looks upon a curious clock, and views how regularly and constantly the *Index* moves upon the dial-plate, how orderly and how distinctly the hours are struck, how the alarum-bell rouses mens attention at determinate times, and the chimes do at other times delight his ear by their harmonious strokes; though this man, I say, cannot certainly decide a controversy, that may arise from clock-makers; whereof one may affirm, that the machine is moved barely by *weights*; another may derive its motions from those of a *Pendulum*; and a third may dissent from both those, and substitute to weights a *spring*: but which of these hypotheses soever be pitched upon, it will still be true, that the clock was not made by chance, but by a skilful and designing artificer; this being not founded upon the truth of this or that *Hypothesis*, about the latent structure of the engine, but upon the inspection of the curious and regular *Phænomena* themselves, that it manifestly exhibits. And so, notwithstanding that *Galen* and other ancients did in many things differ from the moderns, about the structure and uses of the parts of the human body; yet neither this difference, nor the disputes, that still continue about the circulation of the blood, (at least as to divers circumstances and consequences of it,) the motions and use of the *Lympha*, the cause and manner of digestion in the stomach, the nutrition of some parts by the nerves, and the like controverted points, are of moment enough to keep skilful considerers, either from acknowledging, or so much as from admiring, the wisdom of the divine opificer, that shines in the manifest and undisputed contrivance and œconomy of a human body, alive and dead.

To the foregoing remark I shall add this that follows. *Though*, as has been newly said, there is not any of the mentioned *Hypotheses*, that ought to hinder its embracers from discerning the marks of an excellent wisdom, in the system and motions of the heavenly bodies; *yet* one of these theories may make it out much better than another does: and on that account, our *Virtuoso* may have a clearer and more affecting view of the divine wisdom, that is expressed in the cœlestial part of the universe, and especially in the situations and motions of the lights that adorn it, than the erroneous, or very imperfect theories of the vulgar philosophy, or the Ptolemaic astronomy, are capable of affording him. I could alledge, as a strong presumption in favour of this opinion, that the indefatigable industry of the modern *Virtuosi*, and the noble discoveries they have made by the happy invention of the telescope, having given them a much fuller information of the number and *Phænomena* of the fixed stars and planets; the theories thereby suggested are more true than the ancient and vulgar ones, and on that account very like to discover to us more of the wisdom of the divine author of this great and wonderful fabrick. But to descend to somewhat more particular, I shall add, that whereas the greater part by far of the modern *Virtuosi*, that are any thing versed in astronomy, favour the doctrine of *Copernicus*, as it is improved by the discoveries made by the help of the telescope, you will not wonder at it, if you duly weigh the advantages this *Hypothesis* has of that, which is vulgarly received. And though it will not be proper for me to enumerate and insist on them, yet it may not be amiss to touch upon two or three of the chief.

And first, by the Copernican system divers inconveniencies are avoided, that do very much incumber the Ptolemaic. As for instance, the *Primum Mobile*, that must be of a greater diameter than the firmament, and move with so much force and swiftness, as to hurry all the stars of heaven, as well fixed as wandering, in twenty four hours about the earth, is rendered needless. And so is that stupendous and incredible swiftness, wherewith a star or designable point in the equinoctial of the *Firmament* is computed to move fifty thousand times faster, than a correspondent point upon the equinoctial of the *terrestrial Globe*. And yet this last named point is estimated to be moved no less swiftly, than a bullet shot out of a cannon. The Copernican *Hypothesis* does also take off that extreme violence, that is perpetually offered by the *Primum Mobile* to the inferior heavens, which it rapidly whirls about from East to West contrary to the natural inclination of the planetary orbs, which continually makes them tend from West to East. The same doctrine likewise frees the heavens from the cumbersom *Epicycles*, which the vulgar theory places in divers of the orbs, and particularly an incredibly vast one in that of *Venus*. It takes away likewise the solidity of the spheres, which makes it extremely difficult, if not impossible, to conceive, how they can exercise the contrary motions attributed to them, one within another; not to mention, that

that these presumedly solid orbs are inconsistent with that fluidity of the interstellar part of the heavens, that may be inferred from the free trajection of the cœlestial comets, and divers other *Phænomena.*

Secondly, the *Hypothesis* we speak of does both render as good an account as the other, of what is more obviously observed in the stars, such as the vicissitudes and various lengths of the day and night in several parts of the earth, the successive seasons of the year, the *Phases* of the moon, her eclipses, and those of the sun, *&c.* and gives a far better account of the more difficult *Phænomena* in the theory of the planets, as the directions, stations, and retrogradations of some of them; why *Venus* is never distant from the sun above 48 degrees, and Mercury far less; and why the earth is never interposed between the sun and either of them.

And lastly, this *Hypothesis* seems to have much more concinnity than the Ptolemaic, and to be much more congruous, *as* to the course, that nature holds on other occasions, *so* to the wisdom of the divine opificer of the heavens. For great bodies, such as the *starry Heaven* or *Firmament*, seem rather made for rest, and little ones for motion; which therefore may be best ascribed to the earth, which is but a physical point in comparison of the other. Besides, whereas nature is wont to perform her work by the most compendious ways, it seems unreasonable to suppose, that she will keep the vast cœlestial bodies in a perpetual and most rapid motion, when all that invites them to assert these amazing motions, may be as well performed by a simple turning of this physical point, the earth, about its own *Axis* in twenty four hours. And this some pleasant disciples of the new philosophy think so extravagant, that they scruple not to represent it no less unreasonable, than it were to make the shore move about a ship at anchor, instead of making the ship sail along the shore, that the mariners might take a view of it; or to make the auditory walk round about the pulpit, instead of making the preacher turn his face successively to the auditory. And this incongruity they judged to be the greater, because the sun has no need of the earth, that may invite it to motion for its sake; but the earth has great need of the sun, and receives all the benefit of the motion, that one of the two is supposed to make about the other. The violent and contrary motions ascribed to the planets are much less agreeable to the simplicity of nature's ways of acting, than the single and regular motion, that *Copernicus* ascribes to each planet, constantly moving according to its own natural inclination from West to East. And *Galileo*, *Gassendus*, and other elder Copernicans of this age, would have wonderfully rejoiced, and looked on it as a great confirmation of the Pythagorean doctrine, *that the earth is a planet*, if they had known what the happy industry of later years has discovered; namely, that as the earth turns about its own centre, so there are other stars unquestionably planets, as Jupiter and Saturn, that do the like, though not all of them in the same number of hours. And perhaps such a conversion about their own *Axis* may be found even among the fixed stars, since the sun, who shining by its own light seems to be one of those, does probably make a revolution about his *Axis* in about twenty six or twenty seven days, as is plausibly conjectured by the motion of some spots, that now and then last long enough (as with a good telescope I also had opportunity to observe) to finish an entire revolution in the forementioned space of time.

Other advantages may be mentioned, that warrant the preference our *Virtuosi* give to the Copernican *Hypothesis* before the vulgar. But I forbear to mention them, partly because I could not do it without many words; partly because you may find most of them judiciously laid down by the learned *Gassendus* in his Astronomical Institutions, to which I therefore refer you; and partly because I presume what has been already said, may suffice to justify this inference, that since a popular consideration, or theories in divers points defective or erroneous, have been able to convince even heathen philosophers, as well as multitudes of other men, that the disposition and motions of the cœlestial parts of the world argued a *wisdom*, worthy to be ascribed to *God* or *Gods*; a more true and full information of the state of that noblest part of the world is able to furnish a Christian *Virtuoso* with solid grounds, for a high veneration of the divine wisdom and goodness, and suitable sentiments of piety. * * *

Propos. I. Sect. I. Subsect. 3.

APHORISM.

The mineral Kingdom, as, after the chemists, most writers now call it, comprises a far greater multitude of different bodies, than now naturalists, even most of the chemists themselves, are aware of; and I know not whether there be not some kinds of them, that were not known to *Albertus Magnus*, *Gesnerus*, *Eucelius*, and others, not excepting *Agricola* himself, that it would perhaps puzzle them to know to what established classes they can properly be referred. The curiosity I once had to make a collection of the native ores, and other minerals and fossils of *England*, furnishes me with not inconsiderable store and variety of them; and if I had not been quite discouraged by the disaster of a sudden fire, that broke out in the midst of the night in my lodging (whence I was forced to be carried out in my bed-clothes) and occasioned a concourse of soldiers from a neighbouring guard, and had dissipated, burnt or confounded the titles of the particular bodies, I should doubtless have much encreased the number of the different sorts of minerals, that this kingdom affords.

Propos. I. Sect. I. Subsect. 4.

APHORISM I.

If you show an observing man, that has seen but common watches, one of those curious watches, that show besides the hour of the day, the day of the week, and of the month, the age of the moon, the rising and setting of the sun, and the tides, that continually vary according to the age of the moon: this person, though he will look upon the watch, as it is able to show him the hour of the day, as a fine piece of workmanship; yet if he be informed and satisfied of the other, and particularly of the cœlestial *Phænomena*, if I may so call them, that belong to that little engine, he will have a much higher value both for the work and for the artist. For he, to make it fit for those additional and noble uses above-mentioned, must not only have the skill of a bare mechanician, but be acquainted with the motions and periods of the heavenly lights, and those of that vast portion of our inferior world, which under one name, the ocean, comprehends many seas; because the artificer must in the framing of his little engine have had due regard to all these, and consequently have had a comprehension of divers cœlestial and hydrographical truths. This gives me a rise to observe, that the knowledge and providence, which the divine author of things has manifested in his animated works, though it be very conspicuous in the organization of the matter of a hen, for instance, and her chickens; yet to a skilful considerer, it will appear greater upon another account, I mean that of instincts. For though it be very improbable, that such an exquisite structure, as that of a hen, should have been made by chance luckily connecting and disposing the small parts of the matter, whereof the animal consists; yet it is far more improbable, that chance should produce an engine, that is not only furnished with what is requisite for its own support and welfare, but with organs for the propagation of its *species*, and, which is more, with impressions, that look like notices and affections, that do not belong to mere mechanism, but to providence, which foresaw what was like to befal this engine at certain times, and in certain states of it, and accordingly provided for such occasions and emergencies.

APHORISM II.

Adam having been formed the last of all the visible works of God, at the first opening of his eyes, saw plants and animals at their full growth and their full perfection; and no doubt was ravished into admiration of such exquisite and beautiful contrivances, as that glorious spectacle invited him to contemplate. But these curious machines being made by the immediate hand of God, it was less wonderful, that by his omniscience and omnipotence, such works should be constructed; but he might think, that the parts of the matter they consisted of, could not without the immediate and continual guidance of the divine artificer have been brought to constitute such curious and elaborate engines, which must be therefore uncapable to be imitated or produced by any other agent, or in any other way. But if he afterwards observed the propagation of plants from their seeds; and how from so small a body as an acorn, for instance, there should without any help of man be gradually formed a tall oak with all its trunk, branches, *&c.* and, which is more, its numerous acorns, each of which contains in a small part of it, perhaps scarce exceeding a good pin's-head, the model of a future oak; if, we say, he took notice of this, and considered by what simple methods, without any mechanical tools or instruments, the first acorn became an oak, such as we have mentioned; he probably more admired, that such a machine should be produced after such a manner; and that the first oak, that was the parent of it, should be framed without any tools at all by a divine artificer. Incomparably smaller bodies there are than acorns are found to be, the seeds, that produce great trees, some of them perhaps bigger than oaks: but I chose to take an instance from acorns, because the oak is so obvious and well known a tree.

If also we suppose *Adam* to have observed the steps, whereby a hen or other animal is produced from the *cicatricula* of an egg, whereof perhaps not near the ten thousandth part, a perfect animal, I say, furnished with all that multitude and variety of organical parts, or subordinate machines, that concur to compleat it; he saw yet more cause of admiration, especially supposing him to have considered, that such large birds as ostriches, and such large animals as allegators and crocodiles, do notoriously spring from eggs; and so perhaps do far greater animals than these, though not so manifestly, because they are not excluded nor found enclosed in shells. The fabrick of these living machines is very wonderful; but it is perhaps no less so, that such curious pieces of work should be produced by such simple ways, as a few laws of local motion, whose efficacy is determined by the present constitution of the world, especially those parts of matter, that they act upon, or that act upon them. Which puts me in mind of *Euclid*'s *Axiomata* and *Postulata*, which, as few and simple as they are, led that skilful geometrician to the mystery of that admirable science, and even to the abstrusest propositions, and to all of the tenth book of his elements, which one will admire, how the wit of man could be able to discover by any means whatsoever, much more by a few such plain and simple ones as we lately named.

If an Indian, or country fellow, or a man wholly unacquainted with mathematicks, should be shown out of a window a fine garden and neighbouring landskip; and should see a skilful painter with his pencils, and great variety of colours, draw the picture of them very much to the life, he would justly esteem

esteem his skill. But if a master of opticks should tell him, that he would make him a fine picture of all the things there represented by those pencils, and colours, or skill in painting, by ways far more simple, the spectator would scarce believe him: but if the artist should by barely darkening the room, by putting to the shuts of the windows, and letting in the light at a hole duly placed and covered with a convex glass; he would be amazed to see in a trice, upon a sheet of paper held at a just distance from the glass, a whole landskip curiously delineated with the proportions, colours, and situation upon the plants of the garden; and, which the landskip could not show, the several motions, that the flowers and leaves were chanced to be put into by the wind, and such a picture, (to add that upon the by) though less distinct and vivid, may be made without the help of the glass, especially if the sun shine upon the garden, when the species enter at the hole.

APHORISM III.

THERE are other creatures subjected to man's direct dominion, that are of very great use to him without exceeding the number of twenty or thirty.

To which belongs the oak, the fir-tree, the cocoa-tree, the cotton-tree, the vine, the plant that bears the pepper, the plant that affords indico, wheat, rice, mayz, flax, hemp, horses, beeves, sheep, beavers, dogs; and in the northern countries deer, (taking that name in a large sense) to comprise elks, rein-deer, *&c.* and in hot climates, camels, and elephants; and in the sea, whales, not to mention clays (for bricks, pots, *&c.*) Common stone for building and manuring of ground, and the ores of metals, whose utility is generally enough known.

I MUST not here forget to take notice, that even poisonous creatures are not all of them to be excluded from the number of those that are found to be highly advantageous to multitudes of men, and consequently to deserve their gratitude. For not to mention the great medicinal virtues of vipers and scorpions, that opium is a poison to most men, that are not by degrees used to it, in case it be given, though but in few grains, as six or seven, and perhaps far less, many tragical instances have declared, and yet it is, if skilfully given, of great efficacy to multitudes of persons of differing ages and complexions, and in great number and variety of distempers as is notorious to physicians and apothecaries, and many others besides. And as one poisonous plant, as the poppy, whose juice affords opium, is in many cases a noble medicine; so another poisonous plant, by a very slight preparation, affords a very useful aliment. The plant I mean is mandioca, whose root (though when it is crude) is believed to be poisonous; and a general of the English forces in *America* told me, that in his army several animals were killed by the use of it, before they knew the mischievous qualities of it. And yet by a slight preparation, not only the juice of this root is made a drink, that is in great request and common use among the Indians, but a great part of the people of divers vast regions of *America* live upon it as we do upon bread; their cassavi, which is made of the consistent substance of the root after the juicy part is separated from it, affording them a substance analogous to our bread, which I have seen very white, and have sometimes tasted with pleasure.

AND if there be (for I speak but conditionally, and very hesitantly) a truth in the vulgar astrology, or in some other doctrine of the influences of the cœlestial bodies for such a one, some things, that I have observed, incline me to think there may be, man may apply the stars themselves to several beneficial purposes and uses, particularly by making talismans, and the like bodies. Of which divers instances are given us by historians and travellers of good credit, and of which in another paper I deliver two memorable relations, that I had from very credible witnesses upon their own punctual knowledge.

APHORISM IV.

GOD bestowed upon man the dominion and use of all other animals, beasts, birds, fishes, reptiles, and insects, by direct donation, and together with them all vegetables that grow upon the earth, which he may make use of by employing them immediately, or oftentimes more to his advantage by the intervention of beasts and other animals, to whom they serve for aliments, as these do for man, the number of man's direct subjects is more considerable than most men think; for the various kinds of four footed beasts, birds, fishes, and other animals amount to a multitude, as those that have been curious and industrious to find them out, and enumerate them have declared; and for plants, though botanists agree not so well, as it were to be wished they did, about the several species of plants, yet by what we find in the diligent *Bauhinus*, there was in his time about six thousand sorts of plants, and the number has been since much increased, by what divers curious persons have written, besides which, I know two or three virtuosi that are good herbalists, who travelling in divers parts of *America*, partly islands, and partly regions of the continent, found there and brought away for *Europe*, many scores, if not many hundreds of undescribed plants, some of which they shewed me, and others they presented me to.

APHORISM V.

THAT so many and so various creatures as we have mentioned, to be directly subjected by God to man's dominion, may be of great advantage to him, and of more than they have been, when once they shall be improved by sagacious and industrious virtuosi, may appear very probable, if we consider what great benefits accrue not only to single persons,

sons, but to whole communities, and sometimes even to nations by two or three vegetables, as many reptiles and insects, and as few minerals, of most of which the uses were unknown to the ancients, and those of the rest but little known; the vegetables I mean, are none of the greater stately trees, but plants which are most despicable for their small bulk. The first of these is sugar, made of the express juice of the sugar cane, which is brought both from the *West* and *East Indies*, and that in such quantities, that the little island of *Barbados* alone furnishes *Europe* with the lading of many score ships in a year; and a sober knight, which was governor of it, told me, that, if I much misremember not the number, that small island did then furnish *England* with about eleven hundred thousand pound weight of sugar of its own growth. The other plant, though reckoned but a weed, makes at this day a great part of the commerce between *Europe* and some American country, especially *Virginia*; the latter of which country sends yearly into *England* alone a considerable fleet freighted almost only with tobacco. If therefore two plants, whereof one is a reed, and the other a weed, and two insects, the meanest sort of animals, and a couple of rude and dark minerals have already been made to be so serviceable to man, by what they afford him, and by the various employments they give to some hundreds of thousands of indigent persons to cultivate, manufacture, and transport them, what may we not think of the benefits, that in process of time, such multitudes as we lately mentioned of other plants, animals, and minerals, may by man's industry be brought to afford him? All which improvements ought to excite man's gratitude to him, that made those creatures to his hand, and endowed him with a rational faculty and fit organs to exercise his plenary dominion over them.

APHORISM VI.

Two reptiles there are that afford a great part of the wealth of divers whole countries, viz. that caterpillar, which we call the silkworm, which is said to have been brought into *Europe* about the time of the emperor *Justinian*, and now is so much used in a great many kingdoms and other countries, that its products, raw and manufactured, make the wealth of a great part of the inhabitants of the earth, and the pride of many more. The other is cochineal, whose nature I know is much disputed; but an ingenious person, that was the first English governor of *Jamaica*, and was at his bidding me farewel, desired to examine the Spaniards about it, informed me, that it was the hinder part of a peculiar sort of fly, which was confirmed to me by a physician, whose writings are not unknown, that was born in *America*, who assured me, that he had not only seen the flies breed, but purposely bred them; how rich a commodity they are, the great rates that are given for them by dyers of scarlet, and several other colours, and also by men of other professions do sufficiently manifest.

APHORISM VII.

There is another thing that belongs to animal creatures in certain states, which though it be not properly referable to any of the foregoing heads, and is not wont to be taken notice of by anatomists and physicians; yet seems to me to deserve a peculiar mention and regard. The thing I mean is, that which is commonly called instinct, and seems to be a seminal, or at least a congenite impression, that inclines an animal whilst he is in a certain state, spontaneously to pursue or avoid some things, that tend to supply him with somewhat that he wants, or to make him avoid or escape something that would endanger or hurt him. I speak thus disjunctively, because the instincts of animals are not all of one kind in differing species, and sometimes are manifold even in the same individual; when he happens to be in differing circumstances, though they all tend to one general scope, the welfare of the animal whom the instinct chiefly regards.

APHORISM VIII.

These impressions or propensities are of so peculiar a kind, that not only they seem not referable to casual mechanism, but have something belonging to them, that is supra-mechanical, and beyond the reach, not only of mere chance alone, but of any plastic principle not framed by an intelligent and designing agent. For in the *storge* or natural affections of divers animals to their young ones, as (that I may give a very obvious example) of hens to their off-spring. There appears in the parent manifest tokens of sollicitousness, skill, and in some cases courage too, *in* sitting upon her eggs for some weeks; *in* turning them from time to time, so as by her warmth successively to cherish several parts of them; *in* taking care when they are hatched, to guide them, to provide for their sustenance, and some time upon occasion to defend them, and that with a stoutness, that belongs not naturally to those tame and pusillanimous birds. Now it may deserve to be considered, that this strange affection towards her eggs and chickens, is no part, whether similar or organical of the hen, who is completely organized and fitted for her own preservation, before she lays an egg. So that this *storge* supervenes to the animal already perfect in her kind, and does not tend directly to her own preservation, but on the contrary makes her lose a great deal of time in sitting, which she might and would have otherwise employed to go in quest of her own food, and makes her give herself a great deal of trouble, and sometimes expose herself to a great deal of danger, for the sake of a little helpless creature, that when grown up will exercise no gratitude towards her. When all this is reflected on, if it be also further considered, that this passionate concern of the hen

hen for her off-spring, is but a temporary thing, and ceases when the young birds are grown up to be able to live without their dam, and provide for themselves: this wonderful storge seems manifestly enough to declare, that it is an institution, if not an artifice, of some benign and provident being, that just at a fit season, and whilst it lasts, and no longer, acts the parent to do things she was never taught, that are as unprofitable to herself, as useful, nay necessary, to her otherwise helpless off-spring.

APHORISM IX.

Among the other things, which because they are familiar, do not so much as engage our attention, much less excite our wonder, we must not forget the eggs of dunghil hens. For though their commonness makes men daily eat them, without looking on them but as aliments; yet a heedful inspection may soon manifest, that they deserve more regard. This it were not hard to show by several instances, but it may suffice for our present purpose to point at two. The first is the *cicatricula* or small round speck, that is to be seen on the coat of the yolk of an egg. For in this very small part of the egg, the curiosity of the excellent *Malphigi* has lately discovered a chick already formed, with all its essential parts; so that the incubation of the hen does little, or nothing more, than dissolve the humours of the egg, and procure that the parts of the chick, that seemed indistinct, or scarce (if at all) visible before, coming to be enlarged by the accession of aliment stored up by nature in the egg itself, are displayed, and become first manifest and then conspicuous. The order and series of opposite changes, that may be observed in this curious work of nature, to turn a *cicatricula* into a perfect chick, is truly admirable, as will easily be confessed by him, that has read our excellent *Harvey*, and some other modern anatomists, who have further and happily cultivated that subject.

Wherefore I pass on to my second instance, which I shall take from one part of the structure of an egg, which seems trivial, and accordingly is wont to be overlooked. For the treadles of the egg, which have been for many ages erroneously thought to be the principles of the chick (though each egg has two of them, and those very distant from one another) these, I say, are considerable parts of a wonderful mechanical contrivance; for such that is, that suspends a fluid body, as is the yolk of the egg in the midst of another fluid; the white, which incompasses the yolk equally on every side, and that so constantly, that which way soever you turn the egg, the liquors retain their due situation in respect of one another. And this is so fine and difficult a piece of mechanism, that the most skilful artists, (whether mathematicians or chemists) that have attempted to *detain* one liquor in the midst of another, every way ambient, have found their industry defeated. And though my endeavours to perform this have perhaps made a somewhat nearer approximation, yet I willingly confess, that the utmost I was able to do, did but very imperfectly imitate what nature excellently does in the situation of the yolk and white of the egg.

APHORISM X.

As light as we make of the feathers of a bird, yet one of these may give even philosophers just cause to admire the divine perspicacity and providence. To take, for instance, the feather of a peacock's train, and yet to pass by the curious mechanisms, that may be observed in the feather upon the account of its quill and other parts; what a stupendous foresight is argued by the half-moon that adorns it? For it is more than barely wonderful, *that* in so small, and as to sense, so simple and uniform a liquor, as that small portion of an hatching egg, which later anatomists call the *Colliquamentum*, that appears to the eye an uniform liquor, there should be some minute and distinguishable parcel of matter, which by virtue of the general laws of motion, and the fabrick of the egg, (which seems very slight and unelaborate) *that* I say, this small portion of a drop or two of matter, should by the divine governance be so carried through all the various changes of size, situation, motion, and contexture, which during the incubation it undergoes in the egg, that at length it should appear in the feather in a new and peculiar texture, and vivid colour, quite different from those it had in the *Colliquamentum*; and so exactly determined to a particular position, and (which is yet more strange) to a true regard to all the other particles, that belong to the half-moon,) as to concur exactly with them all, to constitute that gaudy and pleasant figure. This is still the more wonderful, because a skilful painter could not make it more fine in point of shape, nor adorn it with such beautiful colours and those changeable too; nor could such a regular and vivid picture be made, unless every sensible part of it were as skilfully guided as that we first pitched upon, and so steered as both to attain its proper colour, and to arrive at its determinate place, and settle there, without stopping short of it, or advancing sensibly beyond it.

You, Sir, to whom I have the happiness to be sufficiently known, will need but a short advertisement (if any) to persuade you, that after all that I have said, or shall hereafter say in this discourse, to the advantage of philosophical piety, I am far from any intention to depreciate, that sublime and compleat piety which is taught in the gospel, and much more from preferring natural religion to that which Christians are blessed with by supernatural revelation. And indeed, though the fabrick of the world, and the gospel dispensation, do both of them proceed from the same divine author, and therefore may without profaneness be compared with one another; yet the latter may without partiality be judged more admirable than the former. And in my opinion, it is pity, that so excellent a contrivance as the divine wisdom and goodness has devised for the salvation of men, should not be more worthily treated

treated of, and should not have its mysterious recesses better looked into, and more skilfully displayed, than they are wont to be in common place books, and vulgar (though perhaps pompous) courses of theology. And indeed the divine wisdom and beneficence, not to mention other adorable attributes can scarce be *so* wonderfully exercised in such an ignoble a subject as senseless matter, in all whose productions and phænomena, how various and wonderful soever they appear to us, there needs but the guidance of the local motions of the greater and smaller fragments of it according to a very few laws which they are not disposed to disobey, *as* in governing spiritual beings and free agents, that have wills, interests, and designs, of their own.

But I fear, you will tell me, that I wander from my subject, (which yet on this occasion, I think but a venial fault,) and therefore I shall only in this place hint to you, that the study, how successful soever, of corporeal things, can give us but a mechanical knowledge, and discover to us nothing but variety of mechanism; whereas the study of immaterial and sacred things, may procure us the knowledge of incomparably nobler objects, and of such depths and fetches (if I may so speak) of wisdom and providence, as human reason without illapses of divine light, would never have discovered, and as *the angels themselves desire to pry into*. And having said thus much, which probably is more than enough, to show that a man, that admires the wisdom of God conspicuous in his works, may discern both it and divers other adorable attributes, more gloriously displayed in the book we call scripture, than in the book of nature. I shall now resume my interrupted discourse.

SECTION II.

The second section shews the religious use a *Christian Virtuoso* may make of the contemplation of the *Microcosm*, which consists of four parts. The 1st relates to the anatomy of a dead human body, and the mechanism of a living one. The 2d relates to the human mind, or rational soul, and the faculties and powers it has within itself, as belonging to its own distinct nature. The 3d relates to a man, as he is a being integrated by a human mind and living body, strictly associated by certain laws of union or consociation established by God in this monadical creature. To which sub-sections there are joined, *fourthly*, some applicatory reflections on the whole.

Sub-sect. (1.)
Sub-sect. (2.)
Sub-sect. (3.)
Sub-sect. (4.)

Having dispatched what I thought fit to say about the *Macrocosm*, I proceed to take notice of some helps to piety and devotion, that may be afforded to our *Virtuoso* by the consideration of the *Microcosm*, as the ancient philosophers, as well as the later chemists, have stiled man. * * *

But that you may not expect in the following papers, what I did not intend they should contain; it is very necessary, that you should seasonably know, (though it be not perhaps necessary, that I should solicitously inform you of it) that I do neither *pretend* nor *purpose* in this paper, to treat of any works of nature as they are such, and are endowed with physical qualities and other affections. Since my design is to consider those few I have occasion to make mention of, not chiefly, if at all, with reference to philosophy, but to religion, as the contemplation of them may conduce to piety, and suggest reflections fit to excite and cherish devotion.

The first SUBSECTION.

Though the dignity of the subjects seems to require, that we should begin what we have to say of man, rather by the consideration of the rational soul, than by that of the human body; yet I shall chuse to treat first of this latter, both because the body is generally reputed to be more known to us than the mind; and because the knowledge of the body, and its corporeal functions, may assist us to discover the nature of the mind, by reflecting on those operations, that exceed the mechanical powers of the body, or even those of matter taken in a more general sense. And it may perhaps recommend this order, that it aspires to imitate that of the infinitely wise author of human nature, who first framed the body of *Adam*, and then breathed the soul into it: thus preparing the mansion, before he thought fit to introduce the inhabitant.

As human bodies are found in two very differing states, namely whilst they are living, and when they are dead; so they may fall under two distinct considerations. But in this place, where I do not pretend to treat fully of the subject, I shall for brevity's sake allow myself sometimes to intermingle my reflections on both, as they occur to me, and leave you to sort them, if you think fit.

Though a living animal be confessedly by great odds preferable to the same animal destitute of life, yet because the knowledge of the structure and contents of a cadaver has been more cultivated by physicians, and is more easily attainable than that of a living man, I shall begin with the less worthy subject. I say then, that even a dead human body, though an engine by very great odds inferior to a living one, does yet abound with, or rather consists of, parts so curiously framed and skilfully united into one engine: that to give a satisfactory account of all the particulars in it, that manifest an excellent wisdom in the mechanist, would oblige me to transcribe almost a whole institution of anatomy. For which reason it may suffice for my present purpose, cursorily to mention some of the chief heads, to which the particular reflections, that my intended brevity forbids me to insist on, may, I think, be commodiously enough referred: such are, first, the number, and secondly, the variety of the integrant parts of the body; thirdly, the fabrick of these, considered as parts; and fourthly,

ly, (and lastly) the contrivance and symmetry of the whole machine as such.

But though, that I might not too much wrong my subject, I thought fit to enumerate the newly mentioned particulars; yet I hope you do not expect to find them separately enlarged upon, in papers that must make but a part of a tract, which when entire, ought not to be great. On which account, and that of my want of leisure, I shall make reflections but upon *some* of them by way of *specimens*, contenting myself to have named the rest, and to declare, that I decline treating of them as well as the others, not out of disesteem, but because I cannot treat of all I have enumerated. And this advertisement I desire may be extended to all the remaining part of this (second) section, and applied to the other lists of particulars, which would, if all of them were insisted on, make the first proposition (of the second part) enormously disproportionate to the rest.

Article I. That the *number* of the manifestly distinct parts of a human body, in proportion to its bulk is very great, especially if compared with those that suffice to make up even the most curious artificial engines, as clocks, watches, &c. will be easily granted, if we consider, that those grosser parts, the bones, notwithstanding the fewness of them, that are usually taken notice of by the vulgar, are reckoned to be above 250; nay, I find, that the famous and diligent anatomist *Vesingius*, asserts them to amount to more than 300. And it is known, that many of the bones have each of them several muscles fastened or belonging to it; and a muscle is usually furnished with two tendons, blood vessels, and divers other parts. And not to mention those parts, that are found either single, as the heart, liver, spleen, &c. or only in pairs, as the eyes, the ears, the testicles, &c. There are several other sorts of parts, whereof each sort contains many of the same denomination to be found in divers parts of the body, as cartilages, ligaments, and more plentifully glandules of divers kinds, membranes, nerves, veins, arteries, &c. To say nothing of the liquors to be met with in a human body, as blood, gall, chyle, *succus pancreaticus*, *lympha*, &c. But that a human body comprises very numerous parts, will be further manifested, if we proceed to take notice of the variety of them, since it will appear highly probable, that an engine, that consists of so great and conspicuous variety of parts cannot but comprehend a multitude of them.

Article II. The *variety* just now mentioned, may in great part be easily deduced from what has been newly said already, but because the enumeration there made is very imperfect, the number and differences of distinct sorts of parts would much better appear, if the limits this paper ought to have, would permit me to display the several distinctions, that naturalists and physicians have been obliged to make of the parts of a human body, as into simular and organical, into head, chest, and limbs, into parts containing, contained, and impellent, to mention now no more of such like distinctions, but I am reduced for brevity's sake, to refer you for satisfaction, to what will abundantly give it you, the attentive survey of a skilfully dissected body. For there you will not only see many different sorts of parts, as bones, veins, arteries, nerves, cartilages, ligaments, muscles, fibres, membranes, parenchyma's, as they are called, glandules, &c. But you will easily observe, that the parts comprised under each of these sorts or denominations are many, if not most of them manifestly diversified by distinguishing accidents, such as bulk, figure, consistence, texture, colour, &c. As bones are some far bigger, and some much harder than others are, unlike in shape, have epiphyses and apophyses, differing in situation, connexion, and other accidents; so the membranes of the eye differ from most others of the body, and not a little from one another, as is evident in the *cornea* and the *retina*, so the milky and the lymphatick vessels differ from other veins, and the valves of the two ventricles of the heart differ both in situation, figure, and strength, from those of the sanguiferous veins, and of the lymphæducts, so in the muscles there is a wonderful diversity, either (to omit their being, or not being sphincters) as to their largeness, thickness, tendons, corneous portions, thinness of fibres, number, strength, and tendencies of fibres, shapes, bigness, number, origination and insertion of the tendons, of which most are entire, but some perforated by other; so of glandules, some are conglobated, as the moderns call them, and some conglomerated, or cluster-like, some very large, and others in comparison extremely small, as many of those formerly unobserved ones in the stomach, and divers other places; and these glandules are respectively furnished with an artery, a vein, and nerve, and usually also an excretory vessel suitable to its size and uses, to all which kinds of parts, if we add such as, for the peculiarities belonging to them, seem not so clearly referable to any of the former kinds, such as the vitreous substance, the horny coat, as it is called, and the crystalline lens of the eye. And also those parts of a female human body, that belong peculiarly to the sex, and those temporary ones, if I may so call them, that are proper to a woman that is big with child, and come off after her delivery, and which some anatomists therefore call deciduous parts, such as the placenta uterina, urachus, and the different membranes that involve the fœtus; if, I say, to the formerly enumerated kinds of parts, we subjoin these two additional sorts, we shall find the number of parts that deserve to be looked on as distinct, and the various accidents, that diversify them to be exceeding great, which I think may be more probable, if you consider with me (what is too little taken notice of) that this great multitude and variety of parts, whereof this human engine consists, are (without need to interfere in their actions) packed up in incomparably less room, than the best mechanist

mechanist in the world would require; for an engine of very much fewer and less different parts, especially, which I desire you to reflect on, if due regard be had to the strength, as well as disposition of the parts; for this strength is wonderful in divers that make up the human body, as may appear by the wonderful things, that some muscles will perform, and some tendons and ligaments sustain; for during that time where nature aims not at the strength of parts, but their fabrick and confirmation, or, in a word, the due organization of the matter, as in an embryo, almost all the parts of a man at his full stature are to be found crouded, yet without interfering, injuring, or hindring each other, into a fœtus incredibly small, since it is delivered by anatomists of great authority, that about the end of six weeks, or such a term, as may suffice to show the little model of a man to be compleatly animated, it is sometimes scarce any bigger than an ant or pismire. This may appear incredible to many, and it would have done so to me, if I had not remembred, that when I made the observations, elsewhere mentioned, about the progress observed by nature in the hatching of the eggs of hens, I found it true what our famous *Harvey*, and some of his followers have noted, that the bird proceeds from the cicatricula, or white spot, that is found upon the coat, or membrane of the yolk, the rest of the fluid matter of the egg being employed to nourish the daily growing *embryo*; for the proportion of this little speck, as some good authors call it, of the whole body of the egg, or that of the compleat chick is so very small as scarce to be at all considerable, as will be readily granted by those, that having compared the small dimensions of the animated speck with those of the cavity of the whole egg, and made due allowance for the imperfection of the figures, shall on this occasion make use of the mathematical rules about triplicate proportion.

But I must not inlarge on a subject, that would lead me too far, and therefore it shall here suffice to add this reflection, that the number and variety of the parts of a human body are so great, that the names of the parts *already* observed (and I am confident *all* that may be are not so) might, if well ranged, almost suffice to make a dictionary, the terms that dissectors have been obliged to employ, to express the parts of the lesser world, are more numerous than those that mathematicians have thought fit to make use of in astronomy and geography put together; so that an anatomical dictionary may be more copious than a cosmographical one, which you will perhaps the more easily believe, if I add this reflection, that besides the distinct parts considered separately, there are many things fit to be declared in the writings of anatomists about the situations, insertions, and connexions of parts, as to omit the system of muscles that compose the heart, the manners wherein the bones are joined are so many, that they are nine or ten harsh terms, such as synchondrosis, synneurosis, gomphosis, arthrodia, ginglymus, *&c.* to express them.

Article III.

The consideration of the parts of a human body looked upon *separately*, that is, as each of them is *single* or connected with only *some others*, and not united with *all* of them into one engine, (for this, considered as such, is to be the head of the fourth article:) this consideration, I say, added to the two foregoing articles, may manifest how exquisitely framed a fabrick the human body is; the parts that make it up being not more numerous than considerable for the differing structures and consistences of them: all which are here comprised under the name of the *fabrick of the several integrant parts* of the human body. I say then, that the parts considered as such, may afford a great many instances to our present purpose; but time will not permit me to take notice, in this place, of more than one or two.

The first of these is the eye, which in a little room comprises so many curious parts, and so skilfully associated into one instrument of vision; that as great a variety of objects as it surveys in the spacious universe, it scarce discovers any thing more exquisitely framed than itself.

This part of the body, as small as it is in bulk, hath several *auxiliary* parts belonging to it, and is itself composed of a considerable number and variety of *constituent* parts.

For anatomists are wont to reckon as belonging to the eye, not only the newly mentioned adjuvant parts, which they call contained, but those others to which they give the name of containing, such as *the pericranium*, that lines the *orbit*, or socket of the eye; *the* two eye-lids, *the* two *canthi* or glands at the two corners of each eye; *the* fat, to fence the eyes from cold, and help to keep them dry; the six muscles, four right ones, and two oblique ones, whereof one of the first sort serves to raise the eye, another to depress it, a third to draw it to the right hand, and the other towards the left. And of the second sort, one draws obliquely downwards, and the other obliquely upwards; and this last named is furnished with an unusual addition like a pulley to strengthen it, as both that muscle, and each of the fifth is with small nerves to convey to it spirits for sense and motion. Nor do these want others of the containing parts of the eye, that are themselves compounded enough; as the gland seated at the outward corner of the eye, and by some called *innominata*, which though lesser than the other, is yet a conglomerated one, (that is made up of several smaller cleaving together) and furnished with capillary vessels, veins, arteries, and *lymphæducts*. And in an eye-lid, besides other constituent parts, as two fine skins, and between them a thin *membrana carnosa*, we may observe all along the inside of the edge a soft cartilage, besides a row of hairs, that have this peculiar, that they do not grow as the hairs of the head and beard do; but having attained their full

growth, continue of the same length for many years together, so as not to need to be cut. And these eye-lids are of excellent use to the eye, serving *both* for curtains to keep out the light when it is not desired, which the cartilages that strenghten their edges, and help them to shut very close, enable them the better to do, *and* to fence the eye from dust, and cold, and smoke, and other outward injuries; *and*, which is more, to do it two services that seem of a contrary nature: for the eye-lid *both* wipes the cornea when dust or any such thing adheres to it, and in a sort dries it, by displacing inconvenient moistures; *and* yet, by the help of the lympha, it moistens the eye from time to time, which would soon grow dry, and helps it to move more glibly.

To advance now to those intimate parts of the organ, that are called the contained, I think it worth observing, that there is something in the texture of the *tunicles* of the eye, that is but imperfectly discovered by a dissector's knife, and yet is an excellent part of the mechanism of it. For *whereas* the other nerves of the body are industriously hid by nature beneath other parts, to fence them from outward injuries, and from cold, by which the nerves are very much prejudiced; and *whereas* the outward coat of a nerve is wont to be extremely sensible of punctures, or the rude touches of external bodies; *whereas*, I say, these things are thus in other nerves, the bulb of the eye consists mainly of the optick nerve expanded. For the *sclerotis*, of which the *cornea* is a part, is an expansion of the outward coat of the optick nerve; and yet the *cornea* is not easily offended, nor is apt to cause any convulsions, even when it is pricked quite thorough; and it is not only without harm exposed immediately to the cold air, but even in frosty weather it is seldom sensible of any cold. And the other tunicle called *uvea*, though it proceeds from the internal and exceeding thin membrane of the optick nerve, yet it affords the *iris*, which is of a differing texture from the membrane before it enters the eye. And then that which passes for a tunicle under the name of *retina*, not only has its filaments so expanded, as to cover the bottom of the eye, and reach as far as the crystalline humour; but though it be a medullary part of a nerve, yet it is safely exposed to the action of external bodies, whether lucid or illustrated, without losing that exquisite tenderness or sensibility, that makes it capable of being affected both by light itself, and by all the numerous modifications of light, that are, or produce colours. Which sensibility it can retain, though it be thus exposed to the action of so many bodies, because the pores of the diaphanous parts of the eye are so very small, that the objects affect it but by the intervention of light, which is a thing proportionable to such tender filaments, and therefore may be indured by them, though it act briskly enough to make sensible, and perhaps vivid impressions on them.

It has three several humours, besides the juices that serve to nourish it. It hath as many coats, and there belongs to it the optick nerve, and according to modern discoveries, limphæducts, besides sanguiferous vessels, some of which I have had the good fortune to see and shew even in the nerve and other parts of an inferior order. Each of the humours has its own peculiar consistence and nature, and as most anatomists teach, its membrane too. The *aqueous* humour is so called from the fluidity that makes it resemble water; and though it pass for insipid, yet I have found, even without distillation, that it is not destitute of a fine volatile salt. The *vitreous* humour, though it be fluid enough to accommodate itself to the figure of any fitly sized vessel that it may be put into, is yet much heavier than water, and will lye with a distinct surface both in it and in many other liquors. And the *crystalline* humour (improperly so called) though it be clear like the substance, whence it had its denomination, is of a very differing texture from the other two, as is manifest to the touch, and as I have found by easy chemical experiments. There is also much disparity both as to bulk, consistence, and figure, between the several tunicles or coats of the eye. Nor is the difference hard to be discovered between the other parts that concur to compose it, as is obvious to any that hath seen an eye well dissected. Such a person will scarce fail of discovering, that it is not without wonderful art, that so many curious, and several of them very fine and tender parts, can be crouded together into so little room without hindering one another in the exercises of their motions and functions; but, on the contrary, be brought as it were to conspire to assist each other in performing their motions glibly. And here let me observe, that the curiousness of the mechanism of an eye deserves not, perhaps, so much wonder as it is considered with relation to its anatomical structure, as when it is considered with reference to light and to the laws of opticks. For the dissector, who knows no more of the eye, than a dexterous hand, and a sharp knife can teach him, will not be able to give others or himself a good account of several weighty questions, that may rationally be made about the structure of the eye, and divers observables that have a strict connexion with it. He sees not for instance, *why* the crystalline humour ought to be placed between the two others; *why* the cornea should be somewhat protuberant, and almost a portion of a sphere; *why* the humour that lies next under it should be fluid like water, rather than of such a consistence as the vitreous; *why* the crystalline should be not of near so globous a form as the *cornea*, but of a double convex figure; and why both sides of this natural *lens* have not the same kind of (the surface next the *cornea* being much flatter than the other) convexity; *why* the inside of the *choroides* is of a figure somewhat resembling that of a great portion of a hollow sphere; and *why* it is of such a colour; *why* the optick nerve, that reaches entire to the eye, spreads itself in slender fila-

ments

ments all over the concave bottom newly mentioned, making an expansion that looks somewhat like a net; *why* these filaments are so very tender, that they seem to be of a medullary substance, whilst the *cornea*, though reputed to belong to the coat of the nerve, is not like the coats of other nerves easily sensible of the least sharpness in the body that touches it, nor of the great cold to which it is frequently exposed in frosty weather. *Why* besides the muscles, that manifestly draw the eye this way and that way as a man pleases; there is in the eye itself another muscular like action, whereby the bulb of the eye has its figure somewhat altered, being, as occasion requires, sometimes made a little oblong, and sometimes a little flatter; *why* the crystalline humour is seated just at such a distance from the *cornea* on one side, and from the *retina* on the other, but nearer the former, which is also somewhat protuberant; *why* the pupil, or hole in the *uvea*, is round, and not of any other figure; as (for special reasons) it is in horses, kine, cats, and divers other animals; *why* the pupil in its best and natural state is pretty near of such a determinate compass in the same person, and yet makes sometimes a wider and sometimes a narrower circle, but this within certain limits of dilatation and constriction, and only as occasion requires, the variation not naturally exceeding those bounds, nor much out-lasting the occasion of it.

To these and many more such questions that may reasonably be proposed, he will not be able to give the most satisfactory answers they are capable of, that is not well acquainted, if not with a natural light, but at least *both* with the laws of the refractions, and reflexions of light, according to the bodies it meets with in its way; *and* with the properties of several figures in bodies, which qualify them to refract, or reflect the light, after very differing manners, as is apparent in the distinct (and some of them strange) properties, that spherical, eliptical, parabolical, and hyperbolical surfaces have, to modify the beams of light, that falling on them, rebound from them, or pass beyond them. So that, if I mistake not, writers of dioptricks, such as *Scheiner* and *Des-Cartes*, are as fit to be consulted by him, that would know the unobvious uses of several parts of the eye, as *Galen* and *Vesalius*, &c.

* * * And indeed the whole eye being designed for an instrument of sight, the fitness of its parts to perform the functions it was intended for, will be best discerned and highliest valued by those that can discover, *how* the transparency and differing refractive powers of the humours and the *cornea*, *how* the opacity of other parts of the eye, and especially *how* the situation and anomalous figuration of the anterior and posterior surface of the crystalline humour, and *how* the motions which the *ligamentum ciliare* may give it; to mention now no other adjuvant causes, concur to take in as many rays of light, as conveniently can be let in, and made convergent; and to refract and dispose of all of them respectively after the best manner wherein they can be ordered, to make a brisk impression upon the due parts of the *retina*, and paint there an image of the object, both *vivid*, and as *like* it, as the nature of things will permit.

The eye is, by the modern masters of opticks, fitly compared to a darkened room, and by some of them to a telescope, or perspective glass, that receives from without by the beams of light, that enter it at one hole, left purposely open to let them in, the umbratile pictures of external things. I have often employed such a darkened room to make optical experiments and observations, and have endeavoured by the help of glasses fitly figured and placed, to make moveable instruments to answer those ends, and yet small enough to be carried in one's pocket. But all that I have hitherto seen are more inferior to the natural eye in point of excellency, than the greatest of them exceeds it in bulk. And even those things in the eye, that are looked upon by many as little useful, are really both necessary to sight itself, and very useful to make it more compleat. For the aqueous humour, that is despised by some as an insipid and worthless liquor, does besides other good offices to the eye, support the *uvea*, that it may hang freely between the cornea and the crystalline humour, and keep the *cornea* duly moistened and plumped up as it ought to be, to make the refraction required to distinct vision, as may appear, when being by any mischance let out, the *uvea* presently subsides, and the sight is depraved. And it is remarkable, that though nature regenerate neither of the other humours of the eye, yet the aqueous, if the wound be closed up, will in no long time be supplied by her, especially if good remedies be employed, insomuch that I have seen the eye of a goose, out of which we had purposely squeezed the aqueous humour, upon the application of an excellent balsam to the hurt, in the short space of two hours so closed and plumped up, that it looked like the other that was sound. To this I shall add, that not only all the parts of the eye have their uses, but there is in the eye something that is not a part of it, and yet is not only useful, but necessary to vision. This is it, which is called the pupil, or apple of the eye, which though it have a name, and be thought to have a colour, as being deeply black, yet is really, as is confessed, but a circular hole, whence no beams of light are reflected to the eye, as there are from the rest of the tunicle it belongs to, which makes that part of the *uvea* or *iris* appear black.

This *uvea*, that hangs freely in the aqueous humour, does by its opacity serve for an internal curtain to cover as much as is requisite of the crystalline humour, and fence it from too much light. And whereas in our telescopes, whose fabrick this age glories in, it is oftentimes requisite to let in more or less light, as the object is more or less lucid or illustrated, and according to its distance, and perhaps other circumstances, which oblige us to open the

the tube, and change the aperture for a wider or a narrower: nature has provided for the eye far more commodiously, since the fibres of the *uvea* contract or dilate the pupil according to the exigency of occasions, and this not only in a trice, and without our pains, but without so much as our intending to change the aperture, or even knowing that it does change. So that when too much light begins to break in upon the eye, that very light presently occasions the contracting of the pupil to exclude the excess of it. And when the object is but dim, or faintly illustrated, the pupil is much enlarged, to let in greater number of the beams of light; so that, especially in young persons, the pupil does upon very slight occasions, and very often, vary its extent, as may be easily seen by what monsieur *Des-Cartes* judiciously observes, that if a *boy* be bid to look upon an enlightened window, and then to turn his eyes to some dark corner of the room, he that heedfully looks upon his eyes, shall see them upon the first mentioned occasion contract the pupil notably, and on the second, manifestly expand it, which I could easily confirm by auxiliary experiments, if it were proper to enlarge. But I shall rather observe, that a just breadth of the pupil does far more conduce to the compleatness of vision, than most men are aware of. For if the *uvea* be *constantly* contracted a little too much, that disease is produced, that oculists call the constriction of the pupil: and on the other side, if the hole or aperture be *constantly* a little too wide, there follows an opposite disease, which they name *dilatatio pupillæ*, by which the sight is much dimmed and impaired, as is well known to oculists and physicians. And indeed the necessity, or great usefulness of several parts of the eye, may sometimes be better manifested by distempers, that deprave them, than by the knife of a skilful anatomist. I have known a person, that after some accidents, that frequently enough recurred, was wont, for a considerable time, to see in objects other colours than naturally belong to them. And I lived in an house with another considerable person, whose eyes by a violent concussion of the head were brought to such a tenderness of sense and change of disposition, that not only the light was very dazzling and offensive to them, but for many days some sorts of objects appeared adorned with divers, and those too very vivid colours, of which other spectators could see none. And a famous writer related to me, that at the beginning of a dangerous fever, that he fell into, the bands and other linen of those persons that came near him, seemed to him beautified with the colours of the rainbow.

I REMEMBER a young gentlewoman, that by having her eyes, without any sensible defluxion or inflammation, distended, though uniformly, much beyond their natural dimensions, was so incommodated, that though she could see well the objects that were placed just before her, yet she could not turn her eyes this way or that way to look on them; so that when she read in a book, she was fain to be perpertually moving it, to bring the words successively right over-against the pupils of her eyes.

A VERY skilful oculist gave me an account of a patient of his, a very learned man, who saw objects double, which was very uneasy and sometimes dangerous to him, especially because in walking he sometimes would run against a tree, or some other hard body, thinking that to be the illusory one that was indeed the true one. Which distemper seemed to proceed from some inconvenient change in the situation and distance of the internal parts of the eye, which I the rather guess, because another physician brought me the case of a patient of his, who upon a defluxion had some parts of his eye so swelled and changed, that he saw objects double: and yet this man was in no long time cured by physick, as was also (but more slowly) the learned man lately mentioned. And we may observe, that the unfit posture of the eye, or even the improper motion of the visive spirits, or of the fibres of the *retina*, or the optick nerve, may occasion, as long as the causes last, the seeing of two objects instead of one. For that *phænomenon* may be easily produced by obliquating the eye with one's fingers, and is not seldom one of the effects that accompanies the irregular motions produced in the animal spirits and brain by drunkenness. It were easy to add instances; but I shall rather take notice, that the distempers of the eye may not only manifest the usefulness of the parts they affect, but sometimes make discoveries of some parts that are not wont to appear upon dissection, though dextrously made. For though the tunicle, which some call *adnata*, and others *conjunctiva*, seem to be a very white and uniform substance in a dead eye, and even in a living one, yet in great *ophthalmias*, or inflammations of the eye, blood vessels extremely small, and on that account usually latent, not only show themselves manifestly, but in such numbers, as make the *adnata* look rather red than white. * * * *

To illustrate and confirm what I come from saying, I shall add (what I may perhaps have elsewhere mentioned) that there is a familiar animal, (viz. a white rabbit, whose eye being dextrously taken out, may help us to conceive how well the eye, as small and as every way moveable as we see it, is framed to do the offices and many more of a darkened room. For when the eye of the little beast we speak of was neatly taken out, and, after the optick nerve had been smoothly cut close to the *sclerotica*, was held between a competent light and the spectator, it was pleasant to those to whom I showed the experiment, to see how prettily the neighbouring objects were painted at the bottom of the eye, whose *sclerotis* (as being in this sort of animals transparent) did not hinder the pictures that were made on the inside of it, from being seen by those that looked on the outside. And particularly it was delightful to see the flame of a well snuffed candle held in a convenient posture,

posture, and at a due distance from the rabbit's eye and that of the spectator, vividly painted upon that region, where the optick nerve enters the bulb of the eye. And indeed it deserves admiration, that so small an optical instrument as a human eye, should so far exceed a great darkened room, *not only* by its mobility every way, which makes it, upon the least change of posture, to exhibit in the twinkling of an eye, a new sense of objects, perhaps very numerous and various, and some of them unequally but yet exceeding remote; *but* in the minuteness of some works framed by the help of it, and in the distance at which objects can be represented in it. This exquisiteness of sight does in *some* mens eyes far exceed what is to be found in the *generality* of men. *Cicero* tells us of one that wrote so small a hand, that he shut up *Homer*'s Iliads, and that written upon a sort of parchment, within the narrow bounds of a nut-shell, (which relation hath since given rise to a proverbial speech.) And not here to mention the strangely minute and yet curiously framed bodies that I have seen myself, we have from unquestionable authority such accounts of things framed or written in our age, by the help of a stupendious acuteness of sight, that we need not be amazed at what is recorded of one *Myrmecides*, who, when *Rome* flourished, was famous for having made a chariot so small, that a fly framed of the same matter, could cover it with her wings; and a ship that a bee could hide with hers: it is pity we have lost the memoirs of the excellent *Marcus Varro*, about rarities of this kind. But one thing is preserved, which makes very much for my present purpose, namely, that one *Strabo*, that lived in the times of the Punick war, was endowed with so excellent a sight, that he was used from *Lilybæum*, a Sicilian promontory, to see the Carthaginian fleet, when it sailed out of the harbour (of *Carthage*) and that so distinctly as to be able to tell the number of the ships: nay, he adds, that the same person could well see a hundred and five and thirty thousand faces. And it is the more credible, that here and there one man should be able to see objects at an extraordinary distance, if that be true, which is delivered by several writers concerning the sharp-sightedness of the great nation of the Tartars: on which occasion I remember, that the chief physician of the emperor of *Russia*, having visited me in his passage from his master's court to *Paris*, told me, (among other remarkable things) that frequently when the Russian soldiers go out upon parties, they are careful to take along with them a Tartar or two, because without such an assistance, the Tartars would see the Moscovites, before these could discover the Tartars.

Vid. Plin. H. N. lib. 7. cap. 21.

THE eye, which we have hitherto discoursed of, is a part manifestly organical, and generally looked upon as being curiously framed. And therefore since at the beginning of this article, I promised you, that in it I would make reflections on two parts of the body, I think it not unfit, that the other part which remains yet to be mentioned, should be such a one, that the excellency of its fabrick is not at all obvious, for which reason till of late it has been, if not with little diligence, at least with little exactness, discovered by physicians and anatomists. And I shall the rather subjoin something about the brain, to what has been lately observed about the eye, because the main part of this organ, the optick nerve, does itself, like other nerves, proceed from the brain.

I SCRUPLE not then to say, that there is one part of the human body, the brain, which, when we comprise under it (as we may) the *cerebellum* and *medulla oblongata*, and compare its soft consistence and the structure that its excellent functions and uses argue it to have, challenged a peculiar mention and regard, and on that account a place in this article. For though the softness of the brain make it unfit to be dissected like muscles and other firmer parts of the body, whence anatomists tell us but of two main parts distinguishable in its substance, namely the white and the ash coloured, or as some call it, the cortical and the cinereal, for the four sinuses of the brain are not proper and substantial parts, but cavities (opening into one another) and receptacles of transient fluids; *yet* there must be in the brain and its *appendix* the *cerebellum*, far more of mechanism than is obvious to a vulgar eye, or even to that of a dissector. For though this seemingly rude lump of soft matter does for colour and consistence look almost like so much custard; yet there are such strange things performed partly in it, and partly by the animal spirits that it produces, and sends, through the nerves that proceed from it, to other parts of the body, that we may rationally conceive that its structure is not more difficult to be *discerned* than worthy to be *admired*. For *first*, the brain taken in the large and popular acception of that name, is by philosophers held to be the seat of what they call *common sense*: because the nerves, that terminate at one end in the organs of particular senses, as the eye, the ear, *&c.* do at their other extremes, terminate, and as it were lose themselves in the brain, which by this means becomes the rendezvous (as it were) of the several sensories, whereto those sinews reach, and make it the seat of that faculty, which *both* discerns those objects of sense that are called common, because they are discoverable by several sensories, as magnitude, figure, motion, *&c. and* distinguishes the proper objects of one particular sense from that of another, as light from sound, and heat from taste. The brain also *(secondly)* is the seat of that other faculty of the corporeal soul, that we are wont to call *imagination*, because it exhibits the images as it were of sensible things, which are variously contracted, enlarged, divided, compounded, or otherwise notably altered by this faculty, which often dresses up such a large variety of corporeal *ideas* and fantasms, and both ranges them and makes them succeed one another in such manners, as makes the fancy

fancy a most strange and many times oddly furnished *scene*, incomparably surpassing for variety and extravagance, all the machines devised for theatres, operas, and masks, as may particularly appear in the wild ravings of maniacal and hypochondriacal mad-men, and oftentimes in the dreams of sound men, but much more in those whose brains are heated and agitated by fevers.

That (*thirdly*) the brain is that part of a man, wherein the human mind or rational soul does peculiarly reside, and exercise its power; is the most received opinion among philosophers, physicians, and divines too. And the Cartesians among the moderns confine the seat of the immaterial part of man, to a determinate and but small portion of the brain, *viz.* the *conarium* or *glandula pinealis*, which yet, according to them, has a great connexion with the other more considerable parts of the brain and cerebellum. I need not enlarge upon this great prerogative of the brain, that it is the mansion of so noble and excellent a resident, since such speculations would require far more time than I can spare; and since also the knowledge that the brain, or some part of it, is qualified to be a fit instrument for the exercise of the faculties and functions of so noble and excellent a being as the human mind, may persuade a considering man, that it must have an excellent structure or organization.

In the fourth place, that the brain is likewise agreed upon by most of the moderns, as well as many of the ancients, to be the work-house, wherein and whereby the animal spirits, that serve for sense and motion, are continually by filtration, exaltation, or otherwise, elaborated or produced.

Fifthly, it is likewise the received opinion of naturalists and physicians, that the brain, and, as many hold, one part or region of it is the seat of memory, and indeed I have known persons eminent for parts, whereof one by a fall from a horse, that shook his brain, did in a trice lose the memory of what had just before happened to him, and did not so much as know his own mother, who came to succour him, though otherwise he had his senses and his speech as free as before, and the other person, though more than ordinarily free from transports of any passion, did in a few minutes by (as far as could be judged) a bare invasion of that part of the brain where memory chiefly resides, forget the very names of her near relations when mentioned to her, and of domesticks when I brought them to her; and though she talked good sense to me of several things, yet she did not, that I could perceive, make use of her memory, which but some minutes before I had at parting from her, left very sound and good. But whatever were the cause of these accidents, memory seems to me a faculty wonderful, and whereof the modus is so difficult to conceive, that if experience did not convince us of it, and the instances of it were less familiar to us, I am persuaded, that many considerate men would think it impossible or inconceivable, that there should be so unaccountable a corporeal faculty. If we look upon a learned man that is somewhat aged, and consider, that being a linguist, he must remember I know not how many thousand distinct words, many of which, especially nouns and verbs, are each of them much varied by differing terminations and accents; when I consider the same person as a philosopher and a mathematician, an anatomist, a chemist, and perhaps so general a scholar as to be versed in several other disciplines, and when I consider the same person as having lived sixty years in the world, and during that long tract of time, seen and heard, and read and spoken, and done and suffered a vast multitude of things; when I say, I consider such things as these, I cannot but be amazed how it is possible, that in so small a portion of matter as the memory is seated in, there should be so many thousands or myriads of distinct traces, footsteps, impressions, or whatever you please to call them, lye not only unconfounded, but so distinct, that at the bare will and pleasure of the learned man, we speak of, any of this vast multitude of exceedingly various things, will, as it were, start up and manifestly appear, and if it were a history, or matter of fact, will be presented to the view of the mind with the several circumstances of time, place, colour, and other circumstances that then accompanied it, and that in the right order they first occurred in, and thereby renew an idea like that which was, perhaps, many years before produced. These reflections, though they be but a part of divers that may be made to the same purpose, may, I presume, serve to persuade us, that there must be a most exquisite and indeed an amasing structure in a soft body, that in a little room can afford distinct traces or cells as it were to so vast a multitude of things as are crouded into and yet commodiously lodged in a portion of the brain, and that so durably, that after forty or fifty years they may be at pleasure brought to appear before the mind, or when by some accident, as by a book, or a dream, they are excited, the mind is made sensible, that the things represented were formerly at such a time committed to the memory.

In the sixth place, it is in the brain, that the organs of the particular external senses of seeing, hearing, *&c.* have their general rendezvous, and if Mr. *Des-Cartes* and those physicians and anatomists that follow him be not mistaken (for I speak but conditionally) the reports, that all the differing sensories bring to the mind, are made in a part of the brain, *viz.* the conarium, or glandula pinealis, that in respect to the rest of the brain, is inconsiderable for bulk. But not to examine this new opinion, since in the brain, or some part of it, the actions of all the outward objects upon our organs of senses are, if those actions be vigorous enough, distinctly received, the brain must be capable of being affected in almost innumerable different manners. For to omit the manifold actions of the other three senses, it is plain, that the organ of hearing transmits

transmits a strange multitude of differing motions, that produce so many sounds; for besides the whistling of winds, the claps of thunder, and other noises, that man contributes not to excite, and the many differing sounds that we owe to musick vocal and instrumental, there is a kind of sounds that seldom uses to be reflected on, which in my opinion deserves our wonder, both for their multitude and their variety. For it may justly seem strange to him that duly considers it, that that particular kind of sounds, that when they proceed from men are called voices, should be so very different, that notwithstanding the multitude of persons, which a man, that has occasion to have much conversation in the world, is wont to exchange words with, there is scarce ever any one, that he cannot by his voice distinguish from every other that he has held discourse with, and this though the same party speaks sometimes louder, sometimes lower, sometimes faster, sometimes slower, *&c.* And it is not a little strange, that with very few exceptions, if any, one may very well distinguish the voice, whether the person that he hears, but does not see, be a man or a woman, notwithstanding the almost numberless differing voices that each of the sexes affords. Nay there are many that can readily distinguish persons that they are well acquainted with, but do not see, even by such sounds as they do not form by their vocal organs, as by the noises they make when they walk in a room or knock at the door. Nay, there are some watermen that will know their acquaintances in a dark night, merely by the noise made by their oars striking on the water, of which I somewhere mention instances.

* * * Since the *medulla oblongata*, that is seated within the skull, is one of the three great parts that belong to the brain, and is the common root of the nerves that minister to sense; and since the *spinalis medulla* (or as some call it, *dorsalis*) is looked upon but as a continuation of the *medulla oblongata* newly mentioned, and reaching thence all along the cavity of the spine, whence at so many perforations curiously made by nature, part on one side, and part on the other, it emits thirty pair of nerves, that convey motion to various parts of the body; since, I say, these things are so, we cannot think it strange, that our anatomists should judge the brain to be the principal source of motion, or as learned men are wont to express it, the seat of the locomotive faculty.

Now this being supposed, I think it may much and justly conduce to make us judge the brain taken in a lax sense to be a wonderful part, even without considering what ought to be held about the opinion of many learned anatomists and physicians of our times, that make the sinews subservient to the nutrition, as well as motion, of divers parts of the body. For the locomotive power alone may suffice to challenge our wonder; since philosophers themselves may justly admire, that such minute and invisible corpuscles as the animal spirits, and those too, in no greater numbers than can be furnished by and contained in the brain and inconspicuous cavities of the nerves, even supposing those parts assisted by some small portion of liquor to make explosions, should be able to move all the outward limbs and internal muscles of the body, in such various manners, and with so much agility and strength, as we see they do in divers lusty and active men, and more particularly in some dancers on the ropes here among us, who themselves are far exceeded in nimbleness and sprightliness by several of the same profession in the *East-Indies*, as not only credible authors inform us in their printed voyages, but most credible eye-witnesses of our own nation now alive, have assured me.

* * * We should be far more sensible than we commonly are, and make a juster estimate than we are wont to do, of the great wisdom and artifice, and of the beneficence that are exercised in the fabrick and contrivance of the numerous and various parts of a human body; if we were sufficiently aware of, and did duly consider what things both for number and quality are requisite to make this or that part as well qualified *to* maintain itself, *to* perform all its own functions, *to* prevent inconveniencies or surmount them, and *to* be serviceable to the body it concurs to constitute, as really it is. Thus, for instance, a bone seems to most men to be a very plain and inartificial thing, scarce superior to a wooden leg of an ordinary stool or chair, which as well as the bone is endowed with solidity and a determinate shape. But he will have more advantageous thoughts of a bone, that considers three or four things that belong to it; whereof the *first* is *the shape* of it, which a skilful inspection will show to be far more artificial than at first sight appears; in regard of the various kinds and degrees of protuberances and depressions, such as are called *apophyses*, *epiphyses*, &c. with reference to the several muscles that have their heads, or their tendons, fastened to it, in the most advantageous manner that mechanical skill could direct. And to the shape may be referred the length and the designed uniformity in the thickness of the bone. It is worth considering (in the second place) *that* these bones in children and youths must continually grow for many years, and that in all their dimensions, and so likewise must the cavities that lodge the marrow; to which consideration must be added, that the heat of the blood and other parts of the body continually tends to dissipate the matter of the bones, and by driving off the more volatile parts renders them dry and brittle; so that it is necessary to prevent this mischief, that nature provide them with perpetual supplies of aliment, and that oily or unctuous enough; that the bone may be kept moist by an alimental juice, suitable in its qualities to the needs of the part; and as this aliment must be conveyed by certain channels, as arteries and veins, so these must be able to penetrate, though oftentimes latently, the body of the bone as solid and hard soever as it is. For if the bone were otherwise figured,

and were not furnished with such vessels as usually are not seen in it, and by their means with a constant supply of juices proportionable to its nature and needs; a bone would not be able to perform its functions *well* and *long*, but would be soon spoiled or rendered insufficient for its designed uses. Divers other parts of the body may afford better instances to our purpose than bones, whose mention I pitched upon, not because I think them the *most*, but because they are looked on as some of the *least* elaborated parts of the body. And indeed the provident author of nature has destinated most of the parts to such different functions and uses, that if he had not likewise with admirable foresight obviated the impediments and inconveniences that would otherwise attend their first formation, and settled a course to give them continually fresh supplies to maintain them in their natural state, they would quickly fall into decay, and lose the constitution necessary to their being sound and useful.

Article IV. THE parts of a human body separately considered, are, as we have lately seen, so curiously framed, as to deserve to pass for excellent pieces of workmanship. But when in the body, that is made up of them, they are considered in their entire system, and as they are by a due situation and mutual connexion, associated, or rather united into one great organical body, they appear in this condition with great advantage: and the human engine consisting of so many differing parts most aptly put together, acquires by this state of entireness, a new title to our esteem and wonder. So that we may apply to the microcosm, that passage about the macrocosm, wherein the sacred historian relates, that God said of the particular works of the six days creation, that he saw that this and that work was good; but when he came to survey the aggregate of them all in their entire system, the historian adds with an *ecce*, to excite our attention, that *all that he had made was very good* *.

* Gen. i. 31.

THAT the human body is greatly advantaged by the skilful association of its parts, would manifestly enough appear, if we had leisure to display divers properties that result from it, or depend on it, such as are, 1. The connexion of these parts. 2. Their situation. 3. Their subordination. 4. Their mutual subserviency. 5. The strength and agility springing thence. 6. The symmetry, and comelineſs or beauty observable in the system of them. And 7thly (and lastly) the strange consent of some parts in reference to some others. But to discourse of each of these as it deserves, would too much exceed the bounds of our fourth article, as well as of the time allowed me to dispatch it in; and therefore I shall only cursorily pass over them again.

Numb. 1. THE strict connexion of such a multitude of parts differing in consistence, bulk, figure, situation, functions, *&c.* as, in a little room, make up the human body, may justly, to him that considers it, appear the effect of a wonderful skill, and he that in a curious dissection shall observe *how* aptly the ligaments are placed where they are necessary to fasten the parts together, *how* skilfully they are shaped for their respective offices, and *how* justly their strength is proportional to the works they are to perform, will think, that the wise opificer did not only make a full provision for the uses to which he destinated these several ligaments, but was also careful to husband the matter he made use of to frame the body, so as no more of it than was necessary should be employed about any of its parts. And it is worth observation, that divers of the tendons of the muscles, which in some parts serve to fasten, as well as the ligaments more properly so called, have a peculiar texture that makes them wonderfully strong, in comparison of our factitious cords of the same bigness, as may be seen in the stalls of butchers, where oftentimes the body of a fat hog, or an ox, is kept suspended by the strength of natural cords, that one would think far too slender to support so great a weight. And this strength will further appear, when we come to the fifth number.

Numb. 2. THE several parts thus firmly joined to each other, are not yet confusedly bound together without order, as in a bundle, but are all of them so disposed of, that each of them has obtained the most convenient situation it could be placed in; which advantage is oftentimes much assisted by the shape or figure of the part, which makes it capable of being placed there, without prejudicing any of the contiguous parts. He that has observed the several parts of a human eye, will easily be convinced of how great moment the determinate situation of every one of them is to the compleatness of the organ; since even a small change in their situation may deprave or very much impair the act of vision. The situation of the sphincters, (or muscles that contract themselves circularly towards the centre) this determinate situation, I say, of the sphincters that belong to the *intestinum rectum*, and the urinary bladder is so fit and so necessary, that without it, the animal would be almost perpetually annoyed with the involuntary, nasty, and offensive discharge of his own excrements; which by means of these sphincters so appositely seated, he can (for a great while) retain or discharge at discretion. The valves of the heart are not only admirably figured for the functions they are to perform, but they are no less skilfully situated for the reception and discharge of the blood, that is to pass through the heart, and for the transmission of it from the veins into the arteries, and the return of it into these, and so for the maintenance of a circulation so necessary to life, that the stopping of it but for two or three minutes, does oftentimes in a trice put an end to it. And though the muscles do not, to vulgar spectators, seem to be very curiously placed, yet *when* they are, by a skilful dissector, well raised, and the shape, bigness, strength, *&c.* of particular muscles, and especially *when* their originations and insertions (which are things referable to situation) are heedfully considered, and compared with their situation in

in reference to the bones and the different parts of the bones, (as knobs, cavities, edges, *&c.*) they are severally fastened to: and further, *when* these also shall come to be compared with the rules of mechanicks, and especially those that deliver the nature and properties of the three several kinds of levers: when I say, these collations shall be duly made, you will find cause to admire the excellent mechanism that is employed in so advantageously seating so many muscles differing in bigness, strength, shape, *&c.* as are to be found in the muscular parts of a human engine. * * *

THE particulars mentioned in the seven foregoing articles, may serve to give you a just admiration of the divine architect of so curious a fabrick as an human body, considered in its entire system, appears to be. But yet I must own to you, that there are divers other things as fit perhaps as those lately discoursed of, to justify, if not also to heighten, this admiration. That you may not think this assertion altogether groundless, I shall here cursorily touch upon three or four things that now come into my thoughts. And *first*, it is remarkable, that, where it could be done without prejudice to higher ends, the wise and beneficent author of human nature has made some very noble and useful parts of the body *double*. Thus though a man may not only *live*, but *see* well enough with one eye, yet God has furnished him with two eyes, both to relieve one another; and that in case one should be made useless by sickness or outward accidents, the other may suffice for vision: as many who have lost one of their eyes, daily find to their great comfort. And in like manner, and upon the same accounts, man is furnished with two ears, and two hands, each of which may, for a need, perform most of the functions of both.

2. IT deserves a grateful reflection, though little, or none be wont to be made upon it, that of the small number of features and colours, that suffice to make up the face of a man, providence has made so many combinations, and hath thereby so diversified the faces of men and women, that of about eight hundred millions of human persons, which, by the likeliest estimate I can make, mankind consists of; it is very hard, and scarce possible, to find two, whose faces are not, in something or other, unlike enough to make the persons they belong to distinguishable. For if it were not for this difference, what mistakes and confusions do you think, the want of it would occasion among men, and in human affairs?

3. THE like reflection may be made upon the innumerable differing combinations, that so diversify a few notes, or sounds into the voices of some hundreds of millions of men, women, and children; that it is very rare to meet with two persons, that are not easily distinguishable by their voices, whose too great resemblance would beget strange confusions. On this occasion, I remember, that I was well acquainted with an illustrious family, wherein two sisters, besides a great resemblance in features, were so much alike in their voices, that when I took notice to their mother, how difficult I found it not to mistake one for the other, she told me, that she herself was not exempt from being puzzled by so near a resemblance; so that sometimes when they were behind her, she was obliged to turn her face towards them, that she might discern by her eyes (what her ears could not discover to her) which of her two daughters were the speaker.

THE mention I come from making of voices and words, forbids me silently to pass over a consideration of the chief instrument that frames them, I mean the tongue. For this little part is so skilfully contrived, that it serves excellently for uses of very distant natures; of which the part that it has in human speech is but one, though indeed a main one. For the tongue is the chief organ of tasting, being invested with a skin spongy and full of little teats, which makes it very fit to imbibe the saline or sapid corpuscles of tasted bodies, and convey them to the nerves, by whose intervention we have distinct sensations of far more sapors than we are yet able to give names to. The tongue also by its volubility and manifold flexures, diversified in a trice, as occasions (perhaps a thousand in less than an hour) may require, does serve for a living and supple *spatula* to turn and roll too and fro the meat in the mouth, to expose it to the teeth, and to help it to be afterwards swallowed, with a salivary *menstruum* by the throat. But that which engages me to mention it here, is the great and necessary uses it is of in the formation of the voice and articulate sounds, or words, which, considering the variety of languages, are so different and numerous, that nature had need to croud into this little organ of speech, a great diversity of parts, such as, besides the skin above-mentioned, the veins and arteries, and a peculiar sort of flesh, and the nerves that it receives from more than one conjugation, several muscles that partly belong to that heteroclite bone, the *os hyoides*, and four pair of muscles of its own, to give it that great variety of motions and flexures, that are requisite to the performance of its manifold functions, and especially to the speaking of several languages.

SOMETHING like what has been considered about the dissimilitude of mens voices, may be also observed in the distinguishableness of mens hand-writings, notwithstanding the paucity of the letters of the alphabet, and of the lineaments necessary for writing, and the vast multitudes of men, women, boys, and girls, that employ pen and ink to express their thoughts. * * *

WHEN I was come thus far, (*viz.* to the consideration of a living body) sickness and inevitable, as well as distracting avocations, that had before interrupted me somewhat favourably, fell so thick upon me, and reduced my intervals of leisure to be so few, so uncertain, and so short, that I am not able in the intended remaining part of this discourse, to insist

insist as much (though that be too little) as I have done in that which you have already perused. And therefore I hope you will not think it strange or unpardonable, that in the prosecution of my task, I do not (as I intended, and as I confess the subjects deserve,) enlarge upon every head of discourse that I shall mention. For my occasions permit me at present to *do little more than name divers of them*, and oblige me to defer the intended comments and enlargements, till God shall please to vouchsafe me better opportunity to pursue my first design.

And that you may not be so surprised to find the following papers so incoherent, and the several bundles or parcels of them so very disproportionate in point of bulk to one another, I must beg leave to inform you, that for certain reasons (that you may easily guess at) I did not think fit to write all the *second part* of the Christian Virtuoso in one continued *series* of discourse, without touching upon any other subjects of those that remain to be treated of, till I had quite dispatched those, that, by the laws of method ought to have been first finished, and to precede it. So that when the forementioned discouragements surprised and oppressed me, I had at my disposal *some*, (and but *some*) of the many loose memoirs and short notes, that I had formerly provided as materials to be employed in the *second part* of the above named treatise. But coming to survey, and bundle up the several scattered papers, I could light upon, that mainly consisted of these incoherent *memoirs*, I found, that the parcels they would be fit to constitute would be exceeding unequal. For *some* of the particular heads of discourse had very few notes, or *memoirs* relating to them; whereas to some *other* heads, I found papers enough to furnish divers little bundles, (though some consisting of more, and some of fewer notes,) fairly enough referable. This put me into some perplexity how to dispose of these papers. For to send them you as they were, would be to trouble you with a *chaos* instead of presenting you with a discourse; and not only disparage the writer (which were a very small mischief) but (which is far worse) injure the subject. And on the other side, this very nobleness and usefulness of the excellent subject, that made it deserve a compleat and elaborate discourse, made me scruple to let any thoughts perish, that, though very imperfect and incoherent, might conduce to illustrate or to recommend it. And therefore, *though* I dare not suffer my remarks and reasonings to appear so much to their own and the design's disadvantage, as they must do, if they should pretend to compose an entire body of discourse; *yet* because hereafter, if God permit, the *chasms* may be filled up; I thought fit, lest the loose notes wherein my thoughts had been at different times set down, should be lost, (as many others had been) for want of being bundled up together, I did, I say, think it not amiss they should accompany the first, or initial papers of several sections or subsections, that I had already begun, and intended that these loose ones should join with others to enlarge. And because I had not time to select carefully, and range orderly all those that lay confused in a heap of theological notes, and memoirs about several subjects, I chose to take in, for the present, rather several that perhaps did not in strictness belong to the *Christian Virtuoso*, than throw by any that did. Upon which account several, that formerly were drawn out of some other long neglected discourses were retained, that among those, that should be found coincident, or very near of kin, the fittest might be chosen, and others, that are capable of being made tolerably fit, by due connexions and retrenchments, may be made some use of.

To conclude, you will find, that the little collections or bundles of notes laid together for the several sections and subsections for the remaining part of this tract, and are for the most part lodged in distinct paper-cases, do consist, most of them, of an introductory paper or two, and of several *memoirs* or notes, some longer, and some shorter, that accompany them, in the same bundle, to which they appear to appertain. And to these I subjoin in a distinct paper-case, a larger, and miscellaneous collection of particulars, of which those which shall be found no way pertinent to the *Christian Virtuoso*, are to be laid aside, and the rest may be referred to the respective heads or subjects, whereto they shall be judged, the most properly, to belong.

What has been hitherto observed about the carcase of a dead man, may, I think, suffice to show, that even that is a curiously framed and excellent engine. But I must now add, and endeavour to manifest, that it is almost incomparably inferior to that excellent, nay matchless engine, a living human body. Since whilst a man is truly and properly said to *live*, many affections belong to his corporeal part, or are performed in it, or by it, that make this *automaton* called his body, much, and very advantageously, differing from a mere cadaver. * * * *

We may therefore consider the wisdom expressed by the author of nature in a living body, by superadding to the particulars formerly mentioned, as belonging to a dead one, such as these that follow, viz.

1. The various local motions of a living human body, and its parts, (abstracting from the difference of sexes.)

2. The sensations of several sorts, both external, as sight, taste, *&c.* and internal, as hunger and thirst, which belong to a living body.

3. The functions that belong to the soul of a man, as he is an animal, as imagination and memory, distinct from intellectual operations.

4. The ferments, or principles analogous to them, that are supposed to be lodged in particular parts.

5. The chemical operations that nature exercises in a living body, especially in the liquors and other fluids it contains.

6. The

6. The care that is taken for the propagation of the *species*, both *in* destinating peculiar parts for that only purpose in each sex; and *in* furnishing both at fit seasons with venereal appetites, and in giving the mother ἀσοργὴ, and furnishing her with aliment for the *fœtus*, both in the womb, and whilst it is to suck.

7. The admirable and scarce comprehensible *formation of the fœtus* in the womb, especially when it is very like the parents, and has permanent marks of the mother's longings, or frights, and is subject to her's or the father's hereditary diseases in body, or mind.

8. The instincts and other designations and institutions appointed, by the great mechanist, for the welfare of the animal, in its several states and circumstances of life.

* * * * * Suppose one of those Jesuits that first carried curious watches into *China*, had been cast away, with one of them in his pocket, upon one, or other of those many islands, that are in that vast ocean inhabited by people, though civilized, yet unacquainted with European inventions. Though one of the more judicious and skilful of them, upon the bare superficial view of the rich materials, fine shape, enamellings, and other embellishments of the case and dial-plate, would presently conclude, that this so fine box was not made by chance, but by some skilful workman; yet he would by no means have so good an opinion of the artificer, as when having opened the case, he should see so many wheels and other parts curiously framed and cut, and exquisitely adapted to one another in such manner, as to give him a strong suspicion, that this small, but exquisite engine was designed for some considerable uses, and made very fit for them. But if, afterwards, another of the fathers, that had escaped from the wreck, and been driven ashore upon a plank, should wind up this watch, whose parts before lay moveless; and let him see how the balance, the wheels, and other parts, conspired not only to show, and strike the hour of the day, but also at set times to give an *alarum:* and to show also the day of the week and month, the aspect of the planets, the faces of the moon, the changes of tides, in the place it was made for, and those other singular, and useful things that we have seen capable of being performed by a very curious watch: supposing, I say, the watch wound up, the contemplation of the engine, thus in motion, would give the amazed beholder an incomparably more advantageous *idea* both of the machine and the mechanist, that could foresee, and pre-ordain such various things, and croud into so small a room, all the things that are necessary, and as many as are sufficient to produce such various phænomena and useful effects. And so, he that considers the body of a dead animal, wherein the immediate motions, and agents that entertain life, and the vital functions, and wherein perchance they consist, *&c.*

* * * * In the admirable engine of a human body, besides the *solid* parts, as bones, and the consistent ones, as vessels, nerves, *&c.* There are a good many *fluids*, some manifest to the sight, and others too subtile to be discovered by it. And though the solid, and consistent parts of a lifeless human body, that have hitherto been the objects of our reflections, be the most considerable; yet the fluid parts are such, both for the *quantity* of some of them, and the *number*, *variety*, and *uses* of others, that they are too important to be altogether pretermitted. These fluids may be divided into visible and invisible: of the *former* kind, blood, chyle, and other visible liquors, and these of differing sorts, as *serum*, *gaul*, *lympha*, *succus pancreaticus*, &c. And of the *latter* sort are those subtil and active corpuscles, that make up the unseen fluids that pass under the names of vital and of animal spirits; whence are derived, both many of the functions necessary to life, and also those various sensations and local motions, that give man, as he is an animal, the chief prerogatives he has above plants, metals, *&c.*

* * * To all that has been said, I shall add one thing more, perphaps, of no less importance than any of the rest. For I consider, that the knife even of the most skilful and dexterous anatomist, especially if he dissect but dead bodies, can never sufficiently acquaint us with the curiousness of the contrivance of a human body. For all that anatomy can do, is to manifest or display the structure of the *consistent parts*, such as the bones, cartilages, nerves, arteries, veins, *&c.* and expose to our senses the *visible liquors* of the body, such as blood, gall, the concreted juices, urine, *&c.* But it cannot show us either of the two sorts of invisible parts, *viz.* the *animal* and other *spirits*, and the *ferments*, (or principles analogous to them) that may reasonably be supposed to lodge in the stomach, kidneys, and other particular parts. And yet the influences and operations of these are so considerable, that I am apt to think, that most of the parts of the grosser body seem intended by nature, but as a kind of kitchens to dress the aliment, and make its finer parts pure and subtil enough to become animal; or if you please, *hormetick* or impulsive *spirits*, fit to actuate the brain and nerves, and thereby to become the grand instruments of sense, motion, and imagination. * * *

The curious works of men have been brought to their perfection, such as it is, not by being framed at first, according to an original and compleat idea, but by several helps, additions, and corrections, that the artificers were, from time to time, led to, by the unforeseen inconveniences and imperfections that unwelcome experience did, from time to time, discover to them, as needing remedy or supply, as may appear by several of the curiousest productions of human art, and particularly (to omit watches, clocks, *&c.*) in the building of a ship fit to make long voyages. For this curious, floating machine was not made at first by mere human industry, any thing like what it is now come to. But floating vessels, from troughs or hollowed trees, have

have by many changes and degrees, corrections and supplements, made so slow a progress towards the comparative perfection that is now attained, that many ages have been busied before naval architecture could be brought to the pass it is now at: whereas a human body, for instance, though an engine incomparably more both compounded and exquisite, was in the first protoplast made so compleat, because exactly conformable to the original idea of a divine opificer, that in all the succeeding ages there has been no need to correct any thing, as being amiss, or add any thing by way of supplement to the omission, or want of any thing belonging to its due perfection.

THAT the rational soul, or immaterial mind, is the chief and noblest part of man, none, that deserves that title, will deny. Many heathen philosophers themselves looked upon the rational soul, as not only a , but, as it were, a part (or as they term it ἀπόσπασμα) of God, and others make it to be indeed *the man*, and the human body to be but *the mansion*, or, as they usually speak, the vehicle of it. And perhaps it were worth considering, whether this notion be not favoured by those expressions of St. *Peter*, where he says to the dispersed Christians, *I think it meet, as long as I am in this tabernacle*, (which term St. *Paul*, more than once, uses to signify the body) in which passage, the word *I* is plainly distinguished from the other, as an inhabitant from a mansion. And, within two or three lines after, he employs this expression, consonant to the first, *shortly I must put off this my tabernacle*; wherein he, again, clearly speaks of the body, he was to leave, as of a *possession* belonging to that which was properly *himself*.

2 Pet. i. 13, 14.

SINCE, as I more than once advertise you, I do not in this discourse pretend to treat of my subjects, either absolutely or fully, but only so far forth as some inspection into these works of God, tends to give us more numerous and better grounded motives to glorify him for them: I shall not, in this place, think myself obliged to treat of the rational mind of man, as it is distinct from the body, merely like a naturalist; but consider some things about it, that may justly pass for peculiar excellencies, that deserve we should admire and gratefully celebrate for them, *the Father of spirits*, as the scripture stiles the Almighty Creator.

Heb. xii. 9.

THE things, that here challenge a particular consideration, though I can allow them but a brief and transient one at present, are these. 1. The spirituality, or immateriality of the human mind. 2. Her cogitative nature. 3. Her rationality. 4. Her freedom of will. 5. Her fitness for permanency in a separate state. 6. And her capacity of receiving great improvements, both here and hereafter.

* * * * BUT though, as may appear by what has been discoursed, we have but an imperfect knowledge of the natures of *bodies*, yet it may be thought, that by reason of the cognation betwixt her and them, the rational soul may have a better knowledge of the nature of *spirits*, since they are rational and incorporeal beings, as well as she. But alas! when we come to contemplate the pneumatical world, or system, if I may so call it, we enter into a new world indeed, that much better deserves that title, than did *America*, when it was first discovered by *Columbus*.

AND first, the very notion we have of spirits in general, is, to me, no small argument how little we really and particularly know of them. For though superficial considerers take up with the vulgar definition, that *a spirit is an immaterial substance*, yet that leaves us exceedingly to seek, if we aim at satisfaction in particular enquiries. For it declares rather what the thing *is not*, than what *it is*; and is as little instructive a definition, as it would be to say, that *a curve line is not a strait one*, which sure will never teach us what is an ellipsis, a parabola, an hyperbola, a circle, or a spiral line, &c. and much less acquaint us with the peculiar affections that *Euclid* demonstrates of circles, and *Archimedes* and *Apollonius* deliver of conick sections and other curves. Or to give you an example, that will, perhaps, appear yet more apposite, since corporeal and incorporeal are opposites and contradictory; a man that knows, that a spirit is not a body, may as little know, by virtue of that, what an angel, a dæmon, or any other kind, or order of spirits is in particular, as the knowing, that a body is an unspiritual substance, or which is all one, is not a spirit, teaches him to know the distinct or particular natures of the sun, or a cloud, or of the stars, elements, minerals, plants, animals.

* * * THE terms we use of moving, perceiving, exciting, enlightning, determining, restraining, commanding, &c. do not suggest true notions of the things we would signify, being but applications of corporeal actions or qualities, to things of an incorporeal, and so of a quite differing nature and condition.

WHEN we ascribe *power* to God, as that of creating, it is *toto cælo* differing from that which we ascribe to bodies, and even from that which the human soul exercises on its own body.

THE knowledge we have of our own souls, is but partly by consciousness or internal sensation, the rest we must learn as we can.

WHAT the soul does in the body, as when we remember, and speak, and blush, and see, she knows not how she does it, nor so much as what instruments, or parts are employed in her work.

THE operations of spirits upon bodies and vehicles, and much more upon one another, we are in the dark about. * * * *

* * * * WHAT has been, in more than one place, delivered, about the excellency of the human mind, if it do not (as I wish it may) prevail with you to employ your sagacity in the indagation of a subject so worthy of it, will, at least, I hope, excuse me, for having insisted on it, perhaps, more than was expected, in a discourse that ought not, and was not intended, to be long. And on this occasion,

occasion, I shall freely own, that it is not without much trouble, and some wonder too, that I observe the generality of men, and, which is more, not a few, that are of a philosophical *genius*, and many that are piously disposed, to have so little curiosity to enquire into the nature and faculties of their own souls; which are things that most of them supinely neglect, and others, that do, now and then, turn their eyes towards them, judge to be but dark and airy objects, that do less deserve to be studied, than almost any thing that busies the thoughts of learned men. And yet I think, and do not scruple to say it, that this knowledge, which so many neglect and despise, nay, which the generality of men do, more than any other, fastidiously slight, or studiously shun, is, next the knowledge of its prototype, that which best deserves our study, and which it most concerns us to attain.

It is not reasonable to *expect*, that we, who have but an inadequate knowledge of the least of corporeal things, should have an adequate one of incorporeal ones; or to *pretend*, that we ought not to *cultivate* the knowledge of divine things, and immaterial substances, because we cannot perfectly *understand* them; whilst we are diligent and hopeful cultivators of the science of bodies, which we are very far from perfectly comprehending.

APHORISMS *to Subsect.* 2.

We know but very little of the nature of our own minds, though, to discover that, we need not rove into, much less wander beyond the world without us; but only reflectingly take notice of what passes within ourselves; nor need we anatomical knives, or geographical globes, or optical telescopes or microscopes, or any other material, or elaborate instruments, to investigate and detect what we seek for; the human mind being itself the subject, the object, the faculty, the organ, and the instrument, of the knowledge it should attain.

When the Epicureans dispute the best against the spirituality of the rational soul, (or mind of man) the more plausible their arguments are, the less they prove what they would evince. For the subtilty and acuteness they employ, to conclude the soul to be corporeal, sufficiently argue it not to be material; since it cannot be conceived, that any way of marshalling or contexing of mere bodies, how small, and how well ranged soever you may fancy them, is capable of producing such subtil ratiocinations; whereby they do but establish the preheminence they endeavour to oppose; and whilst they strive to degrade themselves to the condition of beasts, they do it by arguments that shew them to be of a superior order of beings.

Those that despise the consideration of spiritual things, and such as do not sensibly affect our eyes, may do well to consider, *both* of what importance the magnetical effluvia (whereof the terrestrial globe incessantly emits numberless swarms) are, to keep the whole earth itself in a due and settled position: *and* how the winds, though invisible, are not only of great efficacy and importance in navigation, but have a great interest in the temperature and changes of the atmosphere. To which may be added, the force, that the *effluvia* of a good loadstone have to move masses of iron itself; and the vigor, by which the animal spirits, or subtiler fluids of the body, are able *continually* to move, for many years, the heart, and, *upon occasion*, with great violence, the limbs.

The rational soul is inestimably more noble and valuable than any thing corporeal; not only on the score of its spiritual nature and powers of *acting*; but on the account of its immense capacity of *receiving*, both knowledge and felicity; when God shall vouchsafe them to her.

The capacity of the rational soul is so great, and its nature so sublime, and so abstruse, that as it is an object, it surpasses its own comprehension, as it is a faculty.

The knowledge and inspection of a man's own self, especially of his immaterial part or mind, may be more serviceable than we are usually aware of, to natural theology, and even to revealed Religion. For, in the very nature of the mind, we may discern so lively a stamp, or impress of the divine author of it; that it is not to be wondered at, if the Cartesian and divers other philosophers have thence raised themselves to the notion of a Deity; and found a conviction of his existence: which is so fruitful a principle, that it may easily lead us to a multitude of other important truths. Besides, the human soul being immaterial, and there being no proof, but a great improbability, that it has been from all eternity; it must have had a beginning of existence, which being incorporeal, it cannot have received from any thing that is a body; and therefore must have been created by some spirit. And if that spirit be acknowledged to be God, I have what we contend for: and if it be said to be any other spirit, which must be of an inferior order, it is plain, that there is yet more reason to believe it possible for God to have produced it. And if God be granted to have had the power to create an immaterial being, and that so excellent an one as the mind is, why should he be denied the power of producing a senseless being; which is so ignoble, and so far inferior to a rational spirit as stupid matter is? Moreover, the consideration of the wonderful union that is made of two beings, of such distinct natures, as are the human soul and body, into one man, may convince us, that we must not reject a mystery of religion, only because there is nothing like it in *rerum natura*, or that we cannot conceive the *modus* of it.

SECT. II. SUBSECT. 3.

I have already (more than once) had occasion to tell you, that the main thing that is aimed at, in the present discourse, is to find, by a heedful inspection into the works of God, just motives to admire, to praise, and to thank him for them. Upon this ground it will

will be very fit, that, after what has been said of the human body and mind, looked upon separately, as distinct substances; we proceed to consider them as God has been pleased to unite them, into that heteroclite and singular creature, man.

I AM not ignorant, that the generality of men, without excepting those that are addicted to letters, are wont, either totally to overlook, or to pass by without any great reflection, the union we are speaking of. But if we consider the matter attentively, we may clearly discover, that this union, and the laws of it, deserve a far greater, and indeed a very peculiar, regard.

AND for my part, I am of so differing a mind from those who think, that this subject is not worthy of our attention, that the consideration of the nature and properties of the unmatched union of the body and mind of man, has, I confess, sometimes invited and inclined me to venture upon making a distinction, that appears not to have yet occurred to philosophers, or divines. For instead of dividing the operations of God, here below, into two sorts only, natural and supernatural; I think we may take in a third sort, and divide the same operations into supernatural, natural in a stricter sense, that is mechanical, and natural in a larger sense, which I call supra-mechanical. For whereas all the *phænomena* of the world, as it is an aggregate, or system of mere bodies, are performed by matter, and local motion, according to mechanical laws; the operations of the human mind, and its organical body upon one another, are not to be accounted for by mere matter, and its mechanical powers: as is partly evident, by what is in this paper delivered about it, and may farther appear to those that, acknowledging the human soul to be an immaterial substance, heedfully consider the various effects of the intercourse betwixt her and it. So that these operations, that belong to a man as he is so, though in some sense they are not supernatural, because the order of things being once established by the most wise and powerful author of them, they are produced according to the course of nature; yet they may be stiled supra-mechanical, because they cannot be mechanically explicated or produced, nor can they be proved to flow from natural causes, if these are considered, as but corporeal ones. * * *

BUT, whatever be judged of the foregoing reflection, I think it may be justly said, that the strict association of the human body and mind is truly wonderful, as might appear, though we had no other proofs, by several peculiarities that relate to it: whereof some are antecedent to the union of those two substances, others do essentially constitute it, and others again belong to it, as laws or properties of it; but because, as I just now intimated, these are not the only proofs that may be proper for my design, I must desire you to take them up as you will meet with them, among some others in the following part of this discourse. For in man, in whom the human soul and body are in a state of union and conjunction, we may consider several things, which might here deservedly make so many distinct heads of this sub-section, if I had leisure to treat of them separately; such as are, 1st, The union itself of the two parts of man, nakedly considered. 2dly, The time and manner of this union. 3dly, The power of the soul upon the body. 4thly, The passions, properly so called. 5thly, Other laws and *phænomena* of the union and intercourse of the soul and body. 6thly, The dominion of the whole man over the creatures. And 7thly, Their re-union after death, by the resurrection of the body, and the happy change of it; and perhaps new conditions of union or intercourse.

BUT these heads are too many, and too comprehensive to be here severally insisted on (especially in the order they are here delivered in.) Upon which score, I must content myself only but to touch upon some of them, and that but very briefly. * * *

THE considerations, we have been discoursing of may furnish us with an answer to those friends of who reject some mysterious articles of the Christian faith, because we cannot explain them by any adequate examples, or parallel properties; for even among mere creatures, there may be instances of monadical beings, whose properties are not to be found any where else; as in quantity, the incommensurableness of the side and diagonal of a square; in figures, some of the affections of the circle, hyperbola, and other conick sections; in bodies, those of the sphere; and, to come closer to the objection, in compounded beings, man, as he is a creature that results from the strict and vital union of an incorporeal and intelligent mind, with a corporeal and organical body into one person, which has diverse peculiarities, not to be met with in any creature of the whole visible world.

APHORISMS *added to Sect.* 2. *Subsect.* 3.

APHORISM I.

THE virtuoso will easily find himself disposed to ascribe the formation and conduct of an animal, especially of a man, rather to a Divine Author, than to so blind a thing as chance, that shall without partiality, and with attention, consider the great variety of organs requisite to sensation and nutrition, especially of sucking children, and the difficulty of compendiously uniting them into one engine, capable of so many, and so various functions, and especially of producing a new engine like itself. For which last power alone, it must be furnished with a whole set of otherwise unnecessary, though not always unuseful, organs: which must also be adapted to those that should correspond with them in another sex.

APHORISM II.

GOD may display more of his wisdom in the metaphorical motions of an intelligent substance, such as the human mind; than in the

the physical ones of a material substance; such as is the corporeal world. For all that is done in matter, is performed by the help of local motion, by which the parts of it are divided and variously ranged; so that all the numberless *phænomena* that are exhibited in the material world, are but local motions of its parts, and the productions or results of such motions: whereas an immaterial and intelligent substance is capable of as many differing modifications, as the world, as far as it is known to us, can produce sensations in it; since it is by these sensations, that we are brought to take notice of those *phænomena*. And if it should please the Divine Author of things, to furnish a human body, whereto the soul is united, with a greater number of sensitive organs, or a greater tenderness of those that belong naturally to it; it would be found capable of modifications, correspondent to the impressions, it were then disposed to receive, from bodies or actions that do not now affect it: and consequently, this new sensibility would shew, that it is still capable of more numerous modifications and perceptions, than all the *phænomena* of the universe, hitherto known to it, amount to.

APHORISM III.

God, by subjecting to the mind of man, some parts of the body it is united to, such as some muscles, and other instruments of voluntary motion, and by leaving it no power over many other parts of the same body, such as the stomach, spleen, liver, kidneys, *&c.* that are subservient to nutrition, shews, that he has freely, and arbitrarily established the laws of union between the soul and body. And since the mind cannot, by bare willing, move even the instruments of voluntary motions, unless the organs be rightly disposed, as in some palsies, the patient is unable to move either his hand, or his tongue, how much soever he desires to do it, and cannot feel even the prick of a thorn, or a pin: we ought to think it the less strange, that this union of the human soul and body should be of such a nature, that, when the necessary parts have lost their vital dispositions, without which, they must be unfit to obey the mind, there ensues a total separation of the two differing substances, in which divorce consists, what we call death.

APHORISM IV.

There are some of the motions of a human body, that seem to argue a peculiar regard, and, as it were, interposition of divine providence, in the production and regulation of them. For I consider, that there are divers motions of a man's limbs, and some other parts, that do not seem derivable from the general laws of motion in things (merely) corporeal, but rather to deviate from them, or thwart them: as when, for instance, a man lifts up a heavy body to approach it to a fit distance from his eyes, and holds it in his hand, whilst he reads it; in this case the natural tendency of his hand and arm, is, as well as that of the book and other heavy bodies, downwards; so that when he raises the book to his eyes, and sustains it there, notwithstanding its gravitation on his hand, the motion upward, and the *conatus* that keeps the body from falling, is the effect of the arbitrary power of his will, and not derivable from the merely mechanical laws of motion; and therefore, though I will not say, that this elevation of the hand, that lifts up the book, is supernatural, because it is conformable to the regular powers, the Author of nature has vouchsafed to man, yet, it may be termed supra-mechanical, because it does not follow from the laws of motion established among corporeal things: to which instance may be added, with advantage, the motions of a painter's and those of a scrivener's hand, and many others. Nor will it suffice to object, that the human will does, in these cases, not produce any new motion, but only determine the motions of the spirits, and by their means of the locomotive organs. For to put a check, at pleasure, to the motion of a body, that does already actually move in one line, and determine its motion to continue in another, that is perhaps differing from it, or even opposite to it; to do this, I say, without opposing to the moving body, some other body, which, by its resistance and situation may change its former course, is not a mechanical operation, as may appear by all the changes of determination, that one body makes in the motion of another. And I consider farther, that this power, given to the human mind, seems, though a wise, yet an arbitrary, as well as peculiar effect of God's regard to man; in that this power extends only to some particular parts of his body, which are performed by pure mechanism, without the concurrence, or so much as the knowledge of the rational mind, and sometimes against its will; such as are the systole and diastole of the heart, the circulation of the blood, the motion of the chyle and lympha, and the peristaltick motion of the guts.

APHORISM V.

In those instruments of musick, upon which tunes are played by help of an internal and hidden machine, both the manifest, and the latent contrivance deserve our wonder, though, for differing reasons, some reaching much farther than others. So likewise in *Archimedes*'s sphere, and those curious watches, that show, besides the hour, the phases of the moon, the length of the days, the tides, *&c.* an ordinary man may justly, with admiration, discern the fitness and sufficiency of such a system and frame of parts, and such a consecution of their motions, as the artist appears to have intended; and yet he may, no less, justly admire the astronomical and cosmographical skill, unknown to him, which enabled the artist to contrive, especially in so little room, an instrument, regularly emulating the various

motions of those vast bodies, the sun, the moon, and the sea.

But whatever may be said of the engines made by man, yet of man himself, who is a living engine made by God, it may be justly said, that our knowledge, as well as our ignorance may well be a mother of admiration. For as the human body is so exquisitely fitted for its numerous and various functions, as to deserve our wonder upon the score of its organization; so the noble faculties of the human mind, and the laws of its unparalleled and wonderful union with the body, by surpassing our clear comprehension, are entitled to our deserved admiration.

A little reflection on what has been hitherto discoursed, may serve to discover to you, that the knowledge and contemplation of the works of God, that make up the greater and lesser world, may afford divers motives to piety, and incentives to devotion, in a person as much disposed to it, as we have all along supposed our virtuoso to be. But among these it may suffice, in so short a paper as this was designed to be, to touch upon five or six, and observe, that the study of the creatures may justly produce in a *virtuoso*, 1st, A profound *admiration* of the majesty, and some of the attributes of God. Secondly, An external *celebration* of him, for them, by hymns and praises. Thirdly, A deep *humility* in the view of his immense greatness and majesty, and the distance of our nature, as we are human creatures, from his. Fourthly, A most deserved *gratitude* for what he has vouchsafed to make us, and to do for us. Fifthly. A sincere love of so excellent, so beneficent, and in a word, so highly amiable a being. [In making such liberable and manifold provisions, both for our necessities, conveniencies, innocent delights, and instruction, as if we be not wanting to ourselves, we may find he has stored up for us in his other works.] And lastly, the study of God's creatures may produce a *trust* to, or reliance and dependance on his goodness, his promises, and his ability to accomplish them both here and hereafter, especially by providing for us such noble, such various, such manly, and in some cases, such supra human entertainments of our rational faculties, as may make us happy during all eternity itself.

But before we descend to the consideration of the forementioned particular expressions of piety, or acts of natural religion, it may not be amiss to observe, that the insight of a *virtuoso* into the works of nature, may enable him to contribute much [in a general way] to them all, by solidly laying, or strongly confirming the foundation of all religion, whether natural or revealed, which is a firm belief of the existence of God, and of some of his attributes that relate to the world, and to man. For, as the writer to the Hebrews judiciously observes, *He that* will *come to God*, that is, that would be religious, *must believe that he is, and that he is a rewarder of them that diligently seek him.* And this is a truth that surpasses all others, in regard of the influences it has upon mens lives, as much as the pole star is more considerable than any other of the firmament, though they shine never so bright, to the attentive pilot; since by its direction, he steers all his courses in his navigation. I know it will be said by some, that it seems a libelling of our times and country, to labour to confirm the existence of a Deity, as if in a Christian country there could be any such monsters as atheists or infidels. But though, by the conversation I have had for many years, with no small variety of persons, who were suspected to be unfavourable enough to religion, I am not satisfied, that I have met two or three speculative and resolved atheists, yet I am forced to suspect, if not to believe, that the territory of infidelity is not by much so narrowly circumscribed, as most men take it to be. For though, thanks be to God, and (partly) to good laws, there is little professed and speculative atheism to be found amongst us; yet in Christian countries themselves, there are too many that are but baptised infidels, especially among the pretenders to the knowledge of nature. For these men are not indeed, upon a deliberate *examen* of the question, come to a settled belief, that there is no Deity, and therefore may perchance abstain from some gross, heinous, or unprofitable sins, *for fear there should be one*: but they are not so fully persuaded, that really *there is one*, as, out of regard to him, to deny themselves a much beloved, or very profitable sin, or undergo any considerable hardship, or run any great danger. For some of these irresolved persons never thought the question, *whether or no there be a God*, worthy of a deliberate and serious debate, and therefore have no principle in them, that will carry them either to act or to suffer nobly for religion: and others, though they do not despise the question, yet do rather *take it for granted*, that there is a Deity, than *truly believe it*. And therefore they will suffer it, perhaps, to influence those passages of their lives, for which they are not much concerned: but when there happens to be a case, wherein, though a firm belief *would*, yet a bare surmise *will never* enable them to surmount a great difficulty, or resist a strong temptation, it will quickly appear to others, and oftentimes to themselves too, that their supposed faith was but a deceitful presumption.

For my part, the observation I have been long making of the publick and private transactions of men, inclines me to think, that *though* inconsideration and inordinate affections have oftentimes a criminal part in the impieties and immoralities that debase and trouble mankind; *yet* the greatest part of the mischief that bad men do to others, or themselves, may be imputed to the want of a sufficiently firm conviction, or belief of the existence and the main attributes of God. For though in particular actions, men, whose persuasions are sound, may, by the impetuosity of a passion or temptation, be hurried into great and criminal transgressions; yet it is hard to conceive, that deliberate, avowed, and habitual impieties

Heb. xi. 6.

impieties and vices, can consist with a deliberate and firm belief, that there is such a being, as even natural religion represents God to be: that is, not an undiscerning, weak, or unconcerned, and in a word, a mere nominal deity; but such a powerful, wise, just, and active author, upholder, and sovereign governor of the world, as philosophy itself has been able to represent God to be. * * * *

As in divine faith, the measures are very unequal, some mens faith being like *Abraham*'s, of the first magnitude, and other mens so little, as to be likened to a grain of mustard-seed: so the philosophical faith, (if I may so call it) or the assent that, upon grounds furnished by nature, men have concerning the existence and chief attributes of God, is very unequal, as to the degrees of evidence and firmness. And therefore it cannot but be an employment very worthy of a Christian philosopher, to range about among the creatures, and discover there what arguments he can, to confirm in himself and others, that great and fundamental truth, which is supposed in all the truths of natural, as well as of revealed religion. And here give me leave to consider, that though even a very weak assent may keep a man from being a downright atheist, yet it will not ordinarily suffice to make him a pious man; but his piety, as well as his other virtues, will usually be proportionate to the firmness of the assent he gives to that fundamental article of religion, that there is a Divine Maker and Ruler of the world. For this may be compared to a tree, which may indeed grow without reaching much beneath the surface of the ground, but one that is better rooted, is not only more free from the danger of being thrown down by winds and storms, but by spreading its roots far and deep, becomes as well more fruitful, as more robust and firm. And sure, a Christian *virtuoso* may very well think it worth while to *study* the world, in order to gather from that inspection, arguments to prove a Deity, since it is very probable, that the world was *made*, to manifest the existence, and display the attributes of God; who, on this supposition, may be said to have made the world for the same purpose, for which the pious philosopher studies it.

Applicatory Reflections.

Admiration.

Now to apply the past discourse to our present scope; as the contemplation of the creatures naturally leads a *virtuoso* to admire the Divine Author for them, so when this admiration is rightly grounded and directed, it becomes an act of piety or natural religion. For admiration, when it regards a person, involves in its notion an inward acknowledgement of great excellency in the object. And accordingly, he that duly admires God for the immense power, the matchless wisdom, and the exuberant goodness he has displayed in the fabrick and guidance of the universe, and mankind, does by that internal conviction of the greatness, or rather boundlessness of those perfections, pay God the noblest homage his human intellect is able to tender. And that high veneration, which this inspection of the creatures produces in the innermost recesses of the mind, is an act of adoration, by which the rational soul doth indeed (to use our Saviour's expression on another occasion) *worship God in spirit and in truth*; since in the exercise of this philosophical devotion, (if I may so call it) the mind is exceedingly raised and elevated, to frame notions and thoughts of God the least unworthy of him, that our present imperfect state will permit.

Among the many corporeal *phænomena*, and the other things, that may serve for just motives to a high admiration of the divine attributes displayed in the creatures, the chief, or at least the fittest to be here touched upon by me, seem to be the following *six*, viz. 1st, The vastness of extent of the common matter of bodies. 2dly, The stupendious quantity and excellent laws of motion, framed and maintained in the parts of this common matter. 3dly, The amasing number of creatures, that by motion are produced out of this common matter. 4thly, The incomputable variety that is to be found among these productions. 5thly, The exquisite structures and contrivances of these productions, in particular. 6thly and lastly, Their relations to each other, as by way of influence and dependency, co-ordinations of some sorts, and subordinations of other sorts, mutual subserviency to one another, harmony and symmetry, in reference to the cosmical system, and the whole that they constitute. * * *

There is a strange mixture of willingness and necessity, in the admiration that is produced in a Christian *virtuoso*, by the consideration of the works of God. For *though* by an attentive and skilful contemplation of that multitude and variety of curiously framed objects, that he may meet with among them, he finds himself reduced to acknowledge, both that they are wonderfully contrived and ordered, and that they are more so than he is able to explicate or comprehend; *yet* his devotion makes him forward to confess this internal conviction, and even to rejoice in finding, that the supreme object of his veneration and love, is the author of greater perfections than he is able to comprehend. * * *

I confess it is an easy thing to lose one self in such speculations, about God's wisdom, and his other attributes displayed in the framing and conduct of his creatures. But by this happy loss, a pious *virtuoso* finds himself a gainer, not only by discovering more and more of the divine excellencies, the further his contemplation penetrates into the mysteries or recesses of them; but also by discovering, that how far soever his speculations may have carried him, yet there remains in the divine perfections, an immense region, that is still unknown to him, and which no penetration, or industry will enable him to see any bounds of. So that at the same time, and by the same means, he enlarges his knowledge, and yet plainly discerns, that he can never enlarge it so as to make

make it any thing near adequate to its object. For by seeing so far, and by finding himself unable to see that, which he is convinced must lie beyond the bounds of his sight; it is natural for him to conclude, *both* that the divine object is admirable, and that it is to his understanding, incomprehensible. And indeed when we duly contemplate the divine attributes, and the signatures of them that are stamped upon (some, especially, of) the creatures, even rapturous and exstatick celebrations are not only allowable, but laudable: and a *virtuoso* may employ such expressions without being an *enthusiast*, or doing ought, but what becomes a philosopher.

If a naturalist were transported to, and made able to subsist in one of those cœlestial comets, that, according to some eminent modern mathematicians, are said to pass through divers *vortices*, till their continual remove from us, makes them vanish. Upon this supposition, I say, with what admiration and delight, may we presume, that such a man would pass thorough those cœlestial regions, and survey those shining globes, that he should in his way see near enough to discover, that they are not only far more vast, but perhaps far more adorned with multitudes of various creatures, and curious pieces of work, than the dull earth, we men inhabit. For even of this comparatively little globe, not to call it pill, in some American regions, that are, by great odds, less remote from our country, than the *East-Indies* are from *Europe*, the first discoverers inform us, that they scarce found any (not half a dozen) of the same kinds of animals, that we Europeans have among us; so that beasts, birds, fishes, trees, fruits, herbs, and almost every thing they met with was new and surprising to them. And yet we know, that *America* affords us both plenty, and variety of creatures, which, though much differing from those our countries supply us with, are no less noble, rich, and curiously framed than they.

But here I conceive myself obliged to admonish you, that a Christian virtuoso may excite and cherish pious sentiments in himself and others, not only by his contemplations of the corporeal creatures of God, but as he is versed in chemistry, hydrostaticks, *&c.* by his skilful ways of managing and improving them to human uses, such as medical, metallurgical, mechanical, agriculture, manual, and other trades.

Though speculative philosophy does most conduce to the glory of the Creator of things, as that which displays his wisdom in the formation and conduct of the world, yet I think practical, or rather operative philosophy, which teaches men the manifold usefulness of the creatures to human life and welfare, may much contribute to the same end, the glory of God. For when we find by welcome experience, the great advantages, that we may by the due exercise of the rational faculty, God has endowed us with, derive from the creatures, he has liberally bestowed upon us, we are naturally led to acknowledge thankfully his goodness, and look upon him as a greater benefactor to us, than otherwise we should think him. I see not why a chemist, for instance, may not find himself engaged to glorify God for his creatures, as well as a cosmographer; nor why an astronomer should be more affected with the speculation of the pole star, as it makes a lucid part of the cœlestial globe, than a pilot that finds himself enabled, with the sight of that star, to steer his course, in the darkest night, through the ocean itself, to the desired port.

I grant then, that the speculative part of natural philosophy, does *most conduce* to make men admire and praise God's *wisdom*; but the experimental part, may *powerfully engage* them to admire and praise his *goodness*. And as in this great and noble machine of the world, God has thought fit to display more than one of his divine attributes; so I think, that they ought, each of them, to excite suitable affections in us: and that the curious fabrick of the world does highly deserve our praises, but should not ingross them: since as we owe our admiration to his incomparable wisdom, so we owe, both that and our gratitude to his diffused beneficence.

There is a great deal of difference betwixt the admiration that proceeds from *simple ignorance*, i. e. a nescience of what a learned man may and ought to know, and that which proceeds from a *learned ignorance*, if I may so call it, wherein a man, after having taken pains to be instructed, is, by the utmost knowledge he has attained, made sensible, that that knowledge is but imperfect, and very disproportionate to the admired object. * * * *

* * * There is a great deal of difference between admiration, and admiration, according to the degrees of knowledge of the persons that admire, and the grounds upon which they do it. And accordingly the wisdom and munificence of God, expressed in the greater and the lesser world, are nothing near so well celebrated by the vulgar of men, or even of scholars, as they may, and ought to be by philosophers and *virtuosi*. For *though* the obvious phænomena of the world, that present themselves to the eyes, even of vulgar beholders, have on them stamps, or impresses of their Divine Author's attributes, capable of being seen, even by unskilful or perfunctory spectators; *yet* the conceptions, that have but such superficial notices for their rises, must needs fall very far short of those sublime, and enlarged ideas of the works of God, that are framed by the more enlightened intellects of those, that, not content with the superficial prospects of such excellent pieces of work, do with great industry and sagacity penetrate as far as those two helps will enable them, (and that is more than a little) into the latent structures, springs, and other contrivances, and in a word, into the more intimate nature, or constitution of particular things, and their several relations to the various bodies (though, perhaps, very differing and distant, that, according to the institution of the Author of things, either act upon them, or are acted on

on by them. It is true, that ignorance of the causes of things, or of the manner of their being produced, is very ordinarily the parent of wonder. But this remark belongs to such cases, where it is the want of such instruction, as learned men may give the ignorant admirer, that raises his wonder, which, oftentimes too, terminates in the sensible *phænomena*, or effect produced, as it was excited *by* it. But besides this admiration of the ignorant, there is an admiration of the learned, which brings far greater honour to the Author of the things, that are both ways, but by differently qualified persons, admired. For there are many of the works of God, which all the disciplines, that a man can resort to for instructions, will but engage him to admire the more deservedly. For as I partly noted already, a true *virtuoso* will not be satisfied with the obvious appearances of things, though even these may challenge some wonder, but he will be curious about the hidden manner, whereby those appearances or *phænomena* are produced: and when by attentive and skilful speculations he discovers, that so far, and no farther, he can give himself a rational account of the manner how such difficult things are brought to pass, his admiration becomes thereby, as well greater, as better grounded.

It is true, that here below, familiarity oftentimes breeds contempt or weariness. But when the mind is conversant about divine objects, the innumerous and (as to our way of apprehension) manifold prospects they afford, are such, both for excellency and number, that the mind can never exhaust that fountain of rational, and perhaps exstatical delights: but finds in that most glorious, and, in a sound sense, most various object, new causes of pleasure and motives of veneration, as she considers it under this, or that aspect: just as a rich diamond, cut in facettes, appears with new and varied beauty and lustre, as its parts and motions are considered in this, or that position and light: and though the blessed angels have, ever since the beginning of the world, been employed in contemplating, celebrating, and serving God; yet, far from being weary of those blessed employments, they discover still, in that boundless ocean of perfections, things fit to heighten, even *their* wonder and veneration.

Admiration and Celebration.

* * * Though I do not deny a distinction, between the admiration, and the celebration of God's works, since the former, as such, is an internal affection, confined to the soul of the admirer, and the latter, is an external declaration of that sentiment by words, and sometimes also by actions; *yet* these two are, on several accounts, of such great affinity to one another, that most of the things I have to say in this subsection, may be applied to both. And therefore I shall not be solicitous to sort them nicely, contenting myself, if there be occasion, to postpose to the rest, some more properly referable to the later member of the proposed distinction, than to the former. * * *

As our virtuoso (whom in this discourse we always suppose to be a naturalist) by his deeper insight into the works of God, is able to discern far better than another spectator, how much they deserve to be admired; so he is upon the same score, far better qualified than other men, though, perhaps, otherwise learned, to celebrate the divine opificer for them. For the skill, that his experiments and speculations may have given him, of the divine artifices and providence, observable in the frame and government of the world, may enable him both to discern, and to display many excellent signatures and impresses of the divine wisdom, œconomy, and beneficence, that a man needs be an industrious, and happier studier of nature's wonders, to be able to perceive himself, and much more, to be fit to disclose them to others.

A virtuoso may glorify God, *i. e.* declare his divine perfections. 1st, As he is a *naturalist in general*, since a school-philosopher, and even an illiterate person may see in the creatures, things that deserve our veneration and praise. And 2dly, as a *virtuoso*, or *modern naturalist*, who is versed in a way of philosophising, that may enable him to discern himself, and discover to others, a *great many* signatures and impresses of the divine attributes, not taken notice of, or not reflected on by the ancients, nor by merely book-learned spectators, even of this age, that are so many just, as well as new motives, to praise the most wise Author of such excellent works.

Though admiration of God for his works, be a kind of mental celebration of him, and is very much our duty, yet whilst it is but internal, it does not show itself abroad; it may be indeed, and probably is acceptable to God, who sees the heart: but is too private an homage. It is fit therefore, that we publickly declare our admiration to others, and invite them to join with us, in acknowledging and celebrating the excellencies, that we have discovered to be displayed in the creatures, whereby we may, as far as in us lies, both do right to the divine possessor of such excellencies, and engage others, by our example and reason, to join with us, to glorify him for them. Since the scripture introduces God himself, as saying, *he that offers praise, glorifieth me* *. And indeed it has been, from age to age, the general sentiment of mankind, that the most excellent, and beneficent being has a title, not only to our internal veneration, but to external and solemn expressions of it, both vocal and real.

* Ps. l. ult.

By vocal, I mean, not only thanksgivings, but pathetical expressions, whereby God's excellencies, and the impresses of them, in his works and doings, are magnified and extolled, which, for the greater solemnity, and the raising of mens minds to higher thoughts of him and them, were, also, oftentimes accompanied with the choicest musick, and sometimes, with poetical raptures, dressed in a form of songs or hymns.

But besides these, the light of nature taught men to declare their veneration and gratitude, by

by such expressions, as, for distinction sake, I call real, such as are erecting of altars, temples, and other structures, in honour of the Deity, true or supposed, they adored, as also feasts and such like publick rejoicings, and particularly sacrifices, which last I the rather mention, because that the more religious among philosophers offered sacrifice to *Mercury*, *Apollo*, *Minerva*, *Æsculapius*, &c. for the discoveries which they made, as they supposed, by the patefactions, or guidance, and influence of those divinely intelligent beings. Of this we have a memorable example in that great philosopher *Pythagoras*, who, as several ancient writers tell us, sacrificed a hecatomb to the muses, for the happy discovery he made of that noble and useful theorem, that was afterwards made the proposition of the first book of *Euclid*'s Elements, where it may be still found, though, perhaps, all the good uses of it will not in haste be found out.

Since then even heathen philosophers could think themselves obliged not to confine their gratitude to the breast, but to make publick acknowledgments of it; it will surely become a Christian *virtuoso*, to whom God has vouchsafed more than ordinary degrees of knowledge, of the excellency and usefulness of his admirable works of creation and providence, to extol and celebrate the Divine Author of them, and invite others to join with him, in paying a debt of praise and thanks, which is so great, that he is not able, alone, sufficiently to acknowledge. The best way of doing this, is to manifest to others, (by more exact accounts, enriched with new discoveries,) and engage them to take notice of the wonderful works of God, which neither a vulgar spectator, or even a vulgar scholar, is able to do, any thing near so well as a skilful naturalist, and curious *virtuoso*; for such a person, by the help of anatomy, astronomy, chemistry, hydrostaticks, dioptricks, *&c.* will be able to disclose many wonderful things, about the fabrick, uses, *&c.* of many of the creatures, that by unskilful, or unattentive, or lazy perusers, are altogether either unperceived, or unheeded. For, to inculcate here, what I elsewhere note, the works of God, need no greater celebration, than to be skilfully displayed, and well understood, being not like the feats of juglers, that require ignorant, or heedless spectators to make themselves admired, nor like the engines, and other works made by human artificers, which lose their admirableness, when the artifice comes to be discovered, but the works of God are so perfect in their kind, that the more narrowly and critically they are inspected, the more curious and exquisite they appear, and the more they recommend the wisdom and munificence of the Divine Author, and the more they invite the critical inspectors to magnify him, for them. * * * *

The knowledge that a virtuoso has, above that of the vulgar, or the mere school-men, of the admirable fabrick of his own body, or the faculties of his mind, and of the sensations and passions that arise from their conjunction, deserves, that he should, for such excellent things, extol and magnify the divine wisdom and goodness. For sure, if it be his duty to praise God for inanimate beings, and animals devoid of reason, he has much more cause to celebrate the divine goodness, for the fabrick of his body, which, for ought we know, is the curiousest piece of workmanship, of all corporeal creatures, in the world, and yet more reason to extol the Author of his nature, for having ennobled him with a mind capable of the knowledge of such a body, and of celebrating the Author of the fabrick of that, and the much more noble nature, she herself is blessed with.

A true Christian philosopher thinks it a greater honour and advantage to be the image of God, than his vicegerent, and to have some, though but a faint *resemblance* of his knowledge, immortality, holiness, and some other perfections, than a *participation* of his power, over inferior creatures. And such a person will find a higher satisfaction in being, as it were, the *priest of nature*, that offers up, what he only, of the visible creatures, can present, the sacrifice of praise and wonder to their common Maker, than in being *prince of the inferior world*; justly reputing piety to be a greater blessing than empire.

The visible works of God appear so excellent, even to such immaterial and intelligent creatures as inhabit the invisible world, that the scripture represents the angels themselves, as applauding and celebrating their Maker, upon his *laying the foundations of the earth*, and the glorified saints, in the *apocalyps*, are introduced, as adoring and praising God, for his admirable works of the creation.

Humility.

It will, probably, be thought somewhat strange, that among the religious virtues, which the contemplation of God's creatures, is proper to excite, or cherish in our virtuoso, I should reckon humility, since the higher degree of knowledge, that his inspection into God's works, is reasonably supposed to have given him, seems more likely to puff him up, than to make him humble.

But, to counterbalance this temptation, there are divers things in the book of nature, that are very fit to give a well-disposed mind, sentiments of humility, some of which reflections, I shall now briefly mention: though I purposely decline to insist on the reproach, that seems to be made, even to the best part of mankind, the people of God, by the rest of the creatures, whose regular conformity to the laws, God has settled for them in nature, may upbraid the moral irregularity of men, who alone, of the visible creatures, are endowed with reason, that enables them to know God's laws, and a will, whereby they may conform to many, that they deviate from.

To proceed then, to motives of another kind, I shall in the first place represent, that it is an astonishing thing, to a person acquainted with modern discoveries, to consider, attentively, the wonderful vastness of the corporeal world. For *not only* mankind, if it

it were all crowded into one place, would be of very inconsiderable bulk, in respect of the globe, it inhabits; *but* this terrestrial globe itself, is, without hyperbole, but a physical point, in comparison of the cœlestial part of the universe. Nay, as is elsewhere declared, according to the Copernicans, and divers others of the more accurate, modern astronomers, the same may be said of the incomparably vaster great orb itself, which is that wherein the earth moves about the sun, or he about her. Now it is natural enough, that the contemplation of this almost inconceivable extent of the world, should make man, who is but an atom, in comparison of that globe he inhabits, which is itself scarce more than an atom, in comparison of the visible world; should, I say, make man have humble thoughts of such a body as his, when he compares himself to that *great God*, as the scripture speaks, that made and governs this immense mass, we call the world, and whose power doth infinitely exceed it. The evangelical prophet, in a lofty strain, magnifies God, for the great inferiority of mankind to him: Isaiah xl. 15. *Behold*, saith he, *the nations are as a drop of the bucket*, &c. and *are counted as the small dust of the balance; behold, he taketh up the isles, as a very little thing*: and again a little after, * *All nations, before him, are as nothing, and they are counted to him, less than nothing, and vanity.* * v. 17.

A REFLECTION of this kind, suggested to the kingly prophet, that humble and adoring exclamation, Psal. viii. 3. *When I consider thy heavens, the work of thy fingers, the moon and stars*, (for it seems this devout address was made in the night) *which thou hast ordained, what is man that thou art mindful of him, and the son of man that thou visitest him!* * * * *

THERE is another reflection, that may justly lead our *virtuoso* to sentiments of humility, which is, the imperfection of his knowledge of God's creatures, both in regard of those, that he is a stranger to, and in relation to those, which men are presumed to be already acquainted with. * * * *

IT is true, that the opinion, men generally have, that because *virtuosi*, are more industrious to pry into the secrets of nature, than other men, they are liable to a greater temptation than they, to be proud of their knowledge, is a persuasion specious enough: but yet, I think it erroneous, as grounded upon a mistake. For the same application of mind, and the same instruments of knowledge, that enable them to make uncommon discoveries, are fit, at the same time, to make them sensible, that there remains more and more to be discovered, in the objects of their knowledge, and let them see, that *as* they have learned divers things, that vulgar scholars do not know, *so* they must confess, that there are more things, necessary to be learned, for the compleat knowledge of their subjects, than vulgar philosophers do so much as dream they ought to know, and than these virtuosi themselves have yet attained the knowledge of.

Gratitude.

OUR gratitude, when it respects God himself, who has obliged us in such peculiar ways, and such high degrees, as no other benefactor can do, should engage us, not only, to acknowledge *thankfully*, his great beneficence, but to make that a powerful motive, to *love* the divine Donor of all these benefits. This reflection, together with the great affinity between gratitude to God, and love of him, which makes it very difficult, and not very necessary, to separate those two duties, if not parts of the same duty, are the reasons why, when I discourse of the former, in this fourth article, I shall treat in such a manner of gratitude, more strictly so called, to God, as not to separate from the rest, divers passages, that relate more directly to the fifth article, about the love of God, as being fit to become incentives to it.

THE Gentiles, by the light of nature, had the means of obtaining so much knowledge of God, that is, of what was expedient for them to know, and not too difficult to attain, as to render them excuseless, if they did not pay him a high veneration and gratitude. For they are condemned, by their apostle, for two things, which, by his censuring them for, it appears, that the light of natural reason ought to have led them to avoid. For *first*, he reproaches them for this, that, *having known God*, they yet *did not glorify him as God*, i. e. with that peculiar and highest veneration, that belongs to the supreme and most excellent of beings. And *then*, he reproves them for not being thankful to him, in such a manner and degree, as becomes, and as far as may be, is worthy of a divine and most munificent benefactor. Both which reprehensions laid together, sufficiently argue, that if the works of God's creation and providence, be duly considered, though but by the dim remains of the light of nature, much impaired indeed, but not extinguished by the fall of our first parents, it will suggest both sufficient proofs of the existence, power, eternity, and divers other attributes of God, and furnish the mind with very engaging motives to gratitude, to so excellent and beneficent a being: the genuine expressions of which gratitude, are not only verbal, such as are praises and thanks, but real too, such as to pay him religious worship, imitation of him in all things, wherein it is fit for us to endeavour it, and a faithful obedience to all his laws, written in our hearts, or that by any other means, come to our knowledge. * * *

BESIDES the benefit a man receives from his continual conservation, by God's sustaining power, as he is a part of the universe, and so partakes of the common benefit of the creatures in general, there is scarce any man, especially, if he be not young, that does not owe very much to his Maker, for particular and personal preservations, there are very few that take notice of this, and make returns of gratitude, any way proportionate, to what the benefit deserves. For, when I consider what a vast number and variety of accidents, man is subject to in this world, and how often he is in

danger,

danger, even when he knows it not, or has the least suspicion of it, and so does nothing to prevent some, and can do nothing, to the purpose, to prevent others, did he know them, never so well; I can scarce but admire to see an old man, especially that enjoys health. For a human body consists of divers hundreds of parts, great and distinct enough, to be manifest to the unassisted eye, nay, and to have distinct names given them, by anatomists, and each of these may be harmed, by so many outward agents, and internal causes, and some of these invisible and unsuspected, that, as I elsewhere note, it seems as strange, that in so compounded and delicate a machine, as a human body, nothing should be out of order, or complained of, as that a musical instrument, that were furnished with a thousand strings, (none of them superfluous,) should be long in tune, since the very change of the air, may suffice to disorder it, as oftentimes we see it also do, to the living machine of a human body.

Venomous creatures themselves are not to be kept out of the list (or number) of those, for which men ought to praise and thank the Creator. For however, in some regards, or in some circumstances, they may be hurtful to us, yet, their nature may be as admirable, as those that are harmless, or even beneficial to us. And therefore deserves, that we should praise the Author of such curious works, as we do the fires of a pyrobolist, and the artificer himself, as well, when they threaten us in bombs and fire-balls, as when they shine innocently, in rockets, and other delightful fireworks; and as for the mischievousness of some venomous creatures, it is, in many instances, compensated by the advantageous uses, that skilful men have already made, or, in probability, will hereafter make of them, as did partly appear, long ago, by viper-wine, treacle, *&c.* and by oil of scorpions, useful for divers distempers, besides those, which their own stings produce. Thus, though opium be vulgarly reckoned among poisons, and indeed too often proves one, in unskilful hands, yet, especially if it be dexterously prepared, when it is given in a fit dose, and other circumstances, it becomes a remedy, that many of the modern physicians look upon, as one of the chief and noblest instruments of physick. And so arsenick, though a rank poison, may be so corrected, that some chemists have made very good use of it, in stubborn outward affections. And by an easy preparation of it, not to be met with in any book, we have so corrected it, that not only it proved, in chirurgeons hands, very effectual in some uncommon and obstinate distempers, but, almost against my will, was given in pretty large doses inwardly, and found to be a notable medicine, operating as a potent diaphoretick, and, which I less looked for, a cordial.

God hath an indisputable title to our gratitude, as being our benefactor, and that, in so eminent and peculiar a manner, as is impossible to be equalled by any other. For besides, that upon the score of being our maker and preserver, we owe him even ourselves, we are likewise indebted to him, for all the benefits, that we receive from other benefactors. For as, speaking in general, he alone is the original and exuberant fountain of good: so, as to particular men, he is, what an apostle stiles him, that *Father of lights, from whom every good and perfect gift comes down unto us* *. Since it is he that gives all our other benefactors, as well the ability, as the will to be so, and that doth indeed intend us all, that is reached out to us, by the hands of others, who, though they are looked upon as free agents, are indeed but as instruments, in doing of us good. And therefore, if the noblest patriots, among the ancient Gentiles, had reason to esteem, that the gratitude, that a man owes his parents and his country, can never be fully discharged, or so paid off, as not to remain due; sure such an obligation on us, may be far more challenged by God, to whom we owe them, our parents, and our country, as well as other blessings.

* James i. 17.

Nor do the benefits we enjoy as men, exact so much of our gratitude, as the advantages which he doth vouchsafe us, as Christians. For, as he gives us, in reason, a capacity of *knowing* him, so he allows us, in religion, the means of *enjoying him*: and not only permits, but invites and encourages us to aspire to a felicity, that will so dignify our natures, and make our persons so happy, that all that we either do, or can enjoy here below, is the least part of those blessings, which nothing, but our being unkindly and criminally wanting to ourselves, can make us miss. So that we owe him incomparably less, for what we possess, than for what we are allowed to hope for, and the highest blessings, we can here attain to, must be so less, as they are present effects of his bounty, than, as we may make them pledges of his future favour.

It ought much to encrease our gratitude to God, for all the above mentioned benefits, and indeed, all his benefits in general, that they are wholly free, and no way deserved, or procured by any thing in us. For we owe to God, our very beings, as we are men, (since of the same lump of earthy matter, of which he formed the body of the first man, he might, if he had pleased, as easily have formed a dog, or an ape.) This being is antecedent to, and must be presupposed, in all those qualities and actions, by which the proudest men can pretend any thing of merit. God was supremely happy in himself, before he made man, and that production of some of his other attributes, was an effect of his pure liberality, and a voluntary emanation of his exuberant goodness. He needs not the services of men, nor receives any other advantages by them, than that they give him occasions to exercise his liberality, to those that perform them, nor needs he the unskilful praises of mortal men. Since, if he delighted in them, for their own sakes, he can be, and still is celebrated, by the hymns and hallelujahs of creatures, of a higher order than men, I mean the angels, who with joyful songs and shouts

shouts did, as we are told, in the book of *Job*, celebrate the foundation of the earth, and afterwards loudly praised God, for the whole creation, as we are told, in the apocalyps. * * * * * God is so munificent and disinterested a benefactor, that gratitude to him is not more a great duty, than a profitable one. For when we pay him our thanks, we invite him to encrease the motives of our thankfulness.

For his goodness delights in the occasions of exercising further degrees of it, when he finds, that his first favours qualify men to receive new ones, nay, which is more, his exuberant goodness does not only recompense us with an extreme delight, when we exercise acts of gratitude, but rewards even, our desires and our ineffective endeavours, to show ourselves grateful.

I will not here make a solemn invective against ingratitude, contenting myself to give you this observation about it, that, although I have for many years been reduced to converse with no small number of persons, guilty of impiety or immorality; and though many of them owned, and gloried in their vices, some in this, as drunkenness, and some in another, as uncleanness, yet, I never met with, nor heard of any, that owned, much less boasted of ingratitude: so heinous is that sin, even in the eyes of those, to whom other vices appear justifiable, if not laudable. How great a crime then must it be, to be ungrateful to God, who is, on many and peculiar accounts, the first and greatest of our benefactors! And to apply this to our present purpose: it is some degree of ingratitude for benefits, that we can never be sufficiently thankful for, if we neglect any fit means (such as are a pious study of his works, with a design of growing more religious by it) to heighten our gratitude, and excite us to express it, by thanks and praises, as well skilfully, as devoutly paid; especially, since our acts of gratitude are, by the exuberance of our great benefactor's goodness, made to be such, that instead of paying our debt, they encrease it; since by his bounty, the thanks, that we give for past benefits, entitle us to new ones.

Love. Those divine perfections, that have been lately represented, as proper motives to the six *separate* acts of religion, formerly mentioned, those, I say, being considered *all together*, and in conjunction with some others, ought powerfully to engage us, by their concourse, to a true and ardent *love* of God. For the two main things, that, naturally and usually produce love in us, are the excellency and amiableness of the person, and his kindness and beneficence to us. Now, both these attractives are to be found, and that in a peculiar way, and transcendent degree, united in God; who since (as partly has been, and partly will be shown,) he highly deserves our wonder, adoration, thanks, and trust, must, upon those accounts, (which yet are not the sole ones) most justly deserve our love. For in what object can we find, *any thing near*, so manifold, or so great excellency, as in him, whose very nature it is to be *a being infinitely perfect*; and in whom, all those excellencies, that we admire and venerate in the creatures, among whom they are but scattered, do meet and concur (if that be possible) in a more than superlative degree.

Though the nature of this little tract obliges me to treat of the subjects handled in it, more as a naturalist, than a divine; yet, upon this occasion, I shall desire you to take notice, once for all, that philosophical arguments are the most usual, without being the only ones, that are employed in this paper, especially, because I did not think myself obliged, scrupulously, to forbear to use, now and then, a passage of the holy scriptures, when I find it very pertinent to the subject and design. For there are several things that may be proved, or persuaded, by arguments and motives furnished, both by natural reason, and by revelation too. Of which many instances may be given, as in the divine attributes, the creation, the rational soul, the affections and passions incident to man, *&c.* And therefore, since I write not to an infidel, but to a *Christian Virtuoso*, it may be allowable, as well as useful, sometimes, to bring in a passage or two of scripture, to dilucidate or confirm something, whereof natural reason gives us *some*, and yet, but a more *imperfect* notice, and by the association, to enlarge our notions, and strengthen what we say, and make it more operative.

To discourse of the love of God, merely as a naturalist, is to treat of it with great disadvantage and imperfection. For of the motives fit to produce that love in us, those are far more powerful, that may be drawn from the reading of that divine book we call the scripture, than those, that are afforded us by the most accurate inspection of the book of nature. For this latter does, indeed, show us *a part* of what God *has done for us*; but the former manifests to us, not only, *another part*, consisting of many other, and greater things, that God, and his only Son have *done for us*; but (what the contemplation of the creatures, would never have suggested, so much as a suspicion of) those afflictions, ignominies, and torments, (worse than the death, they ended in) that his divine Son, by whom he made the world, whereto he granted him, *has suffered for us.* * * * *

But, though the Christian religion does furnish us with the noblest motives to the love of God, yet, I do not see cause to question, as some moderns are said to do, whether, by the dictates of natural reason, men are bound to love God. For it seems to me, that the obligation men have to love God, is the same, on which all the other duties of natural religion are founded; namely, on the *one side*, the excellency of his divine nature, and his beneficence to us, as the author and preserver of human nature; and, on the *other side*, man's being a rational creature, who, upon the account of his reason, is able to discern enough of the divine perfections, to convince him, that they are adorable, and that he is a debtor

to God's goodness and providence, both for his being, and his well being. For, these relations being thus stated, the obligation, not only to *worship* and *obey*, but to *love* so excellent a being, and so bounteous a benefactor, does naturally result from them. * * * *

THAT it is God's will, that men should love him, may be argued from hence, that he has given to man, both ideas of what is amiable, or lovely, and a propensity, or inclination to love that, and nothing else. For he who is both a most free, and a most wise agent, would never have so framed the mind of man, as we find he has done, if he did not know himself to be most lovely and amiable, to such a creature, rightly constituted; to whom, he *could* else have, and no doubt *would* have given other ideas and natural propensions. * * * * *

YOU will easily be persuaded of the ravishing amiableness of GOD, if you consider, that being both infinitely perfect, wise, and potent, it is yet his will to be beloved by men; and that he vouchsafes to appear very desirous we should accomplish it, since he, that in a transcendent degree possesses those amiable and attractive excellencies, would never have given us those notions of goodness, and loveliness, that he hath done, if he did not know that his attributes can fully answer, and deserve them. * * * *

BUT it will much the better appear, that men are obliged, by the dictates of natural reason, to love God, if we somewhat distinctly, though but briefly, consider the immediate and proper motives to do so, wherewith, on several accounts, an ingenuous and rational man is furnished.

THESE motives, or inducements, are chiefly of two sorts; to the first belong all the adorable excellencies of the divine nature, that are discoverable by the light of reason.

THE motives of the second sort, may be reduced to these two, which are afforded by considering, 1st, What God *has done for man*. And 2dly, What *he will do for him*, in case he prove a fit object of his beneficence.

To the first sort belong, (as was newly said) all the adorable excellencies of the divine nature, at least, as far forth, as they are either clearly discoverable by our human reason, in its full exercise, or are, in a more particular way, probably, deducible from the consideration of God's works of creation and providence.

THE nature of man is so framed, that when he perceives, in another rational being, any true virtue, or excellency, he finds himself incited to make that being an object of his love, though, perhaps, he did not derive, or promise himself, any personal benefit from the object that engages his affection. It is congruous to this, that we observe, that when a reader of the history of *Scipio*, *Cato*, *Socrates*, *Xenophon*, or some other ancient worthies, mentally transports himself, (if I may so speak) into the country, and the age, wherein that rare person lived and acted; he does naturally, and oftentimes warmly, concern himself in the adventures of his admired hero: he heartily wishes him success in his enterprises, is troubled at his crosses, fears in his dangers, triumphs in his victories, rejoices in his prosperity, and, in short, makes himself a sharer in his good, and in his evil fortunes; which are the natural tokens of the real affection we have, for those we truly love; though the heroes, whose partners we thus make ourselves, lived in times and places, so remote, that we could receive no benefit from their greatest prosperity, and could be no personal objects of their love. And it seems to be upon the like account, that many, especially of the more generous minds, are so affected in reading of well writ romances, whilst they forget, that they are but fictitious persons, who are represented, as endowed with the excellent qualities, by which it was designed to recommend them. Upon this propension in human nature, to love rational beings, that excel in virtues, whether intellectual or moral, it is but just, that a *virtuoso* should elevate his love to God, who has not only, in a supreme degree, those excellencies, that are directly beneficial to us, as wisdom and beneficence, but divers others too, that make him most justly adorable; such as are his self-existence, his absolute independency, his spirituality, his eternity, both *à parte ante*, and *à parte post*; his immense power, his providence, in the conservation and the government of his creatures, his infinite perspicacity, and his exact veracity, *&c.* But, though I do not, nay, though I could not name any more of his perfections, in particular, yet it is rational to think, in general, that he may have many perfections, whereof we have, as yet no distinct notice, not to say, so much as a suspicion. For when I consider, that this visible world of ours, though its vastness do usually and justly astonish us purblind men, yet may, for ought we know, be but a small part of the great universe, or system of the corporeal works of God: and when I also consider, that we know very little of any other of the divine perfections, save those that relate to the creatures (among which we men are to be numbered) already known to us, *as* God's power, and his wisdom relate to the creation and government of the world, and of mankind, *and* his goodness relates to his beneficence, from which effects, the suitable attributes of God are inferred: *so*, if there be *other parts*, of the material world, not yet visible, or known to us, I see no reason, why God may not have other relations to *them*, than those that our world suggests us the notices of.

I KNOW not but that I may, without impertinency, add, that we ought not confidently to think, that the corporeal world, even in its utmost extent, (whether visible to our naked eyes, or not visible to them) and also, even when assisted by our best telescopes, affords us all the grounds we may have of thinking, that God may have many excellencies that are not known to us. For if there be really, besides mere bodies, incorporeal beings endowed

dowed with understandings, and wills, we may rationally suppose, upon their account, other excellencies in God, than those which his material works have discovered to us.

SINCE divers philosophers, that took nature only for their guide, arrived so far, as to acknowledge abstracted intelligences: *since* we find, that *Aristotle*, and the philosophers of his numerous sect, held such to be the movers of the cœlestial orbs: and *since* other philosophers, upon differing accounts, believed there were good and bad *dæmons* of several orders, and the greater number of philosophers believed rational souls to be immortal, and many of them, that, as they were distinguished from their vehicles, were immaterial too.

SINCE these things, I say, are so, we may reasonably suppose, that among those communities of spiritual beings, many things would be found, if we were able to observe them, that may give God occasion to make several exertions, (if I may so speak) of his boundless and exuberant perfection, which, after our manner of conceiving things, would require distinct names, and induce us to frame for them other ideas, and consider in God so many (new) attributes, and excellencies, that we never thought of before. As upon such discoveries, occasioned by the fall of the first man, his posterity came to ascribe to God new relations to his human creatures, and divers others too: upon which relations, his actings gave men occasion, to ascribe to him such attributes as punitive justice, mercy, longanimity, severity, patience, *&c.* proportionably to this, if we knew how his perfection is exercised towards those several orders, or communities, of his invisible, and yet rational creatures, that we were newly speaking of, according to their several natures, laws, and actings; it is scarce to be doubted, but that we should thence take occasions (and that justly too) to frame *ideas*, for several divine excellencies, in that boundless ocean of perfection, God, for which we have yet no names, and much less any proper and distinct notions. * * *

I KNOW not, why it may not be added, on this occasion, that since men naturally think themselves obliged to love their benefactors, especially if they be worthy persons, and so are wont to look upon love, as a part, or duty of gratitude, I see not, I say, why the things represented, in the article about gratitude, may not be made use of to encrease the number, or, at least, the force of those arguments, that are, in this article, employed, to engage men to the love of God.

To the second sort of motives to love God, belong,

FIRST, The consideration of what God has done for man, under which may be included, 1st, What he has made man. 2dly, The dominion he has given him over multitudes of other creatures. 3dly, His placing man in a world so framed, as this of ours is, and enabling him to employ, or enjoy, by contemplation, application, spiritualisation, or otherwise, those creatures he cannot reach, nor directly command. 4thly, The faculties, that are granted him, and improvable by him, over animals, plants, and fossils, to rule over them, and convert them to his uses. 5thly, The conservation, both of the universe itself, or present frame of things, and of other animals, besides men, by God's continual concourse, also his governing the world by an admirable providence, especially with relation to the welfare of mankind. 6thly, The personal benefits, particular men have received, and especially that lasting one (not only of conservation, but) of preservation, by preventing dangers, and delivering them from them. * * *

AMONG the things, that God has been pleased to do for man, we way reckon, in the first place, that he has made him man, for as this is the prime benefit, and is necessarily presupposed in all others, (for that which is not is uncapable of enjoying any thing) so what we have newly discoursed of the excellency of the human nature, may let us see, that we owe our Maker exceeding much, for having conferred on us so precious a benefit.

IN man, as it concerns our present purpose to consider him, there are three things, that are briefly to be taken notice of, his mind, or rational soul, his body, and the union of both, with the natural consequences of it. I do not here, where I am confined to a few pages, pretend to deliver a psychology, or full and methodical discourse of the soul, since it may, here, suffice to observe, that according to what has been said, when we treated of it in the second section, it is a creature endowed with most noble faculties, as understanding, will, memory, and a spiritual sort of affections, and that these are accompanied with a capacity of being further and further improved, both by those great illuminations, that God may vouchsafe it, and by his blessing, upon her own orderly and diligent endeavours, to improve herself. So that the rational soul being an immaterial and immortal, as well as an intelligent creature, is of a higher order, and greater excellency, than any part of the corporeal world, not to say, than that whole world itself, the soul being indeed but an imprisoned angel, if I may so call it, as in the Cartesian philosophy, a planet is, inwardly, a self shining star, shrouded and kept obscure by the gross, and opacous matter that surrounds it. And this, I presume, may suffice to make such a gift, as the soul, a just motive to human gratitude.

BUT since the rational soul exists not here below, but in a vehicle, *viz.* the human body, it may justly encrease the motives of gratitude, if it be considered, how excellent a mansion the wisdom, and goodness of God, have provided for the noble guest; this mansion, as *Moses* informs us, was formed at the close of the corporeal world, as a masterpiece, worthy to crown the whole work. Of the excellency of this admirable vital engine: many things have been said already, which allows me to pass on. * * * *

I THINK

I THINK it may be deservedly added, to the other motives, that philosophy itself, affords the studiers of nature, to love the God of nature; that he has made man, and man only, among his visible creatures, capable of loving him. For whether, or no, it be true, which we are told by the Cartesians, and some other philosophers, that beasts are but engines; yet it is generally confessed, that no creature, that is merely corporeal, whatever love it may be capable of, for other objects, is capable of raising its love so high, as to fix upon God. Inanimate creatures are evidently uncapable of love, which is a passion of the soul, or mind, that is, of a subject, whereof they are destitute. And, for ought I know, it may well be doubted, whether brutes have any true passions, that is, as properly so called, as those that go under the same name in men, even when the visible motions of their bodies seem to argue a sufficient resemblance betwixt them, as a child, or perhaps a country-fellow, will judge by the grinning change made in the countenance of an ape or monkey, and much more by the noise, by a parrot, that has been taught to speak, *&c.* that he truly laughs, though laughter have long been, by philosophers, reckoned to be almost as essential a property of man, as rationality itself. And even in our own *species*, I have seen some ladies, that in violent fits of the mother, would fall into great fits of laughter, though I knew the occasion of the hysterical distempers, that produced this seeming laughter, was an excess of grief for the untimely death of a beloved relative. * * *

* * * * THE second boon of the divine bounty to man is, that God has placed him in a world so framed as ours is, *&c.* I will not say, as many do, that all this vast and beautiful structure, we call the universe, was made solely, or principally for man, but this may be said, that a great part of that mundan globe, he lives upon, is very well fitted for his uses, so that, if he be not wanting to himself, it will furnish him, not only with all necessaries to his life, but with a multitude of accommodations to make it easy and comfortable to him. * * * *

SINCE all the beautiful and useful creatures we admire, or enjoy, are the free emanations of the Creator's exuberant goodness, it is but just and natural, that those streams should lead us to the fountain, whence they flow, and give us affections suitable to the contentment, and other benefits we receive from them.

APHORISMS *added to Sect.* 2. *Subsect.* 4.

APHORISM I.

IF a man light upon an anonymous, but excellent poem, that is partly written in plain characters, and partly in cyphers of differing kinds, (as of numbers and transposed letters of the alphabet) it will be much more rational for him to infer, from the verses he does clearly understand, that it was written by an excellent poet, than it were to argue, that because he cannot understand some passages, that are written in cyphers, the author did not show himself a poet, but rather wrote nonsense in those passages; especially, if the perufer, having, by an attentive study, decyphered some part of the critical words, perceives them to be very congruous and apposite. For thence he may very probably gather, that even those passages are so too, that by reason of the transpositions, purposely made of the letters, do not afford good rhymes, but perchance sounds very harsh and unlike to them. It is easy to apply this to the artifice, that shining in very many of the works of nature, do far more strongly argue, that the world was made by an intelligent and designing agent, than the contrary can be proved, by some *phænomena*, that we cannot understand the reason of, or by few others, that, to our dim apprehensions, appear incongruous to the providence, or wisdom, of the author and rector of the world.

APHORISM II.

I HAVE one consideration to add to all that I have said, of the wisdom (and, if I may so speak) the skill of the divine opificer of things, which though, perhaps, it may somewhat surprize you, I cannot allow myself to pretermit. I consider then, that though what I have hitherto delivered, about the wisdom of God, and what has been observed, in former ages, to the same purpose, are grounded upon our survey of the manifestly visible world, that is, of those parts of the corporeal universe, that are discoverable by our naked eyes: yet that gives us but a very imperfect notice of the works of the omniscient author. For, I think we may distinguish the works of God into three worlds, or grand communities. The first, is the spiritual world, consisting of good angels, and other intelligent beings, as devils, and separate human minds, that have either no bodies, or none that we can see. And of these spirits, there may be more species, than we are acquainted with, since, without admitting the various kinds, or orders, of dæmons, which the heathen philosophers, especially Platonists and Pythagoreans, speak of, or those elementary spirits, that *Paracelsus*, in his extravagant book of them, calls silphes, nymphs, gnomes, and salamanders, not to admit these, I say, the scripture itself speaks of angels, good and bad, calls one of these last named, the prince of the devils, and to the blessed spirits, out of the state of conjunction, gives the titles of arch-angels, angels, *&c.* and both stiles the separated souls of good men, *the spirits of just men made perfect*, and mentions them as like, or equal to the angels. But to take further notice of this noblest invisible world, were improper in this place. The second, is the visible world, in the usual sense of the term, consisting of all the bodies, great and little, that are objects proportioned to our unassisted sight. And the third, which for want of a fitter name, I venture to call the dioptrical world, which

which consists of all those creatures, that lay concealed, in former ages, from mortal eyes, and are not now discovered, without dioptrical glasses, and this itself, if one please, one may, for distinction sake, distribute into telescopical and microscopical. The first whereof, comprehends the numerous fixed stars, that good telescopes show us, in the milky way, the pleiades, the belt of orion, and divers other parts of the firmament, or expansum, and the latter (*viz.* the microscopical, comprises those numerous sets of different creatures, mineral, vegetable, and animal, which, by reason of their wonderful minuteness, remain invisible to our eyes, unless they be assisted by good microscopes.

APHORISM III.

THE consideration of speech, seems to be a thing of importance, in the disquisition about divine providence. For we see, that a man, that knows a language, as for instance, Greek, or Latin, whose words, with the various determinations, that a good part of them may require to be declined, or conjugated, amount to many thousands, may yet be readily pronounced, and that swiftly, after one another, by the bare will that the speaker's mind has to pronounce them, without any *conatus* or laborious endeavour of the rational appetite itself, (though not always, without producing, at length, some wearinesse in the corporeal instruments of these numerous and various motions.) And if a man be supposed to be as great a linguist, as good authors assure us that *Mithridates* was, who understood the differing languages of above two or three scores of people, that he commanded, the wonderfulness of speech will seem to be encreased. And if the mind of man, who is so *imperfect* a creature, can, without pains, or wearinesse, produce so great a multitude of differing motions and sounds, why may not God, who is infinitely *perfect*, be able to produce, and regulate, as many motions, as may suffice to produce all the phænomena of things corporeal. And if you should tell me, with some new Cartesians, that it is not the mind itself, that excites and governs these motions, but God who does it, at the wish and endeavour of the mind: I shall answer, that the objection much strengthens my argument, since there being some hundreds of millions of men in the world, that, excepting very few, are well endowed with the faculty of speech, God must be acknowledged to have, both a very extended power, an astonishing degree of knowledge, and a continual watchfulness and care, that so numberless a multitude of sonorifick motions, (if I may so call them) should be continually produced, and regulated, according to the various intentions, and desires, of all the inhabitants of this our world.

APHORISM IV.

DIVERS of the ancient heathens, philosophers, and others, thought the sun a living, and rational being, and beneficent to man. To which belief, it was congruous they should think, *that when* he produces those lovely colours, for which we admire the rainbow, and the drops of dew, and those brighter ones, that ennoble sparkling diamonds; *and when* he surveys them all, he can behold no other beautiful colours, than those he *gives* them (by his beams) and yet does not so part with, but that he still continues the possessor of them, as well as he is the original and source. The application of this is easily made, by the Christian *virtuoso*, who knows, that the scripture ascribes to God, to have *the fountain of light*, and teaches, that he is *the former of all things*, that he looks quite thorough them, and not only gives to men *life and breath, and all things*, but sustains all his creatures, and (as the original word imports) enlivens them. Our *virtuoso*, I say, being convinced of all this, must also be persuaded, that God, who sees all things, sees nothing that is excellent, beautiful, or amiable, among his creatures, of which he is not the giver; and yet either formally, or eminently, (as the schools speak) continues the possessor: whence so ancient and venerable a theologer, as the patriarch *Abraham*, more than once, calls him, whom he stiles, *the high God, possessor of heaven and earth.*

APHORISM V.

THE Christian virtuoso considers the rational soul, not barely as it guides the motions of that living engine, we call the body, but as it is a kind of imprisoned angel, that bears the image of God, and is capable of knowing, both ourselves and him; and by a consciousness of her being his production, is capable of acknowledging, loving, and obeying him, and referring to his glory all the excellencies she discovers, both in herself, and in the body she is united to; by which just reference, she is, by his goodness, in his divine Son, made capable of becoming incomparably more knowing, than here she is, and eternally happy with him.

APHORISM IV.

THE rational soul, being the image of God, I do not wonder, that it should be inscrutable. For to have so much resemblance to that incomprehensible being, as to deserve the title of his image, it must have a nature so sublime, and abstruse, that at the same time, that our contemplations discover its excellency, in comparison of all corporeal creatures, they discover also its imperfection, in comparison of the boundless excellencies of its prototype. This may pass for a truth, not only upon other accounts, but upon this, that, though its nature be very limited, yet, all that belong to it, is far from being perfectly known, even to itself. Whereas, notwithstanding the infiniteness of God, in all his attributes, he is but an adequate object to his own infinite intellect; and his spirit, as the scripture teaches

us, *searches, even, the deep things of God*, the innermost recess of that most abstruse and (to us) ineffable being. Which reflection ought, in my opinion, to inspire us, both with a high degree of gratitude, for the great honour we have, to be made after God's own image and likeness, and with a great depth of humility, when we find, that, besides the depravedness of our wills and affections, the very inferiority of our nature keeps us unable, clearly to comprehend, so much as ourselves, much less that adorable being, that, by inhabiting an *unapproachable* light, is, to our dim sight, *covered with darkness*.

APHORISM VII.

As much as, we use to wonder at many of the bodies, among which we are placed, yet, in reality [or upon a due inspection] man himself is a greater wonder, than any of the visible creatures, that he admires. And indeed, a just, and well grounded valuation of the dignity of the human nature, may be made a thing, very conducive to the improvement of it. For, when a man seriously considers, *that* God has been pleased to make man but *a little lower than the angels*, even in this world, and *that*, if he be not wanting to himself, and to the divine goodness, God will make him *like, or equal to the angels* in the next world. What may not a nature aspire and attain to, that is furnished with such endowments, and such hopes? And due reflections on the excellent faculties, organs, and other talents, that God has furnished man with, will not only excite and animate him to high and noble attempts, but greatly dispose him to contemn many of those little and ignoble objects, as below him, the fondness of which, is wont to engage men in a great part of the vices, and meannesses, that dishonour God and mankind.

APHORISM VIII.

The uses, that man may make of creatures, made directly subject to his dominion, are chiefly, three.

And first, we may enjoy divers of them by contemplation, as he may, with great pleasure, observe the beauty, number, and regular motions of the cœlestial lights, whether fixed stars, or planets, and with great delight perceive himself to be able, without moving from the earth he lives on, to measure the magnitudes, and distances, of those vast bodies of the sun and planets, and, in some regard also, of the fixed stars, compute their stupendious swiftnesses, and, nay frame, of all these, theories, to give fair accounts of those as wonderful phænomena, as seemingly contrary motions, eclipses, *&c.* that quite puzzle ordinary men, and transport others with a just admiration; man being a rational creature born, and enabled to contemplate the noblest objects, among which, doubtlessly, are those heavenly lights, that shine in the cœlestial part of the world, it may justly be reckoned, with great utility, to so intelligent a creature, that God has provided such objects, to exercise his reason, and gratify his noblest faculties.

Secondly, man may enjoy the world above him, by applying to his uses creatures, that are by vast removes out of his reach, as the sun, by making it afford him the elevations of the pole, and the azimuths, sundials of all sorts, enough to make up an art called gnomonicks; burning glasses of differing sorts, and, some of them, of wonderful efficacy; and so the moon affords man, the opportunity of determining and predicting, almost incessant changes of the tides, *&c.* and both the sun and moon, by their eclipses, which his reason and skill teach him, wonderfully to foresee, and thereby enable him to find, in the most distant parts of the world, and rectify the longitude of places, the knowledge of which is of great concern, and use, both to promote navigation, and settle geography, and to rectify the doctrine of time, and correct, even, the ancient errors of chronologers.

APHORISM IX.

The study of nature, with design to promote piety by our attainments, is useful, not only for other purposes, but to encrease our knowledge, even of natural things, if not immediately, and presently, yet in time, and in the issue of affairs. For, at least, in the great renovation of the world, and the future state of things, those corporeal creatures, that will then, be knowable, notwithstanding such a change, as the universe will have been subject to, shall probably, be known best by those, that have here made their best use of their former knowledge, which there will, together with their other gifts, be *congruously*, as well as *munificently*, rewarded. And then the attainment of a high degree of knowledge, which here, was so difficult, may, to the enlightened and enlarged mind, become as *easy*, as it will be *satisfactory*: and our improved understandings will, with joy, perceive, how much all the knowledge, that we can give ourselves of God's works, is inferior to what their divine Author can impart to us, of them.

APHORISM X.

When, in the future state, it shall please God to make his servants happy, it will, probably, be one of the most effectual ways of heightening the felicity, which will welcome them, at their first arrival in heaven, that God will be pleased, as well to *awaken*, as to *enlarge* their faculties. For though we here know, and feel, that we have understanding, will, and affections, yet in our mortal state, we do not know *how great things* those faculties, when improved to the height, are capable of performing, and enjoying. And when the munificent rewarder of his faithful servants, shall please to say, in reference to their intellects, as he did, at the beginning of things, to the benighted water, *Let there be light:*

these illuminated faculties will make us noble and surprising, and, perhaps, as various discoveries, as, in the fourth day of the creation, the angels, that were present, and rejoiced at the laying of the foundations of the earth, are said to have beheld, with wonder, and praised the Divine Author for. And *as* some wild American, that has never used his hands, but about the most familiar and simple works, can have no *ideas* of the exquisite and beautiful things, that the hands of an excellent architect, a dextrous mechanist, a curious painter, and a skilful musician, may be taught to produce: *so* in our present state of comparative ignorance, and weakness, we do not so much as imagine, what excellent attaintments, and enjoyments, our imperfect faculties may, by divine illustration, and improvements, be rendered capable of, in a future state. And *though* the account, which the scripture itself gives us, however it represents this state, as desirable enough to deserve our highest ambition, and utmost endeavours, does not give us such a representation of that blessed condition, as the enjoyment of it will; *yet*, I observe two things in the accounts, that are given of it, that seem to allow us very elevated, and very vast expectations; since, as it tells us, concerning *the children of God, that it does not now, appear what they shall be*; so (nevertheless) it adds, *that when* their *Saviour*, or, *that state*, or, *when what we shall be* (for the words may be either way rendered) *shall appear, we shall be like our* Saviour, whose ascended body, is justly called a *glorious body*, and whose promises assure us, that *the children of the resurrection shall be like, or equal to* the angels. And secondly, to heighten yet more, our expectations, the same scripture teaches us, not to measure our future blessedness, by any thing we here enjoy, or are acquainted with, but to look for things beyond our present conceptions; since it informs us, that not only, *no eye has seen, or ear heard*, but that *it has not entered into the heart of man, what God has reserved for those* he vouchsafes to favour.

APHORISM XI.

He that has made such rich (and, in many instances, admirable) provision, for the sustenance, propagation, and welfare of brute animals, and even insects themselves, (to divers of which he has given, not only the necessaries, befitting creatures of their kind, but ornaments and beauty too) may very rationally be presumed, to be both able, and disposed, to furnish his crowned servants munificently, with all that may be requisite to entertain, and improve their enlarged and enlightened faculties, with the most worthy and most suitable objects, and with the other advantages, becoming the glorious state of those happy saints, that are not only the noblest of his visible works, but the brethren, and resemblers of his divine, and most beloved Son, whom, on that score he has not only dignified in their nature, but crowned with his supernatural rewards.

To the second motive, to thank and love God, viz. what *he will do for man*, if he be pious, belongs the consideration, 1st, Of greater discoveries of the nature and glory of God, 2dly, The rectitude, the improvement, and the enlargement of his faculties, understanding, will, and affections. 3dly, The great discoveries that will be made to man, of the nature of other creatures, and of the ways by which they themselves act, and are by God governed. 4thly, The æthereal bodies, which the soul will then inhabit. 5thly, The free conversation with other just men, and with the good angels, and their glorious head. 6thly, An assurance that all this felicity shall last for ever.

PROPOSITION II.

That a man's own experience (easy to be seconded by that of *others*) may discover unto him, the excellency, satisfactorinesS, and the advantageousness of those graces, and virtues, that are recommended by Christianity.

To clear the way, for divers passages of the ensuing discourse, I shall, in this place, observe, that though it be a very common error, yet, it is one, that I think very prejudicial, not only to physicks, but to divers things, that are of a moral nature, to suppose, that no experience, or at least none considerable, (or useful) can be had, but of things, that are *without* us; that is, of external things, and their operations upon one another, and upon our bodies. Whereas, indeed, divers of the most certain, and perhaps of the most important notices, we have, by experience, are afforded us, by the *internal* operations of our own faculties, and the perceptions we have, of what passes within ourselves. So that, for an experimental knowledge of several things, that highly concern us, we need, neither mathematical instruments, nor chemical furnaces, but only a due attention to those things, that are transacted within our own selves, and make impressions on us, whereto we can scarce avoid the finding of ourselves conscious. For, as the mind is the true seat of delight, and grief, happiness, and misery; so it is, as the mind is pleasingly, or ungratefully affected, that we are all well, or ill satisfied with the state we are in; and all outward things are considerable to us, but as they are capable to please, or dissatisfy the *mind*. And the delights of this, may be oftentimes great, notwithstanding the absence, or perhaps the loss, of those external goods, that otherwise are wont, especially, to please her, if, at the same time, there be excited in her, very pleasing perceptions; though these proceed not from the usual outward causes, but from any other, and particularly from the operations, and impressions, of her own formerly disregarded faculties.

The happy experience of a good and religious man, will convince him, that the contentment, and other advantages, accruing from a serious course of piety and virtue, are exceeding great and valuable, and do much surpass,

surpass, in true and intrinsick worth, the sinful pleasures, that a contrary course affords those, that choose it.

I MENTION the *experience* of the person, I speak of, in such a way, as does already suppose him *good* and religious, for two reasons. The *first*, because the satisfaction, that such persons receive, upon the account of being so, can scarce be fully known, but by a man's own personal trial, which makes him feel such pure and manly delights, in obeying the laws of his God, and the dictates of his reason, and his conscience, that those, who have not felt the like, cannot have any adequate ideas, or genuine relishes of them: these being pleasures, that, flowing from God himself, and being possessed immediately by the rational soul, as marks of his paternal love, and recompences of the noblest kind of actions, may justly be supposed to be peculiar, as well in their degree of sweetness, as in their excellency of nature.

AND *secondly*, because, that till a man has made some good progress in a Christian course, he is not, sufficiently, capable of enjoying and relishing the contentments of it, by reason of the difficulties, that men usually find, especially at the beginning, to resist and surmount those vicious habitudes, unruly passions, and sensual lusts, the triumph over which, and their constant subjection to the laws of God, and reason, make up a great, and noble part of the true Christian's pleasures.

AND now, having declared, why, in my expressions, I supposed the good man, I meant to speak of, to be experimentally such; my next task must be, to shew, that the condition of such a person, is really very desirable, as upon other accounts, so, especially, upon that of the *contentment* and *advantages*, deservedly, belonging to it.

THAT the laws of Christianity, if duly obeyed, are very advantageous to the observer, will be easily granted, if we consider, that they are given us by *God*, who is the author of our nature, and, consequently, understands it better, than either other directors, or we ourselves can do; and by his divine Son, who so loved mankind, that he left heaven to die for men, and gave them in his death, and his life, a most perfect example of the obedience he requires of them. And whereas other legislators, being interested persons, and having need of their subjects performances, are wont to frame their laws with more regard to their own advantages, than theirs, on whom they impose them: God, who is *self-sufficient*, and needs no man's services, and whose munificence, and goodness, are inexhaustible, and exuberant, gives us laws so admirably framed for our own good, that, it is as much our advantage, as our duty, to obey them: since our obedience, both highly improves us at present, and qualifies us, through his divine bounty, both to obtain future rewards, and to relish them. So that by enjoining us to study the mysteries of the gospel, and to exercise ourselves in the virtues it enjoins; he prepares us for a full fruition of the blessed state, he designs us; and does, in St. *Paul*'s phrase, make us *meet to be partakers of the inheritance of the saints in light*; which previous aptitude will very much endear it to us: as when a musician, by teaching his son his art, makes the gifts of his lutes, and other musical instruments, much more welcome and acceptable to him, than if he had given him them, without having instructed him in musick. * * *

AGAINST what has been discoursed, of the advantages, and joys of a good and pious life, I know there may be made an objection, which seems to be of very great weight, because it is taken from the confession, of one of the greatest preachers, and patterns of Christian piety, that any age hath afforded us. For, no less a person than the apostle St. *Paul* himself acknowledges, or rather asserts, that *if in this life only, we have hope in Christ, we are of all men, the most miserable.* 1 Cor. xv. 19.

BUT, to this specious objection, I have three things to return, by way of answer.

FOR, *first*, I consider, that this is not an universal affirmation concerning pious Christians, in all ages and places, but is to be limited, by circumstances. For at that time, indeed, the sincere and constant professors of the Christian religion, were sadly exposed, not only to scandals and injuries, but, in many places, to open persecution, partly from the Gentiles, and more, from the unbelieving Jews, and some mungrel Christians, that (to save their own stakes) joined with them in oppressing the orthodox. But though for these, and the like reasons, the state of the sincerely pious was, when St. *Paul* wrote that epistle, exposed to great distresses and dangers; yet it will not follow, that what was then truly said, may be justly extended to all times and places, without excepting those, where kings and other magistrates being Christians, and orthodox, make it their business to protect, and encourage those that are so too, thereby endeavouring to accomplish the prophesy of *Isaiah*, that there should come a time, when the people of God should have *kings for their nursing fathers, and queens for their nursing mothers.* Isa. xlix. 23.

SECONDLY, I consider, that this text is not so fitly rendered, as I think it may, and ought to be. For in my apprehension, the words will not only *bear*, but seem to *require* another sense, than our translation gives them. For it seems more proper to say, that we have hope in Christ in this life, than in the next; for here, as the same apostle speaks, *we live by faith, and not by sight*, but after this mortal life is ended, *hope* will be turned into certainty and *fruition*, according to what the same writer elsewhere, says—hope that is seen, is not hope; for what a man seeth, why doth he yet hope for? Wherefore I would rather render the Greek particle ἐν, by *for*, than by *in*. 2 Cor. v.

FOR I consider, that the Hebrew prefix ב, that answers to it, does in several texts signify *for*, and import the impulsive cause, or end of the action: as when *Jacob* says to *Laban*,

Gen. xxix. 18. *Laban, I will serve thee seven years, for Rachel thy younger daughter*, and the same expression is used, not only, in two other places, in the same chapter, but in that passage of the prophet *Hosea*, in which the same story is referred to, where it is said, that *Israel served for a wife, and for a wife he kept sheep*; what our translators have, according to the exigency of the sense, justly rendered *for*, is in both places, in the original, the same particle we are now speaking of, which is also employed, in the like sense, in divers other texts of the old testament. And since (as it hath been well observed by some modern criticks) the Greek penmen of the new testament, being themselves Hebrews, did very much hebraize, in many parts of their writings; it need not be thought strange, if, in some passages of the new testament, they use the particle in the same sense with the Hebrew, to which it most commonly answers, and employ it to express, sometimes, the impulsive cause, and, sometimes, the final cause, or thing aimed at, (which itself is also a motive;) and that the proposition will bear this sense, may appear by several texts, (some of them cited in the margin) and, among others, by that known passage in St. *Matthew*, where our Saviour speaks thus, to his disciples, *When ye pray, use not vain repetitions, as the heathen do, for they think that they shall be heard for their much speaking*. And that which more induced me to vary from common translators of this text, was, that whereas it is manifest enough, that the penmen of the new testament, do, in their Greek, very much follow the dialect of the Septuagint, whose version of the old testament was, generally, used in the apostolick times, I remembered, that I found the Greek particle employed, by those interpreters, in the very same sense, that I would render it in: for in *Hosea* (xii. 12.) where the prophet speaks of *Jacob*'s flight into *Syria*, he says, according to the Hebrew particle, that I lately observed to have been used in that very story, that *Israel* served *for* a wife. And according to this rendering of St. *Paul*'s expression, the sense of it will be, that if for this life only, (that is, for the sake, or on the account of the good things of this life, that we receive, or can expect) we have hope in Christ, we are the miserablest of men.

Ver. 20, 25. Hos. xii. 12. Matt. vi. 7.

I CONSIDER, in the third and last place, that though, if a Christian's hope did not reach beyond the grave, but were terminated in the things he is like to meet with, in this life, Christianity, especially under sharp persecutions, would be but a melancholy religion: yet, it cannot thence be inferred, that it is so to those, whose hopes reach, not only beyond the grave, but as far as eternity itself. For, though we should suppose, (in spite of the great reason we have to the contrary) that all those *great and precious promises*, as the scripture calls them, which are made in the gospel, to those, that heartily believe, and obey it, should prove illusory in the event; yet, as long as a Christian does not believe, or so much as suspect, that they will ever deceive him, the hope, and expectation of no less than heavenly joys, and endless happiness, in a future state, will not only allay, but sweeten all his hardships, and sufferings, in this life. For the support, and comfort, we receive from things, considered barely as future, flow from our hope, as it is hope, without considering, whether it may, or may not, deceive us: and if the objects of that hope be not to be possessed, but in the life to come, a Christian shall not find the frustration of that hope, till he be dead, and consequently may enjoy the pleasures, that attend such a hope, as long as this life lasts, and so cannot be thought one of the miserablest men, in the world. There have been examples in our age, and one in our nation, of persons, that being heirs to crowns, did yet travel disguised in foreign countries, like those private men that accompanied them. But though one of these princes had been cast away, or had died in his return, yet, it will scarce be doubted, but that, whilst he travelled *incognito* towards the kingdom, he looked on, as his patrimony, the expectation of so great, and dazzling a thing, as a crown, made him, during the hardships of his journey, far more happy, than those that accompanied him in it, without being animated by any such hope. And to such a purpose, I remember the scripture affords us a real instance, in the story of *Jacob* and *Rachel*. For, though he served the churlish *Laban*, seven years for the lovely *Rachel*, and was in the end deceived, and put off with blear-eyed *Leah*, yet, the value he had for the beautiful object of his passion, and the expectation of possessing her at last, as the recompence of his service, did so alleviate all his burdens, and refresh him in all his toils, that the text says, the seven years he served, for the beloved object, *seemed to him but a few days*. Gen. xxix. 20.

THE natural result of the three foregoing considerations, will be this, that the passage of St. *Paul* ought to be understood, in another sense, than that which is supposed in the objection; and so, that it ought not to hinder us from believing, what thousands have found true, viz. that sincere Christians may, even in this life, be far from being miserable: not to add, that they may enjoy more real and solid contentment in this world, than those, that neither seek, nor expect it, any where else. * * *

APHORISM.

As there is a far greater pleasure given to a novice in musick, when he is taught to play better and better upon a lute, than when he is presented with viols, virginals, and other instruments, that he knows not how to make use of: so one, that has the virtue of making the best use of a small fortune, may enjoy more true contentment in it, than one that is an unskilful, and disorderly possessor of great external riches.

PROPO-

PROPOSITION III.

THAT personal experience (as well as vicarious) may convince a man of the evils of differing kinds, that attend a vicious course of life, and even particular sins, and of the resistibleness of temptations to them.

THE main inconveniences of a vicious, and sinful course of life are, referable; 1. *To* the mind, or soul, both as it is endowed with understanding, and will, and as it is the principle, and ought to be the moderator of the affections. 2. *To* the body, in point of health, *&c.* 3. *To* a man's fortune, or outward state, and that in divers regards. 4. *To* a man's reputation, or esteem, among men. 5. *To* his posterity (if he have any) and 6. *To* the everlasting state, or condition, of his soul.

BESIDES the things, that are more commonly, and very justly employed, to dissuade men from vicious courses, and especially from such as waste their consciences, or blast their reputations, there are two things, that, though not wont to be much insisted on, have, I confess, still appeared of great weight to me, to with-hold men from those habitudes, or even single actions, that are either very *criminal*, or very *scandalous*. For I consider, that a *heinous* sin is so provoking to the most holy God, who, as the scripture speaks, *is of purer eyes than to behold iniquity*, without abhorrence, that though, upon a sincere repentance, a man may be so far pardoned, as to be rescued from eternal torments, in another life; yet to keep him under, a sense, and penitently mindful of his transgressions, he may be so chastised in this life, as frequently to find *it a bitter thing*, to have thus provoked his most just and sovereign master. And as astrologers tell us, that very great eclipses do mischief, not only, whilst the darkness does manifestly last, but by a malevolent influence, that continues a great while longer: so we may justly fear, that a heinous offence, will not only, for the present, intercept the *light of God's countenance, (which is better than life)* but may, for a long time after, (and, perhaps, for all our days) expose us to inflictions, that, only his gracious designs in them, distinguishes from heavy punishments. To which reflection, I may accommodate that remark, of divers of the Jewish Rabbies, who were wont to say, that *no mischief falls upon Israel, in which there is not a mixture of the golden calf*; according to that passage in *Exodus*, where it is said, nevertheless, in the day when I visit, I will visit their sin upon them, *i. e. when I punish other offences, I will further punish this.*

Exod. xxxii. 34.

AND we may observe, that though, upon *David*'s solemn repentance, and humiliation, his life was spared, and he was reconciled to God; yet the death of *Uriah* was followed by that of the child, *David* was so concerned for, and his subsequent life, was little more, than a series of afflictions, and those such, as, for the most part, were fit to remind him of his faults.

AND as for *very scandalous* sins, *besides* that they do so highly offend God, that after these, as we lately observed of crimes, even true repentance does not always, secure the penitent from smarting for them, in this life; as, when *David* was forgiven, both his *adultery* and his *murder*, he was chastised for his *scandals*; besides this (I say) I consider, that though, after such a sin, I should be pardon edmyself, yet, it is not only possible, but probable, that some or other, if not many, of those that my bad example, or corrupt discourses, or writings, may have perverted, may not be so happy as I, but die without repentance, and, consequently, without human possibility of salvation. And, since we have several examples of mere moral men, endowed, but with an ordinary measure of good nature, who having, on slight provocations, destroyed men in duels, or but casually, or without design, killed some body in hunting, or otherwise, have been so sensible of a mischief they did by mistake, or mischance, as to deplore it all their lives: with what trouble and regret, ought I to look back, upon a scandalous action, that was not only sinful in itself, but naturally tended to make others so, and made me criminally accessary to the eternal ruin, perhaps, of my nearest and most familiar friends, who may, for ought I know, be cursing me, in a state of unspeakable misery, and themselves, for having suffered me, to have so much influence on them. So that if we could think, that grief could have access to heaven, (for we are taught, that there is *fulness of joy*, and that *all tears shall be wiped from their eyes)* a good man might surmise, that his happiness would, even there, be much allayed, by the remembrance of the mischief he drew on others. And therefore I look upon it, as one of the chief favours vouchsafed me, by the divine goodness, that I have been heard, when in my youth, I often made the Psalmist's prayer, *to be kept from presumptuous sins*, which usually prove *scandalous* ones too. * * *

* * * * * ANOTHER advantage, and that no small one, accrues to our experimentarian, towards being virtuous, and religious, from his genius, and way of philosophising. For these incline, and accustom him to slight and reject popular opinions, and to judge of things by solid, and intrinsick arguments, not the prejudices, and authority of the most. He that searcheth into nature, with the freedom, as well as industry, that becomes a philosopher, will discover so many vulgar errors, as will justly make him very backward to believe an opinion true, because it is vulgar. And he will prefer one good argument, or clear experiment, to the unanimous suffrages, not only of a multitude of plebeian judges, but of men of great titles, and, perhaps, reputation too: since, even such may greatly mistake, either for want of right principles, or for want of attentively and impartially considering them. Now it will be easily granted by him, that duly observes what passeth in the world, that a great deal of the vice and irreligion, that is too frequently to be met with

with among men, proceeds from the wrong estimates, that they make of things. * * *

PROPOSITION IV.

THAT the same kind of experience may assure him of the practical possibility, of performing the duties and functions of a Christian, by the help of those assistances, that God gives the faithful implorers of them, to enable them to obey, and please him.

THE chief things, that render the laws of Christianity practicable, are referable to these heads; *The* internal advantages, that piety and virtue bring to their embracers, (to which belong the serenity of mind, the peace of conscience, and the joys of a good one, *&c.*) *The* assistances of the holy Spirit, both in our actings and sufferings for religion. *The* external or secular advantages of a virtuous life, such as frugality, health, belovedness, reputation, *&c.* to which may be referred, *the* advantages that the publick receives from the practice of virtue, as also *the* immunity from the inconveniences that attend vice. And to all this, may be added, *the* easiness that custom brings to all such practices, as we are speaking of, (so that the advantages of virtue may be considered, either absolutely, or respectively, and in the latter sense, much of the following section may be accommodated to them.) Lastly, to this section belongs *the* well grounded hope, and expectation of an eternal and inestimable reward.

THE benefits and advantages of a virtuous and religious life, and the mischiefs and inconveniences that attend a contrary one, are so many, and so great, and some of them, so conspicuous, and acknowledged, that it would be hard for considering men, not to prefer the former course of life, before the latter, if they were not deterred by an apprehension, *That the difficulties and hardships that attend a Christian life, make it scarce, if at all, practicable.*

To surmount this great prejudice, (than which, perhaps, there is hardly any one, that has kept off greater numbers from turning votaries to real goodness) a person inclined to make trials of all such things as may be innocently tried, and are very beneficial, if they succeed, has a great and peculiar disposition. For the difficulties that attend a pious and virtuous life, though, I confess, they are not inconsiderable, yet really they are not near so formidable, as most men imagine them; and a great part of their strength lies in the weakness, and faintness, of our resolutions, and endeavours, to surmount them. And therefore, he that resolvedly enters upon a virtuous course of life, will, by happy experience, be encouraged to prosecute it; because in practising virtue, both moral and Christian, as in learning to play upon the lute, or some other musical instrument, exercise does daily, both lessen the difficulty, and encrease the pleasure. And he, that upon the motives suggested by Christian religion, and enfranchised reason, shall resolutely engage in a course of piety, will experimentally find himself, both animated, and strengthened to proceed, by the several helps and encouragements contained, and promised in the holy scriptures, and the writings of the best philosophers. Of which encouragements, and aids, the chief and the only, I shall touch upon, are those that follow, (viz.) our *obligation* to obey God and reason; the *promises* contained in his holy word; the *inward assistances* of his holy Spirit; and the *advantages* which, in the nature of the thing, accrue from the practice of real goodness. * *

I KNOW it may, and I doubt not will, by many be objected, that they cannot believe the acquisition of virtue, and piety, to be so delightful, as we pretend: since one cannot, without offering a very great, and *painful* violence to himself, forego the pleasures, that inclination, and custom, have endeared to him, and exchange them for the hardships, whereto religion exposes its embracers. Nor is it possible, that a man should take much *delight* in the actions of virtue, which, for the most part, cross our affections, or our interests.

To answer this twofold objection, by degrees, I shall begin with frankly acknowledging, that the first steps, that are made by a reclaimed sinner, are really uneasy enough. But that proceeds not barely, from the amiable nature of the things, he forsakes; but in great part from the difficulty of leaving off an inveterate custom, though, perhaps, that custom itself, be the chief thing, that endears the thing forsaken. Of which we have a notable instance, in those that take tobacco; who, when they first begin, find it a drug very unpleasant and nauseous, so that it usually makes them very sick, and apt to vomit: but when custom hath made it familiar to them, few can leave it off, without much uneasiness; so that by-standers are tempted to think them bewitched, when they see them so loth to part with so ill scented a weed. We must not therefore wonder, or be discouraged, if at the entrance into a virtuous course, we meet with some trouble, and uneasiness; since as these proceed chiefly from the difficulty, that usually attends the changing of a long custom, though for a better; so, when once this custom is forsaken, and brought into disuse, and a contrary one introduced, in its place, the advantages virtue has of vice, in the very nature of the thing, will daily render it less troublesom, both further to forsake vicious customs, and to follow virtuous ones. And indeed, it is one of the greatest pieces of wisdom, to resolve and attempt betimes, to acquire good habitudes; since those, which reason approves, as most eligible, custom will render practicable, and conscience delightful too. And this rule is signally applicable to our case. For, in the exercise of piety, and virtue, not only every new act is attended with that encreasing facility, that flows from custom, as it is custom, but (through the goodness of God) it is also rewarded, and encouraged with an encrease of divine grace, and strength; so that the easiness is encreased, and, perhaps, turned into delight, by the fresh influences of the holy Spirit, and the

renewed applauses of a good conscience. And this is the first part of my intended answer to the lately proposed objection.

But I shall further represent, as the second, and chief part of the same answer, that, in my opinion, sensualists much mistake, when they judge of the hardships and contentments of a pious man, by what themselves would feel, if they were to abstain from all the things he forbears, and do all the acts of virtue he performs. For the pleasantness (and the like may be said, *mutatis mutandis*, of the uneasiness) of human actions, is not an absolute, but a relative, or respective thing, and depends upon the congruity, or suitableness, betwixt the object, and the faculty, or between the action itself, and the disposition of the agent. * * *

Though that were true, (which I do not grant it to be) which the libertines pretend, when they say, that they do not really find any lashes of conscience, to disturb the enjoyment of their forbidden pleasures; yet it would not follow, that a virtuous man, whose faculties are not depraved by bad education, ill company, or vicious habitudes, may not receive a great deal of joy and contentment in the acquisition of truth, and the practice of virtue. For there being in rightly disposed minds, natural notices of truth, and error, and of moral rectitude, and pravity, accompanied with an innate propensity to pursue the one, and avoid the other: such a man cannot duly exercise his faculties, in order to such ends, without being internally recompensed with a delightful sense of having done, what became him, as a rational creature. And sensualists have as little right to undervalue such a person, for so employing himself, to his own justifiable satisfaction, as a man, that has a dull ear, and is ignorant of musick, has to censure him that having a good ear, and a strong inclination to musick, takes the pains to learn the rules of that art, and to tune a lute, invited by the pleasure of knowledge, and the agreeable sense of melodious harmony. * * *

PROPOSITION V.

That both a man's own, and other mens experience, may oblige his assent to the truth of what the scripture teacheth of the good and bad estate of the pious, and the wicked.

The heads of the fifth proposition.

1. It is deplored and reprehended, that Christian virtuosi, as well as other *believers*, should not be more concerned and assiduous studiers of the scriptures, than most of them are, and should not make particular use and application of the advantageous truths, it may afford them. 2. The scripture, well considered and methodised, contains a far more copious, as well as better collection, or system of truths, useful to the purposes of good and studious men, than even they, are wont to be aware of. 3. That the author of the scripture, being also that of mankind, and the great discerner of hearts, and governor, as well as lover of men, has given us, in the sacred records, the truest judgments, instances, and examples, of what is really, and has actually been found good, or bad, for man, that can be met with any where. And it is a strange, as well as sad perverseness, that we, that believe divers things, that are above, and others, that seem contrary to reason, and prudence, upon the authority of that book, should not, upon the same authority, assent to assertions, about the vanity of the world, and other moral things, which our reason closes with, and all the experience we have, bears witness to, and confirms.

The carelessness, or ignorance of men, keeps most of them from discovering, as well in the *written*, as in the *created* book of God, many excellent footsteps, and, as it were, signatures of the divine Author's wisdom and goodness, that a more skilful and attentive survey will enable us to discover. And thus a butcher kills and divides into pieces, sheep and oxen, perhaps a thousand times, and takes the calf out of the cow's belly, without ever discovering any thing of that wonderful contrivance, that a good anatomist will, by skilfully dissecting the same animals, take notice of, and much more, without perceiving in the womb, and in the humours and vessels wherewith it supplies the *fœtus*, that admirable œconomy, whereby the *species* is propagated. And thus house-wives take care of the hatching of the eggs, without observing any thing considerable of the excellent method, that nature follows in the formation of chickens, which yet, has given no less wonder, than exercise, to those great enquirers, *Aristotle*, *Fabricius ab aqua pendente*, and our famous *Harvey*. And thus most readers, and even many learned men, peruse the scripture so slightly, and desultorily, that so transient and superficial a view makes them overlook in it, a multitude of excellent and instructive things, and leaves them great strangers to those mysterious harmonies, and symmetries, that, lying deep, are less obvious. Whereas a diligent and devout perusser, furnished with the original languages, and other useful parts of learning, by attentively and assiduously reading those excellent writings, and carefully comparing place with place, phrase with phrase, and, in short, adding one help of interpretation to another, may discover excellent and mysterious truths, that are wholly missed by vulgar readers; and are, some of them, so sublime, so important, and so delightful, that his admiration of them will lessen that which many conceive, at St. *Peter*'s saying, of the œconomy and mysteries of the gospel, that *the angels* themselves *desire to pry into them*.

And, on this occasion, give me leave to offer to you a notion, which, perhaps, you have not met with, and which yet may, I hope, be useful to my present purpose. And it is this, that I observe the generality of Christians (I wish I could not add of divines too) are wont to look upon the scripture as a repository

poſitory of articles of faith, and laws of life, without ſufficiently conſidering it as a book, that contains ſuch things, as being orderly laid together, would make up a body of Chriſtian morals, far more uſeful to a believer, than the Ariſtotelian, or other heathen ethicks. For the holy ſcripture does not only lay down excellent rules, as well for the regulation of the courſe of our lives in general, as for the practice of particular virtues, and that in great variety of circumſtances; but it alſo contains (which is what I would chiefly obſerve) ſuch rational arguments, and ſtrong motives to piety, and virtue, and affords ſuch great *comforts*, and *ſupports*, in the hardſhips, whereto they may expoſe us, together with ſuch powerful *helps* to perform what it directs, and obtain what it promiſes, as, though they are peculiar to the Chriſtian religion, are more excellent and engaging, than all that philoſophy hath been able to afford us. And though I deny not, that ſome of the heathen moraliſts have, here and there, glanced at ſome of the ſame things that are employed, to the like purpoſes, in the ſcripture, yet, beſides that, it is but of ſome of thoſe things, that this can be truly ſaid; beſides this, I ſay, thoſe very particulars are, by the heathen writers, rather touched upon, than inſiſted on, and ſeem to have been lighted on, almoſt by chance, being mentioned, among other things, without having any peculiar ſtreſs laid upon them, by their authors, who ſeem not to have known the weight, and worth of them; whereas they are, in ſcripture, inſiſted on and improved, being inculcated with that earneſtneſs, that obliges the Chriſtian reader to take notice of them, as things, whoſe importance makes them deſerve a particular attention, and regard: the Chriſtian religion is juſtly ſtiled by St. *Paul*, *The doctrine, which is according to godlineſs.* For it is indeed, a doctrine mainly deſigned, and excellently contrived, for the promoting of true piety, and virtue, in the world. In order to which end, it affords us, not only excellent precepts, ſhining examples, pathetical exhortations, ſweet conſolations, great and precious promiſes, and powerful (though ſecret) aſſiſtances: but the very myſteries of Chriſtianity, though their chief office ſeem to be, to enlighten and inform the underſtanding, yet have, moſt of them, a direct influence upon the will, and great tendency to make men good, reſembling the pillars of cloud, and of fire, in the wilderneſs, that were not only to be gazed on, as rare and wonderful things, but both were intended, and did happily ſerve, to lead the Iſraelites, that followed that cœleſtial guide, to the bleſſed land of *Canaan*, the type of heaven.

1 Tim. vi. 3.

* * * And here I ſhall add, that, in my opinion, it ought much to recommend many of the things, that revelation diſcovers to us, that they are congruous, and, if I may ſo ſpeak, ſymmetrical, to what reaſon itſelf teaches us; and this ſupernatural light, does not only confirm, but advance and compleat, the truths diſcoverable by the light of nature. For God has ſo excellently ordered the diſcoveries he makes of theological truths, by mere reaſon, and by the holy ſcriptures, that what revelation ſuperadds to reaſon, does, both very well agree with it, and ſupply what was wanting to it, that from them both, might reſult as compleat a body of theological verities, as is either neceſſary, or fit for us, to have, in our mortal ſtate. *That* mankind had a beginning, though denied by *Ariſtotle*, and his followers, was affirmed by, the greater part of the heathen philoſophers, which yet, ſome of them referred, either to chance, with the Epicureans, or to ſome other way, liable to many phyſical objections, and very derogatory to the dignity of mankind. But, when the ſcripture teaches, *that* the whole race of men proceeded from one man and one woman; *that* this firſt woman herſelf, was taken from the ſide of the firſt man; *that* theſe were not made, like the reſt of the creatures, by a ſimple *fiat*, but by a peculiar and more immediate operation of God, and, as it were, a conſultation; *that* the firſt pair was not created, till after the reſt of the world was finiſhed, and fitted to receive them; *that* their ſtrict union in marriage, was not the effect of appetite, but made by the inſtitution of God himſelf; *that* he, by an expreſs commiſſion, made them lords of the terraqueous globe, and all the living creatures, it is peopled with, and *that* they knew neither ſickneſs, war, ſhame, nor toil, till they had offended their Maker, and Benefactor, by tranſgreſſing that ſingle, and eaſy law he had preſcribed them, and endowed them with a free will to keep; when, I ſay, theſe, and other particulars, are made known to us by divine revelation, reaſon well perceives, that they not only very well agree with, what men believed upon the ſcore of reaſon, viz. *that* man had a beginning; *that* he is of a nobler nature than other animals; *that* God is pleaſed to concern himſelf for him, and exerciſe peculiar acts of providence about him; and *that* his ſufferings proceed from his own faults; but the ſame revelation, that confirms theſe perſuaſions, does, by adding thoſe other circumſtances, I have been mentioning, afford reaſon materials, wherewithal to make up theſe perſuaſions, into an *account of the origin of mankind*, that agrees far better with the nature of things, the providence, juſtice, and goodneſs of God, and the dignity, and yet obligations and dependency of mankind, than any of the hypotheſes of the heathen philoſophers, and prieſts. The time, at which, we may collect from the ſacred ſtory, the world was made, if it had been known to the Ethnic hiſtorians, and philoſophers, might eaſily have prevented divers of their erroneous, and extravagant conceits; and the hiſtory of *Noah*'s flood, ſeems to afford a better account, not only of ſundry, hiſtorical, and political, but of divers natural phænomena, than any, or all, of the heathen writers have left us. And as the account, given in the ſcripture, of the creation of man by God, ſo, that, which it delivers of his redemption from his lapſed ſtate, by the Son of God, exhibits another gueſs contrivance, than

men

men are usually, aware of, or, than can be here proposed, in few words: the salvation of man being indeed undertaken, and managed, in a way highly rational, and upon terms, agreeable to the justice, honour, and goodness of God, and to man's nature, condition, duty, and aims, (as, on some other occasion, may be declared.) At present, what I mainly drive at, may, methinks, be somewhat illustrated, by comparing the object of theology, to a book of excellent notions and secrets, but written in cyphers; and the knowledge of divine things, conferred by bare philosophy, to a very imperfect key; consisting of not half the letters of the alphabet: for though, by the help of this, a man may make a shift to understand, here and there, many whole words, that consist of such letters, as his key answers to, and may perchance, on the same account, understand some few short and scattered sentences, and other periods; yet the whole scope, and contrivance of the book, and many of the principal things, contained in it, he must be ignorant of: but revelation is like the remaining part of the key, which compleats the other; and which, when he is once possessed of, he will not only learn, many new truths, and understand satisfactorily, many passages, which he but doubtingly, guessed at before; but, which is the main thing in our comparison, he will clearly perceive, that what he has last discovered, both perfectly agrees with what he had learned before, and compleats what it wanted, to make up a symmetrical piece, worthy of the author. * * *

* * * In the scripture are contained, both obligations, and other motives, (as rules, examples, and encouragements) to piety, and virtue, and dissuasives from the contrary, peculiar to the Christian religion. St. *Paul* exhorts the *Corinthians*, to *glorify God, both in their bodies, and in their spirits*; (which two constitute the whole man) upon these grounds, *that they were not their own* proprietors, but *were bought with a price*; so that their *bodies, and their spirits, were God's*, and therefore ought to be employed, in things that tended to his glory. Another obligation, and motive to piety, is the sense, that Christians ought to have, of the great honour of being the adopted sons of God, *see* (says St. *John*) *how great a love* (i. e. effect of love) *the Father hath vouchsafed us, that we should be called*, (that is, by an Hebraism, should be) *the children of God*. And accordingly, we are exhorted to *walk as dear children*, and behave ourselves *as the sons of God*, and *born of God our Father and Saviour*; in all things aiming, not only *to obey*, but to *please* God; and by *our shining works*, to engage those that behold them, *to glorify our Father, which is in heaven*.

* * * * Notwithstanding our greediness of the knowledge of natural things, and our preference of it, to that of divine things, we are not sure, but that after the great day of judgment, the present visible world, or our own notions, memories, and affections, or both these, will be so changed, that our past knowledge of physical things, may be either forgotten by us, or insipid to us: or else, that, if we shall retain any memory of our past studies, and labours, we shall find more delight in them, as they were exercises of a laudable industry, than as they helped us to acquire, the knowledge of transitory things.

The present state of things will not last always; but that future state, that must succeed it, will be eternal. And therefore, prudence directs us to regard chiefly, as well in our studies, as in our actions, that state that will most concern our everlasting welfare. The *Christian virtuoso* is taught by the holy scripture, not only that *the fashion of this world passes away*, whilst we live in it, but that afterwards the world itself, as to its present constitution, will be destroyed, by that last fire, that will *dissolve the main parts*, and quite *shatter the frame of it*. And who knows, but that in that *new heaven, and new earth*, (that is, by an usual Hebraism, that new world) that God will substitute for it, the primordial frames of things, and the laws of motion, and consequently, the nature of things corporeal, may be very differing from those that obtain in the present worlds. And if this prove to be the case, our formerly acquired knowledge of natural things, may either grow useless to us, or mislead us. But the knowledge of divine, and other immaterial objects, that will retain their nature, (which cannot perish with the universal deflagration) will probably be, not only retained, but highly improved, in the glorious future state. For *as* in the new *Jerusalem*, there will be neither need of the sun, nor yet be any night, because a divine splendor will afford an abundant, and a perpetual light; *so* in the understandings of its blessed inhabitants, divine irradiations will dispel all ignorance, that may cloud our happiness, whether we do, or do not, enjoy the ordinary means of being enlightened; and we shall be ἰσάγγελοι, like, or equal to, those clear sighted spirits, the angels: so that there seems, almost, such a difference between the present, and future knowledge of a true Christian philosopher, that the former may be compared to the light of a glow-worm, which is but very faint, and of small extent, and will perish with the subject of it, and is visible but in the night; whereas the knowledge he hath of divine things, such as God, and his truths, may be resembled to the *aurora*, which, being though but an imperfect, yet a cœlestial light, does not suffer by the rising of the sun, but *encreases more and more, unto the perfect day*.

* * * * To increase our knowlege, and thereby our felicity in the future state, as God *can*, so, it is probable, he *will*, excite in the mind new *ideas*, and notions, which it was a stranger to before; and these will furnish fresh occasions of true and delightful speculations. Such *ideas*, we may presume to have been excited in the angels, at the close of the sixth day's creation, when after all the numerous, and various qualities they had observed, in beings merely corporeal, or, at least, not rational, they perceived in *Adam*, a wonderful, and,

and, in probability, a surprising union of two such distant natures, as an immaterial soul, and a human body. * * *

To those Christian virtuosi, that are afraid to quit this world, chiefly, because they fear to lose the delightful philosophical knowledge, they have of it; it may be represented, first, that it is likely, that as all our faculties will, in the future blessed state, be enlarged and heightened; so will our knowledge also be, of all things that will continue worth it, and can contribute to our happiness in that new state. 2dly, And that God can make a rational creature happy, though it should have no remembrance, or knowledge, of the world, or any corporeal creature; as the angels were happy before the world was created, and consequently, without any knowledge of it, or any corporeal creature contained in it. * * * *

THOUGH the precepts of the Christian religion, be each of them, single and apart, excellent and useful, yet they are much more so, when they are considered as in a state of union, and are conformed to in their entire system; which brings into my mind what we read in *Genesis*, that when God looked upon the particular work of every single day, it is said, *he saw that it was good*; but when he surveyed the whole aggregate of his creatures, as in one body, or system, wherein, by their connexions, and subordinations, the parts mutually assist each other, and conspire to promote the same general ends; it is emphatically said, that *he saw they were very good.* And though the precepts of the gospel, as imperfectly as men have submitted to, and embraced them, have done a great deal of good, and hindered a great deal of mischief, in the world; yet they would incomparably more promote the welfare of mankind, if most men did not either altogether reject them, or pick and choose which of them they will adhere to, or else did conform but very imperfectly, to those to which they profess submission: but did sincerely, and resolutely, and impartially, endeavour to conform to the whole practical doctrine of the gospel. And indeed, if so excellent a religion were generally entertained with that entire belief, and hearty obedience, that it deserves, it would make so great change in the state of mankind for the better, that men may justly hope for little less, if not more happy and flourishing times, than those that have been celebrated under the name of the golden age. For I consider here, that there are four grand fountains of the mischiefs that afflict mankind, namely, *the* evils that men are naturally subject to as mortal creatures, from external agents, such as inevitable sicknesses, famines, floods, *&c.* *the* evils that particular men bring upon themselves by their own inevitable faults, such as surfeits, venereal diseases, procured poverty, and other effects of intemperance, prodigality, *&c.* *the* evils that God inflicts on men for the punishment of their sins, or to repair the imperfections of their virtues, and graces; and lastly, *the* mischiefs men do to one another. I do not to these add as a fifth, the enmity of the devil, because he offending us as a moral agent, that hurts us, but by tempting and assisting us to hurt ourselves, or one another; the harms we receive from his enmity, may be conveniently enough referred to the second and fourth of the noxious springs we have freshly enumerated. Now as to the three latter, if the dictates of the Christian religion did universally and unreservedly sway mens minds and actions, men would be almost entirely preserved or freed from them. For where the precepts of the gospel, which teach men to live soberly, and prudently (for the word St. *Paul* employs signifies both) are conscientiously put in practice, they would avoid all those diseases, that multitudes draw upon themselves, and which as well shorten, as embitter, mens lives, by drunkenness, incontinence, quarrelsomness, *&c.* and would not only escape many bodily diseases, but also those distempers of the mind, that are oftentimes far more afflictive than they. For a true Christian will neither burn with rage, nor fret with impatience, nor swell with pride, nor pine with envy, nor disquiet himself with ambition, nor pinch himself for avarice, *&c.*

Gen. i. 31.

* * * I HAVE often wondered to see men so perversly partial, in the assent they give to truths, proposed by the same authority. For it seems strange to me, that Christians should believe those passages of scripture, which tell them, that their dead bodies, though made the food of worms, or fuel of flames, shall have their dispersed particles, at the last, reunited, (of which nature, or experience, affords us no examples, and against which philosophy, not to say reason, frames very specious and considerable objections;) and yet, at the same time, should refuse to believe what the scripture teaches, of the vanity of the world, the transitorinesS of this life, the hurtfulness of sin and vice, the advantages of a virtuous life, and the joys of a good conscience; though all these doctrines are agreeable to the dictates of unprejudiced reason, and, as far as we can observe, or try, are verified also, by experience.

APHORISM I.

THERE are some professors of Christianity, that talk and live, as if they would introduce a theological magick, (if I may so call it) which, by the help of certain words, habits, gestures, and other ceremonies, may enable them, without sound faith, and good life, to do strange feats in Christianity, as superstitious magicians pretend by charms, spells, *&c.*

APHORISM II.

THERE are many vices that are mean, as well as sinful, and do as well depress, as deprave human nature; no less degrading it of its dignity, than they deprive it of its innocency.

APHO-

APHORISM III.

THOUGH a fit of sensual delight may, for the present, make very vivid impressions on our eyes, and even dazzle them, yet being no less evanid, than affecting, it can no more produce a durable joy and tranquillity of mind, or compensate for the want of it, than flashes of lightning, though never so many, can turn the night into day, or make amends for the absence of the sun.

APHORISM IV.

THERE is a great difference betwixt pleasure and joy, the one being a sensual, and the other a rational delight. And though vicious men may oftentimes have a greater share, than pious men, of the former, yet virtuous men usually have a far greater share of the latter, which is more noble, more durable, and less allayed by present censures of reason, or remorses of conscience, or fear of after reckonings.

APHORISM V.

THE pleasures, that religion depreciates, do but affect our mortal part, and are more mortal than it; usually dying before the body, always dying with it, and sometimes also, killing it.

APHORISM VI.

WHATEVER advantages of fortune a man may have, and whatever possessions he may be admired, or envied for, yet if he be swayed by irrational notions of things, and by impetuous and irregular appetites, whilst that depraved constitution, and distemper of mind lasts, he is as uncapable of being made happy by the affluence of outward goods, as *Nebuchadnezzar* was, during his frantick condition, to enjoy and relish his magnificent palace, or his universal empire.

APHORISM VII.

GOD, oftentimes, by an affliction, deprives us of a present of his bounty, but by an effect of his love.

APHORISM VIII.

THOSE, who are content to part with their hopes of, or at least forfeit their right to future goods, upon the pretence of preferring certainties, those of the present life, before contingencies, are indeed far from having a certainty upon earth, of what they forego heaven for.

APHORISM IX.

THE serious meditation of *death* will teach men to despise the world, which can be enjoyed but during a transitory life, and the attentive contemplation of eternity will lead them to abhor those sinful practices, that tend to make it a miserable one for them.

PROPOSITION VI.

THAT heedful observation may satisfy a man of the vanity of the world, and the transitorinesS of external, and, especially, sinful enjoyments; and of the emptiness of those things, for which men refuse and forsake the ways of piety, and virtue.

The heads of the sixth proposition.

1. VICARIOUS experience, viz. that which is afforded us by observation, of what passes in the world, and happens to other men, may be a sufficient proof of what is intended to be shown. And according to this, in divers cases, many men are more like to pass right judgments, because the case is not their own. 2. Vicarious experience may be either historical, such as may be gathered from the records, or histories, of other times, and countries; or personal, such as is afforded by the things, that have come within our own observation: the former of these, singly, may yield a very considerable testimony, but will become, much the more full and weighty, if a virtuoso add to it, his own personal experience of the things, that himself hath observed; which experience, his heedfulness, and penetration, will render much more ample, than that of another man, of the same years. And if he hath lived any considerable time, he must have observed many instances of the contentment, good name, healthfulness, comforts, supports, deliverances, and other blessings, accruing to good and worthy men, * by the divine justice, and partly springing from the nature of the things, about which they are, or have been, faulty. And these observations will be much encreased, by discerning the intrigues of state, and of particular, especially great families. 3. But the grand force of vicarious experience lies in the testimony of good and bad men themselves, when they freely deliver their minds, especially when they are like, or going to die; for then masks are usually laid aside, or pulled off, and men make both more sincere confessions, and declarations, of their judgment, and also more right and impartial estimates of things. And then the comforts of pious men, and often the applauses, their own consciences give them, that have been eminently so, do make their condition to be incomparably more eligible, than that of the most prosperous sinners, who, on their death-beds, by their grief, and oftentimes amazement, if not horror, and despair, do not more sadly, than loudly, condemn, and bear testimony against the, as wretched, as criminal course of life they embraced.

To these six propositions is added a kind of short and summary review of the second and last part of the Christian virtuoso, with a pero-

a peroration of the whole epistle, to the person it is addressed to. *Hæc omnia desunt.*

GENERAL APHORISMS.

1. A VIRTUOSO has four advantages, *&c.* one, that he is not swayed by vulgar opinions, and estimates. 2dly, That he can value pleasures, and employments, that are of a spiritual nature, and do not affect either the senses, or imagination; and therefore, 3dly, That he can always find himself delightful and useful employments, and so escape the dangers that idleness exposes to. 4thly, That he knows the dignity, and reports of a soul.

2. IT ought much to elevate the aims, and raise the courage of a *virtuoso*, to make some great attempts, and aspire to high attainments, that the scripture itself teaches, that God made man, *but a little lower than the angel.*

APHORISM II.

WE ought heedfully to observe, and if we do so, we cannot but admire the signatures, *specimens*, or stamps, of the divine wisdom, power, and beneficence, that are, as it were, interwoven with the nature of the creatures; and indeed, in several of them, make, in some sense, a part of it, as light, and colour, do in the rainbow, and transparency, and redness, in a ruby, *&c.*

APHORISM III.

EVEN in artificial, or factitious things, the artifice of nature, or, rather, of its author, may often far surpass the artifice of man: the texture of what man takes for the matter he is to work on, and which he looks upon, only as a material, to be fashioned by him, as he shall please, being oftentimes more curious and admirable, than the contrivance it receives from art, which, frequently, does little more, than put together divers pieces of nature's workmanship. Thus the contexture of the hide of an ox, which, when dressed, we call leather, is a far more elaborate, and curious thing, than the outward form that is superadded to it, to make it a shoe, or a boot. And a ball of ivory, or of *lignum vitæ*, is of a much less curious frame, as it is a globe, than as it consists of an elephant's tooth, or the wood of a solid tree.

APHORISM IV.

THERE are some truths of theology, that, to become very useful to us, must be made very familiar; among which, and especially, is a right notion of the Deity, which it is not enough, once in one's life, or now and then, at very distant times, to frame, and to assent to; as, anciently, it was not sufficient for a pilot to know, and confess, that the pole-star is a cœlestial light, fixed, elevated, and worthy to be peculiarly regarded, but he must take it for the guide of his navigation, and have, ever and anon, his eye upon it to steer his ship by, and keep it from deviating from the right course. And, indeed, there are some truths, that are so worthy to be remembered, and so easy to be forgotten by us, that they can scarce be too often inculcated, and established, by too many *mediums* of probation.

APHORISM V.

IT ought not to be looked upon as a disparagement, but an advantage, to the cause of the assertors of a Deity, that it draws arguments from the testimony of conscience, and a sensation, or perception, of what passes in the mind itself. For it is true, indeed, that the grounds of these arguments have no novelty to endear them, but then it serves more to recommend them, than novelty could do, that they were always congruous to the mind, (or radicated in it) and are, as it were, twins to human nature, being either of the number of congenite notions, or impressions, or else very near of kin to them; since, as the understanding is naturally furnished with some theoretical ideas, and notices, so the will is furnished with some practical ones, and, perhaps, the mind, with some, that naturally result from both.

APHORISM VI.

THE Christian religion does not only serve its faithful disciples, as the pole-star does pilots, to *direct* them in the course of their navigation, but furnishes them with winds too, to *set their ships a moving*, affording them, from above, strength to sail in that course, that it does from heaven, direct them to steer.

APHORISM VII.

As in a lute, a string will be more affected by the soft sound of another, that is unison to it, though, perhaps, it be but a small one, than by the louder noise of all the other strings, though many of them be much bigger: so a mind, that is unison, (if I may so speak to truth,) that is disposed to receive and close with it, will be more wrought upon by one single proof, that is, as it were, congruous, or consonant, to it, than by many differing, and seemingly, more forcible arguments, that have not, to it, the like relation.

APHORISM VIII.

WHEN *Adam* was first brought into Paradise, it is like, that *though* he saw cause to admire several of the beautiful and flourishing trees, and other plants, that there surprized his sight; *yet* he did not perceive the most admirable part of the artifice, expressed in their frame; namely, that each of them contained a latent prolifick principle, or seed, and some plants, as it is probable, a multitude of actual compleat seeds, each of which was fitted, notwithstanding the smallness of its bulk, to produce a tree resembling the mother

mother plant, and capable of successively propagating itself, to the world's end.

APHORISM IX.

The *cicatricula* of an egg, or the germen in the seed of a plant, being, in reality, a model of the animal, or plant, to be produced from it; the wonderful minuteness of a machine, at once so very little, and so curious, does abundantly recommend the matchless skill of the divine mechanist. But it does no less recommend his providence too, which *both* foresaw, that the concourse of so many external bodies, and adjuvant causes, was necessary to plump up, compleat, and display, the parts that lay admirably folded, and packed up, in these little *seeds*, and took care, that, ordinarily, they should be provided of all that assistance, which was necessary for them to have, from the favourable concourse of external agents, and helpful causes.

APHORISM X.

Many of the works of God, are as *magnificent*, as *exquisite*; and in very many of them, he is as beneficent, as admirable.

APHORISM XI.

The jollity, for which men are apt to envy the condition of divers notoriously vicious persons, is oftentimes but put on, or affected, by men, that seek to delude their disquieted consciences, by outward diversions. And such men are as little to be envied by a good man, notwithstanding their flashy mirth, as one in a violent fit of the mother, is, for the loudness of her laughter, which is as sure a sign, and oftentimes more, than as bad an effect of her disease, as profuse weeping is.

APHORISM XII.

It is scarce a more common, than prejudicial error, and the fruitful parent of many of the irregularities, and miscarriages, of human life, that men are not aware, that happiness consists not in the possession of external goods, but in a right *constitution*, and well grounded *satisfaction*, of the mind. And they that look upon felicity, as a thing without them, and fancy, that riches, honours, *&c.* have the same power to make a man *happy*, as diamonds, pearls, and other jewels, have, to make him *rich*, and so confound some uncertain, and but partial, helps to felicity, with felicity itself, do as unskilfully mistake, as the sick man would, that should think, that he must needs enjoy health, if he could be master of an apothecary's shop.

APHORISM XIII.

Those internal applauses of virtue, beyond which the most heroical heathens did not aspire, make but a pledge, and earnest, of the pious Christian's happiness: the testimony of conscience, not being, by far, so great a blessing on the score, that conscience is a domestic judge, as on this, that it is God's vicegerent in the soul, and promises man a much higher recompence from God, than virtue is able to give him, or man to give himself.

APHORISM XIV.

Remember, what even men, not counted religious, will do, to quiet, and appease, not gratify their consciences; and consider thereupon, what a good man may do, not to procure the silence of his conscience, but to merit its applause.

APHORISM XV.

We are to esteem our condition, not in comparison of what it was before our last affliction, but upon the whole matter: and after collation made, of what we enjoy, and suffer, with what most other men, and, among them, many better than we, endure and want.

APHORISM XVI.

To them that alledge, that self-love is natural, and therefore not an imprudent principle of human actions, one may justly represent, that this assertion justifies only those, that *wisely*, but not those that inordinately love themselves; and such a self-love, is not only allowed, but promoted, as well as directed by Christianity.

APHORISM XVII.

The experiences, that verify that part of the scripture, that we do feel, or know, may well give us a great confirmation of the truth of the rest.

APHORISM XVIII.

We have been, from our infancy, so much accustomed to see nothing but bodies, and to receive all our informations from our senses, that most men do not only make bodies, and corporeal natures, the only objects of their imaginations, and discourses, but the models of their ideas, and highest notions, and the measures by which they estimate and judge of all other things, though, perhaps, of natures quite differing from those that belong to bodies.

APHORISM XIX.

I THINK it becomes Chriſtian philoſophiſers, rather *to* try, whether they can inveſtigate the final cauſes of things, than, without trial, to take it for granted, that they are undiſcoverable; and *to* diſpenſe with themſelves for the neglect of enquiring, upon a ſuppoſition, that it muſt be fruitleſs; which courſe, a cenſorious man might ſay, was deviſed to exempt ignorance from diſparagement, and father an evitable, and therefore blameable, negligence, upon the preſumedly inevitable weakneſs of human nature.

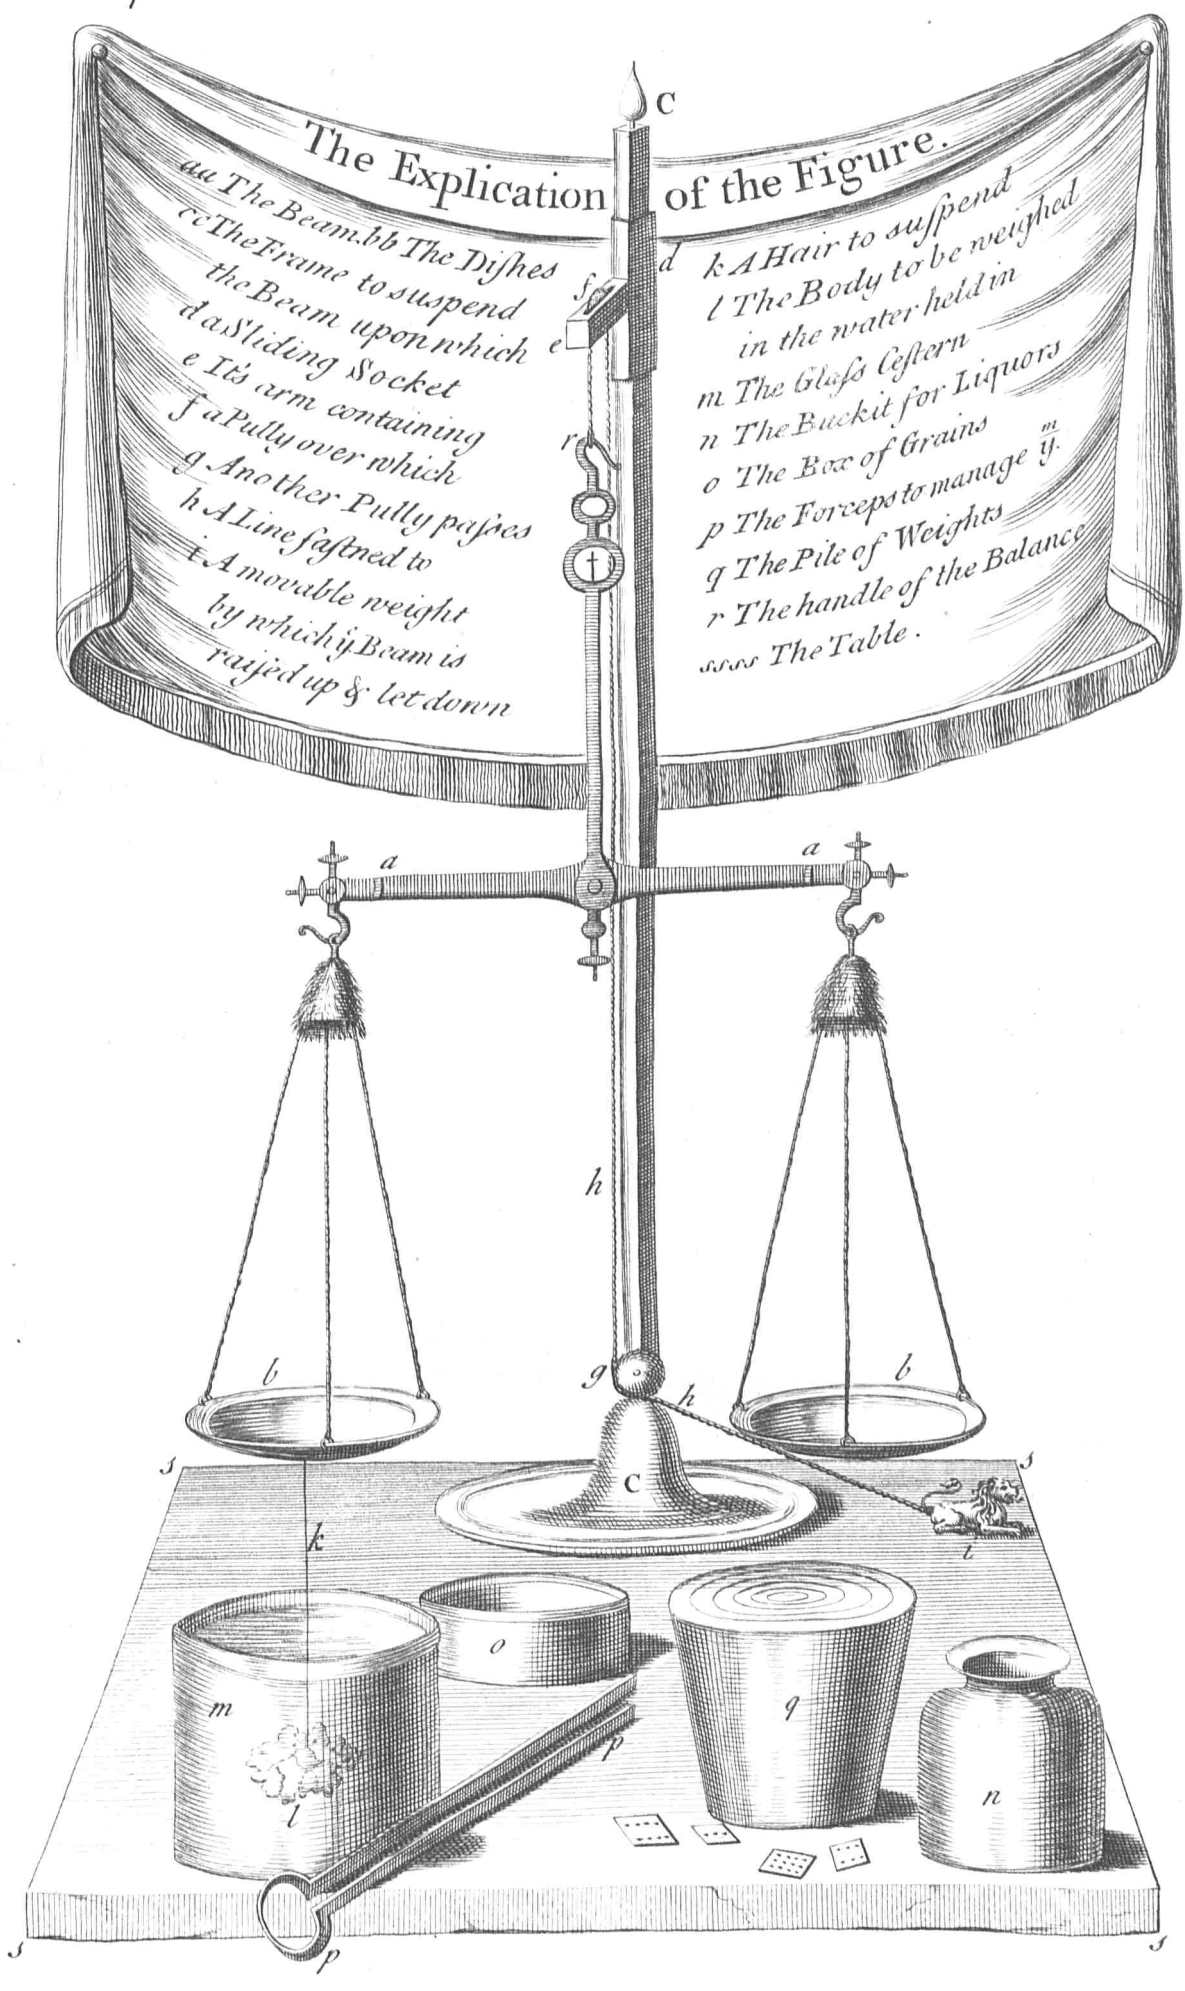
APHORISM XX.

How negligent men are in obſerving things, and how much, upon that account, there probably remains, to be *diſcovered*, in probability, to be alſo uſefully *employed* in the works of nature, may be gueſſed at, by ſuch inſtances as theſe; *that* the loadſtone was, for many ages, admired for its attractive virtue, and yet men were not, till three or four ages ſince, aware of its directive faculty, whereby it diſpoſes both itſelf, and the needles it has touched, to regard, with their extremities, the northern and ſouthern poles: *the* ſtar-like figure of many flakes of ſnow, eſpecially thoſe that fall at the beginning of winter, or freezing times: *the* elliptical figure of the ſetting and riſing ſun: *the* great incaleſcence of quick lime with hot water, *&c.*

APHORISM XXI.

THE book of nature, is a fine and large piece of tapeſtry rolled up, which we are not able to ſee all at once, but muſt be content to wait for the diſcovery of its beauty, and ſymmetry, little by little, as it gradually comes to be more and more unfolded, or diſplayed.

INDEX.



The Explication of the Figure.
aa The Beam. bb The Dishes
cc The Frame to suspend
the Beam upon which
d a Sliding Socket
e It's arm containing
f a Pully over which
g Another Pully passes
h A Line fastened to
i A movable weight
by which f Beam is
raised up & let down
k A Hair to suspend
l The Body to be weighed

A

COMPLETE INDEX

TO THE

WORKS

OF THE HONOURABLE

ROBERT BOYLE,

IN FIVE VOLUMES.

The *Numeral Letters* denote the Volume; the *Figures* the Page; and *a* the first, *b* the second Column.

A.

ABDOMEN, the liquor that distends the *Abdomen* in the dropsy, i. 474 *a*.

ABENDANA, Rabbi, his selling of Hebrew manuscripts, v. 382 *a*.

ABRAHAM introduced astronomy among the Egyptians, i. 426 *b*.

ABULFEDA, account of his book, v. 512 *b*.

ABYSSINE Christians, their opinion of the sabbath, i. 443 *a*.

ACADEMY, the institution of the French *Academy*, v. 357 *a*.

ACAJOU, an account of that fruit, iii. 91 *b*.

ACCIDENT, the inseparable *Accidents* of matter explained, ii. 461 *b*. *Accident* used by philosophers in two different senses, ii. 462 *a*. An *Accident* cannot subsist without a subject, ii. 462 *b*. *Accidents* distinguished into genders or species, ii. 469 *a*. May be essential to particular bodies, ii. 470 *a*. Matter distinguished by the *Accidents* that diversify it, ii. 474 *b*. What is meant by a compounded *Accident*, iv. 401 *b*.

ACID salts by corroding often alter their nature, i. 238 *b*. The way to discover an *acid* salt, ii. 66 *b*. Serum coagulated by *Acids*, iv. 173 *a*. The hostility of the spirit of human blood to *Acids*, iv. 189 *a*. No *acid* substance in a sound human body, iv. 190 *a*. Diseases are generally the effect of *Acids*, iv. 310 *b*. The way of mortifying *Acids* by sheathing them, iv. 311 *a*. The Difference in the virtue of *acid* menstruums, iv. 311 *b*. Every *Acid* not mortified by every alkali, *ib*. Preternatural *Acids* the cause of distempers, iv. 312 *a*. The fluids in the blood coagulated by *Acids*, *ib*. *Acid* corpuscles not always the cause of diseases, iv. 312 *b* Will sometimes prove correctors, iv. 319 *b*. *Acids* used in working on steel, v. 93 *a*. The production of *acid* salts, i. 378 *a*. They are not always discernible by the taste, i. 378 *b*. Are produced by the operation of the fire, *ib*. The production of *acid* spirits, i. 387 *b*. Account of freezing by snow and *acid* spirits, ii. 259 *b*. Experiment on turning an *acid* salt into an alkali, ii. 510 *a*. The injecting of *acid* liquors into blood, ii. 554 *a*. The operation of *acid* bodies upon others examined, iii. 603 *b*. The difference in the operation of *Acids* considered, iii. 604 *b*. The definitions given of Alkali and *Acid* insufficient, iii. 605 *a*. To discover *Acids* and Alkalies by the taste uncertain, iii. 605 *b*. The hostility between Alkalies and *Acids* examined, iii. 606 *b*.

ACIDITY of mineral waters inquired into, iv. 245 *a*. The trial of the *Acidity* of mineral waters, iv. 245 *b*. No *Acidity* found in the stomach of fishes, i. 468 *b*.

ACIDULÆ, waters so called, iv. 233 *b*.

ACOSTA, his account of an earthquake in *Peru*, iv. 260 *a*. Of pure gold and silver mines in *America*, i. 360 *a*. Of native gold of many pounds weight, i. 360 *b*. Of the heats and cold in the torrid zone, ii. 321 *a*. Of emeralds, iii. 222 *b*. Of iron grates, i. 33 *b*. His observation of winds in *America*, i. 60 *b*. Of the air on the high mountains of *Peru*, i. 68 *a*. His account of the mines of *Peru*, i. 217 *a*.

ACTIO COMMUNIS of the schools explained, ii. 538 *a*.

ACTION of corrosive liquors in dissolving of bodies, i. 73 *a*.

ACTON water, the weight of it, iv. 243 *a*. Has no discernable acidity, iv. 245 *a*.

ADAM, the reason of his losing *Paradise*, i. 175 *b*. His loss of *Paradise* by an apple, v. 218 *b*. Remark upon his knowledge in *Paradise*, iii. 435 *a*.

ADAMS, Sir *Thomas*, a stone taken out of his body, i. 387 *a*.

ADDER, experiment on an *Adder* in artificial air, iv. 127 *a*.

ADDITAMENTS used in the volatilization of bodies considered, iii. 614 *a*. The nature and quantity of the volatile *Additament* to be regarded, iii. 614 *b*. A fixed *Additament* gives a degree of fixity to a very volatile body, iii. 622 *a*. *Additaments* employed in the mercurification of metals examined, i. 405 *b*.

ADHESION of two flat marbles accounted for, i. 110 *b*. According to *Hobbes* not owing to the spring of the air, i. 144 *b*. The *Adhesion* of flat glass together, i. 255 *b*. Experiment on the *Adhesion* of ice, ii. 386 *a*.

ADIAPHOROUS spirits of wood, observations concerning them, i. 390 *b*. Their nature and quality, i. 391 *b*. The producing of colours *de novo* by *adiaphorous* spirits, i. 392 *a*. Remarks on *adiaphorous* bodies, iii. 369 *a*.

ADMIRATION of the divine wisdom explained, v. 713 *b*. The *Admiration* and celebration of God for his works particularly distinguished, v. 714 *b*.

ADVICES in judging of things above reason, iv. 54 *a*.

ADVOCATE of *Roan*, author of a strange book, v. 391 *b*.

ÆGYPT, the uncertainty of the weather in that country, ii. 323 *a*.

ÆOLIPILE used in the experiment to change water into air, i. 33 *b*. An *Æolipile* used in the experiment of weighing of air, i. 55 *b*. The gravity of the air proved by an *Æolipile*, i. 126 *a*. The resistance of the air in an *Æolipile* examined, i. 144 *a*. Experiment of an *Æolipile* sunk into the sea, iii. 111 *b*. The rarefaction of water into vapours by an *Æolipile*, iii. 312 *b*. The weight of the atmospherical air tried by an *Æolipile*, iii. 492 *a*.

ÆQUILIBRIUM of liquors tried, ii. 418 *a*.

AERIAL,

A Complete Index

Aerial, a particular account of an *aerial* noctiluca, iv. 21 *a*. The way of preparing it, iv. 35 *a*. Appendix to the *aerial* noctiluca, iv. 71 *a*.

Ætesian winds in *Egypt*, their effect, ii. 323 *b*.

Æther, Mr. *Hobbes*'s notion of it, i. 125 *a*. Experiment on the Cartesian *Æther*, iii. 47 *b*. On its existence and qualifications, iii. 48 *a*. On rarified *Æther*, iii. 51 *a*. The qualities of *Æther* assigned by the Cartesians, iii. 84 *a*. A description of it by Mr. *Boyle*, iii. 340 *a*.

Ætna, the dreadful irruptions of that mountain, iv. 273 *a*.

Affliction, the design of it by God, i. 175 *b*. The study of the scriptures a consolation under *Affliction*, iii. 424 *b*. God is able to support us under the greatest *Afflictions*, iii. 425 *a*. The benefit of them, ii. 169 *a*.

Africa, an account of Divers on the coast of *Africa*, iii. 107 *b*.

Agate, the cloud in an *Agate*, an account of its removing, i. 286 *a*.

Agents unobserved, what they are, iii. 83 *a*.

Agitation, the force and effect of it in the solution of bodies, iii. 626 *a*.

Agricola, his way of discovering veins of mineral, iii. 102 *b*. His account of the air in subterraneal cavities, iii. 103 *b*. Of the present generation of iron, i. 358 *a*. His remarks on the making of vitriol, ii. 488 *b*. Concerning allum, iii. 465 *b*. His Experiment on the *Terra damnata* of brimstone, i. 364 *b*. His sense of the *Virgula divinatoria*, i. 220 *a*. His remarks on the colliquation of copper, i. 304 *b*. On the shooting of salts, ii. 489 *b*.

Ague, reflections on the accidents of an *Ague*, ii. 166 *a*. On the cold and hot fit, ii. 167 *b*. The dangerous symptoms of an *Ague*, ii. 173 *a*. *Agues* not frequent in *Scotland*, iv. 284 *a*. Cure of *Agues* by outward applications, iv. 211 *b*. Account of transplantation of *Agues*, v. 317 *b*. *Agues* cured by the Jesuits bark, i. 438 *a*. A cure for a tertian *Ague*, v. 457 *b*.

Air, reasons for writing of the spring of the *Air*, i. 1 *a*. The *Air* kept out of the receiver for a whole day, i. 3 *b*. The nature of the *Air* necessary to be explained, i. 4 *b*. An experiment in an *Air*-pump concerning it, i. 7 *a*. The *Air* near the earth resembled to a fleece of wool, i. 8 *a*. What the *Air* is, explained, i. 8 *b*. Objection against the pressure of the inferior *Air*, i. 10 *a*. The *Air* thrusts away all bodies that hinder its expansion, i. 10 *a*. Its yielding to bodies accounted for, i. 10 *b*. The equal pressure of it upon bodies, i. 11 *a*. Why it rushes violently into a body after it has been sucked out, i. 12 *a*. The *Air* in a lamb's bladder, an experiment concerning it, i. 13 *a*. The Dilatation of the *Air* explained, i. 14 *a*. The wonderful expansion of the *Air* by the violence of heat, i. 15 *a*. Its strength in a crystalline glass tried, i. 17 *b*. Its motion in an experiment upon quick-silver, i. 23 *b*. How to hinder its intrusion in the Torricellian experiment, i. 26 *a*. It is ingenerable and incorruptible, i. 32 *b*. It may be generated of water, i. 34 *a*. *Air* and water easily transmutable into one another, i. 35 *b*. *Air* a congeries of little tender springs, i. 36 *a*. An experiment concerning the gravity or levity of it under water, i. 38 *b*. Sounds conveyed to the ear by the *Air*, i. 40 *b*. The *Air* presses upon bodies shut up with it in the receiver, i. 42 *a*. Its restless endeavour to expand itself, i. 48 *b*. It bears strongly upon the bodies to which it is contiguous, i. 50 *a*. An experiment upon the weight of the *Air*, i. 53 *a*. The *Air* may be weighed as well as other bodies, *ibid*. When compressed, will enter through narrower pores than water, i. 54 *a*. The effect of it inclosed in marble, i. 55 *a*. Its gravity in proportion to quick-silver, i. 57 *b*. To what extent it may be rarified, i. 57 *b*. It abounds with little bodies capable to reflect the beams of light, i. 59 *a*. Its use as to animals endowed with lungs, i. 66 *a*. A consistence of *Air* necessary to respiration, i. 67 *b*. Its gravity manifestly a pair of scales, i. 90 *a*. Enquiries concerning its extension, i. 93 *b*. An account of it in the Torricellian experiment, i. 100 *a*. *Air* compressed obtains a much greater spring, i. 102 *a*. An experiment upon the debilitated force of expanded *Air*, i. 103 *a*. The particles of it of the form of a piece of ribbon, i. 114 *a*. The different motions of the *Air* in the *Air*-pump, i. 133 *a*. How it affects the sucker in that engine, i. 135 *b*. It gravitates upon the terraqueous globe, i. 144 *b*. An experiment to prove the elastical power of the *Air*, i. 146 *b*. The proportion between *Air* and water, i. 224 *a*. Whether the *Air* contributes to the production of saltpetre, i. 236 *b*. The parts of it diversly agitated, i. 249 *b*. An experiment on the sustaining force of the *Air*, i. 259 *a*. The *Air* concerned in the induration of bodies, i. 277 *a*. Has a resisting spring and an active spring, iii. 6 *a*. Quicksilver drawn up by rarified *Air*, iii. 7 *b*. The raising of water by the spring of the *Air*, iii. 10 *b*. The force of *Air* uncompressed upon solid bodies, iii. 14 *a*. The elevation of quicksilver depends on rarified *Air*, iii. 16 *a*. The concern of the *Air* in the restitution of bodies, iii. 22 *b*. The pressure of the *Air* made sensible to the touch, iii. 25 *b*. An account of the *Air* in a brass syringe, iii. 42 *a*. Liquor ascends in a syringe by the pressure of the *Air*, iii. 43 *a*. An account of the *Air* in the use of cupping-glasses, iii. 44 *b*. The dependance of sounds upon the *Air*, iii. 54 *b*. The force of the spring of the *Air* tried by a syringe, iii. 58 *a*. The effects of different cylinders of *Air*, iii. 59 *b*. The proportion of the gravity of English *Air* to water, iii. 62 *a*. In what manner the *Air* is necessary to the production of phænomena, iii. 85 *b*. The *Air* near the top of a mine, iii. 96 *a*. In the uppermost region of the earth, iii. 97 *a*. Its temperature in the middle region of the earth, iii. 99 *a*. The *Air* warm in the third region of the earth, iii. 101 *a*. The nature of subterraneal *Air* in mines, iii. 103 *b*. *Air* concealed in the pores of water, iii. 117 *b*. The pressure of the *Air* unfit for respiration, iii. 129 *b*. The use of the *Air* to elevate the steams of bodies, iii. 130 *a*. To produce light in *aerial* noctilucas, iv. 25 *a*. The concurrence of the *Air* to the shining of phosphorus, iv. 26 *a*. Experiments in compressed and factitious *Air*, iv. 96 *a*. An engine for exhausting of *Air*, iv. 100 *a*. The quality of the *Air* in the mercurial gage, iv. 101 *a*. An engine to compress the *Air*, iv. 102 *b*. Experiment of mixtures in compressed *Air*, iv. 102 *a*. The way to make factitious *Air*, iv. 103 *a*. *Air* filtrated through water, iv. 104 *a*. The same *Air* condensed and rarified, iv. 104 *b*. Ways to help the production of the *Air*, iv. 106 *a*. Experiment to extract *Air* from bread, iv. 106 *b*. Ways to hinder the production of *Air*, iv. 108 *a*. *Air* produced by reciprocations, iv. 109 *a*. The effects of artificial *Air*, iv. 113 *b*. The colour of fruits altered by artificial *Air*, iv. 117 *a*. Corruption increases in free *Air*, iv. 119 *a*. The effects of compressed *Air*, iv. 120 *b*. Putrefaction hindred by compressed *Air*, iv. 121 *a*. Experiment on pears in compressed *Air*, iv. 124 *a*. The effect of artificial *Air* upon animals, iv. 125 *a*. Insects breathe in *Air* highly rarefied, iv. 128 *b*. Experiment on fire in compressed *Air*, iv. 129 *b*. A greater consumption wrought by reduced *Air*, iv. 130 *a*. Fire used to produce *Air*, iv. 131 *a*. No *Air* produced by burnt amber, iv. 131 *a*. The production of *Air* in vacuo, iv. 131 *b*. The production of *Air* above its wonted pressure, iv. 135 *b*. *Air* produced in pears by paroxysms, iv. 139 *a*. Artificial *Air* destroyed, iv. 144 *b*. The different celerity in producing *Air*, iv. 145 *a*. *Air* not produced in bruised fruits so soon as entire, iv. 147 *a*. *Air* unfit to produce mouldiness, iv. 148 *b*. Is at divers times diversly affected, iv. 148 *b*. Relation between the *Air* and the spirit of human blood, iv. 188 *a*. Experiment on *Air* piercing through wood, iv. 221 *a*. The salubrity and insalubrity of the *Air*, iv. 251 *a*. The effect of *Air* in a wind-gun, iv. 254 *a*. The great percussion of the *Air* by the loudness of sounds, iv. 256 *a*. The *Air* put into an undulating motion by sonorous bodies, iv. 262 *b*. The impulse of the *Air* on the strings of instruments, iv. 265 *b*. Causes of salubrity and insalubrity of the *Air*, iv. 276 *a*. The quality of the *Air* affected by subterraneal effluvia, iv. 277 *a*. The *Air* impregnated with magnetical effluvia of the earth, iv. 279 *a*. The *Air* affects human bodies through the skin, iv. 280 *a*. The intemperateness of the *Air* proceeds from subterraneal bodies, iv. 285 *a*. The plague improved by a malignant disposition in the *Air*, iv. 289 *a*. The *Air* of *Egypt* during the increase of the *Nile*, iv. 291 *a*. The general history of the *Air*, v. 105 *a*. The use and benefits of the *Air*, v. 106 *a*. What we are to understand by the *Air*, v. 107 *a*. The constant and permanent ingredients of the *Air*, v. 107 *b*. The corpuscles of which the *Air* consists, v. 108 *a*. The *Air* like curled locks of hairs of wool, v. 108 *b*. Springy particles of the *Air* like shavings of wood, v. 108 *b*. Experiments about producing of *Air*, v. 110 *b*. Whether *Air* may or may not

not be produced by Art, v. 111 *a*. *Air* produced from bruised raisins and water, v. 112 *b*. Of the moisture and dryness of the *Air*, v. 113 *b*. Experiment on the *Air* by a hygroscope, v. 115 *b*. The *Air* consists of saline particles, v. 116 *b*. The *Air* impregnated with corpuscles of nitre, v. 117 *a*. Vitriolate salt dispersed through the *Air*, v. 117 *b*. The *Air* contains compounded salts, v. 118 *a*. Different sorts of salts in the *Air*, v. 119 *a*. To try what salts abound in the *Air*, v. 119 *b*. The effect of the *Air* upon silver-plate, v. 120 *a*. The change of colour in bodies effected by the *Air*, v. 120 *b*. Whether the *Air* be impregnated with esurine salt, v. 121 *a*. Of sulphur and inflammable particles in the *Air*, v. 122 *a*. Of celestial influences in the *Air*, v. 124 *a*. The *Air* regulated by the influence of the planets, v. 125 *b*. A diary of the alteration of the *Air* useful, v. 127 *a*. Of the motion of the *Air* and winds, v. 128 *b*. The operation of the *Air* on the sounds of bodies, v. 130 *a*. The weight and density of the *Air* examined, v. 133 *a*. The difference of the weight of the *Air* at the top and bottom of a hill, v. 133 *b*. A register of the *Air* by Mr. *Locke*, v. 136 *a*. Of the consistency of the *Air*, v. 160 *a*. The effect of summer-*Air* upon glass, v. 160 *b*. Of the *Air* in reference to light, v. 175 *b*. Clear *Air* proper for celestial observations, v. 177 *b*. The operation of the *Air* on the consistency of animal substances, v. 178 *b*. The several faculties and powers of the *Air*, v 179 *a*. The operation of the *Air* on vegetable substances, v. 179 *b*. On the consistency of mineral substances, *ibid*. Of the *Air* in reference to fire and flame, v. 180 *b*. The operation of the *Air* upon odours, v. 181 *a*. On the odours of various kinds of substances, v. 181 *b*. On the colours of substances, v. 182 *a*. The changes produced by the *Air* on solid minerals, v. 182 *b*. Changes made by the *Air* in vegetable substances, v. 184 *b*. Of the *Air* in reference to the preservation of animals, v. 185 *b*. The qualities of the *Air* proper for natural history, v. 191 *b*. The *Air* has weight, but weighs not, v. 324 *a*. Its use to the health of the body, v. 354 *a*. The weight of the *Air* in any dimension examined, *ibid*. A contrivance of scales for weighing of *Air*, v. 356 *a*. The qualities of the *Air* discovered by the naturalist, i. 496 *b*. The healthfulness of the *Air* considered, i. 582 *b*. A new way of condensing of *Air*, ii. 291 *a*. Whether the *Air* be the *primum frigidum*, ii. 312 *b*. or *summum frigidum*, ii. 313 *a*. Observations on the coolness and temperature of the *Air*, ii. 315 *b*. The *Air* is rather cold than hot, ii. 316 *a*. Experiment on the contraction or condensation of the *Air*, ii. 317 *a*. Why the *Air* seems hot or cold, ii. 376 *b*. The effect of the expansion and compression of the *Air* upon shining wood, ii. 556 *b*. *Air* not devoid of weight, iii. 191 *a*. The admirable rarefaction of *Air* without heat, iii. 203 *a*. The great expansion of *Air* in the *Machina Boyleana*, iii. 203 *b*. The duration of the spring of expanded *Air*, iii. 206 *a*. Experiments on the condensation of the *Air* by mere cold, iii. 209 *a*. The efficacy of *Air* in producing flame without any flaming or burning body, iii. 251 *b*. The resistance of bodies against the pressure of the *Air* tried, iii. 285 *a*. The alterations of the *Air* affect men's sickness and health, iii. 307 *a*. The natural and preternatural state of the *Air*, iii. 390 *a*. The natural state of the *Air* as to rarity and density explained, iii. 392 *a*. The compression of the inferior *Air* by the weight of the incumbent, iii. 392 *b*. The preternatural state of the *Air* considered, *ibid*. The moisture and dryness of the *Air* discovered by the hygroscope, iii. 397 *a*. Experiment on the efficacy of the *Air*'s moisture, iii. 400 *a*. Suspicions about hidden qualities in the *Air*, iii. 463 *a*. Derived perhaps from the sun and planets, iii. 463 *b*. A coagulated body made fluid by the *Air*, iii. 468 *b*. Plagues arising from some latent pestiferous constitution of the *Air*, iii. 469 *b*. The peculiar action of the *Air* on some vitriolate liquors, iii. 473 *a*. The force of the weight of the atmospherical *Air* examined, iii. 483 *b*. *Air* extracted by suction out of a glass, iii. 490 *a*. The weight and elasticity of the *Air* examined, iii. 498 *a*. Whether some unobserved quality in the *Air* do not produce some unobserved effects, iii. 553 *b*. The *Air* sometimes an instrument in the volatilization of bodies, iii. 617 *a*.

AIR-PUMP invented by Mr. *Hooke* described, i. 5 *a*. More particularly explained, i. 6 *a*. The way of working it, i. 7 *b*. The expansion of water in the *Air-Pump*, i. 30 *b*. An experiment upon pieces of polished marble in the *Air-Pump*, i. 45 *a*. Upon weighing of air, i. 53 *b*. The motion of the air in this engine according to Mr. *Hobbes*, i. 131 *b*. An experiment by a cupping-glass in an *Air-Pump*, iii. 46 *a*. The experiment of a lamb's bladder in the *Air-Pump*, i. 12 *b*. An experiment in it concerning the expansion of the air, i. 15 *a*. To try the strength of glass, i. 14 *b*. &c. The motion of quicksilver in the *Air-Pump*, i. 22 *b*. The reason of its suction explained, i. 47 *b*. The raising of quicksilver in an *Air-Pump* by the spring of the air, iii. 8 *b*. The breaking of glass plates in an *Air-Pump*, iii. 12 *b*.

AIR-SHAFT belonging to mines, its nature, v. 194 *b*.

ALABASTER, an experiment of its powder over fire, i. 247 *b*. A further explanation of that experiment, i 267 *a*. The coagulating property of burnt *Alabaster* considered, i. 277 *a*.

ALATERNUS, a plant, its virtue, ii. 58 *b*.

ALBEMARLE, Duke of, a dispute between him and the Dutch embassador, v. 345 *b*.

ALBUM GRÆCUM given for sore throats, ii. 220 *b*.

ALCALIZATE spirit of wine, the way to make it, i. 214 *b*. The properties of *alcalizate* salts, i. 236 *b*. Will change syrup of violets into a green colour, ii. 53 *b*. An account of the *alcalizate* spirit of blood, iv. 201 *b*. The effect of its mixture with a rectified ardent spirit, iv. 202 *a*. Salts of an *alcalizate* nature in the earth, iv. 246 *a*. The quality of *alcalizate* salt produced by incineration, i. 335 *b*. *Alcalizate* spirits their quality, iv. 28 *a*. Acids mortified by *alcalizate* salts, iv. 310 *b*.

ALCANNA, the virtue of the juice of it, ii. 77 *a*.

ALCOHOL, experiment on the noctiluca dissolved in *Alcohol* of wine, iv. 80 *a*. To produce air in *Alcohol* of wine, v. 113 *a*. An experiment on *Alcohol* mixed with spirit of urine, i. 263 *b*. The effect of spirit of human blood with *Alcohol* of wine, iv. 194 *b*.

ALE, experiment on the production of air in new *Ale*, iv. 113 *a*. It ferments slowly without air, iv. 113 *b*.

ALENIS JULES, his remark upon magnetical variation, i. 226 *a*.

ALEXANDER the Great, his character by an historian, v. 66 *b*. His esteem for the works of *Homer*, iii. 409 *a*.

ALEXANDER VAN SUCHTEN, his account of a green mercury of copper, i. 343 *a*. The method of his sceptical way of writing, i. 574 *b*.

ALGEBRA, the clearest exercise of reason, iii. 157 *a*. Its use in weighing in scales, iii. 158 *b*.

ALGEBRAISTS, their way of expressing quantities by symbols, iii. 526 *a*.

ALGIER, an infection brought from thence, v. 310 *a*.

ALIMENT, the quantity of it that goes off by insensible transpiration, i. 68 *a*. Experiments on the preservation of *Aliments*, iv. 156 *b*. The wholesomeness and insalubrity of *Aliments* examined, i. 495 *a*. The changes of *Aliments* within the body, i. 475 *a*.

ALKAHEST reduces gross bodies into insipid water, i. 244 *a*. The strange effects ascribed to it by *Helmont*, i. 245 *a*. It coagulates common quicksilver, i. 274 *a*. The *Alkahest* a nobler secret than the philosopher's stone, i. 307 *b*. The means of its resolution of bodies, i. 314 *a*. It reduces mixed bodies into insipid water, i. 317 *b*. Account of the operations of the *Alkahest*, i. 326 *b*. Its power described by *Helmont* and *Paracelsus*, i. 355 *b*. It deprives running mercury of its fluidity, i. 403 *a*. Reduces all tangible bodies into insipid water, i. 414 *a*. The power and virtue of the *Alkahest*, iii. 613 *b*. The sects of chymists differ concerning the operation of the *Alkahest*, iii. 629 *b*. Its power in resolving bodies, i. 307 *a*.

ALKALI, the meaning of it by chymists, i 233 *a*. The production of *Alkalies*, i. 379 *b*. Whether *Alkalies* are præexistent in mixed bodies, *ibid*. Oil and sulphur not necessary to the production of an *Alkali*, i. 380 *b*. Sea-salt distilled affords phænomena of an *Alkali*, i. 382 *a*. Acid salts and *Alkali* afforded by the same body, i. 382 *b*. The way to make the *Alkali* of nitre, *ibid*. Of salt-petre and tobacco-pipe clay, i. 383 *a*. A bluish *Alkali* made of fine silver and nitre, i. 383 *b*. Sea-salt not a common lixiviate *Alkali*, i. 385 *a*. Fixt *Alkali* produced from compounded salt, i. 388 *a*. *Alkali* concurs to the making of glass, iii 194 *b*. Reflections on the hypothesis of *Alkali* and Acidum, iii. 565 *a*. The various qualities of different *Alkalies*, iii. 604 *b*. Experiment by deliquated *Alkali*, iv. 5 *a*. Spirit of human blood a noble *Alkali*, iv. 176 *b*. The qualities

qualities of fixed and volatile *Alkalies*, iv. 176 *b*. Whether ſpirit of blood differs from other volatile *Alkalies*, iv. 180 *b*. The uſe of depurated volatile *Alkalies*, iv. 191 *b*. Volatile *Alkalies* ſucceſsfully uſed in phyſick, iv. 193 *a*. Fixed *Alkalies* alter the colour of human blood, iv. 198 *a*. The diſcovery of an *Alkali* in mineral waters, iv. 246 *a*.

ALKORAN, the eloquence of that book conſidered, ii. 122 *a*.

ALLAY, the quantity of it in coined ſilver, i. 212 *a*. An inſtrument to determine the *Allays* in metals, iii. 353 *a*. Of tin added to copper, iii. 553 *b*.

ALLUM robbed of its ſalt recovers it by being expoſed to the air, iii. 465 *b*. The particular nature of it, ii. 78 *a*. Difficult to take the principles of *Allum* aſunder, ii. 493 *b*. Experiment by a ſolution of *Allum* and nitre, v. 189 *b*.

ALOES of *St. Iago*, an account of them, v. 182 *b*.

ALPHABET, the uſe of it in the art of memory, v. 427 *a*. *Alphabet* of the Hanſoretan and Malabar writing, v. 600 *b*.

ALPHABETUM NATURÆ, an account of that book, v. 378 *b*.

ALPHONSUS King of *Arragon* a great reader of the Scriptures, ii. 133 *b*.

ALPS, the nature of the air there, i. 68 *b*.

ALTERATION, a phyſical definition of it, iii. 475 *b*. The *Alteration* of bodies accounted for, ii 481 *b*.

ALTITUDE of the mercurial cylinder, i. 26 *b*.

AMALGAM, the induration of it particularly conſidered, i. 279 *a*. The ſtraining an *Amalgam* of gold and ſilver through leather, i. 409 *a*. To make *Amalgams* of gold and mercury, i. 409 *b*.

AMALGAMATION, a diſſolution of metals in a fluid body, i. 404 *a*. The *Amalgamation* of metals with mercury explained, i. 404 *b*.

AMALPHI, the inventor of the mariner's compaſs, iii. 165 *a*.

AMANSES, or counterfeit gems, the way to make them, ii. 76 *a*.

AMBER, ſolution of it good for the ſtomach, i. 211 *b*. Grows hot by rubbing, i. 233 *b*. A way of preparing oil of *Amber*, i. 265 *a*. An experiment upon the tincture of *Amber*, i. 267 *b*. A particular account of European *Amber*, i. 276 *b*. *Amber* to try the ſtrength of ſaline liquors, iii. 152 *b*. The effect of diſtillations of oil of *Amber*, iv. 94 *b*. An account of liquor of *Amber*, iv. 95 *a*. Experiment on *Amber* burnt *in vacuo*, iv. 131 *a*. *Amber* will float in ſpirit of blood, iv. 181 *b*. The effect of ſpirit of human blood on powdered *Amber*, iv. 185 *a*. Oil of *Amber* of uſe in convulſive fits, iv. 192 *a*. *Amber* employed in the examining of liquors, v. 13 *b*. Will ſwim in liquors made by ſolution of ſalts, v. 15 *a*. The particles of it agitated by the ſun's beams, v. 165 *a*. Uncoagulated naphta found in lumps of *Amber*, v. 250 *b*. Experiment with ſpirit of *Amber*, v. 346 *b*. Remark upon the ſoot of kindled *Amber*, i. 302 *b*. Oil and ſulphur yielded by *Amber*, i. 319 *b*. Remark on the electrical faculty of *Amber*, i. 354 *b*. Salt produced from *Amber* gradually diſtilled, i. 379 *b*. The effect of tincture of *Amber* in a weather-glaſs, ii. 250 *b*. A fly incloſed in *Amber*, iii. 224 *a*. *Amber* attracts moſt by being rubbed, iii. 648 *a*. Its attractive power when excited will continue ſome time, iii. 648 *b*. The electrical force of a vigorous piece of poliſhed *Amber*, iii. 649 *b*. Whether *Amber* would draw a light body in a glaſs whence the air was pumped out, iii. 651 *a*. The diſſipation and re-union of the parts of common *Amber*, ii. 493 *a*. *Amber* emits effluvia by the ſun's heat, iii. 69 *a*.

AMBERGREASE loſes little of its weight by its effluvia, iii. 69 *a*. Is thrown up by the ſea in ſtorms, i. 375 *b*. Diſſolved in rectified ſpirit of wine, its quality, ii. 251 *b*. Expoſed to the air, loſes nothing of its weight, iii 317 *b*. A letter concerning *Ambergreaſe* and its being a vegetable production, iii. 355 *a*. Its nature, and where it is found, iii. 356 *b*.

AMBITION, the effects of it, ii. 192 *b*. Sometimes paſſes for magnanimity, v. 71 *a*.

AMEL, the virtue of white *Amel*, ii. 75 *a*. The particular nature and quality of it explained, iii. 454 *a*.

AMERICAN navigators, their good fortune, i. 227 *a*.

AMETHYST, remark upon white *Amethyſts*, iii. 224 *a*. German *Amethyſt* made by glaſs of lead, iii. 492 *b*.

AMOREATIM, a venomous fiſh in *Braſil*, iii. 315 *b*. Account of its ſtupefying emanations, iii. 336 *b*.

AMULET to cure a quotidian ague, i. 525 *b*. The virtue of *Amulets* on human bodies, i. 534 *b*. The particular operation of *Amulets*, iv. 212 *a*. Their effluvia paſs through the ſkin, iv. 212 *b*. Their virtue depends on thoſe that wear them, iv. 284 *a*. The effects of arſenical *Amulets*, iv. 292 *b*.

ANABAPTISTS condemn all oaths, v. 221 *b*.

ANALYSIS, the chemical *Analyſis* of pearls, v. 100 *b*. The *Analyſis* of bodies by fire examined, i. 299 *b*. Remark on the *Analyſis* of mixed bodies, i. 303 *a*. The *Analyſis* of bodies by other ſubſtances than fire, i. 307 *a*. The ſubſtances into which bodies may be ſeparated by *Analyſis*, i. 323 *b*. Obſervations on the *Analyſis* of the chymiſts, i. 333 *b*. *Analyſis* of bodies conſider'd, iv. 92 *a*.

ANANA, a fruit in the *Weſt-Indies*, an account of it, v. 534 *b*.

ANATHEMA, the force of a papal *Anathema*, v. 415 *a*.

ANATOMISTS, ſome account of them, i. 434 *b*. The knowledge they receive by the diſſection of brutes, i. 465 *a*. The number of their terms of art, a ſpecimen of ſome of them, v. 696 *a*.

ANATOMY, ſkill in it proves the being of a God, v. 43 *a*. Muſical and dialling *Anatomies*, v. 264 *a*. An account of two bodies of *Anatomy*, v. 292 *b*. Improvements in *Anatomy*, v. 294 *b*. The opinion of the Muſcovites concerning it, i. 466 *a*. The chymical *Anatomy* of bodies examined, i. 337 *a*. The pleaſure that attends the ſtudy of *Anatomy*, i. 424 *b*.

ANAXAGORAS an anſwer of his, i. 185 *b*. His opinion of matter, v. 674 *b*.

ANDROMEDA, ſtars in the girdle of *Andromeda*, iii. 93 *b*.

ANGEL, the glory and beauty of *Angels* deſcribed, i. 168 *a*. Their love of God elegantly expreſſed, i. 168 *b*. The ſtrength and power of *Angels*, i. 182 *a*. They rejoice at the repentance of a ſinner, i. 187 *a*. Are properly qualified to celebrate the divine praiſes, i. 188. *b*. Have opportunities of obſerving the excellencies of the Deity, i. 189 *a*. Are at the head of kingdoms and empires, ii. 131 *b*. The nature of good *Angels* not to be comprehended, iv. 40 *b*. The wiſdom of God in the government of *Angels*, iv. 347 *a*. The capacity of the intellects of *Angels*, iv. 347 *b*. Their degrees, offices and employments, iv. 347 *b*. They are employed in adoring the divine majeſty, iv. 350 *a*. Are miniſtring ſpirits, iv. 350 *b*. Are creatures infinitely inferior to God, iv. 351 *a*. The production of *Angels* not mentioned in ſcripture, iv. 351 *b*. The manner of their appearance, v. 70 *a*. The waters and the fire govern'd by an *Angel*, iv. 369 *a*. The reaſon of God's creating the *Angels* before the material world, iv. 536 *a*. An inquiry into the capacity of the knowledge of *Angels*, iv. 340 *a*. Their nature and offices diſcovered by revelation, iii. 410 *b*. Of good and bad *Angels*, iii. 417 *a*. The ſeveral powers and properties of *Angels* not to be conceived, v. 663 *b*.

ANGELICA, Spaniſh, the root of it good againſt the plague, v. 103 *a*.

ANGELUS SALA, his anatomy of anatomy, i. 400 *a*.

ANGELUS SOTUS, his opinion of the extracting mercury from gold, i. 325 *b*.

ANGER, the uſe and abuſe of it, ii. 192 *a*.

ANGLESEY, a rock of loadſtones in that iſland, v. 363 *a*.

ANGLING improved to ſpiritual uſes, ii. 182 *a*.

ANIMA HEPATIS, the virtue of it, i. 582 *b*.

ANIMADVERSIONS on Mr *Hobbes*'s *Problemata de vacuo*, iii. 476 *b*.

ANIMALS, why they die in the receiver, according to Mr. *Hobbes*, i. 139 *b*. *Animals*, as foxes, horſes, &c. change their colour in northern countries, ii. 35 *b*. The times in which *Animals* are killed by drowning, iii. 121 *a*. The hatching of the ſeeds of *Animals* in a vacuum, iii. 126 *b*. Living *Animals* conſume air, dead ones produce it, iv. 123 *b*. A great compreſſion of air noxious to *Animals*, iv. 124 *b*. The effect of artificial air upon *Animals*, iv. 125 *a*. Factitious air a greater enemy to *Animals* than a vacuum, iv. 128 *a*. Experiments on *Animals* in vacuo, *ibid*. The parts of *Animals* full of pores, iv. 206 *b*. The body of an *Animal* admirably contrived, iv. 207 *a*. *Animals* grow in all their parts, iv. 207 *b*. Living *Animals* in drops of water, iv. 244 *a*. The inviſible motion of fluids on the bodies of *Animals*, iv. 263 *a*. The excellent workmanſhip of particular *Animals*, iv. 343 *b*. The mechaniſm of particular *Animals* very unlike, *ibid*. The exact ſymmetry of their parts deſcribed, iv. 344 *a*. The nature of brute *Animals* conſidered, v. 44 *a*. A wonderful contrivance in the formation of them, v. 44 *b*. The effect of the air in the preſervation of *Animals*, v. 185 *b*. The

functions

functions of *Animals* particularly explained, v. 288 *a*. The bleeding of one *Animal* into another, v. 363 *b*. Water may by seminal principles be transmuted into *Animals* i. 357 *a*. The growth of *Animals* nourished by water, i. 366 *a*. The *Animals* involved in the ruin of man, i. 431 *b*. Scripture frequently alludes to the properties of *Animals*, i. 433 *a*. Experiments on the pressure of water upon *Animals*, ii. 447 *a*. The curious bodies of *Animals* not made by chance, ii. 488 *a*. The relation between the air and the *flamma vitalis* of *Animals*, iii. 261 *a*. Whether *Animals* are heavier dead than alive, iii. 263 *b*. The resistance made by *Animals* to a great pressure by the mediation of a fluid body, iii. 284 *b*. The curious structure of *Animals* could not be owing to blind chance, iv. 540 *a*. The meanest parts of *Animals* worthy of the divine wisdom, iv. 543 *a*. The parts of *Animals* suited to their respective natures, iv. 545 *a*. And made to consist with the cosmical ends of the universe, iv. 548 *a*. *Animals* in the air-pump die with convulsive motions, i. 63 *b*.

ANIMAL spirits, their nature and quality, iv. 257 *b*.

ANNEALING upon glass, remark upon it, iii. 193 *a*.

ANNISEED, the oil of it differs in winter and summer, i. 265 *a*. An experiment upon it, i. 265 *b*. Reflexion of light from oil of *Anniseeds*, iv. 6 *a*. Experiment of the noctiluca and oil of *Anniseeds*, iv. 78 *a*. On distillation of essential oil of *Anniseeds*, iv. 90 *a*. A spirit extracted from it, iv. 91 *b*. The changes made upon it by fire, iv. 92 *a*. The digesting of spirit of blood with oil of *Anniseeds*, iv. 187 *a*. Oil of *Anniseed* thickens like white butter, i. 339 *b*. The different oils drawn from *Anniseeds*, i. 340 *a*. Essential oil of *Anniseeds* useful in weather-glasses, ii. 246 *b*. An experiment of oil of *Anniseed* mixed with oil of vitriol, ii. 60 *a*.

ANOMALOUS, the qualities of an *anomalous* sublimate, iv. 91 *b*.

ANT, the necessity of air to the motion of *Ants*, iii. 133 *b*. Experiment on *Ants* in a receiver without air, v. 187 *a*. The strange providence and sagacity of *Ants*, iv. 541 *b*.

ANTANACLASIS, a figure in rhetorick, ii. 95 *b*.

ANT-HILL, the turning up of an *Ant-hill* stock'd with eggs, iv. 256 *b*.

ANTHONINUS GUNTHERUS BILLICHIUS, his notion of the four elements, i. 350 *a*. He divides the flame of green wood into four elements, i. 350 *b*. His system examined and confuted, i. 351 *a*.

ANTIDOTE against the plague, v. 335 *a*.

ANTI-ELIXIR, an account of it, iv. 13 *a*.

ANTIMONIUM DIAPHORETICUM, the nature of it, i. 549 *b*. An inquiry concerning its qualities and operation, iii. 467 *a*. *b*. A particular remark upon it, v. 185 *a*.

ANTIMONIUM ROSATUM, its virtue, v. 265 *b*.

ANTIMONY, an account of butter of *Antimony*, i. 206 *b*. The difference in the several sorts of it, i. 208 *b*. The white calx of *Antimony* melted into glass, ii. 32 *b*. *Antimony* of use to fatten horses, iii. 146 *a*. The effect of glass of *Antimony* taken inwardly, iv. 319 *a*. Dissolved in spirit of vinegar, iv. 325 *b*. The effects of crude *Antimony*, iv. 326 *a*. Glass of *Antimony* corrected by distilled vinegar, iv. 331 *b*. Preparations of *Antimony* their great use, iv. 334 *a*. Experiment with powdered *Antimony* and spirit of salt, v. 87 *a*. Account of an *Antimony* cup, v. 257 *b*. A way to sublime sulphur out of *Antimony*, i. 305 *b*. Butter of *Antimony* reduced to a clear liquor, i. 333 *b*. A combustible sulphur obtained from *Antimony*, i. 396 *b*. Experiment by aqua fortis and crude *Antimony*, i. 397 *b*. The making mercury of *Antimony*, i. 401 *a*. A real combustible sulphur of *Antimony*, i. 427 *b*. Several ways of destroying the common properties of it, i. 503 *a*. The difference between glass of *Antimony* and fixed gems, 505 *b*. Glass of *Antimony* deprived of its vomitive faculty, i. 518 *b*. A balsam of *Antimony*, i. 573 *b*. Experiment upon the boiling of crude *Antimony*, ii. 66 *a*. The effect of the various preparations of *Antimony*, iv. 331 *b*.

ANTIPATHIES and their effects consider'd, i. 541 *b*.

ANTIPERISTASIS, account of the treatise concerning it, ii. 230 *b*. An examen of it, as it is usually taught and proved, ii. 355 *a*. A self-invigorating power, arguments offered to prove it, ii. 355 *b*. Arguments against it, ii. 357 *a*. The heat of cellars in summer not caused by *Antiperistasis*, ii. 365 *a*. The doctrine of *Antiperistasis* overthrown, ii. 369 *a*. Confuted by experiments, ii. 369 *b*.

ANTONINO NERI, his account of the turquois, ii. 85 *a*.

ANVIL, gripings cured by sitting on a hot *Anvil*, i. 539 *a*.

APELLES, how discovered by *Protagoras*, i. 435 *a*.

APES have a more exquisite palate than men, i. 364 *a*.

APHORISMS relating to piety and religion, v. 733 *a*.

APODOSIS in rhetorick explained, ii. 143 *b*.

APOPLEXY, a remedy against it, iv. 332 *b*. A subtile spirit given in a fit of an *Apoplexy*, iv. 190 *b*.

APOSTATE spirits fell by aspiring to divine perfections, i. 169 *a*.

APOSTLE, the testimony of the *Apostles* worthy the greatest credit, v. 52 *b*. Arguments to confirm believers used by the *Apostles*, ii. 105 *b*.

APOTHECARY with three testicles, v. 311 *a*.

APPENDIX, a paradoxical *Appendix* to the *Sceptical Chymist*, i. 356 *a*. *Appendix* to the *Aërial Noctiluca*, iv. 71 *a*. To the *History of human Blood*, iv. 164 *a*. To the Memoirs for the *History of human Blood*, iv. 19 *b*. To the *History of mineral Waters*, iv. 237 *a*. To the first part of the *Christian Vertuoso*, v. 655 *b*.

APPENSA, the effects of arsenical *Appensa*, iv. 281 *b*.

APPETITE raised by agents of contrary qualities, ii. 361 *a*.

APPLE, a woman by eating an *Apple* turned into a stone, i. 278 *b*. Reflections on the paring of an *Apple*, ii. 165 *a*. The producing of air in boiled *Apples*, iv. 107 *b*. Experiment on *Apples* in an empty receiver, iv. 133 *b*. On whole and bruised *Apples*, iv. 147 *a*. On three sorts of *Apples* in three vacuated receivers, iv. 148 *a*. On four *Apples* with powdered sugar, iv. 154 *b*. On boiled *Apples* in a receiver stopped with a screw, iv. 158 *a*. *Apples* blasted by a red wind, v. 177 *b*. *Paradise* lost by eating an *Apple*, v. 218 *b*. Experiment on the freezing and thawing of *Apples*, ii. 271 *a*. An account of the improvement of *Apples*, iii. 146 *b*.

APPLICATION, diseases cured by outward *Applications*, i. 525 *b*.

APRICOCKS, experiment on the production of air in *Apricocks*, iv. 110 *b*. A way to preserve them, iv. 111 *a*. An experiment on *Apricocks* in common air, iv. 119 *a*. The effect of it in four receivers, iv. 119 *b*.

AQUA FORTIS, used to draw a volatile tincture of gold, i. 214 *b*. Whether it will coagulate common oil, i. 224 *b*. Its various uses by artificers, iii. 171 *a*. Capable of being improved, iii. 171 *b*. Experiment on *Aqua fortis* with fixed nitre, iv. 139 *b*. On *Aqua fortis* with spirit of wine, iv. 142 *a*. Solution of *Aqua fortis* to stain ivory, iv. 216 *a*. The effect of *Aqua fortis* poured on salt of tartar, iv. 295 *a*. Of digesting or distilling of *Aqua fortis*, iv. 319 *a*. The particular strength of *aqua fortis*, v. 15 *b*. Its use in examining of sand-gold, v. 31 *b*. The separation of mixed metals by *Aqua fortis*, i. 319 *a*. The *caput mortuum* of common *Aqua fortis*, ii. 490 *a*. *Aqua fortis* used in silvering over brass and copper, iii. 199 *b*. The operation of *Aqua fortis* and *Aqua regia* upon gold and silver, iii. 625 *b*. *Aqua fortis* purified by small pieces of silver, i. 556 *b*.

AQUA *Limarum*, the virtue of it, v. 421 *a*.

AQUA *Regis*, its nature and effect upon gold, iv. 286 *b*. An account of spiritual *Aqua regis*, v. 100 *a*. Its dissolving of gold, copper, and mercury, examined, iii. 607 *a*. It is reckoned among the solvents of sulphur, iii. 629 *a*.

ARCH, the effect of a determinate sound upon an *Arch*, iv. 266 *b*.

ARCHANGEL, the nature of the frosts there, v. 166 *a*. A north-wind there produces a thaw, iii. 397 *b*.

ARCHIMEDES, his proposition concerning the weight of bodies, v. 6 *a*. A particular account of him, i. 424 *a*. His discovery of weighing bodies, iii. 2 *b*. His weighing of sinking solids explained, v. 20 *a*. His theorem concerning the weight of bodies, v. 20 *b*.

ARCHITECTURE of nature wonderful to an intelligent spectator, i. 424 *a*.

ARCHIVIOLE, a musical instrument, an account of it, v. 311 *b*.

ARDENNE, of the marble in the mountains of *Ardenne*, ii. 340 *b*.

ARGONAUTICK invention by *Becher*, v. 283 *b*.

ARGUMENT, physical *Arguments* of Atheists not unanswerable, v. 42 *a*.

ARIES, the motion of the first star in that sign, iv. 343 *a*.

ARISTOTELIAN rarifaction examined, i. 92 *b*.

ARISTOTLE, his reasons for speaking doubtfully, i. 2 *a*. His opinion of fire and water, i. 35 *b*. His notion of rarifaction, i. 93 *a*. His saying of motion, i. 148 *a*.

He justifies his dissent from *Plato*, i. 200 *a*. His remark upon the sight of the eye, iv. 48 *b*. His notion of place, iv. 62 *b*. His division of entities, iv. 63 *a*. The first that perverted physicks, v. 57 *b*. His character particularly displayed, i. 297 *a*. He framed the doctrine of the four elements, i. 298 *a*. His definition of heat, i. 309 *a*. His opinion of mistion, i. 318 *a*. His principle of mistion confuted, i. 319 *b*. His account of his history of animals, i. 424 *b*. His character of philosophy, i. 425 *a*. His sentiments on the animal-creation, i. 428 *b*. His followers guilty of errors and mistakes, i. 444 *a*. In what manner he explained the phænomena of nature, i. 450 *a*. His sentiments of God and his works, i. 453 *b*. His sayings of God and the creation, i. 456 *b*. Of the conspicuousness of the Creator in his creatures, i. 457 *b*. His saying of the dissection of beasts, i. 465 *b*. His opinion of the *Primum frigidum*, ii. 310 *b*. Of the generation of hail examined, ii. 361 *b*. A general character of his philosophy, ii. 454 *b*. His way of writing, and the comments of his interpreters, ii. 455 *a*. He was one of the greatest ornaments of *Greece*, ii. 456 *b*. His treating and defining the qualities of bodies, ii. 458 *a*. His definition of quality, ii. 465 *b*. Of a sphere examined, ii. 470 *a*. His remark on the generation of man, ii. 528 *a*. Account of the origin of gems, iii. 215 *a*. Opinion of the saltness of the sea, iii. 378 *a*. A particular character of him and his philosophy, iii. 442 *b*. His opinion of the ascension of liquor upon suction, iii. 495 *b*. His system exploded by the moderns, iii. 520 *a*. His opinions relating to religion pernicious to it, iv. 361 *a*. His famous definition of nature, iv. 367 *b*. What he means by *Nature does nothing in vain*, iv. 529 *b*. His notion of spirits and intelligences, v. 664 *a*. The powers and properties he applies to them, examined, v. 664 *b*. His philosophy prejudicial to religion, v. 677 *b*. To what he ascribed the regularity of the world, v. 688 *a*.

ARITHMETICK, the *Regula falsi* in *Arithmetick*, i. 194 *b*.

ARMENIA, on respiration on the mountains of *Armenia*, iii. 125 *a*.

ARMENIAN Bible, an account of the printing of it, v. 295 *b*.

ARMINIANS, their controversy concerning God's grace, i. 178 *a*.

ARMONIACK, experiment upon Sal-*Armoniack* sublimed and sublimate, ii. 65 *b*. Its effect in changing the colour of liquors, ii. 66 *b*. Ways of attaining a spirit of Sal-*Armoniack*, i. 570 *a*.

ARMY of *Turks* killed by excessive cold, ii. 328 *b*. Account of *Armies* fighting in the air, v. 565 *a*.

ARROW, the wound of an *Arrow* cured, v. 440 *b*.

ARSENICAL Amulets, their effect, iv. 321 *a*. Medicines from preparations of *Arsenick*, i. 501 *b*.

ARSENICK, an experiment by colliquating *Arsenick* and copper, ii. 39 *a*. Natural *Arsenick* to be found in mines, iv. 279 *a*. Its fatal effect on human bodies, iv. 292 *b*. Experiment from the mixture of *Arsenick* and nitre, i. 380 *a*. Experiment upon *Arsenick* by powder of galls, iv. 238 *a*. The dangerous quality of native *Arsenick*, iv. 240 *b*. *Arsenick* mingled with mineral waters, iv. 241 *a*. Is *ex prædominio* an acid body, iv. 241 *b*. Is poisonous by a corrosiveness *sui generis*, iv. 241 *b*.

ART, how far improved by mechanicks, iii. 153 *b*. The difficulties of the medicinal *Art*, iv. 330 *b*.

ARTERIA ASPERA, exhalations emitted through it, iv. 209 *a*. *Arteria Hepatica*, an account of it, v. 524 *b*.

ARTICLES of religion, their nature, v. 40 *a*. Whether *Articles* of faith are above reason, v. 59 *a*. They are not required to be proved by arguments merely natural, iii. 530 *a*. *Articles* of inquiries touching mines, v. 193 *a*. Necessary *Articles* of religion capable of a moral demonstration, iii. 432 *a*. *Articles* of religion censured because they cannot be conceived, v. 667 *a*.

ARTIFICERS, the nature of them and their trades, iii. 139 *a*. They use one another's productions, iii. 170 *b*. *Artificers* without philosophy have been useful to mankind, i. 199 *b*. They may be assisted by the naturalist, iii. 173 *a*.

ARTIFICIAL AIR, its effect upon animals, iv. 125 *a*. In what manner destroyed, iv. 144 *b*.

ARTIST, the imperfections of human *Artists*, iv. 343 *b*.

ARUNDEL-HOUSE, the Royal Society meet there, v. 359 *b*.

ASARUM, preparation of *Asarum* by *Helmont*, i. 502 *a*. Turned by boiling into a diuretick quality, i. 502 *b*.

ASCENSION of water in siphons explained, ii. 437 *a*. In a tube by suction, iii. 497 *a*. *Ascension* of liquors by suction considered, i. 146 *b*. Of water in sucking-pumps, iii. 15 *b*. Of liquors in an exhausted receiver, iii. 36 *a*. Of salts along the sides of glasses, iii. 37 *b*. The cause of the *Ascension* of liquor in a syringe, iii. 42 *b*.

ASCENT of light bodies examined, iv. 383 *b*. Of water in a glass-pipe held upright, the cause of it, i. 52 *b*.

ASCITES, a remedy for that distemper, iv. 215 *a*.

ASELLIUS, his discovery of the milky veins, i. 218 *b*.

ASHES of marble, the nature of it, i. 267 *b*. Account of the *Ashes* from the distillation of human blood, iv. 197 *a*. *Ashes* by fire indissolubly united into glass, i. 333 *b*. *Ashes* of some woods improper for glass, i. 338 *b*. The different nature of *Ashes* examined, i. 344 *b*. The various taste and colour of *Ashes*, i. 351 *a*. The *Ashes* of some concretes have little salt, i. 351 *b*. Difference between the *Ashes* of minerals and vegetables, i. 415 *b*. *Ashes* alone capable of vitrification, i. 416 *a*. Account of the raining of *Ashes*, v. 355 *b*.

ASPARAGUS, its effect upon the urine, iv. 320 *b*.

ASPERITY, the different forms of it in bodies, ii. 13 *a*. An account of the particular *Asperity* of colours; different kinds of *Asperity* diversify the surface of coloured bodies, ii. 15 *b*.

ASPHALTITES, a lake in *Judæa*, some account of it, ii. 14 *a*. ii. 446 *a*.

ASPHALTUM hydrostatically weighed, iii. 243 *a*.

ASS, the virtue of *Asses* milk, iv. 327 *b*.

ASSA FOETIDA, exposed to the air loses little of its weight, iii. 318 *a*.

ASSENT to be founded on intelligible reasons, iv. 56 *a*. What degree of *Assent* is required to the articles of religion, iii. 534 *a*.

ASSIZE, a description of the great and general *Assize*, v. 69 *a*.

ASSUEFACTION, the power of it, iii. 128 *b*.

ASTHMAS cured by a preparation of antimony, iv. 334 *a*.

ASTROITES, the difference between them and the animals they represent, iv. 527 *b*.

ASTRONOMERS, their way of measuring the difference of planets, iv. 45 *b*.

ATHEISM, the pernicious nature of it, ii. 205 *b*. Not encouraged by the study of philosophy, i. 430 *a*. Arguments afforded by religion against it, i. 458 *b*. *Atheism* overthrown by the miracles of Christ, i. 459 *a*.

ATHEIST, God never wrought a miracle to convert an *Atheist*, v. 41 *b*. *Atheists* pretenders to philosophy, v. 42 *a*. 'Tis possible to be a naturalist without being an *Atheist*, ii. 92 *a*. *Atheists* looked upon as monsters, i. 457 *a*.

ATLAS, a mountain always covered with snow, v. 167 *b*.

ATMOSPHERE we live in, not light, but heavy, i. 9 *a*. How many miles high, i. 9 *b*. Subject to many alterations, i. 27 *b*. Its nature discovered by an experiment, i. 44 *a*. The superficies of it curled and waved, i. 44 *b*. An experiment of its strength considered as a weight, i. 46 *a*. Concerning the pressure of the *Atmosphere*, i. 46 *b*. An Inquiry into the height of the *Atmosphere*, i. 56 *b*. It is many miles high, i. 58 *a*. There is no breathing at the very top of the *Atmosphere*, i. 68 *a*. The pressure of the *Atmosphere* particularly examined, i. 83 *b*. The air higher the nearer it is to the top of the *Atmosphere*, i. 97 *b*. It gravitates most near the surface of the earth, i. 99 *a*. May consist of a thin matter called ethereal, i. 125 *a*. The pressure of the *Atmosphere* concerned in the adhesion of flat bodies, i. 256 *b*. The effect of the weight of the *Atmosphere* upon the spring of the air, iii. 8 *a*. The breaking of glasses by the weight of the *Atmosphere*, iii. 11 *b*. The *Atmosphere* higher than the tops of mountains, iii. 34 *a*. The effects of the oblique pressure of the *Atmosphere*, iii. 34 *b*. The measuring the gravity of cylinders of the *Atmosphere*, iii. 39 *a*. Cupping-glasses fastned by the pressure of the *Atmosphere*, iii. 46 *a*. Notes on the *Atmosphere* of consistent bodies, iii. 64 *a*. *Atmospheres* given to bodies by heat, iii. 68 *b*. The difference of the weight of the *Atmosphere* on the top and bottom of a hill,

v. 133 *a*. The weight of a pillar of the *Atmosphere*, v. 134 *b*. The gravity of the *Atmosphere* in mines, v. 197 *b*. The varying gravity of the *Atmosphere* in the same place, ii. 243 *b*. The weight of the *Atmosphere* on change of weather examined, ii. 319 *a*. Reasons for the varying weight of the *Atmosphere*, ii. 449 *b*. Objections against the pressure of the *Atmosphere* answered, iii. 298 *a*. The reason why a man feels no pain from the pressure of the *Atmosphere*, iii. 299 *a*. The effect of the weight of the *Atmosphere* on men's sickness and health, iii. 307 *a*. The gravitation of the *Atmosphere* upon the surface of liquors exposed to it, iii. 501 *a*. Of what the *Atmosphere* properly consists, v. 116 *b*. Variation in the weight of the *Atmosphere*, iii. 90 *b*.

ATOM, the motion of *Atoms* according to Mr. *Hobbes*, i. 130 *b*. An account of the doctrine of *Atoms*, i. 198 *a*. The littleness of an *Atom* not to be imagined, iv. 45 *b*. The wisdom of God manifest in the smallest *Atoms*, i. 435 *b*. The motion of *Epicurus*'s *Atoms* examined, i. 448 *b*. They could not agree to make the world, i. 452 *b*. The motion of *Atoms* according to *Epicurus*, i. 282 *a*. The production of bodies from *Atoms*, iii. 77 *a*.

ATOMICAL hypothesis, observations concerning it, i. 228 *a*. Cannot explain the phænomena of nature, i. 443 *b*.

ATOMISTS, their notion of the consistence of bodies, i. 263 *a*. Their opinion of colours, ii. 21 *b*. Of glaciation, iv. 258 *b*. Their defects in the ways of reasoning, i. 450 *b*. They exclude a Deity from the production of things, i. 451 *b*. The perplexing difficulties of their scheme, i. 459 *b*.

ATROPHY, the consequence of a palsy, v. 89 *a*.

ATTENTION, the nature and use of it, ii. 152 *a*.

ATTRACTION, its nature explained, i. 48 *a*. Rarified air has no power of *Attraction*, i. 114 *b*. *Attraction* in the effluvia of the loadstone, i. 142 *b*. An account of magnetical *Attraction*, iii. 40 *b*. A briskness of motion requisite to electrical *Attractions*, iii. 323 *b*. The differing hypotheses of electrical *Attraction*, iii 647 *a*. It is weakned by cloudy air, iii. 648 *b*. Electrical *Attraction* the effect of fortuitous causes, iii. 650 *b*. The height that water can be raised by *Attraction*, iii. 19 *a*. The cause of *Attraction* by suction, iii. 493 *a*. When a moved body follows the movement, it is called *Attraction*, iii. 494 *a*. Explained by a man drawing a chain after him, iii. 494 *b*. Magnetical and electrical *Attractions* explained, iii. 495 *a*.

ATTRIBUTES of God not ascribed to created beings, i. 161 *a*. Conspicuous in the inimitable workmanship of nature, i. 167 *b*. Extra-essential *Attributes* belonging to bodies, iii. 80 *a*. The cosmical *Attributes* of bodies how founded, iii. 83 *a*. The divine *Attributes* not to be conceived, iv. 67 *b*. The divine *Attributes* surpass comprehension, iv. 340 *a*. An inquiry into the extent of God's *Attributes*, iv. 340 *a*. God may have divers *Attributes* unknown to us, iv. 340 *b*. The relative *Attributes* of God explained, iv 350 *a*. The *Attributes* of God illustrated by theological experience, v. 52 *b*. Legible in his creatures, i. 433 *b*. A proper contemplation of the divine *Attributes*, i. 440 *b*. The reason why they are not properly conceived, i. 459 *b*. The study of the divine *Attributes* a noble theme, iii. 419 *a*. The divine *Attributes* displayed in the creatures, v. 712 *b*.

ATTRITION produced in the solidest bodies by *Attrition*, iii. 579 *a*. The *Attrition* of contiguous air necessary to the production of heat, iii. 580 *a*. The production of heat by *Attrition* examined, iii. 56 *b*.

AUBREY, Mr. his Letter to Mr. *Boyle*, v. 571 *b*.

AVENTINUS, his strange account of men turned into statues, i. 278 *b*.

AVERNI, the nature and quality of those places, iv. 279 *a*. They kill the birds that fly over them, iv. 283 *a*.

AVERSIONS of particular persons, and their effects, considered, i. 541 *b*.

AVERY, Mr. *William*, his Letters to Mr. *Boyle*, v. 614 *b*. Account of a strange clay, of monstrous worms voided by the small-pox, &c. v. 615 *a*. His trial for the alkahest, account of the balm of *Gilead*, the scurvy, &c. v. 616 *a*. *b*.

AURUM *fulminans*, a way to make it, iv. 202 *b*. To make *Aurum potabile* without a furnace, v. 98 *a*. The nature and qualities of *Aurum potabile*, i. 505 *b*. To make *Aurum fulminans* go off in an exhausted receiver, iii. 253 *b*.

AUSTIN, St. his answer concerning hard questions, i. 73 *a*. His great wit compared to *Aaron*'s rod, ii. 129 *b*. The occasion of his conversion, ii. 136 *a*.

AUTHOR, the reasons why some *Authors* are not to be relied on, i. 202 *a*. The comparison of other *Authors* with the penmen of Scripture, ii. 115 *b*.

AUTHORITY, obedience to it explained, ii. 196 *a*.

AUTOMATON of a human body considered, iv. 412 *a*.

AUZOUT, Mr. his telescope described, v. 344 *a*. His considerations about sounds, v. 388 *b*.

AZORES, the nature of the air there, i. 33 *b*. In those islands the magnetick needle directly respects the poles, i. 221 *b*.

B.

BABEL, the design of the builders of *Babel*, ii. 199 *a*.

BABYLON, predictions of the fall of it, v. 419 *a*.

BACON, *Roger*, his remark upon gold, i. 325 *a*.

BACON, Sir *Francis*, an account of the continuation of his history, i. 196 *b*. His remark upon atheists, v. 41 *b*. His division of experimental philosophy, v. 51 *a*. His remark on the study of philosophy, iii. 154 *b*. His reflections on the rarity and density of bodies, v. 24 *b*. His celebration of God's attributes, i. 458 *b*.

BAGPIPE, a trial concerning sound upon a *Bagpipe*, iii. 54 *b*.

BAIT, the *Baits* to sin used by the devil, ii. 187 *b*.

BALANCES proper in hydrostatical experiments, v. 18 *a*. An account of a steriometrical *Balance*, v. 250 *a*.

BALASSORE, the corruption of the air in that place, v. 188 *b*.

BALDUINUS, his *phosphorus hermeticus*, iv. 20 *a*.

BALL in a tennis-court, remark upon it, iii. 365 *a*. The rebounding of a *Ball* from the ground considered, iv. 383 *b*. The use of a glass *Ball* hermetically sealed, v. 312 *a*.

BALM, the virtue of that herb, v. 440 *b*. The *ens primum* of *Balm* causes rejuvenescence. Some account of the *Balm* of *Gilead*, v. 616 *b*.

BALNEUM MARIÆ, an experiment on paste *in Balneo Mariæ*, iv. 157 *a*. The excellency of this *Balneum Mariæ*, iv. 159 *b*.

BALSAM, the virtue of terebinthinate *Balsam* of sulphur, iv. 331 *a*. The use of the essence of *Balsam*, v. 444 *b*. To volatilize the *Balsam* of sulphur, i. 571 *b*. The preparation of the sulphureous *Balsam* of *Penotus*, i. 572 *a*. Of a *Balsam* of sulphur made with oil-olive, i. 572 *b*. Other ways of preparing this *Balsam*, i. 573 *a*. A *Balsam* of antimony, i. 573 *b*. The nature of Peruvian *Balsam*, i. 575 *b*.

BALSAMUM SULPHURIS CRASSUM, the preparation and virtues of it, i. 511 *b*.

BALSAMUS SAMECH of *Paracelsus*, i. 316 *a*. A remedy against inward ulcers, i. 578 *a*.

BALSERA, a terrible earthquake in that place, v. 384 *a*.

BAMA MUSCATA, its nature and use, v. 301 *b*.

BANANAS, an Indian fruit, the manner of ordering it, iii. 590 *a*.

BAPTISTA PORTA, his water distilled from the tails of glow-worms, i. 354 *b*.

BAR of iron of a magnetick quality, iii. 83 *b*. Whence it has its attractive virtue, iii. 86 *b*. Old iron *Bars* of windows acquire a magnetick virtue, iii. 189 *a*. The attractive quality of a *Bar* of iron considered, iii. 645 *a*.

BARBADOES, account of the wines and drinks of that country, i. 491 *a*. Famous for sugar, iii. 150 *a*. Has no winds from the land, v. 129 *a*.

BARBARY, the mountains there covered with snow, v. 167 *b*.

BARCLAY, a cure for the stone in his *Euphormio*, v. 265 *a*.

BARIEUS, his way of diving, iii. 174 *b*.

BARK, the season to *bark* trees, iii. 169 *b*. The properties of the Peruvian *Bark*, i. 438 *a*. Its effect in the cure of agues, i. 480 *b*. The manner of its operation examined, i. 481 *a*. It works as a specifick against agues, iv. 305 *b*.

BARLOW, Bishop, letters from him to Mr. *Boyle*, v. 406 *a*. His concern for the persecuted Protestants in *France*, v. 408 *b*. His opinion of comets, v. 409 *a*. His account of an earthquake, v. 409 *b*. His opinion of departed souls, v. 410 *b*. Account of his pamphlet and the answer to it, v. 411 *b*. His zeal against images in churches, v. 413 *b*.

BARNET WATERS, an account of them, i. 497 *b*. The weight of that water, iv. 243 *b*.

BAROMETER,

BAROMETER, the height of mercury in *Barometers*, iii. 27 *b*. Made to be transported to distant countries, iii. 28 *a*. The height of mercury at the top and bottom of a hill, iii. 31 *a*. Experiment upon a portable *Barometer*, iii. 35 *a*. Dr. *Beale*'s notes upon it, v. 346 *a*. Extracts of observations on the *Barometer*, v. 348 *a*. Observations and directions about the *Barometer*, ii. 449 *a*.

BAROSCOPE, the raising of quicksilver in a *Baroscope*, iii. 8 *b*. A particular account of travelling *Baroscopes*, iii. 28 *b*. An experiment upon the *Baroscope*, iii. 29 *b*. In a long voyage, iii. 30 *a*. The use of *Baroscopes* in a calm sea, iii. 30 *b*. The ascent of the mercury in a travelling *Baroscope*, iii. 31 *a*. Used in the bottom of deep mines, iii. 32 *a*. The shorter leg sealed up, its effect, iii. 35 *a*. A *Baroscope* that serves at certain times, iii. 35 *b*. The description of a statical *Baroscope*, v. 130 *b*. Particular remarks on that instrument, v. 131 *a*. May be improved by divers accommodations, v. 132 *a*. The principal uses of it, v. 133 *a*. Experiment with an inverted *Baroscope*, v. 164 *b*. Proper directions for the use of *Baroscopes*, ii. 450 *a*. The advantages of a statical *Baroscope* above the mercurial, ii. 543 *a*. The improvement of this instrument by divers accommodations, ii. 545 *a*.

BAROSCOPICAL experiments, v. 578 *a*.

BARREL of a gun perfumed, iv. 226 *a*.

BARRENNESS of various soils remedied, iii. 146 *b*.

BARRYMORE, Earl of, his aversion to a cat, i. 541 *b*.

BARTHOLINUS, his observation concerning the lungs, i. 64 *b*. How the air is driven into the lungs, i. 65 *a*. His account of the ice of sea-water, ii. 264 *b*. Of the use of snow in preserving flesh, ii. 272 *b*. Of dead bodies preserved by cold, ii. 273 *b*. His experiment on the frozen water from a decocted cabbage, ii. 350 *a*. Propositions taken from his book *de Nive*, ii. 387 *b*.

BASHFULNESS in virtue a fault, v. 216 *b*.

BASILIUS VALENTINUS a great chymist, i. 427 *a*.

BASSET, his case with *Sidney-College*, v. 418 *a*.

BATHS, the heat and cold of them considered, ii. 241 *a*. The effect of the water of the hot spring upon silver, ii. 77 *a*. The making of an artificial *Bath*, v. 380 *b*.

BATTEL, *Andrew*, his account of the children of the Blacks, ii. 37 *b*.

BATTS, flying *Batts* as big as hens in the *Indies*, iv. 526 *b*. The symmetry and curious contrivance of the parts of a *Batt* considered, iv. 545 *a*.

BAXTER, Mr. inveighs against the corpuscularian philosophy, v. 377 *b*. His great opinion of Mr. *Boyle*'s writings in a letter to the author, v. 552 *b*.

BEALE, Mr. a character of him, v. 275 *b*. His notes on *Casaubon*'s tract of enthusiasm, v. 277 *a*. His account of himself, v. 280 *a*. The sequel of his barometrical notes, v. 346 *a*. His scales for the weighing of air, v. 356 *a*. His improvements in hearing and smelling, v. 368 *b*. Letters from Dr. *Beale* to Mr. *Boyle*, v. 423 *a*. His copy of Latin verses to Mr. *Boyle*, v. 424 *b*. The state of his health and constitution, v. 425 *b*. His improvement of memory, v. 430 *a*. An instance of his great memory, v. 431 *b*. An account of his mnemonical characters, *ibid*. His medical and chirurgical experiments, v. 439 *a*. His inquiries into husbandry, v. 445 *a*. About the conduct of fame, advancement of learning, arts, &c. v. 458 *b*. His scheme for improving the Royal Society, v. 460 *b*. His inquiries for the improvement of experimental philosophy, v. 468 *a*. *b*. His observations on the writings of Mr. *Boyle*, v. 475 *b*. His advice concerning the order, method, bulk, &c. to be observed in the publication of Mr. *Boyle*'s writings, v. 479 *a*. &c. Concerning the enlargement of his works, v. 487 *b*. His scheme for a correspondence with *New England*, v. 488 *b*. For the improvement of the Royal Society, v. 492 *b*. His opinion concerning dreams and their interpretation, v. 495 *b*. Of comets, darkness within the disk of the sun, &c. v. 496 *a*. His proposal for a supply of proper persons in the Royal Society, v. 498 *b*. For nurseries in gardens, improvements in orchards, v. 500 *a*. His remark on the growth of popery, v. 500 *b*. On Mr. *Boyle*'s treatise of cold, hygroscopes, &c. v. 501 *a*. On a tract of his own concerning gardens and orchards, v. 502 *a*.

BEAM of light, the reflection and refraction of it, iii. 161 *b*. The effect of the *Beams* of the moon, v. 128 *b*. A liquor drawn off the *Beams* of the sun, v. 284 *b*. *Beams* of houses in *Muscovy* crack with the frost, ii. 274 *b*.

BEAN, experiment on the germination of *Beans*, iii. 84 *b*. The expansive force of swelling *Beans*, iii. 85 *a*. Experiment of dried *Beans* in a metalline cylinder, iii. 85 *b*. On horse-*beans in vacuo*, iv. 137 *b*. On *Beans* in an iron tube, iv. 141 *b*. Spirits distilled from *Beans* and peas, i. 388 *b*.

BEAR, an account of the white *Bears* in *Greenland*, ii. 392 *a*. They live by sucking their paws, ii. 400 *a*.

BEAST, the employment of the mysterious *Beasts* in the Revelations, i. 162 *b*. The use of dissecting *Beasts*, i. 477 *a*. Of letting poisons into the veins of *Beasts*, i. 478 *b*.

BEAVER, their art in building their houses considered, iv. 542 *a*.

BEAUTY, the intent of all sublunary *Beauty*, i. 168 *a*.

BECKER, he discovers the perpetual motion, v. 280 *b*. His Argonautick invention, v. 283 *b*.

BED, a particular contrivance of a *Bed* for the sick, v. 274 *b*.

BEE, an experiment with a *Bee* in the air-pump, i. 62 *b*. An account of the swarming of *Bees*, i. 253 *b*. Their way of life, ii. 149 *b*. Experiment on a *Bee* in artificial air, iv. 125 *a*. The nature, government, and œconomy of *Bees*, iv. 541 *b*.

BEEF frozen becomes insipid, ii. 274 *a*. *Beef* too rank a diet for a student, v. 458 *b*. Experiment with a piece of *Beef* and common air, iv. 116 *a*. Of *Beef in vacuo*, iv. 134 *b*. Experiment on raw *Beef*, iv. 152 *a*. On *Beef* and water in a vessel stopt with a screw, iv. 158 *a*.

BEER kept from freezing, iii. 98 *b*. Hinders the fermentation of peaches, iv. 152 *a*. Useful for the preservation of flesh, iv. 152 *b*. Ways of preserving *Beer*, v. 269 *b*. *Beer* turned giddy by thunder, v. 281 *a*. The use and virtue of medicated *Beers*, v. 421 *a*. Account of frozen *Beer* in *Nova Zembla*, i. 311 *b*. The souring of *Beer* in time of thunder considered, iii. 325 *a*. A method to prevent it, iii. 325 *b*.

BEGGAR, reflections upon two *Beggars*, ii. 163 *b*.

BEGUINUS, the effect of his distilling *Saccharum Saturni*, i. 335 *a*. His description of mercury, i. 341 *b*. His three principles of mixed bodies, i. 346 *b*. His remark upon distillation of salt, i. 243 *b*. Upon turbith mineral, ii. 68 *b*. Upon the country of *Gloricia*, iv. 284 *b*.

BEHM, MICHAEL, his character, v. 380 *b*.

BELCARRAS, Lord, his account of a strange light, v. 178 *b*.

BELIEF, when a matter is proper or unfit for our *Belief*, iii. 524 *a*. Necessary qualifications to make the *Belief* of a thing rational, iii. 524 *b*. Our *Belief* may be rational, though the proof of a thing be difficult to be understood, iii. 526 *a*. Our *Belief* of miracles, &c. depends upon the omnipotence of God, v. 656 *b*. How to regulate our *Belief*, when philosophy and the Scriptures disagree, v. 680 *a*. *Belief* regulated by our perceptions, iv. 57 *a*.

BELIEVER, a tree in autumn the emblem of a true *Believer*, ii. 160 *b*.

BELL, experiment made in the air-pump upon a *Bell*, i. 40 *b*. The nature of its sound explained, i. 41 *a*. The metal of it broken by water freezing in the crannies of it, i. 61 *b*. The reason of the sound of a *Bell* explained, i. 283 *a*. A trial about sounds by a *Hand-Bell*, iii. 53 *b*. An account of a diving *Bell*, iii. 107 *a*. Of the ringing noise of a *Bell*, iv. 271 *a*. The way of breaking or cracking a *Bell*, iv. 271 *b*. The effect of striking a key on the side of a *Bell*, iv. 271 *b*. The effect of the sound of a *Bell* upon a lady, i. 537 *b*.

BELL-METAL, made of a mixture of tin and copper, iii. 194 *a*. Sensibly affected by motion, iv. 259 *a*. The cracking of *Bell-metal* by hasty refrigeration, iv. 268 *a*.

BELLONIUS, his account of the smiths of *Damasco*, iii. 148 *a*. Of the air of Mount *Ida*, v. 167 *a*.

BELLOWS, an experiment upon them to try the pressure of the air, iii. 46 *b*. To try the motions of the æther, iii. 48 *a*. The blowing up the lungs of a dog with *Bellows*, v. 369 *b*.

BELSHAZZAR, a remark upon his case, v. 213 *a*.

BELT, observations on *Jupiter*'s *Belt*, v. 309 *b*.

BENJAMIN, the precipitation of it turned into a milky substance, i. 60 *a*. The virtue of the solution of *Benjamin*, iii. 147 *a*. Experiment with tincture of *Benjamin* and spirit of salt, v. 86 *a*. i. 266 *a*.

BENZOIN, an account of a liquor distilled from it, i. 266 *a*.

BERIGARDUS,

BERIGARDUS, his experiment on the congelation of refrigerated water, ii. 342 *a*. His opinion of lixiviums made of the ashes of plants, ii. 350 *b*. His way of writing, instead of ink, ii. 351 *a*.
BERMUDAS, an account of the hurricanes in those islands, v. 96 *a*.
BERNARD, Dr. his Letters to Mr. *Boyle*, v. 598 *b*.
BERRIES growing upon a shrub in *New-England*, an account of them, v. 642 *a*.
BETTY, the character of black *Betty*, v. 239 *b*.
BEVENTO, *Cellini*, his treatise on Sculpture, iii. 172 *a*.
BEZETTA RUBRA, the virtue of it, ii. 71 *b*.
BEZOAR stones, their quality and specifick gravity, v. 7 *b*. A trial of their genuineness, v. 91 *b*.
BEZOARDICUM, a medicine, an account of it, i. 332 *b*. The character of *Bezoardicum imperiale* by *Riverius*, i. 502 *a*. The method of making it, iii. 622 *b*.
BIBLE, objections against the style of it, ii. 94 *b*. Method used in translating the *Bible*, ii. 95 *a*. The *Bible* not to be looked upon as our English Statute-Book, ii. 96 *b*. Suited to all sorts and conditions of men, ii. 97 *b*. Written in a plain and familiar way, ii. 98 *a*. An inquiry into the obscure passages of the *Bible*, ii. 100 *b*. The *Bible* intelligible in all things necessary, ii. 101 *b*. Like the diamond among precious stones, ii. 103 *a*. Objection against the method of the *Bible* answered, i. 103 *b*. The *Bible* ought to be considered as a system, ii. 106 *b*. Composed by the author of the book of Nature, ii. 107 *a*. The *Bible* of more value than all the books in the world, ii. 109 *b*. The repetitions in it teaches us somewhat untaught before, ii. 110 *b*. Objection that the *Bible* is a barren book answered, ii. 112 *a*. It is furnished with all proper motives to a virtuous life, ii. 112 *b*. Is an excellent system of Ethicks, ii. 113 *b*. The best books of devotion taken from the *Bible*, ii. 114 *a*. A particular description of its value and excellency, ii. 114 *b*. Exceeds all books of morality, ii. 115 *a*. Properly compared to the tree of life, ii. 117 *a*. Some chapters of it to be read every day, ii. 117 *b*. It will always contain undiscovered mysteries, ii. 118 *b*. Has more eloquence than it seems to have, ii. 120 *b*. Its style not to be judged by vulgar translations, ii. 121 *a*. Is full of figurative expressions, ii. 124 *a*. It is the interest of bad men to decry the *Bible*, ii. 125 *a*. It has a great influence upon intelligent readers, ii. 132 *b*. The *Bible* purchased at a great rate, ii. 133 *a*. More esteemed than any system of Ethicks, ii. 135 *b*. Compared to *Aaron*'s breast-plate, ii. 137 *b*. The translating of the *Bible* into the *Turkish* language, v. 249 *b*. Qualifications requisite to understand and comment upon the *Bible*, iii. 416 *a*. Some account of the *Irish* translation of the *Bible*, v. 619 *a*.
BILL, Monsieur, some account of him, v. 292 *b*.
BILL, reflections on a physician's *Bill*, ii. 176 *a*. Observations on the *Bills* of mortality, v. 335 *a*.
BIOLYCHNIUM, or the lamp of life, iv. 200 *a*.
BIRCH, the use of the tears of *Birch*, i. 492 *a*. Cups made in *Russia* of the gummy droppings of *Birch*, v. 634 *b*.
BIRCH-WATER, some account of it, v. 266 *b*. The medicinal virtue of it, i. 357 *a*.
BIRD, the manner of their dying in an air-pump, i. 68 *b*. A way of preserving *Birds* taken out of the egg, ii. 543 *a*. The duration of the life of a *Bird* compared with the lasting of a candle or burning-coal *in vacuo*, iii. 262 *a*. The fishy taste of sea-*Birds*, iii. 541 *b*. Observations on the eyes of *Birds*, iv. 525 *a*. Experiment by a *Bird* in the exhausted receiver, iii. 120 *a*. To shew the pressure of the air, iii. 130 *a*. Upon a small *Bird* in common air, iv. 124 *a*. Tender *Birds* preserved by beer, iv. 154 *b*. The life of *Birds* in close air examined, v. 395 *a*.
BISE, a mixture of *Bise* and orpiment to produce a green colour, ii. 51 *a*.
BISKET, a way to preserve it from putrefaction, i. 493 *a*.
BISMUTUM, medicines made out of it, i. 501 *b*. Account of a liquor distilled from it, ii. 250 *b*. A strange liquor obtained from it, v. 103 *b*.
BITING of a dog, a cure for it, v. 317 *b*.
BLACK, from what causes bodies appear *black*, ii. 28 *b*. Beams that fall on *black* bodies are reflected towards the body itself, ii. 29 *b*. Rooms hung with *black* warmer than others, ii. 30 *a*. The surface of *black* bodies rougher than of other colours, ii. 30 *b*. Bodies burnt are *black*, but burnt through are white, ii. 32 *b*. The colour of *black* bodies may be changed, ii. 38 *b*. *Black* bodies easier warmed by the sun than white ones, iii. 190 *a*.
BLACKBERRY, an experiment upon the juice of *Blackberries*, ii. 57 *b*.
BLACKNESS, an inquiry into the nature of it, ii. 28 *a*. An experiment to take away and restore *Blackness*, ii. 31 *b*. The *Blackness* of Negroes considered, ii. 34 *b*. Not inconsistent with beauty, ii. 36 *b*. Is not occasioned by sulphur, ii. 40 *a*. Some inquiries into the theory of *Blackness*, ii. 40 *b*.
BLACKS, poison used by the *Blacks* in *Africa*, iv. 307 *a*.
BLADDERS, various experiments in the air-pump concerning them, i. 13 *a*. *b*. An oiled *Bladder* used to try the expansion of water, i. 30 *a*. An experiment by a *Bladder* to change water into air, i. 33 *b*. A thin *Bladder* will not at its pores give way to rarified air, i. 54 *a*. The weight of a large *Bladder* without air, i. 56 *a*. A *Bladder* found in a boy instead of lungs, i. 65 *a*. *Hobbes*'s objection against the experiment of a *Bladder* to prove the weight of the air, i. 126 *b*. The motion of restitution in a blown *Bladder* considered, i. 198 *b*. A *Bladder* distended with water becomes a hard body, i. 245 *a*. The breaking of blown *Bladders* by the spring of the air, iii. 12 *b*. The lifting of weight by air included in a *Bladder*, iii. 13 *b*. Experiment on bellows made of a *Bladder*, iii. 48 *a*. *Bladders* of dead animals penetrable by water, iv. 209 *b*. Experiment by a *Bladder* to prove the porosity of membranes, iv. 214 *a*. The effect of rubbing-stones taken out of the *Bladder*, iv. 270 *b*. The nature and contexture of the urinal *Bladder*, iv. 280 *b*. The nature and quality of stones in the *Bladder*, v. 7. *b*. The way of cutting the *Bladder* out of the heads of cattle, v. 314 *b*. The weight of a stone taken out of a *Bladder*, v. 387 *a*. A receipt for the stone in the *Bladder*, i. 555 *b*. *Bladders* affected by the moisture of the air, iii. 400 *b*. Water penetrates the pores of *Bladders*, but not air, iii. 484 *b*. Conjecture concerning *Bladders* of air found in fishes, iii. 546 *a*.
BLASPHEMY, in what manner punished among the *Turks*, v. 207 *a*.
BLAST, the effect of malignant *Blasts* of wind, iv. 287 *a*.
BLAZING star, an account of it, v. 178 *a*. With a tail in the form of a sword, v. 290 *a*.
BLEEDING, a gem outwardly applied to stop *Bleeding*, iv. 338 *b*. The *Bleeding* of one animal into another, v. 363 *b*.
BLEY, Monsieur, some account of him, v. 308 *b*.
BLIND, an account of a *blind* man's distinguishing colours, ii. 14 *b*. Of another endowed with the same faculty, v. 339 *b*.
BLINDNESS, cured by a mercurial powder, i. 550 *b*.
BLOCK-TIN, an experiment upon it, i. 208 *a*.
BLOOD, the *Blood* of animals abounds with salt, i. 274 *a*. Meditations on letting of *Blood*, ii. 168 *b*. Experiment on the expansion of *Blood*, iii. 127 *b*. The natural history of human *Blood*, iv. 161 *a*. Particularly of extravasated *Blood*, iv. 162 *b*. Titles relating to the history of human *Blood*, iv. 164 *a*. Miscellaneous experiments about human *Blood*, iv. 166 *a*. Inquiry into the heat of the *Blood*, iv. 166 *b*. Human *Blood* in distillation affords oil, iv. 167 *a*. The specific gravity of human *Blood*, iv. 167 *b*. Experiment on *Blood* and spirit of wine, iv. 168 *a*. The odour of the volatile salt of *Blood*, iv. 168 *b*. Grains of the salt of *Blood*, their figure, iv. 169 *a*. The colour of oil afforded by *Blood* by distillation, iv. 170 *a*. Human *Blood* of use in medicine, iv. 170 *b*. The fixed salt of human *Blood*, iv. 171 *a*. The caput mortuum obtained from dried *Blood*, *ibid*. *Blood* consists of a serous and fibrous part, iv. 172 *a*. The weight of the fibrous part of human *Blood*, iv. 172 *b*. The principles of the serous part of the *Blood*, iv. 174 *a*. No insects generated in *Blood*, iv. 175 *b*. The serum of *Blood* coagulated by heat, iv. 176 *a*. History of the spirit of human *Blood*, iv. 176 *b*. Titles concerning the spirit of human *Blood*, iv. 177 *a*. The effect of human *Blood* by fermentation or putrefaction, iv. 177 *b*. What the spirit of human *Blood* really is, iv. 178 *b*. To what species of saline bodies human *Blood* is to be referred, iv. 179 *a*. The spirit of human *Blood* belongs to the class of alkali's, iv. 179 *b*. The effect of its operation on other bodies, iv. 180 *a*. Whether spirit of *Blood* differs from volatile alkali's, iv. 180 *a*. The quantity of spirit contained in human *Blood*, iv. 181 *a*. The specifick gravity of the spirit of human *Blood*, *ibid*.

ibid. The subtilty of the active parts of spirit of *Blood*, iv. 181 *b*. The heat and coldness of the spirit of human *Blood*, iv. 182 *b*. The dissolutive power of the spirit of human *Blood*, iv. 183 *a*. The coagulating power of the spirit of human *Blood*, iv. 185 *b*. Spirit of *Blood* precipitates the solutions of many bodies, iv. 186 *a*. Spirit of *Blood* mingles with spirit of vegetables, iv. 186 *b*. The way to aromatize the spirit of human *Blood*, iv. 187 *a*. The effect of spirit of *Blood* in a pneumatick engine, iv. 188 *b*. The smell of the spirit of human *Blood* rectified, iv. 191 *b*. The several virtues of the spirit of human *Blood*, iv. 193 *b*. A large quantity of oil in human *Blood*, iv. 197 *a*. An experiment upon pulverable *Blood*, iv. 197 *b*. The colour of *Blood* turned upside down, iv. 198 *a*. Human *Blood* covered with a rectified vinous spirit, iv. 198 *b*. The volatile salt of *Blood* hinders water from freezing, iv. 199 *a*. The freezing of the fibrous part of human *Blood*, iv. 199 *b*. The transplantation of diseases by the patient's *Blood*, iv. 200 *a*. The weighing of the fibrous part and the serum of human *Blood*, iv. 200 *b*. The distilling of human *Blood* with quicklime, iv. 201 *b*. Spirit of *Blood* tried upon powder of dried *Blood*, iv. 203 *b*. Experiment on spirit of *Blood* in a thermoscope with distilled water, iv. 204 *a*. Human *Blood* diversifiable according to the constitutions of persons, iv. 205 *a*. *Blood* conveyed into the substance of bones, iv. 216 *a*. Milk and urine materially in the *Blood*, iv. 306 *a*. How specifick medicines operate upon the *Blood*, iv. 313 *a*. Mineral waters are carried into the mass of *Blood*, iv. 313 *b*. The change of the *Blood* effected by specificks, iv. 316 *b*. They quicken and enliven the mass of *Blood*, iv. 317 *a*. They operate by dilating the *Blood*, iv. 317 *b*. The state of the *Blood* in a deep sorrow, iv. 318 *a*. The *Blood* affected by shame and joy, iv. 318 *b*. And by the moss of a dead man's skull, iv. 323 *a*. An effectual remedy for the stopping of *Blood*, iv. 333 *b*. Experiment upon *Blood* warm from the animal, v. 251 *b*. Experiments on the transfusion of *Blood*, v. 364 *b*. Of the transfusion of the *Blood* of a sheep into a man, v. 372 *a*. An instance of white *Blood*, v. 439 *b*. Analyzed *Blood* consists of five distinct substances, i. 299 *b*. The effect of fire in the distillation of *Blood*, i. 309 *a*. Oils from human *Blood* of different qualities, i. 309 *b*. Experiment on the distillation of human *Blood*, i. 315 *b*. The way of conveying poisons into the *Blood*, i. 479 *a*. The stopping of *Blood* by the Indians, i. 498 *a*. Medicines out of human *Blood*, i. 508 *a*. A simple medicine to stanch *Blood*, i. 509 *b*. A syrup to stop vomiting of *Blood*, i. 510 *a*. The virtues of stones in stopping of *Blood*, i. 524 *b*. Account of the preparations of man's *Blood*, i. 559 *b*. The way of drawing the salts and spirits of *Blood*, i. 560 *b*. Of preserving the fugitive salt of human *Blood*, i. 569 *a*. The weight of bodies frozen and unfrozen examined, ii. 331 *a*. Observations upon white *Blood*, ii. 408 *a*. The method of transfusing the *Blood* out of one animal into another, ii. 550 *a*. Experiments by injecting acid liquors into *Blood*, ii. 554 *a*. The inside of a clot of *Blood* exposed to the air becomes florid, iii. 468 *a*. The uses of the venal and arterial *Blood*, iv. 540 *a*. The reason of the different colour of the *Blood* of the veins and arteries, v. 523 *b*. In letting *blood*, the last *Blood* is the best, v. 524 *a*.

BLOOD-HOUNDS, their quickness of smell upon the scent of a man, a deer, *&c.* iii. 332 *b*

BLOOD-STONE, the virtue of it, iii. 70 *b*. Its particular effects iv. 212 *a*. Hung about the neck stops bleeding, iii. 245 *b*.

BLOSSOM, reflections on the blossoms of a tree, ii. 159 *a*.

BLOWING of glasses in a mould examined, i. 289 *b*.

BLOW-PIPE, its effect in melting of metals, iv. 258 *a*.

BLUE, Cloth dyed *blue* changed into a green, ii. 50 *b*. The way to make an excellent *Blue*, ii. 62 *a*. *Blue* colour destroyed by spirit of vinegar, v. 393 *a*.

BLUE-BOTTLES, a weed, experiment upon the juice of it, ii. 53 *b*

BLUSH, a *Blush* the livery of virtue, i. 536 *a*.

BOAT, Dr. some account of him, v. 258 *b*.

BODY, a living *Body* is perspirable throughout, i. 72 *a*. When a *Body* is said to be rarified or condensed, i. 93 *a*. Great *Bodies* too unwieldy to constitute fluid ones, i. 242 *a*. *Bodies* are kept fluid by agitation, i. 243 *a*. The fluidity of *Bodies* hindred by their shape, i. 244 *a*. The adhesion of convex and concave *Bodies*, i. 255 *b*. *Bodies* become stable by the rest of their parts, i. 261 *a*. The several ways of making *Bodies* consistent, i. 270 *a*. The stability of *Bodies* derived from their abounding in salt, i. 275 *a*. Whether there be among *Bodies* any absolute rest, i. 281 *a*. Of what principles or elements they consist, i. 296 *a*. An account of the particles that compose the surface of bodies, ii. 15 *a*. White bodies become yellow by the affusion of fair water, ii. 17 *a*. White *Bodies* reflect the greatest share of light, ii. 25 *a*. *Bodies* may lose their colours without any alteration of their principles, ii. 52 *b*. To discover the changes made in *Bodies* by nature or art, ii. 67 *b*. The curious structure of a human *Body*, ii. 166 *b*. Effluvia emitted from solid *Bodies*, iii. 64 *a*. Constant atmospheres round solid *Bodies*, iii. 70 *b*. Different qualities produced by mixture of *Bodies*, iii. 75 *a*. The effect of the different shape and size of *Bodies*, iii. 78 *a*. The great variety of motion in *Bodies*, iii 78 *a*. The extra-essential changes in *Bodies*, iii. 81 *b*. The insinuating nature of subtile *Bodies*, iii. 84 *a*. The steams of *Bodies* elevated by the air, iii. 130 *a*. The surface and solidity of *Bodies* explained, iii. 157 *b*. The difference of the weight of *Bodies* in water and in air, iii. 164 *b*. An account of factitious self-shining *Bodies*, iv. 20 *a*. Difficult to frame the true notion of a *Body*, iv. 53 *a*. And the manner of its operation, iv. 58 *b*. How *Bodies* inanimate differ from one another, iv. 93 *a*. How the fire associates with mixed *Bodies*, iv. 93 *b*. Putrified *Bodies* have produced all their air, iv. 133 *a*. The preservation of *Bodies* in compressed liquors, iv. 149 *b*. The porousness of animal *Bodies*, iv. 206 *a*. How much they lose in weight by transpiration, iv. 208 *b*. *Bodies* actually cold emit effluvia, iv. 212 *a*. Solid ponderous *Bodies* not void of pores, iv. 218 *a*. Solid *Bodies* specifically heavier than water, iv. 219 *b*. The reason of the opacity of *Bodies*, iv. 222 *a*. The local motion of *Bodies* inquired into, iv. 252 *a*. The effect of fluid *Bodies* upon solid ones, iv. 254 *b*. The effect of motion in small invisible *Bodies*, iv. 256 *b*. The effect of soft *Bodies* upon hard ones, iv. 259 *b*. The effect of motion in organical *Bodies*, iv. 260 *b*. Remark on *Bodies* being in a state of rest, iv. 266 *b*. The reason of the spontaneous breaking of *Bodies*, iv. 268 *b*. Various steams emitted by subterraneal *Bodies*, iv. 280 *a*. Whether the stars have an effect upon human *Bodies*, iv. 296 *b*. A living *Body* an engine admirably framed, iv. 308 *a*. The quality of the acids in a diseased *Body*, iv. 311 *b*. Strange effects from the mixture of *Bodies*, iv. 325 *b*. The various nature of simple *Bodies*, iv. 335 *a*. The excellent contrivance of particular *Bodies*, iv. 343 *a*. The usefulness of the parts of a human *Body* to each other, iv. 344 *b*. Every intire *Body* retains a motive power, iv. 346 *a*. Hydrostatical way of determining the bulk of *Bodies*, v. 19 *a*. The measuring of *Bodies* not dissoluble in water, v. 21 *b*. The peculiar fabrick of *Bodies* proves a Divine Being, v. 43 *a*. The change of colour in *Bodies* exposed to the air, v. 120 *a*. The embalming of *Bodies* in the island *Teneriff*, v. 173 *b*. Human *Bodies* affected by difference of waters, v. 200 *b*. The burning of *Bodies in vacuo*, v. 255 *a*. Account of four *Bodies* anatomized, v. 292 *b*. The vibrations of hard *Bodies* sounding, v. 306 *a*. Experiments of falling *Bodies*, v. 307 *b*. *Bodies* exhibit the elements they are composed of, i. 247 *b*. The ingredients of mixed *Bodies* according to *Paracelsus*, i. 298 *a*. The matter employed in the production of mixed *Bodies*, i. 300 *a*. The texture and qualities of mixed *Bodies*, i. 301 *b*. Difficult to be resolved into elementary substances, i. 305 *a*. *Bodies* analyzed by other substances than fire, i. 307 *b*. The dissolving of *Bodies* inquired into, i. 308 *a*. Account of what is obtained from mixed *Bodies* by fire, i. 312 *a*. The difference between compounded *Bodies* explained, i. 312 *b*. *Bodies* are nothing but water subdued by several virtues, i. 314 *b*. The nature of mixed *Bodies* examined, i. 318 *b*. Phlegm and earth necessary to the constitution of *Bodies*, i. 327 *a*. The œconomy of *Bodies* discomposed by cold, i. 327 *b*. Decompounded *Bodies* among the works of nature, i. 332 *a*. The change of consistent *Bodies* into fluid, i. 333 *b*. Compounded *Bodies* constitute distilled liquors, *ibid.* Whether the mercurial part of mixed *Bodies* be uncompounded, i. 341 *b*. The consistence of *Bodies* made up of five elements, i. 346 *b*. The artificial resolution of compound *Bodies*, i. 354 *a*. The resolution of mixed *Bodies* into insipid water, i. 365 *b*. The changes made in the texture of *Bodies*, i. 369 *b*. Liquid substances turned into pulverable *Bodies*, i. 403 *a*. The simplicity of the earthy

earthy part of mixed *Bodies*, i. 415 *a*. The diſſolution of *Bodies* in water, i. 415 *b*. Obſervations on the ſtructure of human *Bodies*, i. 434 *b*. The exquiſite workmanſhip of human *Bodies*, i. 455 *a*. The reſemblance between the *Bodies* of Brutes and the *Bodies* of Men, i. 465 *b*. Ways of preſerving the parts of bulky *Bodies*, i. 469 *b*. Dead *Bodies* preſerved by cold, ii. 273 *a*. *Bodies* act by their qualities upon our ſenſes, ii. 458 *a*. Diverſity of *Bodies* ariſes from ſomewhat elſe than the matter they conſiſt of, ii. 460 *b*. *Bodies* not to be conſidered as diſtinct portions of matter, but as diſtinct parts of the univerſe, ii. 464 *a*. The operation of *Bodies* on one another, ii. 466 *b*. From whence the generation and corruption of *Bodies* are deduced, ii. 472 *a*. The matter of all natural *Bodies* is a ſubſtance extended and impenetrable, ii. 474 *b*. The diſtinction of *Bodies* into different ſpecies very uncertain, ii. 485 *b*. *Bodies* in cold countries remain long unputrified; ii. 529 *a*. *Bodies* are what they are by the matter and modification, ii. 529 *b*. The ſame *Body* may have a twofold modification, ii. 532 *b*. Artificial *Bodies* may be endowed with ſpecifick virtues, iii. 244 *b*. A *Body* does gravitate when it does not deſcend, iii. 279 *b*. The reſiſtance of *Bodies* violently compreſſed by air, iii. 283 *b*. The natural and violent ſtate of *Bodies* explained, iii. 390 *a*. How a *Body* in Scripture is ſaid to be the ſame, iii. 539 *a*. A human *Body* continually in a changing condition, iii. 540 *b*. The particles of a *Body* may retain their nature under various diſguiſes, iii. 541 *b*. The relative nature of *Bodies* potentially cold, iii. 573 *b*. To divide a *Body* almoſt inſipid, into two *Bodies* of very ſtrong and differing taſtes, iii. 586 *a*. Of two *Bodies*, one acid and corroſive, the other alkalizate and fiery, to produce a *Body* almoſt inſipid, iii. 586 *b*. Of two *Bodies*, the one very bitter, the other very ſalt, to make an inſipid mixture, iii. 587 *a*. Of two *Bodies*, one very ſweet, the other ſalter than brine, to make an inſipid mixture, iii. 587 *b*. Of an inſipid *Body* and a ſour one, to make a ſubſtance more bitter than gall or aloes; *ibid*. Of an inſipid *Body* and an highly corroſive one, to make a ſubſtance as ſweet as ſugar, iii. 587 *b*. Of obtaining, without addition, from the ſweeteſt *Bodies*, liquors corroſive enough to diſſolve metals, iii. 588 *a*. To divide a *Body* bitter in the higheſt degree, into two ſubſtances, the one very ſour, the other perfectly inſipid, *ibid*. The innate appetite of conjunction between *Bodies* conſidered, iv. 390 *b*. The appetite of *Bodies* to recover their natural ſtate, iv. 391 *a*. A human *Body* conſidered as an hydraulo-pneumatical engine, iv. 409 *a*. The celeſtial *Bodies* not made only to illuminate the little globe of the earth, iv. 535 *a*. The curious contexture of a human *Body* anatomically conſidered, iv. 537 *b*. The great variety of parts in a human *Body*, v. 695 *a*. The ſeveral parts curiouſly examined and explained, v. 695 *b*. The ſymmetry, the aſſociation of the parts, *&c*. of a human *Body* conſidered, v. 703 *a*. Why ſome of the noble parts of a human *Body* were made double, v. 704 *a*. The wonderful perfections and advantages of a living human *Body*, v. 705 *b*.

BOETIUS DE BOOT, his remark upon the carbuncle, ii. 82 *a*.

BOG, the way of drying and curing of *Bogs*, v. 464 *b*.

BOHACK, a ſtrange creature in *Poland*, an account of it, ii 330 *a*.

BOLE-ARMONIACK, a remedy for ſeveral diſeaſes, iv. 337 *a*.

BOLONIAN ſtone, the admired quality of it, iii. 88 *b*. A particular account of its nature, iv. 20 *a*. How long it retains its virtue, iv. 20 *b*. A *Bolonian* ſtone readily calcined, v. 404 *b*.

BOLUS TOCKAVIENSIS, its virtue, i. 501 *a*.

BONE, *Bones* in the ſtomach of dogs reduced into fluid bodies, i. 242 *b*. The poroſity of *Bones* inquired into, iv. 216 *a*. Blood veſſels enter into the ſubſtance of *Bones*, iv. 216 *b*. Miſchief done to the *Bones* by mercury, iv. 217 *b*. The effect of a *Bone* that preſſed upon the *dura mater*, v. 88 *b*. Account of a well that yields *Bones*, v. 275 *a*. Of women voiding of *Bones*, v. 303 *a*. The *Bones* of a youth corrupted, v. 385 *a*. The taſte of *Bone*-aſhes examined, i. 351 *b*. The cure of broken *Bones* by *Oſteocolla*, i. 550 *a*. *Bones* of animals affected by the moiſture of the air, iii. 401 *a*. *Bones* of children voided ſeveral ways by women, v. 530 *b*. *Bones* in a human body, the number of them, v. 695 *a*.

BONTIUS, his account of the bezoar-ſtone, i. 506 *b*. His remedy for the ſpaſmus, i. 544 *b*.

BOOK, the advantages of writing ſmall *Books*, v. 486 *a*. *Books* of natural philoſophy of little uſe, i. 204 *b*. The inconveniences in tranſlating *Books*, iv. 99 *b*.

BOOT, Dr. *Gerard*, his remedy againſt the ſtone, i. 484 *a*.

BORELLUS, a remarkable phænomenon mentioned by him; iv. 272 *b*. His remark on the motion of pendulums, v. 395 *a*. Some account of him, v. 329 *b*.

BORILLIA, the uſe of it in making glaſs, iv. 253 *b*.

BORRHI, Signior, his antidote againſt the plague, v. 333 *b*.

BOUNTY, the particular method of God's *Bounty*, i. 172 *a*.

BOTANISTS, their account of the number of vegetables, i. 427 *a*. The character of Braſilian *Botaniſts*, i. 544 *a*.

BOTTLE, the ſpring of the air tried in a *Bottle* of green glaſs, ii. 9 *a*. The preſſure of the air on the corks of *Bottles* in a deep ſea, iii. 286 *b*. The preſſure of the water more as it grows deeper, iii. 287 *a*. Stone *Bottles* pervaded by ſpirituous liquors, iv. 221 *b*.

BOTTOM, the *Bottom* of the ſea cold, iii. 108 *a*. Relations about the *Bottom* of the ſea, iii. 110 *a*. The tranquillity of the water in the *Bottom* of the ſea, iii. 112 *a*. Trees and fruits growing at the bottom of the ſea, iii. 388 *a*.

BOURBON, the nature of the ſalts in the waters of *Bourbon*, iv. 246 *a*.

BOW, remarks on the ſtring and lath of a *Bow*, iv. 207 *a*.

BOW-DYE in ſcarlet, how made, ii. 76 *b*.

BOX, a trial of the propagation of ſounds by a cylinder of *Box*, iii. 53 *a*. Experiment on a coal of *Box*, i. 305 *a*. Remarks on the diſtillation of *Box*, i. 328 *b*. The quality of the ſpirit of *Box*, i. 329 *a*. The effect of diſtilling the rectified ſpirit of *Box*, i. 390 *b*. The mixture of ſpirit of *Box* and oil of vitriol, i. 391 *b*.

BOY, a *Boy* with horns inſtead of nails at the end of his fingers and toes, v. 569 *b*. A ſtrange cure of a *Boy* hurt with a plough, v. 649 *a*.

BOYLE, the Honourable Mr. *Robert*, his reaſons for defending his doctrine of the ſpring of the air, i. 77 *a*. *&c*. His deſign to deviſe experiments, and enrich the hiſtory of nature, i. 78 *a*. The manner of his defence againſt *Linus*, i. 78 *b*. His opinion concerning his writings, i. 79 *b*. His experiments defended againſt the funicular hypotheſis, i. 104 *b*. The manner of his writing againſt *Linus*, i. 113 *a*. His examen of Mr. *Hobbes*'s *Dialogus Phyſicus*, i. 118 *a*. *&c*. His way of treating that writer, i. 120 *a*. His defence of the Society of *Greſham* College, i. 121 *b*. His account of the air in the air-pump, in oppoſition to Mr. *Hobbes*, i. 132. *b*. His civil method of treating Mr. *Hobbes*, i. 148 *a*. *b*. His opinion of fluid bodies explained, i. 150 *a*. He examines Mr. *Hobbes*'s opinion of fluidity and firmneſs, i. 152 *a*. The reaſon of publiſhing his treatiſe of the love of God, i. 155 *a*. His ſenſe of election and reprobation, i. 177 *a*. His general reaſons for writing, i. 192 *a*. An account of his continuation of Sir *Francis Bacon*'s natural hiſtory, i. 196 *b*. His reaſon for mentioning trivial and recorded experiments, i. 197 *a*. Why he ſpeaks doubtingly of experiments, i. 197 *b*. His deſign of writing with civility, i. 200 *b*. His remarks upon writers, and the method he obſerves in his eſſays, i. 201 *a*. His appeal to other writers, i. 201 *b*. His caution in borrowing from other authors, i. 202 *a*. His reaſon for not being too particular in mechanical experiments, i. 202 *b*. For concealing ſome experiments, i. 203 *a*. For refuſing the authority or expreſſions of others, i. 204 *a*. His manner of entring upon chymical ſtudies, i. 227 *a*. His reaſons for publiſhing the hiſtory of fluidity and firmneſs, i. 229 *b*. For writing a treatiſe called the Sceptical Chymiſt, i. 290 *a*. *b*. His apology for writing his dialogues, i. 292 *b*. An account of his writing experiments touching colours, ii. 1 *a*. *b*. On writing on the ſtyle of the Holy Scriptures, ii. 88 *a*. *b*. His apology for publiſhing that treatiſe, ii. 90 *a*. *b*. His application to wits, orators, and divines, ii. 93 *a*. His opinion of the writings of philoſophers, ii. 116 *a*. His method of reading the Scriptures, ii. 137 *b*. The reaſons for writing his meditations, ii. 140 *a*. The manner of writing them, ii. 141 *b*. His account of compariſons, *ibid*. and of his occaſional reflections, ii. 144 *b*. His reaſons for publiſhing them, ii. 145 *a*. The advantages in

in reading them, ii. 146 *a*. His reasons for continuing his physico-mechanical experiments, iii. 1 *a*. *b*. for not publishing many of his experiments, iii. 135 *b*. His account of the second part of the usefulness of experimental philosophy, iii. 137 *b*. His apology in behalf of tradesmen and artificers, iii. 138 *b*. The nature of his philosophical experiments, iii. 140 *b*. His account of mathematical disciplines, iii. 166 *b*. And of a shining substance made by him, iv. 21 *b*. His account of its preparation, iv. 36 *a*. Of his Icy Noctiluca, iv. 71 *b*. His great loss by fire, iv. 89 *b*. Reasons for continuing his physico-mechanical experiments, iv. 97 *a*. A letter from Mr. *Boyle* to Dr. *Beale*, iv. 159 *a*. His account of his history of human blood, iv. 161 *a*. His reasons for writing an appendix to that history, iv. 196 *a*. His further design of inquiring into the hypothesis of the blood, iv. 205 *b*. His account of his discourse on the corpuscular philosophy, iv. 301 *a*. He is called the English Philosopher, iv. 302 *b*. His account of his *Medicina Hydrostatica*, v. 1 *a*. His reasons for writing on theological subjects, v. 39 *a*. His reasons for using comparisons, v. 39 *b*. His letter to Mr. *Oldenburgh* concerning his *Experimenta*, &c. v. 75 *a*. His account of the general history of the air, v. 106 *a*. His letter to Mr. *Hartlib* concerning effluviums in the air, v. 124 *a*. To Mr. *Oldenburgh* concerning a statical baroscope, v. 130 *b*. His account of making the phosphorus, v. 198 *a*. Letters of Mr. *Boyle* to several persons, v. 229 *a*. His account of his amour, v. 240 *a*. Letters from several persons to Mr. *Boyle*, v. 256 *a*. Dr. *Petty*'s character of Mr. *Boyle*, v. 297 *b*. An account of a list of his writings, v. 369 *a*. A compliment paid him by *Slusius*, v. 392 *b*. His encouragement to Dr. *Sanderson* to write cases of conscience, v. 407 *a*. His reasons for publishing his Usefulness of Experimental Philosophy, i. 422 *a*. His reasons for discoursing on the use of natural philosophy, i. 461 *b*. For studying chymistry, i. 553 *b*. His account of the preparation of *primum ens Veneris*, i. 563 *b*. Of his preparations of hartshorn, i. 567 *a*. Of his philosophick history of cold, ii. 232 *a*. Of the subject, and his manner of treating it, ii. 233 *b*. Of his quotations from several authors, ii. 237 *a*. His letter to Lord *Brouncker* concerning his history of cold, ii. 257 *a*. His proœmial discourse before his *Origin of Forms and Qualities*, ii. 452 *a*. His character of the writings of Dr. *More*, iii. 270 *a*. His reasons for writing on theological subjects, iii. 405 *a*. For writing against Mr. *Hobbes*, iii. 476 *b*. For writing and publishing the martyrdom of *Theodora* and *Didymus*, iv. 425 *a*. His account of his medicinal remedies, iv. 465 *a*. Of the infirm state of his health and constitution, iv. 466 *b*. His letter to Mr. *Baxter*, v. 555 *b*. To Dr. *Marsh*, v. 611 *a*. To Dr. *Burnet*, v. 625 *a*.

BOYLE, Dr. Bishop of *Cork*, his remarks on the restoring impropriations to the church of *Ireland*, v. 632 *b*.

BRACKISHNESS, the sea-water freed from *Brackishness*, iv. 160 *b*.

BRAIN, whether sensation depends upon the constant influence of the *Brain*, i. 467 *b*. The effect of congelation on the *Brains* of animals, ii. 348 *b*. Curious observations on a dissection of the *Brain*, v. 517 *a*. *b*. Whether the water falls from the ventricles of the *Brain* by the infundibulum upon the throat and palate, v. 520 *b*. The memory fixed in the *Brain*, iv. 59 *a*. Its parts and uses anatomically treated, v. 700 *b*. The seat of the locomotive faculty, v. 702 *a*.

BRANDY, a way of dephlegming it, iii. 180 *a*. The way of trying *Brandy* by the froth, iv. 181 *b*. *Brandy* the cause of the tooth-ach, iv. 315 *a*. Good against the infection of the plague, v. 103 *a*. The quality of frozen *Brandy*, v. 165 *b*. The use of *Brandy* in hot climates, i. 493 *a*. *Brandy* frozen in *Russia*, ii. 391 *a*.

BRASS, experiment on a cylindrical piece of *Brass*, iii. 39 *a*. Upon a syringe of *Brass*, iii. 41 *a*. Heat produced in pieces of *Brass* by attrition, iii. 57 *a*. An offensive smell emitted by *Brass*, iii. 67 *b*. The effect of the turning of *Brass*, iv. 253 *a*. *Brass* broken by some degrees of cold, ii. 275 *a*.

BRAZIL, spirit of nitre poured into an infusion of *Brazil* water, i. 236 *b*. An experiment of the infusion of *Brazil* dropt into fair water, ii. 69 *b*. With *Brazil* infused and spirit of salt, v. 85 *b*. The effect of the dew at *Brazil*, v. 122 *a*. The air there changes the colour of clothes, v. 182 *a*. Account of the wines of *Brazil*, i. 491 *a*.

BRAZILIANS, their arts of poisoning, i. 543 *a*.

BREAD, whether *Bread* can produce air *in vacuo*, iv. 106 *a*. An account of a medicated *Bread*, v. 420 *a*. The various sorts of it, v. 420 *b*. A strange menstruum obtained from *Bread*, i. 475 *b*. The effect of a spirit drawn from common *Bread*, i. 487 *b*.

BREASTS, ulcerated *Breasts* of women cured by millepedes, i. 508 *b*.

BREATH, strange effect of a distemper'd *Breath*, i. 475 *b*. How a person blows hot and cold with his *Breath*, ii. 375 *b*.

BREATHING, the occasion of the difficulty of it, i. 544 *a*.

BRICK, a magnetical verticity in a hot *Brick*, v. 81 *b*.

BRIDGEWATER, trees taken out of the moors there, v. 363 *a*.

BRILL, an account of the air of that place, v. 115 *a*.

BRIMSTONE, copper-plates pierced through by *Brimstone*, 224 *b*. The effect of rubbing *Brimstone* upon a cushion, iv. 270 *b*. The smell of *Brimstone* produced from thunder, v. 123 *a*. Remark on common *Brimstone* sublimed, i. 302 *b*. Experiment on the *Terra damnata* of *Brimstone*, i. 364 *b*. A way of kindling *Brimstone in vacuo Boyliano* unsuccessfully tried, iii. 250 *a*. Attempt to preserve the flame of *Brimstone* without air, iii. 254 *a*.

BRINE mingled with the provender of sheep, its use, v. 448 *b*.

BRIONY-ROOT, of use to take marks out of the skin, iv. 209 *b*.

BRISTOL stones, account of their shape, iii. 218 *a*.

BROGHILL, Lord, his character, v. 239 *a*.

BROUNCKER, Lord, his experiments concerning the spring of the air, i. 102 *b*.

BROWN, Dr. his experiment with fresh oil and aqua-fortis, i. 224 *b*.

BRUTES may be doctors of divinity and teachers, ii. 149 *b*. An inquiry into the soul of *Brutes*, v. 44 *a*. Reasons for trying experiments upon *Brutes*, i. 532 *b*.

BUAT, Monsieur, account of his sentence and execution, v. 361 *b*.

BUBBLES made of water and soap, their nature, i. 11* *b*. The motions of *Bubbles* in the experiment concerning the expansion of the air, i. 31 *b*. The *Bubbles* of water in the receiver considered, i. 138 *a*. *Bubbles* afforded by quick-silver, i. 271 *b*. *Bubbles* of glass broken by the spring of the air, iii. 13 *b*. *Bubbles* of mercury in a strait tube, iii. 29 *a*. The gravity of the air and water tried by a sealed *Bubble*, iii. 61 *a*. The weighing of water in water by a glass *Bubble*, iii. 71 *b*. Aerial *Bubbles* in solid bodies, iv. 7 *a*. The reflection of light from aerial *Bubbles*, iv. 7 *b*. *Bubbles* are formed of particular air swimming in water, iv. 140 *b*. Glass *Bubbles* not penetrable by the subtilest spirits, iv. 227 *b*. *Bubbles* that occasion the levity of ice considered, ii. 280 *b*. Whether these *Bubbles* are filled with common air, ii. 281 *b*. An experiment with sealed *Bubbles* of air, ii. 417 *a*. On sinking *Bubbles* of air under water, ii. 421 *a*.

BUCK, the use of *Bucks* horns in remedies, instead of stags horns, i. 568 *b*.

BUCKET, the uses of the hydrostatical *Bucket*, v. 17 *a*. Particularly in trying of gold, v. 31 *b*. In exploring the weight of fossils, v. 33 *a*. A *Bucket* full of water lighter in water than out of it, ii. 442 *a*.

BUCK-THORN berries, an account of pigments made of them, ii. 58 *a*. The colour of the juice, ii. 60 *b*.

BUDS that produce blossoms, the way to discover them, i. 219 *b*.

BUILDINGS shaken by the motion of a cart, iv. 260 *b*.

BULIMIA, the cause of that disorder in the stomach, ii. 361 *a*.

BULK, the *Bulk* of a body contributes to make it sink or swim in a liquor, iii. 637 *b*.

BULLET, the sound of a *Bullet* passing through the air, i. 233 *b*. An account of the time of its descent, iii. 160 *a*. The rapid motion of *Bullets* considered, iv. 252 *b*. The case of *Bullets* discharged from a wind-gun, iv. 254 *a*. The velocity of a *Bullet* from a gun stated, iv. 342 *b*. *Bullets* of lead melted by the sun, v. 169 *a*. Experiment to find the velocity of a *Bullet*, v. 307 *a*. The velocity and strength of a *Bullet* shot out of a carbine, v. 534 *b*.

BULLIALDUS, his observation on the stars, iii. 93 *b*.

BURATTINI, Signior, his optick glasses, v. 350 *b*.

BURLESQUE, remarks upon *Burlesque* writings, ii. 125 *b*.

BURNET, Dr. his letters to Mr. *Boyle*, v. 624 *a*. Account of Mr. *Boyle*'s writings and his own travels, v. 624 *b*.

BURNING-GLASSES, how they set things on fire, i. 141 *a*. Will scarce discolour a sheet of white paper, ii. 25 *a*. The effect of the sun-beams through a *Burning-glass*, iv. 254 *a*. Lead, iron, and steel melted by a *Burning-glass*, v. 250 *a*. The *Burning* of bodies *in vacuo*, v. 255 *a*. Account of a *Burning-glass* made at *Lyons*, v. 332 *b*. A description of it from *Paris*, v. 337 *b*. A double convex *Burning-glass*, iii. 197 *a*.

BURSTNESS, a remedy for it, v. 441 *a*.

BUSBEQUIUS, his account of the air of Mount *Olympus*, i. 68 *b*. Of raising an obelisk at *Constantinople*, iii. 183 *b*.

BUTLER of *Ireland*, an account of his strange remedies, i. 448 *b*. The effect of his stone dipt in oil, i. 489 *a*.

BUTTER, experiment on fresh *Butter*, iv. 153 *b*. Will keep, preserved from outward air, iv. 154 *a*. Melted and hot, will not preserve flesh, iv. 155 *b*. A receipt to make a better sort of *Butter*, v. 260 *b*. *Butter* made of sheeps milk, v. 448 *b*. *Butter* of antimony reduced to a clear liquor, i. 333 *b*. *Butter* sold by measure, not by weight, i. 403 *a*. The way of preserving meats by melted *Butter*, i. 493 *b*. *Butter* of antimony, the quality of it, iv. 311 *b*. The nature and consistence of *Butter* in hot and cold countries, iii. 391 *b*. The taste of *Butter* in *Savoy*, iii. 541 *b*.

BUTTERFLY, an experiment with it in the air-pump, i. 62 *a*. In a vacuum, iii. 133 *b*. In an empty receiver, iv. 128 *a*. *Butterflies* procreate after the loss of their heads, i. 467 *b*.

BUTYRUM ANTIMONII, experiment concerning it, ii. 504 *a*.

BUZZARD, stones found in that bird, v. 310 *b*.

C.

CABÆUS, his strange account of the breaking of a marble pillar, i. 55 *a*. His observation of hard marble broken by congealed water, i. 61 *b*. His method of congealing water, ii. 337 *a*. His opinion of electrical attraction, iii. 647 *a*.

CABBAGE, experiment on a decoction of *Cabbage* frozen, ii. 350 *a*. On *Cabbages* in an empty receiver, iv. 132 *b*.

CABOCLES, an account of that people and their children, ii. 36 *b*.

CAIRO, the nature of the plague there, v. 189 *b*.

CALAMINARIS LAPIS, its virtue in physick, v. 6 *b*.

CALCINATION, a paradox about *Calcination* and calces, iii. 353 *a*.

CALCINED bodies, their nature examined, v. 233 *b*.

CALCULUS HUMANUS, observations concerning it, i. 474 *b*. Account of the distillation of it, i. 500 *a*.

CALDERA on the pic of *Teneriff*, an account of it, v. 171 *b*.

CALENDAR of the gravitation of the air, v. 343 *a*.

CALLUS of a broken bone, how bred, iv. 316 *b*.

CALF, account of an odd monstrous *Calf*, ii. 227 *a*. A madman cured by the transfusion of *Calf*'s blood, v. 382 *b*.

CALVINISTS, their dispute about divine grace, i. 177 *b*. Their doctrine and writings banished the universities, v. 484 *a*.

CALUMNY overcome by innocence, v. 69 *a*.

CALX, the different *Calxes* afforded from minerals, ii. 38 *a*. Glass painted yellow by a *Calx* of silver, ii. 74 *b*. Experiment on *Calx* of tin exposed to the sun-beams, iv. 149 *a*. Uncommon way of making a *Calx* of gold, v. 99 *b*. The *Calx* of minerals particularly examined, i. 415 *a*. A way of preparing a *Calx* of gold, iii. 563 *a*.

CAMBRIDGE, improvements there in botany, anatomy, *&c.* v. 272 *b*.

CAMEL, drinks not in many days, i. 242 *b*. Sal-armoniack made of *Camels* urine, iv. 188 *b*. Account of the dissection of a *Camel*, v. 392 *a*.

CAMELION, the visive organs of his eyes explained, iv. 526 *a*. His way of catching his prey, iv. 527 *a*.

CAMERA OBSCURA, the nature of that instrument, iii. 86 *a*.

CAMPANI, account of his glasses, v. 357 *a*.

CAMPAR, a strange indraught of the sea there, v. 104 *b*.

CAMPEN, remarks upon that country, v. 190 *a*.

CAMPHIRE, its alteration in the air-pump, i. 62 *b*. An experiment concerning it, i. 87 *b*. Of turning *Camphire* into oil, i. 247 *a*. *Camphire* turned into a white consistent body, i. 275 *a*. An experiment upon burnt *Camphire*, ii. 33 *a*. Heated by fire will appear white, ii. 40 *a*. Will lose its weight by avolation, iii. 65 *b*. Will dissolve in oil of vitriol, iv. 91 *a*. Experiment on *Camphire* in an empty receiver, iv. 131 *a*. The effect of *Camphire* outwardly or inwardly applied, iv. 321 *b*. Remark upon the soot of kindled *Camphire*, i. 302 *b*. The way of subliming *Camphire* into flowers, i. 304 *b*. An account of the fluidity of *Camphire*, i. 403 *a*. An unprosperous attempt to make flame kindle *Camphire* without the help of air, iii. 259 *a*. *Camphire* mixed with aqua fortis turned into an oil, iii. 368 *a*. An instance of the fixing of *Camphire*, iii. 624 *a*. The dissolution of *Camphire* in highly rectified spirit of wine, iii. 638 *b*.

CANARY WINE, the effect of rolling it in pipes, iii. 87 *b*.

CANCERS, examples of the cures of them, i. 482 *b*. Cured in women's breasts without pain, i. 498 *a*. A strange *Cancer* in a woman's breast, and the operations concerning it, v. 638 *b*.

CANDLE, an experiment made upon a tallow *Candle* in an air-pump, i. 18 *a*. Meditation on a thief in a *Candle*, ii. 172 *b*. The burning of *Candles* in grooves, v. 180 *b*. The stink of an ill-extinguished *Candle* will make women miscarry, iii. 327 *b*.

CANE, the staining of *Canes* by aqua fortis, iii. 171 *a*. An account of the hollowness of *Canes*, iv. 217 *a*. *Canes* will strike fire like a flint, iv. 253 *b*. The effect of gold on the metalline head of a *Cane*, ii. 401 *a*.

CANNON-BULLET shot near the level of the water, iii. 365 *a*. The motion of the air by the discharge of *Cannon*, iv. 254 *b*.

CANON-LAW, Popish, an account of it, v. 412 *b*.

CANOO made of a cotton-tree, an account of it, v. 104 *a*.

CANTHARIDES, their effect upon the urinary passages, iii. 315 *b*. More particularly explained, iv. 211 *b*. On the inside of the body without touching the skin, iv. 213 *a*. Their forcible operation on the bladder, iv. 315 *b*. The effect of their outward application, i. 479 *a*.

CAPE of *Good-Hope*, the variation of the compass there, iii. 90 *b*.

CAPILLARY VESSELS, their use, iv. 320 *b*.

CAPUT MORTUUM from oil of aniseeds, iv. 92 *a*. The effects of it in a crucible red-hot, iv. 95 *b*. The *Caput mortuum* of human blood by distillation, iv. 171 *a*. Afforded by mineral waters, iv. 247 *a*. The *Caput mortuum* of a spirit of wine, i. 389 *b*. From powder'd antimony and oil of vitriol, ii. 494 *b*.

CARBUNCLE, the opinions of the learned concerning it, ii. 82 *a*. The account of an extraordinary carbuncle at *Rome*, ii. 83 *b*.

CARCAVY, Monsieur, his abilities and character, v. 377 *b*. Extract of a letter from him, v. 385 *b*.

CARDAN, his story of the poison of beaten glass, ii. 342 *a*. Some account of *Cardan*'s lamp, iv. 38 *a*.

CARDAN, a plant on Mount *Teneriff*, v. 172 *b*.

CARDINAL, the saying of a *Cardinal* upon the style of Scripture, ii. 120 *a*.

CARNEADES, his experiments concerning fire, i. 22 *a*. A survey of his principles and way of writing, i. 292 *a*. A particular account of him, v. 230 *b*.

CAROTIDAL ARTERY, experiments upon it, v. 520 *a*.

CARP, an experiment concerning a *Carp*'s bladder in the air-pump, i. 12 *b*. The reason of the swelling of a *Carp*'s bladder explained, i. 114 *b*.

CARPATHUS, an account of the air upon that mountain, i. 68 *b*.

CARROTS, observation upon a cart-load of *Carrots*, ii. 29 *b*. The use of *Carrot*-seeds fermented in small-ale, i. 492 *b*.

CARTESIANS, their notion of the use of respiration, i. 66 *b*. Their account of rarefaction, i. 93 *a*. The strongest champions for a plenum, i. 133 *a*. Their opinion of the origin of colours, ii 21 *b*. Of the motion of matter, iii. 65 *a*. Their hypothesis of the indefiniteness of the world, iv. 62 *b*. Their account of glaciation, iv. 258 *b*. Their notion of springiness, 270 *a*. The *Cartesians* allow no bounds to the world, iv. 341 *b*. Their account of the laws of motion, iv. 346 *a*. Divine providence proved from the *Cartesian* principles, v. 45 *b*. The opinion of the *Cartesians* concerning water, i. 413 *b*. They admit no corpuscles of cold, ii. 324 *a*. Their explication of freezing, iii. 372 *a*.

CART-WHEEL, the *Rota Aristotelica* explained by a *Cart-wheel*, i. 116 *b*. The nature of its motion difficult to be conceived, iv. 44 *a*.

CARVING, reflections upon *Carving* at a feast, ii. 178 *b*.

CARY's warming-stone, an account of it, v. 489 *b*.
CASATUS, his account of the nature of the air, v. 109 *b*.
CASEMENT, the effect of opening a *Casement*, iii. 87 *a*.
CASSINI, his account of a new comet, v. 394 *a*.
CASTILE SOAP, its use in medicine, iv. 329 *a*.
CASTING, remark upon the *casting* of silver, i. 244 *b*.
CASTRATING sheep, the way of it, i. 533 *a*.
CAT, experiment upon a *Cat* bit by a viper, iv. 336 *b*. Upon the eye of a *Cat*, i. 454 *b*. The strange virtue of a *Cat*'s ear, i. 531 *a*. A murrain among *Cats*, iii. 469 *a*.
CATALOGUE of books printed in *England*, v. 253 *b*.
CATARACT, the nature and symptoms of *Cataracts*, iv. 552 *b*. Instances of persons afflicted with *Cataracts*, iv. 553 *a*. A *Cataract* cured by the use of physick, i. 482 *a*. Examples of *Cataracts* strangely cured, i. 483 *a*. Cured by the juice of millepedes, i. 508 *b*.
CATARRH, the Galenical doctrine of *Catarrhs*, i. 473 *a*.
CATERPILLARS, experiment by them in a vacuum, iii. 132 *a*.
CATHARINE, the launching of the ship *St. Catharine*, v. 314 *b*.
CATHARTICK, whether the purging faculty of *Catharticks* are altered by congelation, ii. 346 *b*.
CATHEDRAL at *Salisbury* built of *Purbeck*-stone, v. 180 *a*.
CATTLE, the way of cutting a bladder out of the heads of *Cattle*, v. 314 *a*. Remedies for diseases in *Cattle*, iii. 145 *b*.
CAUCASUS, the height of that mountain, iii. 33 *a*.
CAVE, an account of a *Cave* on Mount *Teneriff*, v. 172 *a*. *Caves* in that island where they lay their dead, v. 173 *a*. A petrifying *Cave* in *Devonshire*, v. 573 *a*.
CAVES GOUTIERES, the waters of that place turns into stone, i. 357 *b*.
CAUSE, the way of judging of *Causes* by their effects, iv. 60 *a*. The scale of *Causes* to the last *Cause* explained, i. 444 *b*. The same effects produced by different *Causes*, i. 450 *a*. A disquisition about the final *Causes* of natural things, iv. 515 *a*. Whether there are any knowable final *Causes* in the works of nature, iv. 515 *b*. Whether final *Causes* are to be considered in all bodies, or only in some particularly qualified ones, iv. 522 *b*. Two ways of reasoning from the final *Causes* of natural things, iv. 534 *b*. The study of efficient causes not prejudicial to the contemplation of final ones, iv. 550 *b*. The consideration of final *Causes* not to be banished from natural philosophy, iv. 551 *a*.
CELERITY of air produced *in vacuo*, and in common air, iv. 145 *a*. The great efficacy of *Celerity* in small bodies, iv. 252 *b*.
CELIBACY, an inferior state of perfection, v. 400 *b*.
CELLARS colder in winter than summer, i. 226 *a*. In what manner preserved from freezing, iii. 97 *b*. An account of the *Cellars* in *Russia*, iii. 98 *a*. The warmth and coldness of them considered, ii. 241 *a*. *Cellars* of *Moscow* hot in winter, ii. 356 *b*. The seeming coldness of *Cellars* in summer examined, ii. 362 *a*. The heat of *Cellars* in winter denied, ii. 362 *b*. Account of the *Cellars* in *Moscow*, ii. 363 *b*. Vents used in *Cellars*, to let out the exhalations, ii. 365 *a*. A sceptical consideration of the heat of *Cellars* in winter, and their coldness in summer, ii. 370 *a*. *Cellars* not hotter in winter than in summer, ii. 371 *a*.
CELSUS, his advice about medicines, i. 489 *b*. Account of physick among barbarous nations, i. 529 *a*. His saying of the method of physick, i. 544 *a*. His account of the rise and progress of physick, i 549 *a*.
CEMENT proper to be used in air-engines, iii. 5 *b*. Made use of by diamond-cutters, iii. 180 *b*. The variety and use of cements, iii. 181 *a*.
CENIS, an account of the air of that mountain, v. 167 *b*.
CENTAURY, a decoction of *Centaury* boiled in beer, a remedy for consumptions, v. 456 *b*.
CENTER, a tendency towards the *Center* in heavy bodies, ii. 420 *a*.
CERTALDUS, his account of the growth of lead, i. 358 *a*.
CERUSSE found upon lead, the nature of it, iii. 461 *a*.
CEYLON, the sea there warmer at the bottom than at the top, iii. 108 *a*. The inequality of the air of that island, v. 166 *a*.
CHALCHOOS, a Peruvian plant, its use in dissolving the stone, i. 484 *a*.
CHALK, experiment by a dissolution of white *Chalk*, iv. 37 *a*.
CHALYBEATES, how dissolved in the body, iv. 185 *a*. An imitation of *Chalybeate* waters, v. 91 *b*. *Chalybeate* medicines much used in *London*, v. 92 *b*.
CHAM, the blackness of the Negroes not owing to the curse of *Cham*, ii. 36 *a*.
CHAMBER, to observe in a *Chamber* the absence or presence of a fire in a chimney or stove, iii. 399 *a*.
CHANCE, the business of *Chance* in its operation upon parts of matter, iv. 523 *b*. It is but a creature of man's intellect, iv. 527 *a*. The curious parts of animals could not be the effects of *Chance*, iv. 540 *a*. The world not made by *Chance*, i. 449 *a*.
CHANOWIUS, his account of the mountains of *Bohemia*, v. 168 *a*.
CHAOS, whence all things were made, was water, i. 314 *b*.
CHARACTERS in a mnemonical table, v. 423 *a*. An account of a mnemonical *Character*, v. 431 *b*.
CHARCOAL, reflections on making a fire with *Charcoal*, ii. 180 *b*. The smell of it sulphureous, v. 116 *a*. *Charcoal* distilled from mint, i. 366 *a*. Used to polish brass and copper, iii. 193 *b*. The steams of *Charcoal* suffocating, iii. 322 *a*.
CHARIOT, account of a new-fashioned *Chariot*, v. 349 *a*.
CHARLES the second, his application to mathematicks, v. 231 *b*. His account of a strange phænomenon, v. 175 *b*.
CHARLETON island, the temperature of the air of that place, ii. 321 *b*. The extreme cold of that country, ii. 319 *b*. The difference of the weather there, ii. 322 *b*.
CHARLTON, Dr. some account of him, v. 318 *b*.
CHARMS for distempers, v. 317 *b*.
CHARRING of coals examined, i. 514 *b*. Of *charring* of peat, i. 515 *a*.
CHEAPNESS of medicines examined, i. 509 *a*.
CHEESE, a thin cream *Cheese* turned into a stone, ii. 236 *b*. The parts of a *Cheese*-mite curiously examined, iii. 314 *a*. The way of transporting *Cheese* to the *East-Indies*, v. 179 *a*. The nature and quality of rotten *Cheese*, ii. 500 *b*. Account of dairy-maids gathering of the *Cheese*, v. 476 *b*.
CHERRIES, experiment on them about the production of air, iv. 113 *a*. They produce air irregularly, iv. 114 *b*. The effect of the air produced from *Cherries*, iv. 117 *b*. Experiment on four *Cherries* in an empty receiver, iv. 132 *a*. Account of *Cherry*-wine, i. 490 *b*. The way of making it, v. 470 *b*.
CHERRY-TREES, an experiment upon the grafts of them, i. 219 *b*. An account of the *Cherry-Trees*, in *Helvetia*, v. 273 *b*.
CHERUBIN, Pere, his objections to Mr. *Boyle*'s experiments, v. 233 *a*.
CHEST, the *Chest* of a man including the lungs like a pair of bellows, i. 65 *a*.
CHEYNEL, Dr. a fanatick preacher run mad, v. 277 *b*.
CHICKEN, the motion of a *Chicken*'s heart with the head cut off, i. 467 *a*. The formation of a *Chicken* in the egg, ii. 497 *a*. The *Chicken* made of the speck that appears on the coat of the yolk, iii. 186 *b*.
CHILD, Dr. his account of wheat imbibed with liquor, v. 260 *b*.
CHILD; *Children* heard to cry in the womb, i. 71 *b*. A *Child* born speckled with spots, ii. 37 *a*. The *Children* of Blacks are born like Europeans, ii. 37 *a*. Turn black in a few days, ii. 37 *b*. A *Child* cannot apprehend a proposition in *Euclid*, iv. 47 *b*. The dissection of a double *Child*, v. 316 *b*. A *Child* may be purged by the milk of the mother, i. 317 *a*. Account of a petrified *Child* found in a woman's belly, v. 557 *b*.
CHILDBLAINS, a cure for them, i. 526 *a*.
CHIN, a remedy for the *Chin*-cough, iv. 327 *b*.
CHINA, the drinks used in that country, i. 490 *b*. The condition of physick there, i. 528 *a*. Some account of the learning of *China*, ii. 123 *b*. The number of the inhabitants computed, iv. 289 *b*.
CHINESE, the eloquence of *Chinese* learning not conceived by us, ii. 122 *b*. Their opinion of the divinity of the heavenly bodies, iv. 375 *a*. Their way of judging of distempers by the pulse, v. 589 *b*. Their reason against phlebotomy, v. 590 *a*.
CHIRURGICAL operations prevented, i. 497 *b*.
CHOCOLATE, a casuistical question concerning it, v. 352 *b*.
CHOLCONDA, a diamond from the king of that country, v. 84 *a*.

CHON-

CHONDRILLA, the root of it a cure for the hæmorrhoids, i. 530 *b*.

CHRIST never rejoiced but once, i. 170 *b*. His manner of living and working miracles, i. 171 *a*. The principal joy of heaven is to see *Christ*, i. 181 *b*. A description of *Christ* in his exaltation in heaven, i. 182 *a*. Of his humility and condescension, i. 183 *a*. His life and character, v. 67 *b*. The time from the creation to the coming of *Christ*, v. 287 *b*.

CHRISTIAN, whether there be a necessity for a *Christian* to deny his reason, iii. 514 *b*.

CHRISTIAN VIRTUOSO, the first part, v. 37 *a*. Can discover true miracles from impostures, v. 53 *b*.

CHRISTIANITY proved by three grand arguments, v. 48 *a*. The sudden propagation of it examined, v. 54 *a*. Supported by divine assistance, v. 55 *a*. Promotes greatness of mind, v. 65 *a*. Is favourable to true magnanimity, v. 67 *a*. Consists with a philosophick genius, v. 70 *b*. Old *Christianity* lost in logical terms, v. 437 *b*. *Christianity* does not oblige us to lay aside reason in matters of religion, iii. 514 *b*. The terms of *Christianity* not difficult to be complied with, iii. 533 *b*. Objections against the unreasonableness of it answered, iii. 534 *a*. What manner of assent *Christianity* requires, iii. 534 *a*. The nature of the evidence required to support it, v 661 *a*. Peculiar remarks on the advantages of it, v. 725 *a*. Objections against the benefits of it answered, v. 725 *b*.

CHURCH, the dissent of the Greek *Church* from the Latin, v. 254 *b*.

CHURNING, an account of its effect, i. 270 *b*.

CHYLE, the passage of the *Chyle* into the stomach explained, iii. 444 *b*. Experiment whether the *Chyle* enters the meseraick veins, v. 522 *a*.

CHYMICAL, an experiment concerning a famous *Chymical* liquor, i. 61 *a*. *Chymical* preparations unsincere, i. 206 *a*. An attempt to make *Chymical* experiments useful, i. 227 *a*. Assistant to natural philosophy, i. 227 *b*. *Chymical* remedies too rashly rejected by physicians, i. 238 *b*. *Chymical* experiments not too readily to be believed, i. 291 *a*. The usefulness of *Chymical* experiments, i. 293 *a*. The *Chymical* principles of mixed bodies, i. 294 *a*. An account of *Chymical* qualities, iii. 73 *b*. Many phænomena not to be ascribed to the three *Chymical* principles, iii. 76 *a*. *Chymical* principles may be transmutable, iv. 70 *a*. A *Chymical* paradox grounded on experiments, iv. 89 *a*. The production of other *Chymical* principles out of one, iv. 93 *b*. What is meant by *Chymical* principles, iv. 94 *a*. *Chymical* principles may be produced *de novo*, i. 312 *b*. The *Chymical* doctrine exploded, i. 322 *b*. The effect of *Chymical* productions examined, i. 334 *a*. A *Chymical* principle denominated from slight qualities, i. 334 *b*. The incompetency of *Chymical* arguments, i. 338 *a*. *Chymical* oils resoluble into a flame, i. 341 *a*. No becoming a philosopher without *Chymical* knowledge, i. 349 *a*. The separated substances in *Chymical* resolutions examined, i. 354 *a*. *Chymical* operations excellent tools in the hands of a philosopher, i. 373 *b*. The nature of a *Chymical* spirit, i. 399 *a*. The qualities of water discovered by *Chymical* experiments, i. 496 *a*. The offensiveness of *Chymical* medicines consider'd, i. 575 *a*. *Chymical* processes ought to be clearly explained, i. 579 *b*. Errors in the time and dose of *Chymical* remedies, i. 580 *a*. *Chymical* principles not to be made out without local motion, iii. 454 *b*. *Chymical* processes, an essay upon them, i. 203 *b*.

CHYMICO-magnetical experiments, v. 79 *a*. *Chymico*-physical doubts and paradoxes, i. 290 *a*.

CHYMIST, an attempt to reconcile the *Chymists* and Corpuscularians, i. 230 *b*. The *Sceptical Chymist* a Treatise, i. 290 *a*. The writings of *Chymists* hard to be understood, i. 291 *a*. Their opinion of the origin of colours, ii. 21 *b*. A character of the *Chymists*, iii. 137 *a*. Of the eastern *Chymists*, iv. 16 *a*. The *Chymists* way of examining metals, v. 57 *b*. His acquaintance of age at a day old, v. 231 *b*. The Sceptical *Chymist*, i. 300 *a*. The hypothesis of the *Chymists* examined and confuted, i. 302 *a*. An inquiry into the experiments of the *Chymists*, i. 322 *a*. They puzzle men with their obscurity, i. 325 *a*. They unreasonably trifle with names, i. 329 *b*. Studiously affect terms of art, i. 330 *a*. The reason of their writing mysteriously, i. 330 *b*. Satyrical remarks on the vanity of the *Chymists*, i. 331 *a*. The business of the *Chymists* is to apply natural agents and patients, i. 334 *b*. The three principles of the *Chymists* examined, i. 336 *a*. Their opposition to the followers of *Aristotle*, i. 337 *a*. They engross to themselves the title of philosophers, i. 347 *b*. Their doctrine of the *tria prima* a new philosophy, i. 348 *b*. Experiments of the *Chymists* useful to philosophy, i. 348 *b*. Vulgar *Chymists* attribute colours to mercury, i. 352 *b*. Are happier in studying experiments than the causes of them, i. 370 *a*. Are like the navigators of *Solomon*'s fleet, i. 370 *b*. The impostures of bragging *Chymists*, i. 400 *a*. Their opinion of the philosopher's stone, i. 406 *a*. Of the material principles of mixed bodies, i. 418 *b*. The tedious preparations of *Chymists* censured, i. 510 *a*. And the making of depurations, i. 510 *b*. The obscure and cryptical way of writing of *Chymists*, i. 574 *a*. The imperfection of the *Chymists* doctrine of qualities, iii. 565 *a*. Reflection on the *Chymists* doctrine of qualities, iii. 595 *a*. Their theory undemonstrated and precarious, iii. 596 *a*. Too narrow and insufficient to explain the particular phænomena, iii. 597 *b*. Not primal and fontal enough, iii. 598 *a*. The *Chymists* salt, sulphur, and mercury are not the most simple principles of bodies, iii. 600 *b*.

CHYMISTRY, the general opinion concerning it, i. 227 *a*. The method of experiments in *Chymistry*, i. 230 *a*. *Chymistry* of use in husbandry, iii. 144 *a*. Strange things in *Chymistry* to be believed, iv 19 *b*. The speculative and operative part of *Chymistry*, i. 373 *b*. *Chymistry* useful to the practical part of natural philosophy, i. 374 *b*. To explain the nature of digestions, i. 473 *a*. The difference between vulgar and true *Chymistry*, i. 476 *a*. The usefulness of *Chymistry* to the therapeutic part of physick, i. 497 *b*. The qualities of medicines discover'd by *Chymistry*, i. 498 *b*. The art of it very imperfect, i. 517 *b*. The great power of *Chymistry*, i. 520 *a*. The *methodus medendi* improved by *Chymistry*, i. 522 *a*. *Chymistry* has improved the preparation of medicines, i. 582 *b*. The use of *Chymistry* iii. 608 *b*.

CICATRICULA in an egg, its use, v. 693 *a*.

CICERO, some remarks upon his eloquence, ii. 123 *a*.

CINNABAR, antimonial, some account of it, i. 208 *b*. Experiment on native *Cinnabar* pulverized, v. 29 *b*. A sulphur obtained from native *Cinnabar*, i. 396 *b*. The way of obtaining a noble *Cinnabar*, i. 412 *b*. Smells emitted from veins of *Cinnabar*, iv. 278 *b*. The effect of native *Cinnabar* by distillation, iv. 335 *b*. In what manner it is prepared for a medicine, iv. 336 *a*.

CINNAMON, experiment of the *Noctiluca* and oil of *Cinnamon*, iv. 77 *a*. The purgative effect of *Cinnamon*, v. 92 *a*. *Cinnamon* and cloves spoiled in the *Indies*, i. 205 *b*. The smell of *Cinnamon* at many leagues distance, iii. 336 *a*.

CIRCLE, an experiment on the division of a circle, iv. 42 *a*. The essential property of a *Circle*, iv. 65 *b*.

CIRCULATION of the blood, the discovery of it, i. 434 *b*. *Circulation* of the blood altered by specific medicines, iv. 318 *a*. Discover'd by the Chinese long before the Europeans, v. 589 *b*.

CITY of *London*, disputes about the rebuilding of it, v. 360 *b*.

CIVET, account of the perfume of *Civet*, iii. 599 *a*.

CIVILITY, persons of quality are slaves to it, ii. 203 *b*.

CLAPPHAM, Mr. his relation of the pic of *Teneriff*, v. 170 *b*.

CLAVEUS, his experiment on metalline mercuries, i. 343 *a*.

CLAY, the nature of green clay found in the river of the Amazons, i. 280 *a*. A sort of clay an excellent cordial in physick, iii. 246 *a*. The quality of a sort of white *Clay*, iv. 278 *b*.

CLEOMBROTUS, his passion upon reading of *Plato*, v. 399 *b*.

CLERC, Monsieur le, some account of him, v. 246 *b*.

CLEVE, account of the inhabitants and buildings in the city of *Cleve*, v. 566 *a*.

CLIMATE, the difference of heat and cold in the same climate considered, ii. 322 *a*.

CLINIAS, a Pythagorean, some account of him, v. 209 *a*.

CLISSUS, a mixture in chymistry, iv. 200 *a*.

CLOCK, meditations on telling the *Clock* in the night, ii. 171 *b*. Upon comparing a *Clock* with a watch, ii. 172 *a*. The invention of pendulum *Clocks*, iii. 139 *b*. They will not go well on shipboard, iv. 344 *a*. Ac-

count of a *Clock* going without a balance, v. 279 *a*. An account of the *Clock* at *Strasburgh*, i. 446 *b*.
CLOD, Dr. a letter upon his marriage from Mr. *Boyle*, v. 229 *a*.
CLODIUS, Mr. his character, v. 241 *b*.
CLOSET, the furniture of a lady's *Closet* considered, ii. 216 *b*.
CLOTH in a draper's shop will appear of different colours, ii. 21 *a*. The secret of the incombustible *Cloth*, v. 404 *a*. The setting fire to a person's *Clothes* without hurt, v. 584 *a*.
CLOUDS, their height, iii. 32 *a*. An account of black and white *Clouds* in the antartick hemisphere, iii. 92 *b*. An account of a *Cloud* forerunner of a hurricane, v. 104 *b*. Of the height of the *Clouds*, v. 115 *b*. The *Clouds* on the pic of *Teneriff*, v. 172 *a*. The appearance of lightening through a thick *Cloud*, v. 177 *a*. The effect of the falling of a *Cloud* at sea, v. 282 *a*. Atheistical wits compared to *Clouds*, ii. 154 *b*. Reflections on the variously-coloured *Clouds*, ii. 177 *a*. A black *Cloud* rising from the water a sign of a storm, ii. 367 *b*. Account of the Magellanick *Clouds*, v. 651 *a*.
CLOVE, a particular account of that spice, ii. 57 *b*. The surface of oil of *Cloves* convex, iv. 2 *b*. The surface of water upon oil of *Cloves*, iv. 8 *a*. Experiment of the noctiluca and oil of *Cloves*, iv. 77 *b*. *Clove*-trees, their effect upon the air, v. 187 *b*.
CLOVER-GRASS, the reason of its not growing, i. 205 *b*. A mill to shell *Clover*-seed, v. 260 *a*. Directions concerning the managing of it, v. 267 *a*.
CLYSTERS of sack, the effect of them, iv. 210 *b*.
COACH, reflections on sitting in a *Coach*, ii. 164 *a*. On his *Coach* stopt in a narrow lane, ii. 165 *b*. Vomiting caused by the agitation of a *Coach*, i. 540 *b*. An account of new-invented *Coaches*, v. 278 *b*.
COAGULATION, experiment concerning the *Coagulation* of different spirits, i. 264 *a*. The *Coagulation* of the spirit of human blood, iv. 185 *b*. *Coagulation* effected several ways, iv. 312 *a*. Particular account of it, iv. 313 *a*. The *Coagulation* of dissolved salts about stable bodies, iii. 229 *a*. The *Coagulation* of petrescent liquor explained, iii. 239 *b*.
COAL, experiment upon *Coals* on fire in an air-pump, i. 19 *a*. Mr. *Hobbes*'s opinion of burning *Coals* in the receiver, i. 141 *a*. Experiment on *Coals* made of wood exposed to the sun-beams, iv. 149 *b*. A *Coal* kept close in a glass not to be calcined, i. 305 *a*. A *Coal* dissolved into two liquid bodies, i. 365 *a*. The charring of *Coals* for chymical furnaces, i. 514 *b*. The resemblances and differences between a burning *Coal* and shining wood, ii. 562 *a*.
COALITION, the primitive *Coalitions* found in compound bodies, i. 324 *a*.
COBWEB, pestilential contagion preserved in a *Cobweb*, iii. 320 *a*.
COCHINEAL, the wonderful expansion of it, iv. 80 *b*. Its colour heightened by spirit of urine, ii. 55 *a*. Experiments upon it relating to colours, ii. 59 *b*. The effect of an infusion of *Cochineal* dropt into fair water, ii. 69 *b*. Its nature inquired into and ascertained, v. 692 *b*.
COCK, an account of a mad *Cock*, v. 299 *b*. A man killed by an enraged dunghill *Cock*, i. 477 *b*.
COCKLE-SHELLS voided by taking a clyster, v. 530 *b*.
COCOA, a tree that bears nuts at the bottom of the sea, iii. 389 *b*.
COCTION of peccant humours, what is meant by it, iv. 396 *b*.
COFFEE, a decoction of it used as a vomit, i. 542 *a*. The qualities and virtue of it, v. 268 *b*.
COGA, *Arthur*, an account of him, v. 372 *b*.
COGIE, Dr. experiment by transfusing of sheep's blood into his arm, v. 638 *a*.
COHESION of two flat polished marbles explained, ii. 440 *b*. Experiment concerning the *Cohesion* of broad bodies, i. 45 *a*. The effect of that experiment considered, i. 111 *a*.
COHOBATION, the effect of repeated *Cohobations* of sal-armoniack upon crude antimony, iii. 616 *a*.
COIN, an instrument to prove whether *Coin* has its just weight, iii. 551 *a*.
COLCOTHAR, the calcination of it examined, i. 344 *b*. Gold and silver obtained from the *Colcothar* of vitriol, i. 417 *b*. The subliming of dulcified *Colcothar* with sal-armoniack, i. 564 *a*. Observations and inquiries concerning it, iii. 472 *a*. What kind of *Colcothar* most proper for experiments, iii. 472 *b*. It is impregnated by the air it is exposed to, iii. 473 *a*.
COLD, contributes towards the making of animals white or black, ii. 35 *b*. The *Cold* of an ague described, ii. 167 *b*. The subterraneal air how affected by *Cold*, iii. 97 *b*. The effect of violent *Cold* upon human bodies, iv. 285 *b*. Uncommon experiment about heat and *Cold*, v. 97 *a*. *Cold* accompanies reflected light, v. 344 *b*. Bodies not united by *Cold*, i. 310 *b*. Their parts not separated by every degree of *Cold*, i. 311 *a*. The stupendous things effected by *Cold*, i. 327 *b*. The effect of *Cold* upon iron and steel, i. 328 *a*. Few professed writers on the subject of *Cold*, ii. 232 *b*. Account of the writing and method of the history of *Cold*, ii. 234 *a*. Hypothesis of *Cold* difficult to be settled, ii. 239 *a*. The reasons of *Cold* not easily adjusted, ii. 241 *b*. The measures of *Cold* not reduced to a standard, ii. 246 *a*. The degrees of *Cold* not fixed, ii. 246 *b*. In what manner the air is contracted by *Cold*, ii. 247 *b*. Degrees of *Cold* discovered by water, ii. 251 *b*. The ascent of water by *Cold* in common weather-glasses, ii. 252 *a*. Objections to the opinion of the schools concerning *Cold*, ii. 252 *b*. The air expanded by *Cold* in sealed weather-glasses, ii. 253 *a*. In them the water descends with *Cold*, ii. 254 *a*. The degrees of *Cold* tried by experiments, ii. 255 *b*. The experimental history of *Cold*, ii. 258 *a*. The effect of *Cold* upon the strongest spirits, ii. 263 *a*. An inquiry into the degrees of *Cold*, ii. 264 *b*. The intensity of *Cold* produced by art, ii. 265 *b*. The tendency of *Cold* upwards or downwards, ii. 268 *a*. Experiments concerning it, ii. 268 *b*. The extremity of *Cold* in northern climates, ii. 271 *b*. The preservation and destruction of inanimate bodies by *Cold*, ii. 272 *b*. Bodies preserved by a moderate degree of *Cold*, ii. 273 *a*. The texture of bodies vitiated by *Cold*, ii. 273 *b*. Solid marble broke by a freezing degree of *Cold*, ii. 275 *a*. The effect of *Cold* upon stones and wood, ii. 276 *a*. The expansion of liquors by *Cold*, ii. 277 *b*. The contraction of liquors by *Cold* proved by experiments, ii. 278 *b*. The pressure of the expansion and contraction of liquors by *Cold*, ii. 285 *a*. The force of the expansion of water by *Cold*, ii. 288 *a*. The Epicurean and Cartesian ways of explicating *Cold*, ii. 290 *a*. Experiments of the sphere and activity of *Cold*, ii. 293 *a*. The diffusion of *Cold* of no great extent, ii. 294 *a*. The differing mediums through which *Cold* may be diffused, ii. 296 *a*. The transmission of *Cold* through indisposed mediums, ii. 297 *b*. The duration of the effects of *Cold*, ii. 306 *a*. Whether *Cold* be a positive quality or a bare privation of heat, ii. 307 *b*. The highest degrees of *Cold* upon the land, ii. 310 *b*. The nature of submarine *Cold*, ii. 312 *b*. Whether *Cold* proceeds from nitrous exhalations, ii. 313 *a*. The operation of the sun upon the air hindred by *Cold*, ii. 318 *a*. The effect of *Cold* upon the atmosphere, ii. 319 *b*. *Cold* produced by winds, ii. 323 *b*. Instances of the strange effects of *Cold*, ii. 325 *b*. The power of *Cold* to restrain the action of fire, ii. 326 *a*. Its effect in reference to air, ii. 326 *b*. In regard to the earth, ii. 327 *a*. And inanimate bodies and animals, ii. 372 *b*. The strange effects of *Cold* in northern countries, ii. 328 *b*. The dreadful circumstances of those that are killed by *Cold*, ii. 329 *a*. Whether birds and animals change their colour by reason of *Cold*, ii. 330 *a*. The nature of the atoms of *Cold* examined, ii. 333 *a*. Promiscuous experiments and observations concerning *Cold*, ii. 334 *b*. The effect of *Cold* upon a pistol-barrel, ii. 337 *a*. The condensation of liquors by *Cold*, in what manner effected, ii. 339 *a*. Bodies preserved from corruption by *Cold*, ii. 343 *a*. Separations made in bodies by the force of *Cold*, ii. 347 *a*. Examen of Mr. *Hobbes*'s doctrine touching *Cold*, ii. 373 *a*. Distemper'd bodies affected by *Cold*, ii. 375 *a*. Promiscuous experiments and observations relating to the history of *Cold*, ii. 391 *a*. A higher degree of *Cold* imparted by the air than is necessary to make water freeze, ii. 394 *b*. Death by *Cold* not painful, ii. 402 *b*. How *Cold* may be produced without the help of snow, ice, hail, wind, or nitre, ii. 547 *a*. *Cold* produced by a substance from sal-armoniack, ii. 547 *b*. Instances of *Cold* performing the offices of heat, iii. 190 *a*. A liquor made by *Cold* from a separation of oil, iii. 190 *b*. The positive or privative nature of *Cold* considered, iii. 357 *a*. Arguments to prove that *Cold* is a positive quality, iii. 361 *b*. The vulgar and philosophical sense of the word *Cold*, iii. 358 *a*. Two problems about *Cold* grounded on new experiments, iii. 371 *a*. Difficulties about the nature of *Cold* examined, iii. 372 *a*. The production of *Cold* by the con-

flict of bodies appearing to make an ebullition, iii. 374 *a*. The mechanical production of *Cold*, iii. 570 *a*. Two bodies upon mixture acquire a greater degree of *Cold* than either had before, iii. 571 *a*. The production of *Cold* often varied, affected, or hinder'd by mechanical circumstances, iii. 574 *b*. *Cold* is a privation of that local motion that is requisite to constitute heat, iii. 575 *b*. An experiment in the air-pump concerning *Cold*, i. 63 *a*. Account of the *Cold* on the pic of *Teneriff*, v. 171 *b*. Whether the particles of *Cold* enter into polished metal, v. 177 *a*. The effect of excessive cold in *Russia*, v. 186 *b*.

COLDNESS of the air not shewn exactly by weather-glasses, ii. 242 *b*. Differs in the same degree, ii. 251 *b*. The air rather disposed to *Coldness* than heat, ii. 316 *b*. The coldness of the air with regard to the pole and the æquator considered, ii. 320 *b*. The *Coldness* of bodies as to sense explained, iii. 369 *a*. *Coldness* produced by a mixture of sal-armoniack and water, iii. 570 *b*. A digression about potential *Coldness*, iii. 572 *a*. *Coldness* in an ague-fit, and other diseases, considered, iii. 572 *b*. Potential *Coldness* is only a relative quality, iii. 573 *b*. *Coldness* as to sense is relative to our organs of feeling, iii. 575 *b*. What measure of *Coldness* is natural to water, iv. 391 *b*. The way to estimate the degree of *Coldness* in water, iv. 242 *a*. Of the heat and *Coldness* of the air, v. 160 *a*.

COLEPRESSE, Mr. his letters to Mr. *Boyle*, v. 573 *a*. Some account of him, v. 381 *a*. His particular observations, v. 393 *a*.

COLICK, a cure for it, i. 539 *a*.

COLLEGE, the draught of a *College* for the Royal Society, v. 381 *a*. A scheme of a philosophical *College*, v. 398 *b*. Account of the building a *College* for the Royal Society, v. 389 *a*.

COLLINS, Dr. account of his practice of physick in *Russia*, in a letter to Mr. *Boyle*, v. 633 *a*.

COLOPHONY, reddish, obtained from the evaporation of turpentine, iii. 80 *b*.

COLORATION, papers concerning it, v. 357 *a*.

COLOUR, observations concerning the changes of *Colours*, i. 225 *b*. Experiments and considerations touching *Colours*, ii. 1 *a*. An account of the experimental history of *Colours*, ii. 5 *a*. The effect of the change of *Colours* in bodies, ii. 6 *a*. *Colours* observed in the tempering of steel, ii. 6 *b*. A particular definition of *Colours*, ii. 7 *a*. *Colours* seem to be distinguished in dreams, ii. 7 *a*. A strange appearance of dazzling *Colours*, ii. 8 *b*. *Colour* is a sort of quality residing in the body *coloured*, ii. 9 *a*. The variety of *Colours* appearing in melted lead, ii. 10 *a*. The variety of *Colours* in taffaty, ii. 12 *b*. An account of the discerning of *Colours* by touch, ii. 13 *a*. *Colours* altered by the reflection of light, ii. 15 *a*. And by variety of liquors, ii. 15 *b*. The many ways of changing a *Colour* by liquor, ii. 16 *a*. *b*. An account of the degeneration of *Colours*, ii. 16 *b*. Changes of *Colour* arise from the dissolution of metals, ii. 18 *a*. The difference of philosophers concerning the *Colour* of bodies, ii. 19 *b*. The difference between emphatical and other *Colours*, ii. 20 *a*. *Colours* reflected in a darkned room, ii. 21 *a*. The opinions of philosophers concerning the origin of *Colours*, ii. 21 *b*. *Colour* is a modification of light, ii. 22 *b*. Dark *Colours* are the blacker, the less light they are viewed in, ii. 28 *b*. The *Colours* of bodies vary according to the different light, ii. 43 *a*. Salts of use in the striking of *Colours*, ii. 46 *b*. The five principal *Colours* used by painters, ii. 48 *a*. Experiments upon fantastical *Colours*, ii. 49 *a*. Observations on primitive *Colours*, ii 50 *b*. Experiments by compounding *Colours*, ii. 51 *a*. The changes of *Colours* in mixed bodies by the intervention of salts, ii. 55 *b*. Bodies will exhibit various *Colours* by digestion, ii. 58 *b*. Not essential to the genuineness of a *Colour* to be durable, ii. 60 *a*. The changes of *Colour* in bodies explained, ii. 61 *b*. *Colours* generated by a mechanical change in the texture of bodies, ii. 64 *a*. A real *Colour* drawn from a liquor that has no *Colour*, ii. 69 *a*. The *Colour* produced by a preparation of steel, ii. 71 *b*. The adventitious *Colours* of metalline bodies, ii. 72 *a*. Various *Colours* produced by different infusions, ii. 80 *a*. The *Colours* of a prismatical glass, ii. 181 *a*. The production of *Colours* in the exhausted receiver, iii. 56 *a*. Fine *Colours* produced by mixtures, iii. 75 *a*. The *Colour* of fruits altered by artificial air, iv. 177 *a*. The staining of white marble with various *Colours*, iv. 223 *b*. The tinging of crystal with divers *Colours*, iv. 224 *a*. *Colours* may be derived from mechanical principles, iv. 229 *b*. Of *Colours* piercing into the pores of glass, iv. 230 *b*. Change of *Colour* in mineral waters by infusion of glass, iv. 237 *b*. The exploring of mineral waters by *Colours*, iv. 239 *b*. The strange effects of a red *Colour*, iv. 265 *a*. The effect of the mixing of *Colours*, iv. 325 *b*. The *Colour* of diamonds, v. 84 *a*. Changes of *Colour* produced by a simple ingredient, v. 85 *a*. *Colours* raised by the beams of light, v. 95 *b*. The change of *Colour* in bodies exposed to the air, v. 120 *a*. The operation of the air on the *Colours* of substances, v. 182 *a*. The doctrine of the chymists concerning *Colours*, i. 352 *b*. *Colours* appearing in steel in the flame of a candle, i. 353 *a*. Experiment of producing *Colours de novo*, i. 392 *a*. The alteration of *Colours* by the mixture of bodies, ii. 502 *a*. *Colours* how distinguished by a vitiated light, iv. 555 *b*. The change of *Colours* in fruits and flowers, v. 468 *b*. *Colours* distinguished by the touch, v. 579 *a*.

COLT, observables on the monstrous head of a *Colt*, ii. 403 *a*.

COLUMBUS, the discoverer of *America*, i. 203 *a*. He varied from the common rules of navigation, ii. 123 *b*.

COLUMELLA, his management and choice of sheep, v. 448 *b*. Breeding, watering, feeding, curing, &c. of sheep, v. 451 *a*.

COMBUSTIBLE MATTER, an experiment upon it in the air-pump, i. 21 *b*.

COMENIUS, some account of him, v. 432 *b*.

COMETS, their motion through the air, i. 24 *b*. Celestial and firmamentary *Comets*, v. 51 *a*. Account of the appearance of a *Comet*, v. 543 *a*. *Cassini*'s account of a new *Comet*, v. 394 *a*.

COMMANDMENT, the second expunged from the decalogue by the Papists, v. 413 *b*. The third *Commandment* explained, v. 207 *a*. An exposition of the fourth, i. 443 *a*.

COMMENT, the design of *Comments* upon classic authors, ii. 96 *b*.

COMPANY, the choice of *Company* considered, ii. 200 *b*. Three sorts of *Companies*, ii. 202 *a*. Infectious *Company* to be avoided, v. 219 *b*.

COMPARISON, the use of *Comparisons* fitly chosen, v. 39 *b*. Proper observations concerning them, ii. 141 *b*. The right use to be made of them, ii. 153 *b*. Were introduced by the best orators, ii. 154 *a*.

COMPASS, the various declinations of it near *London*, iii. 90 *a*. The invention and use of it, iii. 165 *a*. *Compasses* on ship-board changed by thunder, v. 123 *b*. The variation of it near the coasts of *Greenland*, ii. 397 *b*.

COMPASSION of God excellently described, i. 164 *a*.

COMPILERS of books, their practice and character, iii. 441 *b*.

COMPLEMENT, observations on writing of *Complements*, ii. 126 *b*.

COMPOSITI CONTINUI, some account of it, iv. 42 *a*.

COMPOST, an universal *Compost* for land, v. 267 *b*.

COMPOUNDED MEDICINES, the nature of them, iv. 330 *b*. The great variety in the consistence of *compounded* bodies, i. 346 *b*.

COMPREHENSION, account of an act of *Comprehension*, v. 368 *a*.

COMPRESSION of the air particularly examined by experiments, i. 100 *a*. *b*. &c. An engine for the *Compression* of the air, iv. 102 *a*. *Compression* of air hinders the production of it, iv. 109 *b*. Does not prejudice bodies expanded by vegetation, iv. 120 *b*. In a greater *Compression* less air is produced, iv. 124 *a*. A great *Compression* of air noxious to animals, iv. 124 *b*. *Compression* of the air without mechanical engines considered, iii. 209 *a*. Experiments to prove it, iii. 210 *a*.

CONCAVE, the cracking of *Concaves* made of mixed metals, iv. 267 *b*.

CONCENTRATION of spirits and colours, ii. 386 *a*.

CONCEPTIONS of the mind distinguished and explained, iv. 49 *b*. They are either symmetrical or asymmetrical, iv. 50 *a*.

CONCRETES, the parts of which they consist, i. 300 *a*. The dissolution of *Concretes* by fire examined, i. 308 *b*. The resolution of *Concretes* into five elements consider'd, i. 345 *b*. In what consists the noblest properties of *Concretes*, i. 354 *a*. *Concretes* of a mineral nature formed of water, i. 357 *a*. *Helmont*'s opinion on the resolution of *Concretes*, i. 362 *b*. The form of a *Concrete* explained, i. 237 *b*. The unknown properties of divers *Concretes*, i. 437 *b*. Noxious *Concretes* contain their own antidotes, i. 438 *b*.

CONCRETION, the producing of lapideous *Concretions*, i. 472 *a*. Stony *Concretions* formed by the mechanical action of the air, iii. 241 *a*. The origin of *Concretions* particularly examined, i. 300 *b*. *Concretions* of the salt of blood, iv. 169 *a*. Crystal *Concretions* from the spirit of blood, iv. 199 *a*.

CONDENSATION, a table of the *Condensation* of the air, i. 101 *a*. Experiments of the *Condensation* of air, ii. 293 *a*. *Condensation* of the air by mere cold, iii. 209 *a*. Various opinions concerning *Condensation*, i. 96 *b*.

CONE, experiment on a perfumed *Cone*, iv. 129 *b*. An account of its consumption by fire, iv. 130 *a*. Tried in a receiver for compressing of air, iv. 130 *b*.

CONEGA, a river, the boundary of the Moors, ii. 36 *a*.

CONFUSION of the nation disturbs the tranquillity of the mind, i. 2 *a*.

CONGELATION, whether the emission of odorous effluvia are hinder'd by *Congelation*, ii. 335 *a*. The effect of *Congelation* upon the smell of liquors, ii. 335 *b*. *Congelation* effected by putting salt-petre into water, ii. 337 *a*. The effect of *Congelation* upon plants and animals, ii. 348 *b*. Experiments concerning *Congelation*, v. 355 *a*. Vessels of beer and wine broken by *Congelation*, ii. 290 *b*. Whether the quality of catharticks are alter'd by *Congelation*, ii. 246 *b*. Whether liquors may be dephlegm'd by *Congelation*, ii. 347 *a*. In what manner bodies are spoiled by *Congelation*, iii. 349 *a*.

CONGO, the climate of that island, ii. 238 *a*.

CONJUGATION, remarks on the Hebrew *Conjugations*, ii. 121 *b*.

CONRADUS, his character of Mr. *Boyle*'s history of cold, ii. 230 *b*.

CONSCIENCE, rewards of a good *Conscience*, v. 68 *b*. The nature of it stated, v. 208 *a*. The memory roused by *Conscience*, v. 430 *a*.

CONSERVATORIES of snow, ii. 300 *a*.

CONSIDERATIONS touching the style of the Scriptures, ii. 94 *a*.

CONSISTENT bodies are exhaleable, iii. 65 *b*.

CONSTANCY in affliction supported by Christianity, v. 72 *b*.

CONSTANTINOPLE, a letter from thence, v. 351 *b*.

CONSUMPTIONS cured by the smoke of sulphur, i. 546 *a*.

CONTEMPLATION tires the mind, ii. 173 *a*.

CONTINUATION of experiments physico-mechanical, iv. 96 *a*.

CONTINUITY of water accounted for, i. 249 *a*.

CONTINUUM, the divisibility of it considered, i. 94 *b*.

CONTRACTION of liquors by cold examined, ii. 287 *b*.

CONTRADICTIONS, under what restraints they are to be allowed, v. 680 *b*. Conditions required to make a *Contradiction* between two propositions, v. 675 *b*. Seeming *Contradictions* in Scripture considered, ii. 110 *b*.

CONVERSATION, vain *Conversation* more pernicious than diseases, i. 179 *a*. The *Conversation* of the blessed in heaven, i. 181 *b*.

CONVERT, the case of a new *Convert* to religion, ii. 183 *a*.

CONVEX-GLASS, used in a dark room, an account of it, i. 194 *a*.

CONVULSIONS cured by injecting liquors into the veins, v. 374 *a*.

COPERNICAN hypothesis explained, iv. 341 *b*. The *Copernican* opinion of the vastness of the firmament, i. 434 *a*.

COPERNICUS, his opinion of the motion of the earth, iii. 443 *a*. The advantages of his hypothesis above all the rest, v. 688 *b*.

COPPER, an experiment by *Copper*-plates in the form of scales, i. 144 *a*. Gold and silver found in *Copper* ore, i. 208 *b*. *Copper* dissolved in spirit of nitre, the effect of it, i. 254 *a*. An experiment upon *Copper* and spirit of urine, ii. 68 *a*. The variety of colours produced by *Copper* and different menstruums, ii. 73 *b*. An experiment of crude *Copper* reduced to powder, ii, 75 *a*. Dissolved by an urinous spirit, iii. 153 *a*. The operation of the spirit of human blood upon *Copper*, iv. 183 *a*. On filings of *Copper* spread on white paper, iv. 188 *a*. On *Copper* in a cylindrical phial, iv. 204 *b*. Permeating fumes operate upon *Copper*, iv. 212 *b*. *Copper* dissolved in *aqua fortis* will stain ivory, iv. 216 *a*. The tinging of *Copper* by fumes of smoaking liquor, iv. 221 *a*. *Copper*-plates pierced through by brimstone, iv. 224 *b*. Gold found in *Copper* mines, v. 30 *a*. Experiment with calcined *Copper* and spirit of salt, v. 86 *b*. By dissolving *Copper* in *aqua fortis*, i. 321 *a*. *Copper* made inflammable, i. 400 *b*. Running mercury obtained from distilled *Copper*, i. 400 *b*. Experiment on changing the texture of *Copper*, ii. 504 *a*. *Copper* turned white by a particular menstruum, ii. 515 *a*. Into what a number of parts one grain of *Copper* may be divided, iii. 315 *a*. The effect of rust upon *Copper*, iii. 464 *a*. Spirit of urine impregnated with *Copper*, iv. 25 *b*. Experiment of the Noctiluca on filings of *Copper*, iv. 85 *b*. Experiment of a solid body soaking into the pores of *Copper*, iv. 225 *a*. The colours afforded by *Copper* with different salts, iv. 229 *b*. *Copper* subtilized like common water, iv. 241 *a*. The way of melting it with a blow-pipe, iv. 258 *a*. An effect of the hasty refrigeration of *Copper*, iv. 267 *b*. Corpuscles of *Copper* raised in form of exhalations, iv. 298 *a*. A dissolution of *Copper* in *aqua fortis*, iv. 298 *b*. *Copper* of noble use in medicine, iv. 332 *b*. The effect of salts upon plates of *Copper*, v. 119 *b*. *Copper* made inflammable like sulphur, i. 326 *b*. A strange production of *Copper*, i. 364 *b*. A flame raised by a solution of *Copper*, iii. 318 *b*. The cracking of *Copper* like glass, iii. 88 *a*. Experiment on sal-armoniack and filings of *Copper*, iv. 142 *a*. The effect of serum on filings of *Copper*, iv. 173 *b*.

COPPERAS, of *Dantzick*, an experiment upon it, ii. 73 *b*.

CORAL, an experiment upon it, i. 73 *a*. In what manner it grows, i. 276 *a*. A description of the growth of white *Coral*, i. 276 *b*. An experiment upon a solution of *Coral*, i. 280 *a*. On the weight of *Coral* exposed to the sun-beams, iv. 149 *a*. Its specific gravity examined, v. 7 *a*. The discovery of counterfeit *Coral*, v. 8 *b*. Experiment by powder'd *Coral* and box-wood distilled, i. 328 *b*. Tincture of *Coral* obtain'd by an uncompounded liquor, i. 365 *b*. Receipt to make the tincture of *Coral*, i. 557 *b*. Particular remarks concerning it, ii. 223 *a*. Is a succulent plant, and propagates its species, ii. 491 *b*. The operation of the fire upon *Coral* with regard to weight, iii. 349 *a*. Its nature and the fruit it bears, iii. 388 *b*. Experiment of the Noctiluca on powder of red *Coral*, iv. 85 *b*.

CORDIALS, the various sorts of them prescrib'd by physicians, iv. 317 *a*.

CORIANDER-SEED, the quality of it, iii. 188 *a*.

CORK, appearances upon the surface of *Cork*, ii. 10 *b*. Experiment upon *Cork* in the air-pump, i. 51 *a*.

CORN, the colour of ripe *Corn* waved by the wind, ii. 11 *b*. *Corn* spoiled by standing water, v. 466 *a*. Account of the smutting of *Corn*, v. 303 *a*. Various schemes for the improvement of *Corn*, v. 531 *a*.

CORN cured by a leaf of elder, v. 442 *a*. A remedy for *Corns*, i. 553 *a*.

CORNEA of the eye examined, iv. 524 *a*.

CORNELIAN, the closeness of its texture, iii. 67 *a*. The effect of *Cornelian* stones outwardly applied, iv. 323 *a*.

CORNISH diamonds, not uniformly shaped, iii. 228 *a*. A lesser set or bedded in a greater, iii. 228 *b*.

COROMANDEL, the distinction of the weather there, iii. 108 *a*. Strange fogs upon that coast, v. 188 *b*. The nature and effect of the winds in that country, v. 533 *b*.

CORONATION, reflection upon a letter concerning the king's coronation, i. 188 *a*.

CORPUSCLES of the air, their nature explained, i. 10 *b*. Of air not less subtile than those of water, i. 54 *a*. *Hobbes*'s notion of terrene *Corpuscles*, i. 130 *b*. The figure of an aerial *Corpuscle*, i. 140 *a*. The divisibility of them consider'd, i. 262 *a*. Whether the *Corpuscles* of bodies are at rest, i. 281 *b*. The *Corpuscles* of metals in motion, i. 283 *a*. The effect of the superficial *Corpuscles* of bodies, ii. 10 *b*. An account of the different shape of those *Corpuscles*, ii. 11 *a*. Of the situation of superficial *Corpuscles*, ii. 11 *b*. The colour of bodies depends upon the bulk and figure of the superficial *Corpuscles*, ii. 17 *b*. The *Corpuscles* of bodies will shew transparent, ii. 19 *a*. *Corpuscles* of matter have their particular positions, iii. 76 *b*. In what manner affected by figure and motion, iii. 78 *a*. Some account of their various qualities, iii. 80 *b*. *Corpuscles* of peculiar faculties, iii. 88 *b*. An account of the shining *Corpuscles* of a phosphorus, iv. 28 *b*. Glass penetrated by *Corpuscles* roving in the air, iv. 228 *b*.

The

The penetrating nature of the *Corpuscles* of some bodies, iv. 256 *b* The ascending *Corpuscles* of mineral bodies the cause of plagues, iv. 292 *a*. *Corpuscles* of metals ascend by exhalation, iv. 298 *b*. The *Corpuscles* of specifick medicines, their way of acting, iv. 315 *a*. Their co-operating with particles of peccant acids, iv. 319 *a*. They operate through the pores of the skin, iv. 321 *a*. The *Corpuscles* of which the air consists, v. 108 *a*. 116 *b*. The nature and quality of pestilential *Corpuscles*, v. 189 *a*. Of *Corpuscles* that make up the constitution of mixed bodies, i. 324 *a*. The various sorts of elementary *Corpuscles*, i. 326 *b*. The effect of small *Corpuscles* upon human bodies, i. 536 *a*. The nature of the *Corpuscles* of volatile bodies explained, iii. 610 *a*, *b*. *Corpuscles* of the air are never frozen, i. 243 *b*. Aqueous *Corpuscles* moving in the air, i. 249 *b*. The variety of *Corpuscles* that compose the body of an animal, iv. 207 *a*. The kind of *Corpuscles* that are the cause of diseases, iv. 312 *b*. The shape and mixture of the *Corpuscles* in the composition of bodies. i. 301 *a*. The separation of combining *Corpuscles* in mixed bodies, i. 320 *b*. *Corpuscles* of fire may add to the quantities of bodies, i. 332 *a*. The changing the nature of *Corpuscles* by a new texture, i. 367 *a*. The crystals obtained from saline *Corpuscles*, ii. 490 *a*. Whether alexipharmical *Corpuscles* may not be produced in the air by coalition, iii. 334 *b*. Experiments about arresting and weighing of igneous *Corpuscles*, iii. 347 *a*. The operation of the igneous *Corpuscles*, according to the Cartesians and Epicureans, iii. 353 *b*. Enquiries concerning the nature of frigorific *Corpuscles*, iii. 370 *a*. The operation of aerial *Corpuscles*, iii. 464 *a*. The nature of the *Corpuscles* of bodies requisite to the fixity of them, iii. 619 *a*.

CORPUSCULA COLORIS, of what they consist, ii. 18 *b*.

CORPUSCULAR PHILOSOPHY, why so called, i. 228 *b*. The particular advantages of it, iii. 76 *a*. Reconcileable with specific medicines, iv. 301 *a*. Objection against the *Corpuscular Philosophy* answer'd, iv. 302 *b*. Objection against the *Corpuscular* hypothesis, ii. 466 *b*. The proper subject of the *Corpuscular Philosophy*, ii. 501 *b*. The excellency and grounds of it, iii. 450 *a*. What is properly meant by it, iii. 450 *b*. A general misunderstanding between the *Corpuscular Philosophy* and the chymists, i. 229 *b*.

CORROSIBILITY, the mechanical origin of it, iii. 631 *a*. The disposition of bodies to *Corrosibility* consider'd, iii. 631 *b*. The *Corrosibility* of bodies depends upon their texture, iii. 632 *b*.

CORROSIVE liquors, several inquiries concerning them, i. 239 *a*. Attributes that qualify a body to be *corrosive*, iii. 624 *b*.

CORROSIVENESS; experiments on the mechanical origin of *Corrosiveness*, iii. 624 *a*.

CORRUPTIO *unius est generatio alterius*, that axiom explained, ii. 473 *a*.

CORRUPTION increases in free air, iv. 119 *a*. The quantity of *Corruption* depends on the quantity of the air, iv. 120 *a*. Sometimes hinder'd, sometimes promot- by the air, iv. 148 *b*.

CORSICA, a strange prospect of that island, v. 175 *b*.

COSMICAL qualities of things, iii. 72 *a*. More particularly explained, iii. 82 *a*.

COTTON-TREE, a prodigious one in *Jamaica*, v. 104 *a*.

COUGH, the effect of a violent *Cough*, ii. 7 *b*. Cured by spirit of human blood, iv. 194 *a*. The strange cause of a dry *Cough*, iv. 214 *b*. Remedy for an asthmatick *Cough*, v. 290 *b*. *Coughs* stopt by spirit of hartshorn, i. 568 *a*. A *Cough* cured by a salt medicine, i. 545 *b*.

COUNCIL of State, their proceedings, v. 291 *a*.

COUNTRY people not so happy as imagined, ii. 186 *a*. Apt to envy the great, *ibid*.

COW, an account of the milk of the *Cows* in *Savoy*, iv. 306 *b*. The use of *Cow*'s dung in physick, v. 343 *b*. *Cow*-heel, an experiment upon it, iv. 158 *b*.

CRAFTSMEN industrious and inventive, iii. 168 *a*.

CRAMP cured by an outward specifick, iv. 322 *a*.

CRATO, his judgment of receipts in physick, i. 581 *b*.

CRAWFISH, the nature of them, i. 218 *a*. Experiment by them in an exhausted receiver, iii. 119 *a*. The effect of the ashes of burnt *Crawfish*, iv. 305 *a*. Their claws grow after they are torn off, i. 468 *a*. Concretions generated in their heads, i. 472 *b*. Strange *Crawfish* in *China*, ii. 492 *a*. The ashes of *Crawfish* good against the bite of a mad dog, iii. 245 *a*.

CREATION, the designs of God in the *Creation*, i. 432 *a*. The *Creation* sufficient to convince men of a Deity, i. 457 *a*.

CREATURES are living engines curiously contrived, i. 72 *b*. Instruction to be had from all the *Creatures* in nature, ii. 150 *a*. They are the true Egyptian hieroglyphicks, ii. 155 *a*. Were created for the use of man, ii. 156 *a*. Confined to the established laws of nature, ii. 190 *a*. Are brought into the world at the spring of the year, iv. 344 *b*. *Creatures* made by God unknown to us, iv. 350 *a*. Are arbitrary pictures of the Creator, iv. 351 *a*. The nature of swearing by the *Creatures* explained, v. 209 *b*. The *Creatures* made for the service of man, i. 431 *b*. The knowledge of the *Creatures* affords a pleasure to man, i. 432 *b*. The wisdom of God conspicuous in the *Creatures*, i. 434 *a*. Apparent in the lesser *Creatures*, i. 435 *b*. Swimming *Creatures* discovered in vinegar, i. 437 *a*. The *Creatures* instruct man in duty and devotion, i. 439 *b*. The divine praises celebrated by irrational *Creatures*, i. 442 *a*. The actions of irrational *Creatures* explained, i. 445 *b*. Irrational *Creatures* seem to surpass the actings of reason, i. 447 *a*. God's attributes represented in the *Creatures*, i. 461 *b*. In what consists the empire of man over the *Creatures*, i. 463 *b*. An attempt to produce living *Creatures in vacuo Boyliano*, iii. 264 *a*. The *Creatures* could not have been made more perfect to answer the end of their creation, iv. 384 *b*. The great variety of them subject to the dominion of man, v. 691 *b*. The uses man may make of the *Creatures* subject to him, v. 723 *a*.

CREDULITY, religious truths not supported by *Credulity*, v. 57 *a*.

CREED, account of the popish *Creed*, v. 416 *b*. Of the Apostles *Creed*, iii. 421 *a*.

CREMNITZ, regeneration of gold from the earth of *Cremnitz*, iii. 462 *b*. The nature of gold mines there, iii. 102 *b*. Gold found there in copper-mines, v. 30 *a*. The temper of the air in the golden mine of *Cremnitz*, ii. 364 *a*. & v. 168 *b*.

CRIMSON, an account of that colour, ii. 61 *b*.

CRISIS of diseases examined, iv. 395 *a*. *Crisis's* divided into perfect and imperfect, iv. 396 *a*. The doctrine of *Crisis's* particularly explained, iv. 396 *b*.

CRITICKS, they are a hindrance to philosophy, iii. 2 *b*.

CROCUS METALLORUM given to a dog, i. 479 *b*. An infusion of it given to a man, i. 480 *a*. The strange effect of *Crocus Metallorum*, i. 549 *b*. *Crocus* of metals, an account of it, i. 397 *a*. *Crocus per se*, its use, and the way of making it, i. 576 *a*.

CROMERUS, his account of the cold in *China*, *Poland*, &c. ii. 401 *b*.

CROSS, strange *Crosses* upon clothes after an eruption of mount *Vesuvius*, iv. 293 *a*.

CROWN, the difference between earthly and heavenly *Crowns*, v. 69 *b*.

CROWS frighted with the smell of gunpowder, iii. 319 *b*.

CRUCIBLE melted into glass, i. 310 *a*.

CRUDITY of waters corrected by fire, v. 202 *b*.

CRYSTAL, a piece of *Crystal* of various colours, iii. 222 *b*. A drop of water in a piece of *Crystal*, iii. 223 *a*. *Crystal* loses its transparency by being heated and quenched in water, i. 59 *b*. An account of the cracking of *Crystal*, iii. 173 *b*. The imbuing of rock *Crystal* with divers colours, iv. 223 *b*. The discovery of the gravity of liquors by a piece of *Crystal*, v. 14 *a*. An experiment concerning whiteness by a piece of rock *Crystal*, ii. 27 *b*. *Crystals* discovered in the solution of salt of urine, i. 385 *a*. From spirit of urine, from nitre, and from silver, ii. 489 *a*. Obtained from vitriol, ii. 490 *b*. From the *caput mortuum* of sea-salt distilled, ii. 513 *a*. The uniform figuration of *Crystals* accounted for, iii. 225 *a*. Rock *Crystal* hydrostatically weighed, iii. 229 *b*. *Crystals* shooting from salts examined, ii. 488 *b*.

CRYSTALLINE GLASS, an experiment to try the strength of it, i. 17 *a*. A *crystalline* salt made from common sulphur, iv. 247 *a*.

CUBE, the weighing of water in a *Cube* of brass, v. 19 *b*. The particular circumstances in weighing an oaken *Cube*, v. 21 *b*.

CUCUMBER, experiment by the weight of *Cucumbers*, i. 313 *a*.

CUDWORTH, Dr. *Ralph*, his letters to Mr. *Boyle*, v. 549 *a*.

CUGOLI, a sort of concretions, emit a smell, iii. 67 *b*.

CUP, remarks upon an antimony *Cup*, v. 257 *b*. The strange effects of it, i. 549 *b*.
CUPEL, a trial about augmenting the weight of *Cupels*, iii. 343 *b*.
CUPPING-GLASSES, their effect upon the flesh, i. 111 *b*. Their sticking owing to the pressure of the air, iii. 44 *b*. An experiment of a *Cupping-Glass* upon the hand, iii. 45 *b*. It may be fastened without heat, iii. 46 *a*. Its use in hypochondriacal cases, v. 439 *b*. In epileptical agonies, v. 446 *a*. *Cupping-Glasses* used in *Brasil*, i. 540 *b*.
CURE of diseases inquired into, i. 481 *b*. Examples of some unexpected *Cures*, i. 482 *a*. A way to lessen the charge of *Cures*, i. 516 *b*. *Cures* performed by outward application, i. 524 *a*.
CURIOSITIES in the repository of the Royal Society, v. 387 *a*.
CURSER, a *Curser* is the devil's voluntier, v. 225 *a*.
CURSES, are sins by traduction, v. 223 *a*. Gaming the occasion of *Curses*, v. 224 *a*.
CURSING, a dissuasive from it, v. 222 *a*. Texts to prove the sinfulness of it, v. 222 *b*. It is a breach of the Commandments, v. 223 *a*. Is a sin of no use, v. 225 *a*. *David*'s imprecation against *Cursing*, *ibid*. It gives scandal to weak Christians, v. 225 *b*. Arguments against the sin of *Cursing*, v. 204 *a*.
CUSTOM no excuse for sin, v. 217 *a*. Bad *Customs* to be cured at the beginning, v. 218 *a*.
CUSTOMARY SWEARING, a discourse against it, v. 206 *a*.
CUT, the way of taking off a printed *Cut*, iii. 183 *a*. *Cuts* to the *Physico-Mechanical Experiments* explained, iii. 3 *a*.
CUTLER, Sir *John*, his bounty to the Royal Society, v. 322 *a*.
CYDER, a method to make it strong, iii. 152 *b*. The spirit of it penetrates through stone bottles, iv. 221 *b*. The fermentation of *Cyder* examined, v. 531 *b*. The improvement of *Cyder* recommended, v. 500 *a*. An account of excellent *Cyders*, i. 491 *a*.
CYLINDER of an air-pump described, i. 6 *a*. An experiment concerning the altitude of the mercurial *Cylinder*, i. 26 *b*. The causes of the variation of the altitude, i. 27 *b*. Mercurial *Cylinder* raised high in a forcible respiration, i. 85 *a*. The mercurial *Cylinder* shorter near the top of the atmosphere, i. 99 *b*. Its use in weighing bodies under water, iii. 5 *a*. The measuring the weight of *Cylinders* of the atmosphere, iii. 39 *a*. The effect of different *Cylinders* of air, iii. 59 *b*. Experiment on two *Cylinders in vacuo*, iv. 143 *b*. The gravity of liquors tried by a *Cylinder* of brass, v. 16 *a*. The length and diameter of the *Cylinder* considered, v. 127 *b*.
CYNICK, his notions of the pleasures of the world, ii. 116 *a*.

D.

DALMATIA, the quality of the gap of *Dalmatia*, iv. 261 *b*.
DAMASCO-STEEL, the quality of it, i. 219 *a*. The sword-blades of *Damasco*, iii. 148 *a*. The perfection of instruments made of that metal, iii. 468 *a*.
DAMASK ROSES, their smell occasions the head-ach, iii. 327 *a*.
DAMPS, the effects of them in lead-mines, i. 67 *b*. The nature of them more particularly considered, i. 140 *b*. Their irregular way of coming, iv. 286 *b*. Of curing the effect of *Damps*, v. 157 *b*. The particulars of *Damps* examined, v. 194 *b*. An account of fire-*Damps* and earth-*Damps*, v. 305 *b*. *Damps* in mines foretell the changes of the weather, ii. 367 *a*.
DANE, the *Danes* whiter than Swedes and Spaniards, ii. 35 *a*.
DANIEL, his study of the Scriptures, ii. 131 *a*. Inflexible to bad examples, v. 72 *a*.
DANTZICK VITRIOL and sea-salt distilled, iv. 297 *b*.
DARKNESS, a political government in the kingdom of *Darkness*, iv. 347 *b*. *Darkness* occasioned by an eclipse of the moon, iii. 363 *b*. Is clear light to some animals, v. 504 *a*.
DAVID, his several descriptions of the love of God, i. 161 *b*. The contributions of himself and his officers to build the temple, i. 174 *b*. Employed in the study of the Scriptures, ii. 130 *b*. A particular character of that prince, ii. 186 *b*. His imprecation against cursing, v. 225 *a*.
DAVIDEIS, written by Mr. *Cowley*, ii. 89 *b*.
DAY, a solemn description of the *Day* of judgment, iv. 348 *b*.
DEAD bodies embalmed in the island *Teneriff*, v. 173 *b*. Devoured by beasts, no argument against a resurrection, iii. 540 *b*. The strange preservation of a *dead* body in a vault of St. *Paul*'s church, v. 563 *a*.
DEAL, a piece of *Deal* will appear transparent, ii. 19 *a*.
DEAN, account of iron in the forest of *Dean*, v. 197 *a*.
DEATH, sober thoughts of it make men fit for it, ii. 135 *b*. Meditation on the danger of *Death*, ii. 173 *a*. The forethoughts of *Death* of advantage, ii. 173 *b*. Reflections upon a *death*-bed, ii. 174 *a*. Thoughts on the approaches of *Death*, ii. 174 *b*. Repentance not to be delay'd to a *Death*-bed, ii. 175 *a*. *Death* conquered by the Lord of life, ii. 194 *b*. Reflections on the *Death* of relations, v. 240 *b*. *Death* by cold not painful, ii. 402 *a*. The texture of the body alter'd by *Death*, ii. 535 *a*. The nature and power of *Death* explained, iv. 364 *a*. The effect of serious meditation upon it, v. 733 *a*.
DECALOGUE, the nicety of the Rabbies concerning it, ii. 116 *b*.
DECLINATION of the needle not the same in all places, i. 221 *b*.
DECOCTION of a plant in water, an account of it, i. 311 *a*.
DECREE, the *Decrees* of God concerning men discover'd by revelation, iii. 414 *a*.
DEDICATION, the common forms of *Dedications* exploded, i. 156 *a b*.
DEER, an account of bones in the hearts of *Deer*, i. 277 *a*. The effluvia they leave with their feet, iii. 89 *a*. Spirit and salt obtained from the blood of *Deer*, i. 562 *a*. The reason of white *Deer* examined, ii. 330 *a*.
DEFINITION of the divine nature impossible, i. 169 *a*.
DEGENERATION of colours explained, ii. 60 *a*.
DEGRADATION of gold, iv. 13 *a*.
DEISTS, their objections to revelation answered, v. 660 *b*. Their argument against providence, v. 46 *a*.
DEITY, how excluded by philosophers from the production of things, i. 451 *b*. Proved from the knowledge of naturalists, i. 453 *a*.
DELUGE, *Burnet*'s theory of the *Deluge* examined, v. 621 *b*.
DEMOCRITUS, his opinion of whiteness and blackness, ii. 23 *a*. Accounted mad for his anatomy of beasts, i. 420 *a*. His sentiments concerning water turned into ice, ii. 330 *b*.
DEMONS, subterraneous, an inquiry concerning them, v. 197 *b*. Some account of the demon of *Mascon*, v. 245 *b*.
DEMONSTRATION, the difficulty of apprehending some mathematical *Demonstrations*, iii. 526 *a*. The nature of physical *Demonstration* and moral certainty, iii. 432 *a*. The three distinct degrees of *Demonstration* among philosophers, iii. 530 *b*.
DENMARK, declaration of war against that crown, v. 362 *b*.
DENSITY and gravity of the air altered by fumes rolling up and down, i. 109 *a*.
DEPHLEGMED SPIRIT OF WINE, how obtained, i. 213 *b*.
DEPTH of a well, how measured, iii. 179 *a*.
DEPURATION of the blood, the principal use of respiration, i. 73 *a*. Liquors may be spoiled by too exquisite a *Depuration*, i. 213 *a*. The *Depuration* of mercury explained, i. 408 *b*.
DES-CARTES, his notion and explication of the air, i. 8 *b*. Concerning the ebbing and flowing of the sea, i. 27 *a*. His exact definition of air, i. 115 *a*. His judgment of light, iv. 261 *b*. His use of comparisons, v. 39 *b*. An account of his treatise *de Animalibus*, v. 288 *a*. His doctrine of comets, v. 331 *a*. Of the pressure of the upper parts of water on the lower, examined, ii. 445 *a*. His way of treating of the qualities of bodies, ii. 458 *b*. His opinion of local motion, ii. 461 *a*. The character of his writings, and the consequences of them, iii. 269 *a*. The phænomenon of ice made by putting snow and salt about a vessel of water, explained by *Descartes*, iii. 367 *b*. His opinion of the nature of the soul, iii. 412 *b*. On the contemplation of God, iii. 423 *a*. Of a corporeal substance, iii. 433 *a*. Of sensation, iii. 433 *b*. His remark on the circle to be made by the motion of matter, iii. 516 *a*. On the divine omnipotence, iii. 518 *a*. On the prejudices of mankind, iii. 518 *b*. On matters in religion that exceed our reason, iii. 522 *b*. On believing

lieving things not to be comprehended, iii. 524 *b*. On the solution of a problem in *Pappus*, iii. 526 *a*. On believing things relating to God; iii. 527 *a*. On suspension of assent, iii. 531 *b*. On electrical attraction, iii. 647 *b*. On the ends of God in things corporeal, iv. 516 *a*. On inquiries into the final causes of God's actions, iv. 517 *b*. That there is the same quantity of motion in the world at one time as at another, iv. 518 *b*. That it is presumption to investigate the ends of God in the making his creatures, iv. 519 *b* His philosophy not proved by arguments strictly physical, iv. 520 *b*. His reason for the creation of the sun, iv. 521 *a*. For his doctrine of final causes, iv. 521 *b*. He has demonstrated the existence of a God, iv. 522 *b*.

DESCENT, *Hobbes*'s opinion of the *Descent* of bodies, i. 126 *b*. The acceleration of the *Descent* of falling bodies examined, iii. 190 *b*. *Descent* of heavy bodies examined, iv. 383 *b*. Experiment on the *Descent* of variously figured bodies through the water, v. 537 *b*. Particular inquiries concerning the *Descent* of bodies, v. 494 *a*.

DESCRIPTION, remarks upon *Descriptions* in writing, ii. 143 *a*.

DE SERRES, Monsieur, his account of the winds in *France*, iii. 398 *a*.

DEVIL, painted white by the Blacks, ii. 36 *b*. Discourages the reading of the Scripture, ii. 118 *a*. Is the father of falshood, ii. 152 *b*. The baits he uses to delude, ii. 187 *b*. The government, the nature, and offices of *Devils*, iv. 347 *b*. *The Devil take me*, a remark on that imprecation, v. 223 *b*.

DEVOTION, a description of it, i. 161 *a*. Books of *Devotion* not compared to Scripture, ii. 114 *a*. Less affecting than the Bible, ii. 137 *a*. The use and benefit of *Devotion*, ii. 148 *b*. The exercise of *Devotion* delightful, ii. 149 *a*. The use of reading books of *Devotion*, ii. 159 *b*. *Devotion* cherished by the knowledge of nature, i. 429 *b*. Man encouraged to *Devotion* by the creatures, i. 439 *b*.

DEW, the effect of a remarkable *Dew* in *Egypt*, iv. 288 *a*. The power of *Dew* in working on solid bodies, v. 121 *b*. The variety of colours in drops of *Dew*, iii. 189 *b*.

DIACHYLON, a plaister so called, the use of it, i. 5 *a*.

DIAL made to move of itself, v. 128 *a*.

DIALLING, the use and effect of that art, iii. 161 *b*.

DIALOGUE, the author's reason for writing in *Dialogue*, ii. 141 *a*. A sceptical *Dialogue* about the positive or privative nature of cold, iii. 357 *a*.

DIALOGUS PHYSICUS, the author's examen of that treatise, i. 120 *a*.

DIAMOND-DUST used in the cutting of gems, iii. 172 *b*.

DIAMONDS, how reduced to powder, i. 262 *b*. Are bodies absolutely electrical, i. 286 *a*. Will vary in their brightness, i. 286 *b*. *Diamonds* of the old rock, their quality, i. 287 *a*. Observations on a *Diamond* that shined in the dark, ii. 81 *a*. Alterations made in it by affriction, ii. 84 *a*. A particular description of its degrees of light, ii. 85 *b*. Its light increased by rubbing, ii. 86 *a*. Would shine under water, ii. 86 *b*. A *Diamond* emits effluvia, iii. 70 *a*. An account of yellow *Diamonds*, iv. 65 *b*. *Diamonds* not much heavier than glass, iv. 220 *a*. Will strike fire like flints, iv. 253 *b*. Made electrical by rubbing upon woollen clothes, iv. 270 *b*. Observations on the cracking of a *Diamond*, iv. 275 *b*. Various observations about *Diamonds*, v. 82 *b*. The hardness of *Diamonds* examined, v. 83 *a*. The weight of *Diamonds* examined, v 83 *b*. The shape and figure of rough *Diamonds*, *ibid*. The grain and colour of *Diamonds*, v. 84 *a*. *Diamonds* impregnated with metalline principles, v. 84 *b*. A *Diamond* made out of a black flint, v. 331 *b*. The way of finding *Diamonds* in the *East-Indies*, v. 360 *b*. *Diamonds* not resoluble by fire, i. 325 *b*. Are generated at this time, i. 357 *b*. Their seminal principles lodged in the mine they grow in, i. 449 *b*. A grain or flaky contexture in *Diamonds*, iii. 220 *a*. Account of yellow *Diamonds*, iii. 222 *a*. Heterogeneous matter contained in *Diamonds*, iii. 294 *a*. The water of *Diamonds* partakes of the colour of the soil where they are found, iii. 224 *b*. The shape of *Diamonds* not uniform, iii. 228 *b*.

DIAPHRAGM necessary to the motion of the lungs, i. 64 *b*.

DICTATE of reason, the nature of it, iv. 62 *a*.

DIDYMUS, the martyrdom of *Theodora* and *Didymus*, iv. 425 *a*. The time and place in which they lived, iv. 427 *b*. He intercedes for the life of *Theodora*, iv. 430 *a*. Contrives her escape, iv. 436 *b*. Is condemned to death, iv. 447 *a*. Pleads for the life of his mistress, iv. 449 *b*. His speech at execution, and death, iv. 461 *a*.

DIEMERBROECK, his opinion of the plague, iv. 289 *a*.

DIETETICAL part of physick improved by natural philosophy, i. 489 *a*.

DIFFUSEDNESS of noctilucal matter, iv. 79 *a*.

DIGBY, Sir K. his proof of the porosity of glass, v. 233 *b*. A particular account of him, v. 263 *a*. His opinion of electrical attraction, iii. 647 *a*.

DIGESTION, the emergency of redness in bodies by *Digestion*, ii. 61 *a*. *Digestion* occasioned by an acid ferment in the stomach, iv. 179 *b*. Ways of *Digestion* without fire, i. 515 *a*. *Digestion* in the stomach does not always proceed from heat, ii. 360 *b*.

DILATATION of the air explained, i. 14 *a*. Of the thorax opposed by the ambient air, i. 85 *a*.

DIOPTRICKS improved by mathematicks, iii. 159 *a*.

DISCIPLINES, mechanical, their use to natural philosophy, iii. 162 *a*. To the making of instruments and tools, iii. 165 *a*.

DISCOURSE on being called up early in a morning, ii. 182 *a*. On the nature of larks, ii. 183 *b*. On a milk-maid singing to a cow, ii. 184 *b*. Of fishing with a counterfeit fly, ii. 187 *a*. On a fish struggling with the hook, ii. 187 *b*. On a shadow cast upon a river, ii. 188 *a* On falling near the brink of a river, ii. 191 *a*. On the good and harm done by rivers, ii. 191 *b*. On lands placed at a distance, ii. 192 *b*. On a fish running away with the bait, ii. 194 *a*. On a dispute with a steersman, ii. 194 *b*. *Discourse* on the salubrity and insalubrity of the air, iv. 277 *a*. Against customary swearing, v. 204 *a*. Of subordinate forms, v. 252 *b*. On clouds rising out of the sea, &c. ii. 197 *a*. On drawing the boat to the shore, ii. 198 *b*. On catching store of fish at a baited place, ii. 199 *b*. On the magnetical needle of a sun-dial, ii. 200 *b*. On the quenching of quick-lime, ii. 202 *a*. On one's talking to an eccho, ii. 202 *b*. On giddiness by looking on a rapid stream, ii. 205 *a*. On one's drinking water out of the brim of his hat, ii. 205 *b*. On seeing boys swim with bladders, ii. 207 *a*. On sports being interrupted by rainy weather, ii. 208 *a*.

DISEASE, particular description of *Diseases*, ii. 168 *b*. Reflections on a relapse in *Diseases*, ii. 176 *a*. The cause of new *Diseases*, iii. 42 *a*. The nature of *Diseases* in human bodies, iv. 193 *a*. The transplantation of *Diseases* by the patient's blood, iv. 200 *a*. The propagation of *Diseases* by the steams of infected air, iv. 213 *a*. The nature and cause of endemical *Diseases*, iv. 279 *b*. A determinate *Disease* produced by mineral effluvia, iv. 281 *a*. Epidemical *Diseases* produced by subterraneal effluvia, iv. 284 *b*. The short duration of epidemical *Diseases* accounted for, iv. 287 *b*. New *Diseases* caused by subterraneal fumes, iv. 296 *a*. The use of uncommon notions about *Diseases*, iv. 295 *a*. Chronical *Diseases* cured by specific medicines, iv. 308 *b*. Are generally produced by the effect of acids, iv. 310 *b*. Depend on the vitiated constitution of the blood, iv. 316 *b*. The use of simple medicines in the cure of *Diseases*, iv. 334 *b*. The effect of mineral waters upon *Diseases*, iv. 336 *b*. *Diseases* influenced by the planets, v. 125 *a*. The inconveniences of the study of *Diseases*, v. 298 *a*. An oil to cure ricketing *Diseases*, v. 301 *b*. An account of the transplantation of *Diseases*, v. 317 *a*. *Diseases* arising from exterior poisons, i. 477 *b*. The curableness of all *Diseases* examined, i. 481 *b*. The nature of acute and chronical *Diseases*, i. 482 *b*. *Diseases* cured by frights, i. 527 *b*. All *Diseases* cured by one *Indian* plant, i. 529 *b*. Infectious *Diseases* conveyed by effluvia, i. 536 *a*. Divers *Diseases* caused by the same matter, i. 551 *a*. The curing *Diseases* a noble employment, i. 554 *b*. *Diseases* arising from unknown powers and effluvia in the air, iii. 469 *a*. The curious texture of human bodies proved by *Diseases*, iv. 538 *a*.

DISQUISITION about the final causes of natural things, iv. 515 *a*.

DISSECTION of a monster, an account of it, v. 316 *b*. Particular observations in the *Dissection* of bodies, i. 220 *b*. An account of the *Dissection* of a live dog, v. 321 *b*. Of the *Dissection* of a child at *Lyons*, v. 388 *a*. The use of the *Dissection* of brute creatures, i. 465 *a*. Of found beasts, i. 476 *b*.

DISSIMILITUDE of running mercury, i. 408 *b*.

DISSOLVENTS, the manner of their operation examined, i. 486 *a*.

DISSOLUTION of bodies explained, i. 367 *a*. Upon what it depends, i. 404 *b*.
DISSOLUTIVE power of the spirit of human blood, iv. 183 *a*.
DISSUASIVE from cursing, v. 222 *a*.
DISTANCE of places measured by sounds, iii. 185 *a*.
DISTILLATION of urine, an account of it, i. 211 *a*. The effects of the *Distillation* of essential oils, iv. 90 *b*. The number of *Distillations* not settled by chymists, iv. 92 *a*. Experiments concerning *Distillation in vacuo*, iv. 156 *a*. The *Distillation* of dried blood difficult, iv. 171 *b*. A particular effect of the *Distillation* of human blood, iv. 178 *b*. A *Distillation* of the volatile salt of human blood in distilled water, iv. 179 *a*. The taste of saline spirits in *Distillation*, iv. 179 *b*. To find the quantity of the spirit of human blood by *Distillation*, iv. 181 *a*. A particular account of the *Distillation* of dried blood, iv. 197 *a*. Several ways of *Distillation* of human blood, iv. 201 *a*. The *Distillation* of mineral waters inquired into, iv. 236 *a*. *In balneo* examined, i. 504 *b*. Ways of *Distillation* without fire, i. 515 *a*. The effect of *Distillation* on chymical medicines considered, i. 575 *a*.
DISTILLED WATER, the use of it in experiments, iv. 204 *a*. The weight of *Distilled Water*, iv. 243 *a*. An experiment concerning the expansion of *Distilled Water*, i. 36 *b*. Upon *Distilled* oil to try the pressure of the air, i. 37 *a*.
DISTINCTION, reflections upon a theological *Distinction*, v. 59 *a*. The nature of that *Distinction* examined, v. 64 *b*.
DISTRESS, no extremity of *Distress* inconsistent with God's compassion, i. 164 *b*.
DITCH, account of a strange *Ditch* in the north of *England*, ii. 368 *a*.
DIVERS, their account of the sub-marine regions, iii. 105 *a*. Why *Divers* are not hurt by the weight of the incumbent water, iii. 281 *a*. The miseries endured by men and women *Divers*, iii. 284 *b*. Owing chiefly to the pressure of the air, iii. 283 *a*. They feel in great depths fix'd pain in their ears, iii. 284 *b*. The effect of the pressure of the water on the body of a *Diver*, iii. 284 *b*. Why a *Diver* is not pressed to the bottom, by the weight of so great a pillar of sea perpendicularly over him, iii. 300 *b*. Why *Divers* are not oppressed by the weight of the incumbent water, ii. 444 *a*.
DIVINE, benefits received from the *Divine* surpass those received from the naturalist, iii. 430 *b*.
DIVING, an account of it in the *Indies*, and in other places, i. 71 *b*. The weight of water in *diving*, i. 88 *b*. Noctiluca's of use in *diving*, iv. 23 *a*. The pressure of the water on the *genus nervosum* in *diving*, iii. 301 *a*. A proper instrument for *diving*, iii. 174 *b*.
DIVINITY, the pre-eminence of the study of *Divinity* above that of natural philosophy, iii. 408 *a*. The excellency of that study, iii. 427 *a*. It affords a reputation and character to those that follow it, iii. 446 *a*. The saying, Such a thing is true in *Divinity*, but false in philosophy, examined, iii. 521 *b*. The difference between solid *Divinity* and true philosophy but small, iii. 523 *a*.
DIVISIBILITY of bodies examined, i. 262 *a*. A primary affection of matter itself, i. 273 *a*. *Divisibility in infinitum* hard to be understood, iv. 46 *a*. An account of infinite *Divisibility*, iv. 41 *b*.
DIURETICK SALT, an account of it, iii. 333 *b*.
DOCILITY, a happy temper to entertain religion, v. 57 *a*.
DOCTRINE, the peripatetical and chymical *Doctrine* concerning the elements, i. 296 *a*. The excellency of the *Doctrine* a proof of the Christian religion, v. 48 *a*. Some *Doctrines* true that surmount our reason, v. 64 *b*. The *Doctrine* of Christianity consistent with greatness of mind, v. 66 *a*.
DOG, a name commonly used by the Jews, i. 164 *a*. The colour of the hair on a *Dog*'s neck when angry, ii. 11 *b*. Remedy for the bite of a mad *Dog*, iv. 305 *a*. The poison of the tooth of a mad *Dog*, v. 50 *a*. An ague given a *Dog* by transplantation, v. 317 *b*. The dissection of a live *Dog*, v. 321 *b*. The injection of oils into the veins of a *Dog*, v. 365 *a*. The strange memory of *Dogs*, v. 430 *b*. They exceed men in the sense of smelling, i. 413 *a*. The exemption of a *Dog*'s spleen, i. 465 *b*. *Dogs* not hurt by eating of vipers, i. 478 *a*. A solution of opium injected into the veins of a *Dog*, i. 479 *b*. The spittle of a mad *Dog*, i. 542 *b*. The transfusion of the blood of one *Dog* into another, ii. 550 *b*. The excellent scent of a setting *Dog*, iii. 319 *a*. The venom of a mad *Dog* conveyed by exhalations, iii. 337 *a*. And by the slabber of his mouth, iii. 337 *b*. The poison of a mad *Dog* lies concealed for many years, iv. 414 *a*. The manner of bleeding one *Dog* into another, v. 528 *b*. A *Dog* kept alive by blowing air into his lungs with a bellows, v. 541 *a*.
DONDO's, African priests, an account of them, ii. 37 *b*.
DOOR, the effect of shutting a *Door* upon the whole house, iv. 260 *a*.
DOUGH, experiment on *Dough* with spirit of wine, iv. 108 *a*.
DRABICIAN PROPHECIES, some account of them, v. 349 *b*.
DREAMS, and their interpretation, religiously observed by all nations, v. 495 *b*.
DREBELL, *Cornelius*, his invention of a vessel to go under water, i. 69 *b*. Of scarlet dye, and pendulum clocks, iii. 139 *b*. A particular account of his dying of scarlet, iii. 174 *a*. The inventor of submarine navigation, iii. 174 *b*. Some particulars of his invention, v. 128 *a*.
DRINESS, its operation in the changes of bodies, v. 114 *a*.
DRINK, an account of one who lived almost without *Drink*, i. 242 *b*. The way to keep *Drink* cool in long voyages, iii. 107 *b*. The use and benefit of wholesome *Drinks*, i. 489 *a*. *Drinks* made from sorts of coarse bread, i. 490 *b*. From the flesh of animals, i. 492 *b*. The effect of drinking cold *Drinks*, i. 538 *a*. The Persian way of cooling their *Drinks*, ii. 390 *a*. The cooling of *Drinks* by an infrigidating mixture, ii. 548 *a*. By sal-armoniack, ii. 548 *b*.
DRINKERS of water distinguish the taste of waters, i. 364 *a*.
DRINKING-GLASSES, the effect of the motion of musical strings upon them, iv. 265 *b*.
DROP, the effect of some peculiar emetic *Drops*, v. 91 *a*. The reason of the globular figure of *Drops* of water, ii. 357 *b*. *Drops* of water on marble and other hard bodies explained, iii. 401 *b*.
DROPSY cured by preparation of silver, iv. 332 *b*. Experiment to give the *Dropsy* to a dog, v. 371 *a*. The liquor that distends the abdomen in the *Dropsy*, i. 474 *a*. Examples of the cure of the *Dropsy*, i. 483 *b*. The cure of the *Dropsy* by the pill *Lunaris*, i. 500 *b*. By drinking largely of *Tunbridge* waters, i. 544 *b*. The case of a man dying of a *Dropsy*, v. 522 *b*. Account of a *Dropsy* in the breast, v. 523 *a*.
DROUGHT, the height of the quicksilver in *Droughts* examined, v. 251 *a*. Particular reasons for it, ii. 450 *b*.
DROWNING, experiments of *drowning* animals, i. 139 *b*. The time in which animals are *drowning*, iii. 121 *a*. The time of *drowning* of a duck, iii. 122 *a*.
DRUGS sophisticated by the avarice of the seller, i. 205 *b*. The use of the hydrostatical weighing of *Drugs*, v. 9 *b*. A caution concerning the mixing of *Drugs*, v. 87 *b*. The operation of *Drugs* not sufficiently explained, i. 547 *a*.
DRUM, remarks on the beating of a *Drum* near the mouth of a cave, ii. 467 *b*. A *Drum* heard twelve leagues off at sea, iv. 262 *b*.
DRUMMOND, Lieutenant G. his account of the effects of frost in *Russia*, ii. 400 *b*.
DRYNESS, to keep a chamber at the same degree, or at an assigned degree of *Dryness*, iii. 399 *a*.
DUCKS, their lasting alive in the exhausted receiver, iii. 114 *a*. Experiment of a callow *Duckling* in the receiver, iii. 114 *b*. Of keeping a *Duck* under water, iii. 121 *b*.
DUELBCH of *Paracelsus*, an account of it, i. 472 *b*.
DU HAMEL, his character of Mr. *Boyle*'s history of cold, ii. 230 *a*.
DULWICH WATER, the weight of it, iv. 243 *a*.
DU MOULIN, Dr. *Peter*, his letters to Mr. *Boyle*, v. 594 *b*. He translates the French King's declarations against the Protestants, v. 595 *a*. A motion made for his being examined by the House of Commons, v. 595 *b*.
DUNG, some account of the kinds of it, iii. 142 *b*. Salt extracted from the *Dung* of a pigeon-house, i. 378 *b*. Sheep's *Dung* mingled with cheeses in *Holland*, ii. 220 *b*.
DUNG-HILL, account of one that smelt like musk, iii. 594 *a*.
DUNKIRK, the raising the siege of that place, v. 280 *a*.

DURABLENESS of the union between bodies considered, ii. 482 *a*.
DUST of diamonds, an account of it, v. 83 *a*.
DUTCH, an account of their designs in *Guinea*, &c. v. 306 *b*. They play the fox against the English, v. 320 *b*. Their improvement of manufactures, v. 336 *b*. Two *Dutch* ships sail within a degree of the pole, ii. 399 *b*.
DYERS, their observation concerning the changing of black into a lighter colour, ii. 38 *b*.
DYSENTERY, a remedy for that distemper, iv. 332 *a*. Cures of *Dysenteries* by fumes, i. 538 *b*.

E.

EAR, the passage from the *Ear* to the mouth, v. 383 *a*.
EARTH, gold extracted from red *Earth*, i. 209 *a*. The bigness of the *Earth* computed, ii. 156 *b*. The *Earth* a field for meditation, ii. 158 *a*. Is as to sense cold, iii. 98 *b*. The temperature of the air in the three regions of the *Earth*, iii. 99 *a*, &c. The cause of warmth in the third region of the *Earth*, iii. 102 *b*. The *Earth* under the floor of a pigeon-house distilled, iii. 142 *b*. The effluvia of *Earth* will operate on iron, iv. 228 *b*. A strange sort of *Earth* in the north of *England*, iv. 239 *a*. The *Earth* supposed to be a great magnet, iv. 279 *a*. The juices of the *Earth* impregnated by noxious exhalations, iv. 283 *b*. Surprising things beneath the surface of the *Earth*, iv. 285 *a*. The motion of the *Earth* according to *Copernicus*, iv. 341 *b*. Swifter than a bullet out of a cannon, iv. 342 *a*. The *Earth* of an old pigeon-house, the nature of it, v. 117 *a*. The influence of the sun upon the *Earth*, v. 126 *b*. A wonderful quality of the *Earth* of *Egypt*, v. 185 *a*. The particular qualities of the *Earth* proper for a natural history, v. 192 *a*. What *Earth* fit for flowers, v. 248 *a*. The distance of the sun and moon from the *Earth* examined, v. 347 *b*. Experiment by baking of *Earth*, i. 312 *b*. *Earth* and water are principles of mixed bodies, i. 327 *b*. *Earth* a less simple body than imagined by the chymists, i. 343 *b*. *Earth* and water not universal ingredients of mixt bodies, i. 360 *a*. *Earth* not a constant ingredient of mixt bodies, i. 364 *b*. Gold separated from American *Earth*, i. 365 *a*. *Earth* itself may be turned into salt, i. 381 *a*. Experiment of producing *Earth* from water, i. 414 *b*. By particles of fire, i. 416 *b*. Experiment of producing *Earth de novo*, by the destruction of salt of tartar, i. 417 *a*. Whether elementary *Earth* be more than a notional thing, i. 417 *b*. A liquor distilled from *Earth*, i. 418 *a*. The *Earth* but a point in comparison of the heavens, i. 433 *b*. The use of medical *Earths* examined, i. 500 *b*. A red *Earth* used in the plague, i. 501 *a*. Whether the *Earth* be the *Primum frigidum*, ii. 308 *a*. The body of the *Earth* in its lowest parts is hot, ii. 309 *b*. Instances of the effects of cold upon the *Earth*, ii. 327 *a*. Subterraneal heat in the bowels of the *Earth*, ii. 364 *b*. *Earth* from rain-water distilled, ii. 520 *a*. Water and *Earth* not the sole matter of all tangible bodies, ii. 522 *a*. Account of layers of mineral *Earths*, iii. 238 *b*. The medicinal virtue of petrified *Earths*, iii. 246 *a*. The magnetical effluvia of the *Earth* penetrate glass, iii 316 *b*. *Earth* brought to fly in the air, iii. 336 *a*. The heavenly bodies not created only to shed their influence on the *Earth*, iv. 523 *a*. Account of animals living in the *Earth*, v. 464 *b*. Whether the gravitating power of the *Earth* be magnetical, electrical, or of any other nature, v. 546 *b*. What is contained within the bowels of the *Earth*, v. 494 *a*.
EARTHQUAKES, a reasonable account of them, iv. 260 *a*. In what manner the cause of plagues, iv. 290 *b*. A terrible *Earthquake* near the Persian gulf, v. 384 *a*. An *Earthquake* in *Lincolnshire*, v. 409 *b*. A confirmation and the concomitants of an *Earthquake* near *Oxford*, ii. 448 *a*.
EASTERN PEOPLE, their figurative way of arguing, ii. 105 *a*.
EAST-INDIES not infected by the plague, iv. 289 *b*. The way of travelling thither by land, v. 360 *b*.
EBULLITION promoted by spirit of wine *in vacuo*, iv. 142 *a*. Production of cold by the conflict of bodies appearing to make an *Ebullition*, iii. 374 *a*.
ECCHO, some account of it, i. 131 *b*. Her manner of repeating, ii. 204 *b*. The reason of an *Ecchо* from a hollow cave, ii. 467 *a*.
ECLIPSES of the sun and moon often prejudicial to mankind, iv. 537 *a*. *Eclipses* discovered by the mathematicks, iii. 161 *b*.
ECLIPTIC, the motion of the sun under the *Ecliptic*, iv. 343 *a*.
EDGAR, King, his character, v. 366 *a*.
EDINBURGH, a degree more northern than *Moscow*, ii. 320 *b*.
EDUCATION of young ladies considered, ii. 207 *b*.
EDWARD the Sixth employed in the study of the Bible, ii. 133 *b*.
EEL, an experiment by an *Eel* concerning respiration, i. 71 *a*. By the heart of an *Eel* in the exhausted receiver, iii. 120 *b*. On the liver and heart of an *Eel*, iii. 128 *a*. On the distillation of *Eels*, i. 315 *b*. The use of the livers and galls of *Eels*, i. 546 *b*.
EFFECT, the way of judging of causes by their *Effects*, iv. 60 *a*. The great *Effects* of languid unheeded motion, iv. 252 *a*.
EFFERVESCENCE, periodical *Effervescences* in the blood without fermentation, i. 476 *a*.
EFFLUVIA emitted from solid bodies, iii. 64 *b*. From antimonial bodies, iii. 68 *b*. Unobserved *Effluvia* in the air, iii. 89 *b*. They enter the pores of bodies from without, iv. 211 *b*. The penetrating nature of the *Effluvia* of bodies, iv. 256 *b*. The acting of magnetical *Effluvia* upon steel, iv. 258 *b*. The quality of the air affected by subterraneal *Effluvia*, iv. 277 *a*. Healthy air owing to friendly *Effluvia* from the soil, iv. 277 *b*. Endemical Diseases proceed from noxious *Effluvia*, iv. 280 *a*. The effect of noxious *Effluvia* upon the blood, iv. 281 *a*. In what manner subterraneal *Effluvia* produce diseases, iv. 283 *a*. And may hinder the production of diseases, iv. 284 *a*. The effect of noxious *Effluvia* upon human bodies, iv. 286 *b*. Of poisonous *Effluvia* on trees and vegetables, iv. 288 *b*. The *Effluvia* of orpimental bodies the cause of plagues, iv. 293 *a*. The effect of the *Effluvia* from solid bodies, iv. 310 *a*. The *Effluvia* of specifics, their penetrating quality, iv. 321 *a*. The air impregnated with the *Effluvia* of common salt, v. 117 *b*. Saline *Effluvia* sent from under ground into the air, v. 118 *b*. Of *Effluviums* in the air, v. 124 *a*. The causes of divers effects upon our bodies, v. 165 *a*. *Effluvia* of electrical bodies do not affect the senses, i. 327 *a*. The effect of subtile *Effluvia* in human bodies, i. 535 *b*. The strange subtilty of *Effluviums*, iii. 310 *a*. *Effluvia* of solid bodies penetrate the pores of the closest bodies, iii. 316 *a*. A great space impregnated with the *Effluvia* of bodies without much decrease of their bulk, iii. 319 *a*. The pernicious *Effluvia* beasts may leave upon vegetables, iii. 319 *b*. The great efficacy of *Effluviums*, iii. 321 *a*. The many ways the *Effluviums* of a body may operate upon one another, iii. 321 *b*. Their piercing nature co-operates with their multitude in producing effects, iii. 322 *b*. Odorous *Effluvia* assisted by the air, iii. 323 *b*. *Effluvia* of bodies raised by various modifications of motion, iii. 324 *a*. The efficacy of *Effluviums* on organical and living bodies, iii. 325 *b*. The determinate nature of *Effluviums*, iii. 328 *a*. *Effluvia* are of the same nature with the bodies that emit them, iii. 329 *b*. The difference observed in the sensible qualities of *Effluviums*, iii. 330 *b*. The difference of *Effluviums* perceived by human organs of sense, iii. 331 *b*. By brute animals, iii. 332 *a*. *Effluvia* of vegetables retain their distinct nature at a great distance, iii. 336 *a*. *Effluviums* of poisonous bodies transmitted through the air, their effect, iii. 337 *a*. *Effluvia* seem to operate on determinate bodies like occult qualities, iii. 338 *b* *Effluviums* emitted from the subterraneal parts of the terrestrial globe, iii. 463 *a*.
EGG, an experiment by philosophical *Eggs*, i. 36 *a*. The different circumstances of *Eggs* in hatching, i. 221 *a*. The whites of *Eggs* a great disarmer of corrosive salts, i. 238 *b*. Beaten into a thin fluid substance, i. 244 *b*. The stability of bodies illustrated by the white of an *Egg*, i. 262 *b*. The whites of *Eggs* coagulated with spirit of wine, i. 264 *b*. Why *Eggs* grow hard after they are laid, i. 273 *b*. The white of an *Egg* beaten into a natural speculum, ii 26 *b*. *Eggs* blacked over easily heated in the sun, ii. 30 *b*. Lose of their Weight by keeping, iii. 65 *b*. *Eggs* used to try the strength of saline liquors, iii. 142 *a*. *Eggs* do actually transpire, iv. 209 *a*. Membranes or films of *Eggs* are pervious to liquors, iv. 210 *a*. A way to salt *Eggs* in the shell, iv. 210 *b*. The film of an *Egg* not impervious to some fumes, iv. 213 *b*. The moving of *Eggs* in an ant-hill, iv 256 *b*. Remark on

on a body produced from the liquor of an *Egg* i. 322 *b*. The way of a chicken produced from an *Egg*, not known to the chymists, i. 348 *a*. The wisdom of God discover'd in the formation of *Eggs*; i. 440 *b*. The effect of steeping an *Egg* in vinegar, i. 486 *a*. Of an *Egg* buried in an ant-hill, i. 531 *a*. Experiments on the freezing and thawing of *Eggs*, ii. 270 *b*. To try the weight of frozen *Eggs*, ii. 331 *a*. Experiment on frozen *Eggs* put to thaw in cold water, ii. 352 *a*. On freezing a glass *Egg* filled with water, ii. 395 *a*. The chick formed of the nutritive liquor of the *Egg*, ii. 497 *a*. Strange productions from the white of an *Egg*, ii. 497 *b*. A way of preserving birds taken out of the *Egg*, ii. 543 *a*. Observations on the hatching of *Eggs*, ii. 496 *a*. To put an *Egg* into a narrow-mouthed bottle, v. 583 *b*. The chick formed from the round speck on the coat of the yolk of an *Egg*, v. 693 *a*.

EGRIMONY-BREAD, its virtue and use, v. 420 *b*.

EGYPT, the air of *Egypt* during the increase of the *Nile*, iv. 291 *a*. The strange quality of the earth of *Egypt*, v. 185 *a*.

EGYPTIAN NITRE, an account of it, i. 381 *a*. Made by the evaporation of the superfluous water of the *Nile*, i. 381 *b*.

ELASTIC power of the air, what, i. 8 *a*. It proceeds from two causes, i. 13 *b*. Why some bodies have or have not an *elastic* power, i. 124 *b*. An experiment to prove the *elastic* power of the air, i. 146 *b*. *Elastic* particles of the air, v. 108 *b*.

ELASTICITY, the cause of it examined, iii. 22 *b*. An experiment on the power of *Elasticity*, iii. 22 *b*. A search into the hidden quality of it, iv. 270 *a*. The duration of the *Elasticity* of the air examined, iii. 207 *b*.

ELATERISTS, the objections against them examined, i. 79 *a*. Their answer to Mr. *Hobbes*, i. 145 *b*.

ELATERIUM, the effect of it on a woman's milk, iv. 306 *b*.

ELDER used in inflammations, v. 440 *b*. A corn cured by a leaf of *Elder*, v. 442 *a*.

ELECT, the joys of the *Elect* in heaven particularly described, i. 186 *b*.

ELECTRICAL bodies emit effluviums, iii. 65 *b*. A particular account of them, iii. 67 *b*. The *electrical* virtue of a diamond, iii. 70 *a*.

ELECTRICAL ATTRACTION, the opinions concerning it, iii. 647 *a*. *Electrical* bodies draw by being warmed, iii. 648 *a*. The piercing quality of *electrical* effluvia, iii. 649 *a*. Upon what the *Electrical Attraction* depends, iii. 649 *a*.

ELECTRICITY, the mechanical production of *Electricity*, iii. 647 *a*. Ways of destroying the *Electricity* of bodies, iii. 650 *a*. What gems and precious stones are endowed with a power of *Electricity*, iii 652 *a*.

ELECTRUM, the virtues of the *Electrum* of *Paracelsus*, i. 525 *a*.

ELEMENT, the number of the *Elements* disputed, i. 295 *b*. An account of their mixture, iii. 74 *a* Many phænomena not to be ascribed to the four *Elements*, iii. 76 *a*. The doctrine of *Aristotle* concerning them, i. 297 *a*. An argument in proof of the four *Elements*, i. 297 *b*. The *Element* of fire examined, i. 298 *b*. Earth and water the chief of the *Elements*, i. 299 *a*. Four *Elements* not to be extracted by fire from all bodies, i. 299 *b*. The doctrine of the four *Elements* defended, i. 301 *a*. Multitude of bodies produced by the four *Elements*, i. 301 *b*. Difficult to resolve bodies into their *Elements*, i. 305 *a*. Mixed bodies proceed from one *Element*, i. 314 *a*. The existence of the *Elements* in bodies wherein they operate, i. 319 *a*. Whether bodies are resoluble by fire into three distinct *Elements*, i. 323 *b*. The *Elements* that go to the production of mixed bodies, i. 324 *a*. No set number of *Elements* in the constitution of mixed bodies, i. 324 *b*. Divisible bodies yield more than three *Elements*, i. 327 *b*. New bodies may arise from a coalition of *Elements*, i. 333 *a*. The four *Elements* of the Peripateticks examined, i. 336 *a*. Nothing is *Element* but what is homogeneous, i. 336 *b*. The doctrine of bodies analyzed into five *Elements*, examined, i. 345 *b*. Reasons in defence of the system of the five *Elements*, i. 346 *a*. A body formed by art of two or one *Element*, i. 347 *a*. The doctrine of the four *Elements* justly exploded by the Chymists, i. 352 *a*. Doubtful of what number of *Elements* bodies consist, i. 355 *a*. Whether there be any *Elements* at all, inquired, i. 356 *a*. A definition of simple *Elements*, i. 356 *b*. No reason for bodies to be made of pure *Elements*, i. 357 *b*. The difference of the *Elements* from each other examined, i. 360 *b*. Bodies may be changed without separation of the *Elements*, i. 363 *a*. Salt, spirit, oil, the three *Elements* of mixed bodies, i. 371 *a*. The effects of cold upon the four *Elements*, ii. 325 *b*. The doctrine of the Aristotelian *Elements* examined and confuted, iii. 602 *a*.

ELEPHANTS, their bulk and weight, i. 435 *b*.

ELEUTHERIUS, his experiment concerning fire, i. 22 *a*.

ELIOT, Mr. *John*, his letter to Mr. *Boyle*, v. 548 *b*.

ELIXATION, experiments concerning *Elixation in vacuo*, iv. 156 *b*. On *Elixation* in vessels stopt with screws, iv. 158 *a*.

ELIXIR to transmute metals, iv. 15 *b*. *Elixir Proprietatis*, the virtue and quality of it, v. 444 *a*. The philosopher's *Elixir*, that turns all metals into gold, considered, iii. 600 *a*. *Elixir Proprietatis* more particularly examined, v. 268 *a*. Experiment by mixing the red *Elixir* with lead, i. 321 *b*. The way of making it, i. 519 *b*. The composition of the grand and universal *Elixir* according to *Geber*, v. 582 *a*.

ELIZABETH, Queen, a great proficient in the study of the Bible, ii. 134 *a*.

ELK, a ring made of an *Elk*'s hoof, a cure for the cramp, iv. 322 *a*.

ELLIPSIS, a proper definition of it, iv. 66 *a*.

ELOQUENCE, the Scripture not to be censured for want of *Eloquence*, ii. 97 *a*. Passages in Scripture to be admired for their *Eloquence*, ii. 99 *a*. The notions of *Eloquence* different, ii. 120 *b*. The eastern *Eloquence* differs from the western, ii. 121 *b*. *Eloquence* differs in several regions and in several ages, ii. 122 *b*. The *Eloquence* of the Scripture particularly celebrated, ii. 124 *a*. Reflections upon *Eloquence* in sermons, ii. 172 *a*.

ELVA, the growth of iron in that island, iii. 461 *a*.

EMANATIONS, corporeal, emitted from all bodies, iii. 66 *a*.

EMANUEL MAGNAN, his observation concerning the height of the atmosphere, i. 57 *b*.

EMBALMING of bodies in the island *Teneriff*, v. 173 *a*.

EMBRYO preserved in oil of spike, i. 470 *a*. It is compleatly formed in six weeks time, v. 696 *a*.

EMERSION, the reason of the *Emersion* of bodies higher than the fluids they swim in, iii. 294 *a*. Whether this happens rather from the pressure of the fluid, than the positive levity of the body, iii. 295 *a*.

EMERY, the reason of its great weight, iv. 220 *a*. Used by artificers to cut gems, iv. 222 *b*. Its specific gravity in water, v. 26 *b*. The method used to make it fine, iii. 181 *a*.

EMETIC, an ague cured by *emetic* drops, v. 90 *b*.

EMPEDOCLES, his account of the creation, i. 457 *a*.

EMPHATICAL, an enquiry into the nature of *emphatical* colours, ii. 20 *a*.

EMPIRICK, comparison of the *empirick* part of physick with the rational, i. 529 *b*.

EMPYEMA, in what manner carried off, iv. 215 *a*.

EMPYREUMA of chymical extracts considered, i 574 *b*. A way of taking it off, and observations upon it, i. 577 *a*.

ENCURECK, a venomous insect in *Persia*, i. 478 *b*.

END, the *Ends* that God is said to have in things corporeal examined, iv. 518 *a*. No presumption to inquire into those *Ends*, iv. 520 *a*. How inanimate bodies may be said to act regularly for some *Ends*, iv. 529 *b*. In what sense natural things may be said to work for an *End*, iv. 530 *a*.

ENDEMICAL DISEASES, the nature and cause of them, iv. 279 *b*.

ENDICOTT, Mr. his letter to Mr. *Boyle* concerning the state of *New-England*, v. 636 *a*.

ENGINE about the spring of the air, the use of it, i. 3 *b*. Its several defects, i. 5 *a*. The parts of it described, i 5 *b*. The setting of it to work, i. 6 *b*. A diverting experiment upon the air-*Engine*, i. 10 *b*. Upon quicksilver, i. 22 *b*. A particular account of experiments upon the air-*Engine*, iii. 3 *b*. Advertisements concerning the *Engine* itself, iii. 4 *a*. An account of a diving *Engine*, iii. 165 *b*. Work done with expedition by *Engines*, iii. 173 *a*. An *Engine* with a double tube for exhausting of air, iv. 100 *a*. The use and perfection of it, iv. 100 *b*. Description of the *Engine* to compress the air, iv. 102 *a*. Bodies in some sort considered as *Engines*, iv. 252 *a*. The battering *Engines* of the ancients, iv. 253 *a*. An *Engine* for the sinking of ships, iv. 255 *a*. Four principal sorts of living *Engines*, iv. 343 *b*. *Engines* to free mines from water,

water, v. 194 *b*. An *Engine* to water mohairs and tabbies, v. 267 *a*. An experiment in the compressing *Engine*, v. 303 *b*. The variety of living *Engines* considered, i. 435 *b*. The human body considered as an *Engine*, i. 537 *a*. Proposals to try the effects of the pneumatick *Engine* exhausted in plants, seeds, *&c*. ii. 553 *a*. The body of man called a hydraulico-pneumatical *Engine*, iv. 549 *b*. Account of a condensing *Engine*, v. 530 *a*. Of an *Engine* to raise water, v. 532 *b*.

ENGLAND, the differences of religion there explained, v. 415 *b*.

ENGLISH LANGUAGE, its character, v. 229 *a*.

ENQUIRIES to furnish the natural history of a country, v. 192 *b*. Concerning the nature and productions of a country, v. 193 *a*. Concerning the air and soil, v. 193 *b*.

ENS PER ACCIDENS, the notion of it explained, ii. 538 *b*.

ENS PRIMUM of gold and antimony how obtained, i. 518 *b*. Likewise of plants, 519 *a*.

ENS VENERIS, its effect in a *febris petechialis*, v. 92 *b*. The preparation and virtues of *Ens Veneris*, i. 511 *a*. The process used by Mr. *Boyle* for making of *Ens Veneris*, i. 563 *b*. The cause of the reddishness of it, i. 565 *a*. The dose and use of it, i. 565 *b*.

ENVY, the occasion of sin, ii. 186 *a*.

EPANADOS, a figure in rhetorick, ii. 95 *b*.

EPICUREANS, their notion of the divine power, iv. 346 *b*. Of the endless divisibility of quantity, v. 63 *b*. Their way of explaining the productions of nature, i. 451 *a*. Believe the reviving of the dead impossible, i. 452 *b*. Remark on their way of disputing against the spirituality of the rational soul, v. 708 *a*.

EPICURUS, his hypothesis concerning light, i. 87 *b*. A remark upon him, i. 204 *a*. His notion of fluid bodies, i. 241 *a*. Of the creation of the world, i. 282 *a*. Concerning matter, iii. 65 *a*. Unskilled in mathematicks, iii. 158 *b*. His doctrine of the origin of concretions, i. 300 *b*. His pleasure on the day of his death, i. 420 *b*. Defects in the explication of nature by *Epicurus*, i. 447 *a*. His system of the world's original, i. 447 *b*. Was content to assign the possible causes of things, i. 450 *a*. His opinion of the advantages of inquiring into nature, iii. 424 *a*. Of the final ends of things, iv. 515 *b*. Of the parts of animals and their uses, iv. 538 *b*.

EPIDEMICAL DISEASES, their nature and cause, iv. 284 *b*. Their short duration accounted for, iv. 287 *b*.

EPIGRAM, a Latin *Epigram* in honour of Mr. *Boyle*, v. 504 *b*.

EPILEPSIES cured by the spirit of human blood, iv. 180 *b*. By misletoe of the oak powdered, i. 517 *a*.

EPILEPTICAL DISTEMPERS, their cure, v. 446 *a*.

EPIPHANIUS FERDINANDUS, his account of the Tarantati, iv. 264 *b*.

EPISTLES DEDICATORY, the nature of them, ii. 90 *b*.

EPSOM WATER, the weight of it, iv. 243 *a*. Its effect upon a sucking child, v. 544 *a*.

ERASMUS, his character, and an account of his writings, v. 485 *a*. The restorer of truth and literature, v. 486 *a*.

ERROR, no disgrace in quitting it, i. 200 *a*. Not to be opposed with bitterness, i. 200 *b*.

ERVA BABOSA, a Brasilian plant, the use of it, i. 494 *b*.

ERYSIPELAS, a remedy against it, iv. 192 *b*. Another cure for it, v. 281 *b*.

ESAY, his eloquence compared with *Cicero* and *Demosthenes*, ii. 124 *b*.

ESSAY, a new *Essay*-instrument, with the uses thereof, iii. 547 *a*. Useful to examine guineas, iii. 549 *a*. And half-guineas, iii. 551 *b*. Tin and pewter, iii. 552 *a*.

ESSAY, a proëmial essay, i. 192 *a*. Mr. *Boyle*'s particular reasons for writing *Essays*, i. 192 *b*. The use of experimental essays, i. 195 *a*. The manner of writing them, i. 195 *b*. Not adorned with the embellishments of other writers, i. 203 *b*. *Essays* on the unsuccessfulness of experiments, i. 204 *a*. *Essay* of the intestine motions of the particles of quiescent solids, i. 281 *a*. Two *Essays* on the porosity of animal bodies, iv. 206 *a*. *Essay* on the porousness of solid bodies, iv. 219 *a*. Of the effects of languid and unheeded motion, iv. 251 *a*. Supplement to the *Essay* on local motion, iv. 272 *a*. An *Essay* about the origin and virtues of gems, iii. 214 *a*. On the strange subtilty of effluviums, iii. 309 *a*.

ESSENCE, the *Essence* of God entitles him to our love, i. 167 *b*. *Essence* and existence inseparable in God, iv. 64 *a*.

ESSENCE of roses, the virtue and quality of it, v. 402 *b*. *Essence* of wine separated from the phlegm by congelation, i. 310 *b*.

ESSENTIAL, what is meant by an *essential* oil, iv. 90 *a*.

ESTHER, her history explained, ii. 209 *b*.

ETCHING, an account of that art, iii. 178 *b*.

ETERNITY, the difficulties attending the doctrine of it, iv. 46 *a*.

ETESIAN WINDS, their use, iv. 344 *b*.

ETHERIAL matter in the receiver instead of air, i. 66 *a*.

ETHICKS, what is properly meant by them, ii. 113 *b*. A system of *Ethicks* not sufficient to make men virtuous, ii. 114 *b*.

ETHIOPIA, an account of the air on the mountains of *Ethiopia*, v. 166 *b*.

EVACUATIONS peculiar to women considered, iv. 412 *b*.

EUCLID, the master of geometricians, iii. 3 *a*. His way of demonstrating his assertions, iv. 68 *a*. He gives himself no trouble to answer difficulties, iv. 68 *b*. The use of his *axiomata* and *postulata*, v. 690 *b*.

EVELYN, *John*, Esq; letters from him to Mr. *Boyle*, v. 397 *a*. His account of the ornament of gardens, v. 397 *b*. His scheme for a philosophical college, v. 398 *a*. His character of Mr. *Boyle*'s *Seraphick Love*, v. 399 *b*. His praise of a married life, v. 401 *a*. His remark on the mystery of jesuitism, v. 402 *b*. Account of conservatories of snow in *Italy*, ii. 306 *b*.

EVIDENCE of perception, the use of it in judging right, iv. 63 *b*. Primitive ideas received by *Evidence* of perception, iv. 64 *a*.

EUNUCH, some account of the *Eunuch* mentioned in the *Acts*, ii. 102 *b*.

EUSTACHIUS RUDIUS, his observation on quicksilver, iv. 217 *b*.

EXAMPLES of vice why recorded in Scripture, ii. 97 *b*. The great influence of *Examples*, v. 71 *a*. Precedents in Scripture against the force of *Example*, v. 71 *b*.

EXCELLENCY and grounds of the mechanical hypothesis, iii. 449 *a*.

EXCREMENT, remark on the discharging of the *Excrements*, ii. 534 *a*. The *Excrements* blackned by steel-waters, iv. 238 *a*.

EXHALATIONS in the lower parts of the earth, iii. 101 *b*. Mineral water impregnated with volatile *Exhalations*, iv. 248 *a*. The air affected by noxious *Exhalations*, iv. 279 *a*. Subterraneous *Exhalations* from the cavities of the earth, ii. 365 *a*. The danger of subterraneal *Exhalations* in deep mines, ii. 366 *b*. The difference between vapours and *Exhalations*, iii. 328 *a*. How *Exhalations* are affected by the air, i. 42 *b*. How much bodies lose by *Exhalations*, iv. 208 *b*. The effect of sulphureous *Exhalations*, iv. 282 *a*. *Exhalations* made to burn like a candle, iv. 283 *a*. The juice of the earth corrupted by noxious *Exhalations*, iv. 283 *b*. Their effect upon the aliment of animals, iv. 284 *a*. In what manner human bodies affected by subterraneal *Exhalations*, iv. 287 *b*. The particular qualities of some *Exhalations*, iv. 291 *b*. Mineral *Exhalations* will disable pestiferous effluvia, iv. 295 *b*. *Exhalations* from a volcano change the colour of the air, v. 118 *b*. Mineral *Exhalations* in the bowels of the earth, iii. 244 *a*.

EXOTICK words, when allowed to be used, i. 196 *a*.

EXPANSION of the air explained, i. 10 *b*. Experiments concerning it, i. 14 *b*. The *Expansion* of water explained, i. 30 *a*. *Expansion* accounted for from the shape of the particles of the air, i. 114 *a*. The reason of the *Expansion* of gunpowder when fired, i. 115 *b*. Experiment on the *Expansion* of blood, iii. 127 *b*. *Expansion* of liquors by cold measured, ii. 285 *a*. The *Expansion* of air by heat, i. 289 *b*. Experiments on the *Expansion* of water by freezing, ii. 343 *b*. The *Expansion* of frozen liquors and the breaking of bodies wherein they are inclosed, ii. 385 *a*. Experiment on the *Expansion* of water in a bladder, ii. 395 *b*. The *Expansion* of water by freezing, iii. 191 *a*. The *Expansion* of the air pneumatically proved, iii. 205 *a*. The *Expansion* of inflammable bodies turned into flame, iii. 313 *a*.

EXPERIENCE not incompatible with religion, v. 40 *a*. What is properly meant by it, v. 48 *b*. Personal and historical *Experience* explained, v. 49 *a*. Theological *Experience*, v. 49 *b*. The divine attributes illustrated by theological *Experience*, v. 52 *b*. The Christian doctrine

doctrine supported by vicarious *Experience*, v. 53 *a*. *Experience* but an assistant to reason, v. 58 *a*. Reason supported by theological *Experience*, v. 59 *a*. The excellency of the Christian religion discovered by *Experience*, v. 724 *b*. The nature and use of vicarious *Experience* consider'd, v. 733 *b*.

EXPERIMENTA ET OBSERVATIONES PHYSICÆ, v. 75 *a*.

EXPERIMENTAL, the manner of writing *Experimental* essays, i. 195 *b*. *Experimental* philosophy of great use to trades, iii. 172 *a*. *Experimental* remarks on the examining of mineral waters, iv. 237 *b*. *Experimental* philosophy useful to Christianity, v. 37 *a*. Leadeth to the belief of a God, v. 41. *b*. Delights in abstracted truths, v. 47 *a*. The general usefulness of *Experimental* philosophy, i. 423 *a*. Various difficulties arising in the pursuit of it, iii. 428 *b*. *Experimental* discourse of quicksilver growing hot with gold, iii. 557 *a*.

EXPERIMENTS, reasons for being prolix in *Experiments*, i. 1. Improved by inventive and mechanical wits, i. 3 *a*. An *Experiment de vacuo* described, i. 5 *a*. Two sorts of *Experiments* to be tried in an air-pump, i. 7 *a*. *Experiments* to try the expansion of the air, i. 13 *a*. *&c*. Of a tallow candle in an air-pump, i. 18 *a*. Of wax tapers in an air-pump, i. 18 *b*. Upon coals on fire, i. 19 *a*. Upon red-hot iron, i. 19 *a*. Upon a piece of match, i. 19 *b*. With a pistol charged, i. 20 *b*. Upon combustible matter in the air-pump, i. 21 *b* Upon a loadstone, i. 22 *a*. Upon quicksilver, i. 22 *b*. Concerning the subsiding of water in glass tubes, i. 28 *b*. To try the elastic power of water, i. 29 *b*. To shew the cause of the expansion of water, i. 30 *a*. To change water into air, i. 35 *a*. Upon the expansion of distilled water, i. 36 *b*. Upon the gravity and levity of the air before and after its expansion under water, i. 39 *a*. Upon the vibration of pendulums, i. 40 *a*. Concerning the pressure of the air, i. 42 *b*. By a peculiar sort of liquor, i. 43 *b*. Concerning the nature of the atmosphere, i. 44 *a*. Upon two pieces of flat polished marble sticking together, i. 45 *a*. Concerning the force of the air and its pressure on bodies, i. 46 *a*. Concerning the height of the atmosphere, i. 46 *a*. To try the pressure of the atmosphere, i. 46 *b*. Upon filtration, i. 51 *a*. Upon the weighing of air in a bladder, i. 50 *b*. Upon the ascent of water in a glass pipe held upright, i. 52 *a*. Upon the slow texture of glass, i. 53 *b*. Whether the corpuscles of air are more subtil than those of water, i. 54 *a*. To try the difference of weight between water and quicksilver, i. 56 *b*. Concerning a strange phænomenon of light in the receiver, i. 59 *a*. Upon the transparency of the air, i. 59 *b*. Upon smoke in the receiver, i. 60 *a*. Concerning cold, i. 62 *a*. Concerning respiration, i. 70 *b*. To prove the necessity of air, i. 72 *a*. Of corrosive liquors in dissolving of bodies, i. 73 *a*. The difficulty and charge of making *Experiments*, i. 78 *b*. An *Experiment* concerning the spring of the air examined, i. 81 *a*. The *Experiments* of *Linus* concerning the spring of the air, i. 83 *a*. *&c*. Concerning his *Funiculus* examined, i. 90 *a*. To try the weight of the atmosphere, i. 98 *a*. Concerning the motion of the force of the air compressed and dilated, i. 100 *a*. *b*. Upon the debilitated force of expanded air, i. 102 *b*. Concerning the spring of the air defended, i. 105 *a*. *b*. *&c*. The usefulness of *Experiments*, i. 123 *a*. An *Experiment* of water in the receiver, i. 137 *b*. The making *Experiments* useful to the advancement of philosophy, i. 194 *b*. An account of promiscuous *Experiments*, i. 197 *a*. Essays upon the unsuccessfulness of *Experiments*, i. 204 *a*. The reasons for their not succeeding, i. 205 *a*. An *Experiment* of calcined tartar distilled, i. 214 *a*. Of turning silver into gold, i. 215 *a*. Of burning with ice as with a glass lens, i. 217 *a*. *Experiments* in physick the most difficult, i. 222 *b*. No depending upon single *Experiments*, i. 224 *a*. Encouragement to try *Experiments*, i. 226 *b*. *Experiments* in the corpuscular philosophy, i. 228 *b*. An *Experiment* upon common nitre, i. 231 *a*. *Experiments* estimated by their value, not their number, i. 239 *b*. An *Experiment* to make the fumes of bodies acquire a level superficies, i. 241 *b*. To turn camphire into oil, i. 247 *a*. Upon various sorts of oils mixed together, i. 252 *b*. Upon the adhesion of flat pieces of glass, i. 256 *b*. Upon the pressure of the air by two flat marbles, i. 258 *a*. To try the stability of bodies, i. 262 *b*. By distilling quicksilver with oil of vitriol, i. 272 *b*. Chymical *Experiments* not too readily to be believed, i. 291 *a*. *Experiments* and considerations touching colours, ii. 1 *a*. *Experiment* concerning the colours appearing in melted lead, ii. 9 *b*. Of altering colours by liquors, ii. 16 *b*. In consort, touching whiteness and blackness, ii. 31 *a*. Tried in producing whiteness, ii. 38 *a*. Promiscuous *Experiments* about colours, ii. 41 *a*. An *Experiment* upon *Lignum Nephriticum*, ii. 44 *a*. A full account of the physico-mechanical *Experiments*, iii. 3 *a*. *b*. *Experiment* of raising mercury by the spring of the air, iii. 6 *a*. Of raising of water by the spring of the air, iii. 10 *b*. Of breaking glass-plates by the weight of the atmosphere, iii. 12 *a*. On the elevation of liquors by suction, iii. 17 *a*. On the raising of water by sucking pumps, iii. 21 *a*. To find when the air is drawn out of the receiver, iii. 23 *b*. On the pressure of the air made sensible to the touch, iii. 25 *b*. On the raising of quicksilver by the weight of water, iii. 26 *b*. The oblique pressure of the air in the Torricellian *Experiment*, iii. 34 *b*. *Experiment* upon the ascension of water, iii. 36 *a*. Upon minium, iii. 37 *a*. On the solution of sea-salt, iii. 38 *a*. Upon a brass syringe in the receiver, iii. 41 *a*. On the ascension of water in a syringe, iii. 43 *a*. To try the qualities of the æther by a syringe, iii. 49 *a*. On the sound of a watch in an exhausted receiver, iii. 54 *a*. On the production of heat by attrition, iii. 56 *b*. On the spring of a small quantity of air, iii. 60 *b*. On the gravity of air and water, iii. 62 *a*. The disjoining of two marbles by withdrawing the pressure of the air, iii. 63 *b*. An account of the *Experiments* in natural philosophy, iii. 139 *b*. The use of them, iii. 140 *b*. *Experiments* distinguished into luciferous and fructiferous, iii. 154 *b*. *Experiment* of foliating glass, iii. 176 *a*. On the aërial noctiluca, iv. 71 *a*. On a noctiluca kept in water, iv. 75 *b*. *&c*. On the dissolution of the icy noctiluca, iv. 76 *b*. On the inflammability of the noctiluca, iv. 82 *b*. On burning other bodies with the noctiluca, iv. 84 *a*. On the distillation of essential oils, iv. 90 *a*. *Experiments* in compressed and factitious air, iv. 96 *a*. The manner of making his physico-mechanical *Experiments*, iv. 98 *a*. His apology for them, iv. 98 *b*. *Experiments* on the preservation of aliments, iv. 156 *b*. Miscellaneous *Experiments* about human blood, iv. 166 *a*. On the serum of healthy men's blood, iv. 172 *a*. *Experiments* on the spirit of blood, iv. 176 *b*. On the history of human blood, iv. 196 *b*. *Experiments* on the porosity of bodies, iv. 206 *a*. The use of hydrostatical *Experiments*, v. 24 *a*. *Experiments* chymico-mechanical, v. 79 *a*. Solitary, v. 94 *a*. Uncommon *Experiments* about heat and cold, v. 97 *a*. Pentades of chymical *Experiments*, v. 97 *b*. *Experiments* about producing of air, v. 110 *b*. Touching the relation between flame and air, v. 180 *b*. To make salt-water fresh, v. 200 *a*. To prove the possibility of a vacuum, v. 257 *a*. *Experiments* of falling bodies, v. 307 *b*. Concerning congelation, v. 355 *a*. On the transfusion of blood, v. 364 *b*. On blowing up the lungs of a dog, v. 369 *b*. On the transfusion of the blood of a sheep into a man, v. 372 *a*. To discover the pressure of the air at sea, v. 379 *a*. An account of the Florentine *Experiments*, v. 387 *b*. Medical and chirurgical *Experiments*, v. 439 *a*. The *Experiments* of the chymists examined, i. 323 *a*. *Experiments* on the producibleness of chymical principles, i. 372 *a*. On producing colours *de novo*, i. 392 *a*. Uncommon *Experiments* on the loadstone, i. 428 *a*. *Experiments* upon the eyes of animals, i. 455 *a*. On the solution of meats by acid menstruums, i. 468 *b*. Of conveying poisons into the blood, i. 479 *a*. Account of *Experiments* upon cold, ii. 234 *a*. Thermometrical *Experiments*, ii. 240 *a*. *Experiment* of a thin glass egg dipped in water, ii. 242 *a*. *Experiments* concerning the degrees of cold, ii. 255 *b*. *Experiments* of bodies capable of freezing others, ii. 258 *a*. *&c*. Touching bodies disposed to be frozen, ii. 262 *a*. Touching bodies indisposed to be frozen, ii. 263 *a*. Touching the degrees of cold in several bodies, ii. 264 *b*. Touching the tendency of cold upwards or downwards, ii. 268 *a*. Touching the preservation and destruction of bodies by cold, ii. 270 *a*. Touching the expansion of water and aqueous liquors by freezing, ii. 276 *a*. Touching the contraction of liquors by cold, ii. 278 *a*. Touching bubbles that produce the levity of ice, ii. 279 *b*. About the measure of expansion or contraction of liquors by cold, ii. 285 *a*. Touching the expansive force of freezing water, ii. 288 *a*. Touching the estimating the expansive force of congelation, ii. 290 *a*. Touching the sphere of activity

activity of cold, ii. 293 *a*. The different mediums through which cold may be diffused, ii. 296 *a*. Concerning bubbles that cause the levity of the ice, ii. 281 *a*. Whether these bubbles are filled with common air, ii. 282 *a*. Of compressing of air in the wind-fountain, ii. 291 *a*. Touching the mediums thro' which cold may be diffused, ii. 296 *a*. Touching the strength of ice, ii. 299 *b*. The duration of ice and snow, ii. 304 *b*. The coldness and temperature of the air, ii. 315 *b*. *Experiments* on the weight of bodies frozen and unfrozen, ii. 330 *b*. Whether hot water would freeze sooner than cold, ii. 341 *b*. Whether water be capable of compression, ii. 354 *a*. On the freezing of water, beer, wine, &c. ii. 382 *a*. The phænomena of an *Experiment* about freezing, ii. 393 *a*. *Experiment* of a lighter liquor pressing upon a heavier, ii. 420 *b*. Concerning floating bodies, ii. 425 *b*. To prove that a body immersed in a fluid sustains a lateral pressure from the fluid, ii. 433 *b*. Touching the origin of forms and qualities, ii. 460 *a*. About the production and re-production of forms, ii. 484 *a*. *Experiments* touching the curious figures of salts, ii. 488 *a*. Touching the origin of qualities and forms, ii. 502 *a*. On fire and salt, ii. 509 *b*. A new frigorific *Experiment*, ii. 547 *a*. An *Experiment* of the transfusion of blood, ii. 550 *a*. *Experiments* on the relation between light and air in shining wood and fish, ii. 555 *a*. *Experiments* concerning the rarefaction of the air, iii. 204 *a*. *Experiments* on the condensation of the air by meer cold, iii. 209 *a*. *Experiments* touching the relation betwixt flame and air, iii. 248 *a*. Betwixt air and the *flamma vitalis* of animals, iii. 261 *a*. Concerning explosions, iii. 266 *a*. The resistance of animals and other bodies against the pressure of the air, iii. 285 *a*. A dilucidation of the *Experiment* about weighing water in water, iii. 289 *a*. *Experiments* of the positive or relative levity of bodies under water, iii. 293 *a*. About the pressure of the air's spring on bodies under water, iii. 296 *a*. On the pressure of heavy solids and fluids, iii. 298 *a*. On the uniformity of the pressure of fluid bodies on solid ones, iii. 301 *b*. To make fire and flame stable and ponderable, iii. 340 *a*. Additional *Experiments* about arresting and weighing of igneous corpuscles, iii. 347 *a*. Problems about cold grounded upon new *Experiments*, iii. 371 *a*. *Experiment* on the great expansive force of freezing water, iii. 373 *a*. On the production of cold by the conflict of bodies appearing to make an ebullition, iii. 374 *a*. On the saltness of the sea, iii. 378 *a*. On the efficacy of the air's moisture, iii. 400 *a*. Relating to suspicions about the hidden qualities of the air, iii. 474 *a*. The interest of the weight of the atmospherical air, iii. 490 *b*. Of the nature and cause of suction, iii. 500 *a*. New *Experiments* about the preservation of bodies *in vacuo Boyliano*, iii. 504 *a*. About the weakened spring and some unobserved effects of the air, iii. 553 *a*. About the mechanical origin of divers particular qualities, iii. 565 *a*. Three distinct sort of *Experiments* in treating of the origin of qualities, iii. 566 *b*. *Experiments* about the mechanical production of cold, iii. 570 *a*. About the mechanical production of heat, iii. 577 *a*. About the mechanical production of tastes, iii. 586 *a*. Of odours, iii. 591 *a*. About the mechanical origin and production of volatility, iii. 609 *a*. Of corrosiveness and corrosibility, iii. 624 *a*. On the mechanical origin of corrosibility, iii. 632 *a*. On the mechanical production of magnetism, iii. 643 *a*. Of electricity, iii. 647 *a*. Medicinal *Experiments*, or a collection of choice and safe Remedies, iv. 464 *a*.

EXPLICATION, different *Explications* of the same thing, i. 198 *a*.

EXPLOSION, new experiments about *Explosions*, iii. 266 *a*. *Explosion* made with oil of vitriol and oil of turpentine, iii. 266 *b*. Made by two bodies actually cold, iii. 267 *a*.

EXPOSITORS of Scripture of all sects are useful, ii. 107 *b*. They make seeming contradictions in Scripture, ii. 110 *b*. The qualifications required in the *Expositors* of the Bible, iii. 415 *a*. They should be men of a philosophical genius and critical learning, iii. 416 *a*.

EXTENSIBILITY of gold demonstrated, iii. 312 *a*.

EXTENSION inseparable from body, i. 25 *b*. Immediately flowing from matter, i. 93 *b*. Something extended in the souls of brutes, i. 95 *a*. The differing *Extension* of the same quantity of air rarified and compressed, iii. 211 *a*. An account of the *Extension* of bodies, iv. 268 *b*.

EXTRACT, an account of the compound *Extract*, v. 380 *a*. Of *Extracts* drawn from vegetables, i. 340 *b*.

EYE, the author complains of a distemper in his *Eyes*, i. 2 *a*. The cause of what we call the *Eyes* striking of fire, ii. 7 *b*. An account of the relation of the *Eyes* to each other, ii. 8 *a*. The effect of a fall upon a lady's *Eyes*, ii. 8 *b*. In what manner the *Eye* is affected by the beams of light, ii. 22 *a*. The whiteness of snow prejudicial to the *Eye*, ii. 24 *b*. The *Eye* an instrument to estimate distances, iv. 45 *b*. The effect of its looking into a deep sea, iv. 47 *a*. Visible objects not perceived without the *Eye*, iv. 5 *b*. The *Eye* judges of some things by intuition, iv. 63 *b*. Wormwood and parsley prejudicial to the *Eyes*, iv. 326 *b*. Its fabrick particularly consider'd, v. 43 *a*. A surprising distemper in the *Eyes*, v. 247 *a*. The dissection of an owl's *Eye*, v. 376 *a*. A defluxion on the *Eye* cured, v. 441 *a*. Of bleeding of sheep under the *Eye*, v. 447 *b*. The curious fabrick of the *Eye* considered, i. 454 *b*. Experiments on the *Eyes* of animals, i. 455 *a*. The spherical shape of the *Eyes* of fishes consider'd, i. 456 *a*. The curing of cataracts in the *Eye*, i. 483 *a*. The use of millepedes in suffusions of the *Eyes*, i. 508 *a*. How the *Eyes* are affected by light and darkness, iii. 361 *a*. The effect of turning the *Eye* to the dark part of a room explain'd, iii. 362 *b*. The curious frame and contexture of the *Eye* examined, iv. 524 *a*. Arguments that the *Eyes* of animals were made by design, iv. 524 *b*. Observations upon the *Eyes* of birds and flies, iv. 525 *a*. Why the *Eyes* of some beasts are furnished with a seventh muscle, iv. 525 *b*. The different structures and figurations in the *Eyes* of creatures, an evidence of the divine will, iv. 526 *b*. The *Eye* exquisitely adapted to the use of seeing, iv. 538 *a*. The crystalline humour of the *Eye* not the principal seat of vision, iv. 539 *b*. The circumstances attending the looking with one *Eye* or both, iv. 553 *b*. A distension made of the parts of the *Eye* without spoiling the sight, iv. 553 *b*. The apparitions of flame or fire in the *Eyes*, iv. 454 *b*. Flashes of lightning issuing out of the angle of the *Eye*, iv. 555 *a*. The *Eyes* not always see best in the light, iv. 556 *a*. The use of the convex figure of the *Eye*, iii. 159 *a*. The uses of the several parts of the *Eye* anatomically explained, v. 696 *b*. The fitness of the *Eye* to perform its several functions, v. 698 *a*. The reason of its seeing objects double, v. 699 *b*.

EYE-LID, its use, iv. 546 *a*.

EZEKIEL, the mystical resurrection in *Ezekiel* examined, iii. 540 *a*.

F.

FABRICIUS AB AQUAPENDENTE, his remedy for a dropsy, i. 525 *a*.

FABRICIUS HILDANUS, his account of thawing a man frozen, ii. 272 *a*.

FACE, a beautiful *Face* subject to changes, i. 175 *b*. The way of casting of a *Face* in plaister, remark on the infinite diversity in the *Faces* of men, v. 704 *a*.

FACTITIOUS BODIES and natural, distinctly considered, ii. 485 *b*. The qualities they are endowed with, ii. 491 *a*. Experiments on *factitious* air, iv. 97 *a*. *Factitious* air transmitted from one receiver to another, iv. 103 *b*. It will alter colour and preserve taste, iv. 115 *b*. Is a greater enemy to animals than a vacuum, iv. 128 *a*.

FACULÆ, or spots in the sun, observations concerning them, i. 223 *a*.

FACULTY, the meaning of the word *Faculty* examined, and explained, iv. 420 *a*. Why *Faculties* or inherent active powers are ascrib'd to bodies, iv. 420 *b*.

FÆCES of things, observations on them, i. 364 *b*.

FAHLUN in *Sweden*, an account of the air of that place, v. 122 *a*.

FAITH, the effect of *Faith* upon believers, ii. 111 *b*. A distinction concerning articles of *Faith* examined, v. 59 *a*. A confession of the Popish *Faith*, v. 416 *b*. *Faith* is an assent to a revealed proposition on the authority of the revealer, v. 668 *a*. Necessary to salvation examined and explained, iii. 534 *a*. A degree of *Faith* not exempt from doubts may be accepted, iii. 534 *b*. The nature of philosophical *Faith* examined, v. 712 *a*.

FALCONBRIDGE, Lord, some account of him, v. 280 *a*.

FALLING-

FALLING-SICKNESS cured by an amulet, i. 534 *b*.
FALLOPIUS, his account of the generation of sulphur, i. 358 *a*.
FANCY, a description of that faculty, v. 428 *a*.
FARMER, the account of a *Farmer* improving his farm, v. 454 *a*.
FAT, a piece of it taken out of a man's grave, v. 323 *a*.
FATHERS OF THE CHURCH, a proper character of them, iii. 415 *a*.
FEAR, the hair of the head changed white by *Fear*, i. 536 *b*.
FEATHER, the difference of colours in the *Feathers* of birds, ii. 5 *b*. Experiment on a *Feather* in the air-pump, iii. 50 *a*. On the descending of *Feathers* in an exhausted receiver, iii. 51 *b*. The effect of burnt *Feathers*, iv. 305 *a*. *Feathers* attracted by amber, the finger, and other bodies, iii. 651 *b*.
FELL, Dr. his letters to Mr. *Boyle*, v. 627 *a*.
FEMALE-SEX eminent for devotion, v. 401 *a*.
FERMENTATION of the blood, an account of it, iv. 317 *a*. Of the air in reference to *Fermentation*, v. 180 *b*. It subtilizes the juice of grapes into vinous spirits, i. 380 *b*. The use of the knowledge of *Fermentation*, i. 476 *a*. i. 489 *b*. The changes in animal substances by *Fermentation*, i. 500 *a*.
FERNELIUS, his remarks on the plague, iv. 291 *a*.
FERRUGINOUS WATERS, many to be found in *England*, iv. 234 *a*. Lighter than common water, iv. 243 *b*. Scarce have any acidities, iv. 245 *a*. A *Ferruginous Water* not heavier than other water, iii. 236 *a*.
FETIDNESS of spirits, the way of taking it off, i. 576 *b*.
FEVERFEW distilled with oil of amber, its use, v. 420 *a*.
FEVERS, inordinate fermentations of the blood, iv. 177 *b*. The effects of a *Fever* removed from one place to another, iv. 211 *a*. Cured by tincture of gold, iv. 332 *b*. The cure of a *Fever* in *Ireland*, v. 92 *b*. The cause of most *Fevers*, iii. 363 *a*. The strange efforts of nature in the cure of *Fevers*, iv. 395 *a*. The *Fever* of the milk in women explained, iv. 410 *a*.
FIBRE, the effect of specificks on the *Fibres* of the body, iv. 315 *b*.
FIGURATION, experiments concerning the *Figuration* of fluid bodies, i. 253 *a*. Of the volatile salt of human blood, iv. 168 *b*. The determinate *Figuration* of gems considered, iii. 218 *a*. The *Figuration* of consistent bodies made out of fluid ones accounted for, iii. 225 *b*.
FIGURE capable of infinite differences, iii. 77 *b*. The use of the knowledge of *Figures*, iii. 157 *b*. The superficial *Figures* of fluids, iv. 1 *a*. The *Figure* of the surface of water and air, iv. 2 *a*. The *Figures* in minerals how produced, i. 449 *a*. The *Figure* of frozen liquors, ii. 384 *b*. The curious *Figures* of salts examined, ii. 488 *a*.
FILBERDS, experiment on the kernels of *Filberds in vacuo*, iv. 145 *b*.
FILE, the use of a *File* and turning-lath, i. 374 *a*.
FILINGS OF STEEL, the acting of the magnetical effluvia upon them, iv. 258 *b*. Experiment with spirit of salt on *Filings* of copper, v. 85 *a*. With *Filings* of copper and powder'd sal-armoniack, v. 120 *b*. And spirit of vinegar, v. 183 *a*. *Filings* of copper dissolved by spirit of sal-armoniack, iii. 634 *a*.
FILTER, an experiment on a shining *Filter*, iv. 34 *a*.
FILTRATION, the cause of the ascension of water in *Filtration*, i. 51 *a*. The cause of the ascension of quicksilver considered, i. 147 *b*. An account of the nature of *Filtration*, iii. 37 *a*.
FINAL, a disquisition about the *final* causes of natural things, iv. 515 *a*. Whether and how a naturalist should consider *final* causes, iv. 517 *a*. The consideration of *final* causes not to be banished from natural philosophy, iv. 522 *a*. The true doctrine of *final* causes encourages our gratitude to God's bounty, iv. 534 *a*. With what caution *final* causes should be considered by the naturalist, iv. 534 *b*. A *final* cause proved by the structure of the bodies of animals, iv. 537 *a*. The search of *final* causes should not exclude the indagation of efficient ones, iv. 550 *a*.
FINGER, its adhesion to the tube in the air-pump particularly examined, i. 82 *a*. &c. Exhalations from the palp of the finger, iv. 209 *a*. The effect of the pressure of the finger on the orifice of a glass, iv. 269 *b*.
FIORAVANTI, his experiment of curing a lady of the spleen, i. 465 *b*.
FIRE, how it burns in a receiver, i. 70 *a*. The many ways of its being extinguished in mines, i. 141 *a*. Reflections on making of a *Fire*, ii. 177 *a*. Store-houses of *Fire* in the bowels of the earth, iii. 101 *a*. Fire may be kept burning under water, iv. 87 *b*. Whether it is the proper instrument of analyzing mixed bodies, iv. 90 *a*. *Fire* alters the parts of a body exposed to it, iv. 92 *a*. Is the artificial death of things, iv. 93 *a*. The effect of it in ordinary chymical distillations, iv. 93 *b*. Factitious air prejudicial to *Fire*, iv. 125 *a*. Experiment on *Fire* in compressed air, iv. 129 *b*. Easiest kindled in compressed air, iv. 130 *b*. *Fire* used to produce air, iv. 131 *a*. The striking *Fire* by collision, iv. 253 *b*. Out of a smooth loadstone, v. 80 *a*. The effect of *Fire*-damps in mines, v. 306 *a*. The change made in bodies by the element of *Fire*, i. 299 *a*. Of the analyzing of mixed bodies by *Fire*, i. 302 *b*. Whether *Fire* be the true analyzer of mixed bodies, i. 303 *b*. It does not analyze bodies into hypostatical principles, i. 306 *b*. *Fire* not an adequate instrument to analyze mixt bodies, i. 308 *a*. Is but one instrument employed in the resolution of bodies, i. 308 *b*. Does but shatter the form and structure of bodies, i. 309 *a*. The effect of *Fire* in the burning of wood, i. 309 *b*. *Fire* unites bodies of a different nature, i. 310 *a*. Account of what is obtained from mixed bodies by *Fire*, i. 312 *a*. The operation of *Fire* on mixtures produced by art, i. 316 *b*. The analysis of bodies by *Fire* examined, i. 330 *b*. The nature of culinary *Fire*, i. 331 *b*. Its way of operating on solid bodies, i. 332 *a*. The dissolving of bodies not elementary by *Fire*, i. 332 *b*. New mixed bodies produced by *Fire*, i. 334 *a*. Bodies analyzed by *Fire* into five substances, i. 345 *a*. Bodies divided by *Fire* into parts fixed and volatile, i. 345 *b*. The virtues of simples destroyed by *Fire*, i. 354 *a*. In what manner minerals are divided by *Fire*, i. 359 *b*. The effect of the resolution of bodies by *Fire*, i. 365 *a*. Substances extracted from bodies by dissolution by *Fire*, i. 370 *a*. *Fire* resolves bodies into no determinate number, i. 371 *a*. Lixiviate salts produced by *Fire*, i. 379 *b*. Production of alkalies depends on the operations of *Fire*, i. 382 *b*. The action of *Fire* upon bodies may produce water, i. 413 *b*. The impression of *Fire* on chymical medicines considered, i. 575 *b*. The unpleasantness of medicines not occasioned by the *Fire*, i. 576 *a*. The nature of subterraneal *Fires*, ii. 398 *b*. The power of cold to hinder the effects of *Fire*, ii. 325 *b*. Experiment on *Fire* and salt, ii. 509 *b*. The colour of gems destroyed or altered by *Fire*, iii. 221 *a*. Experiments to make *Fire* and flame stable and ponderable, iii. 340 *a*. The violent agitation of the parts in *Fire*, iii. 576 *a*. *Fire* an instrument in the volatilizing of bodies, iii. 618 *a*. In the fixation of bodies, iii. 626 *a*. The operation of *Fire* on magnetic bodies explained, iii. 645 *b*. Account of *Fire* burning downwards in mines, v. 497 *b*.
FIRESHIP, the effect of a *Fireship* at the siege of *Antwerp*, iv. 273 *a*.
FIRE-STONE vitrified by heat, i. 310 *a*. The successive concretions of solid *Fire-stones*, iii. 240 *a*.
FIRE-WORKS, a remark concerning them, iii. 454 *a*.
FIRM, in what manner bodies become *firm*, i. 255 *a*.
FIRMAMENT, opinions concerning the vastness of it, i. 434 *a*. The rapidity of its motion, iv. 343 *a*.
FIRMNESS, Mr. *Hobbes*'s opinion concerning it examined, i. 149 *a*. The definition of it, i. 240 *b*. The cause of it in bodies, i. 254 *a*. The rest of the contiguous parts contributes to the *Firmness* of bodies, i. 255 *a*. The *Firmness* of bodies owing to the texture of the parts, i. 262 *b*. An experiment upon the *Firmness* and fluidity of bodies, i. 280 *a*.
FISH, whether they breathe under water, i. 70 *b*. An account of the shining of putrid *Fish*, iv. 26 *b*. Experiment on *Fish* boiled *in balneo mariæ*, iv. 158 *b*. An account of *Fish* called together in a pond, v. 95 *b*. The raining of *Fish* out of the air, v. 190 *b*. An account of the dissection of *Fishes*, v. 242 *b*. Of *Fish* found alive after they were frozen, v. 311 *a*. A *Fish* kept alive in a glass of water, i. 366 *a*. The spherical shape of the eyes of *Fishes* explained, i. 456 *a*. The hearts of *Fish* of an inverted figure, i. 468 *b*. The way of preserving *Fish* in *Ireland*, ii. 343 *a*. *Fish* found in ponds strongly frozen, ii. 391 *b*. The way of thawing of *Fish*, ii. 392 *a*. The relation between light and air in shining *Fish*, ii. 555 *a*. Experiment on shining stinking *Fish*, ii. 558 *b*. A way of catching *Fish* by a log of wood, iii. 184 *a*. Experiment on the Swims of small *Fish*, iii. 283 *b*. Conjecture concerning bladders

ders of air found in *Fishes*, iii. 546 *a*. In what manner a *Fish* comes to rise or sink in water, iii. 546 *b*. A piece of rotten *Fish* pneumatically treated, ii. 561 *a*. Remark on the eyes of *Fish*, iv. 525 *a*. A *Fish* inclosed in the body of a stone, i. 277 *b*. Struggling with the hook, ii. 188 *a*. The air in water, of what use to *Fish*, iii. 118 *a*. Phænomena by Shell-*Fish* in an exhausted receiver, iii. 119 *a*. By Scale-*Fish*, iii. 119 *b*. *Fish* produce less air than *Flesh*, iv. 153 *b*. An account of a *Fish* pleased with musick, iv. 264 *a*. Of *Fish* in the island *Teneriff*, v. 173 *a*. The digestive quality in the stomach of *Fishes*, i. 468 *b*. Whether *Fish* die in frozen ponds for want of air, ii. 343 *b*. Experiments how long *Fish* will live under frozen water, ii. 345 *a*. The effect of *Fishes* shining in the night, ii. 367 *a*. The shining of *Fish* pneumatically tried, depends upon the air, ii. 560 *a*. Rotten *Fish* will not always shine, ii. 560 *b*. Shoals of *Fish* discovered in the sea from the tops of hills, v. 539 *a*. Account of *Fish* dying in a lake in *New England*, v. 596 *b*.

FISHERMEN to become linguists is supernatural, v. 54 *a*. Sent to convert the world, v. 55 *b*.

FISHERTON, account of a monster born there, v. 315 *b*.

FISHING with a counterfeit fly, remark upon it, ii. 187 *a*.

FISTULA, cured without chirurgical operations, i. 498 *b*. By the juice of millepedes, i. 508 *b*.

FIT, spirit of sal-armoniac of use in *Fits* of the mother, iv. 190 *b*. A remedy for convulsive *Fits*, iv. 307 *b*. Spirits of hartshorn a remedy for hysteric *Fits*, iv. 337 *b*. A cure for *Fits* of the mother, v. 420 *a*. A remedy for hypochondriacal *Fits*, v. 439 *b*. For hysterical *Fits*, i. 538 *b*. The hot and cold *Fit* of an ague described, ii. 168 *a*.

FIXITY, the mechanical origin or production of *Fixity*, iii. 619 *a*. The operation of *Fire* conducing to the *Fixity* of bodies, iii. 620 *a*. It is produced by breaking or disabling the volatile corpuscles of bodies, iii. 621 *b*. By producing a rest among the parts of bodies, iii. 622 *a*.

FIXT SALT, made without salt, oil, or sulphur, i. 381 *a*.

FLAME, the particles of it fiercely agitated, i. 249 *b*. An experiment concerning it, i. 251 *b*. The *Flame* of a candle appearing green, ii. 43 *b*. An experiment of *Flame* produced by a shining liquor, iv. 31 *a*. The ponderability of *Flame*, iv. 93 *a*. The height of the *Flame* issuing from Mount *Vesuvius*, v. 122 *b*. *Flame* produced from bodies actually cold, v. 246 *b*. Experiments touching the relation betwixt *Flame* and air, iii. *a*. 248 The difficulties in making those experiments, iii. 248 *a*. The difficulty of producing *Flame* without air, iii. 250 *a*. The conservation of *Flame* under water, iii. 256 *b*. An odd phænomenon about the *Flame* of a metal *in vacuo Boyliano*, iii. 258 *a*. The duration of the life of animals with the *Flame* of spirit of wine compared, iii. 261 *a*. Experiments to make fire and *Flame* stable and ponderable, iii. 340 *a*. *Flame* will increase the weight of minerals and metals, iii. 342 *a*. The operation of *Flame* on light bodies inclosed in close vessels, iii. 344 *b*. A discovery of the perviousness of glass to ponderable parts of *Flame*, iii. 350 *a*. The operation of mere *Flame* upon bodies inclosed in glasses, iii. 351 *b*. *Flame* may act as a menstruum, and make coalitions with the bodies it works on, iii. 352 *b*. The difficulty of keeping *Flame* alive without air, considered, iii. 466 *b*. The appearing of a strange *Flame* on the coverlid of a bed, v. 528 *a*. The interest of air in an unburning *Flame*, iv. 25 *b*. Life a subtile *Flame* fanned by the air, v. 323 *a*.

FLESH, Mr. *Hobbes*'s opinion of the generation of *Flesh*, i. 153 *a*. Experiment upon *Flesh*-flies, iii. 132 *b*. *Flesh* when putrified produces air, iv. 135 *a*. May be preserved by beer, iv. 152 *b*. Milk useful to preserve *Flesh*, iv. 155 *b*. Experiment on boiled *Flesh in vacuo*, iv. 155 *b*. May be long kept without salt, iv. 156 *a*. Experiment on raw *Flesh* with pepper and cloves, *ibid*. How far boiled *Flesh* will produce air, iv. 157 *a*. Experiment on *Flesh* boiled *in balneo Mariæ*, iv. 158 *b*. Of preserving *Flesh* in spirit of wine, i. 494 *a*. Observations on shining *Flesh* of veal and pullet without sensible putrifaction, iii. 304 *a*.

FLETCHER, Dr. *Giles*, his account of the seasons in *Russia*, ii. 322 *a*. Of the effects of the extreme cold of that country, ii. 328 *a*.

FLIE, experiment on *Flies* in artificial air, iv. 125 *a*. In an empty receiver, iv. 128 *b*. The reviving of drowned *Flies*, ii. 533 *b*. The eye of a *Flie* a more curious piece of workmanship than the body of the sun, iv. 523 *a*. Account of the Fire-*Flie* in *Virginia*, v. 646 *b*.

FLIE-BLOWINGS, an experiment with them in an empty receiver, iv. 129 *a*.

FLINT, a discovery of *Flint* in its embryo, v. 577 *a*. The nature of striking fire with *Flint* and steel, iv. 253 *b*.

FLOATING, an account of the *Floating* of bodies, iii. 164 *a*. The weight of a *floating* body equal to as much water as its immersed part takes up the room of, ii. 426 *b*.

FLOCK-BED, pestilential contagion preserved in it, iii. 320 *a*.

FLORENCE, the government of that state, v. 403 *b*.

FLORENTINE experiments, some account of them, v. 388 *b*. Upon the rarifaction of the air, iii. 203 *b*.

FLORES COLCOTHARINI, i. 506 *b*. *Flores sulphuris*, how produced, iii. 330 *a*.

FLOUNDER, the motion of a *Flounder*'s heart cut asunder, i. 466 *b*.

FLOWER, the difference of colour in the leaves of *Flowers*, ii. 6 *a*. Experiment on *Flowers* in two receivers, iv. 148 *b*. What earth proper for *Flowers*, v. 248 *a*. A *Flower* growing from its own ashes, v. 405 *a*. Two remarkable *Flowers* in *Florence*, v. 405 *b*. *Flowers* change their complexion as they advance in maturity, v. 468 *a*. The effect of cold upon the smell of frozen *Flowers*, ii. 335 *a*.

FLUID, what bodies are *fluid*, according to Mr. *Hobbes*, i. 149 *b*. The qualification of a *fluid* body, i. 150 *a*. The definition of a *fluid* body, i. 241 *a*. *Fluid* bodies may be made more *fluid*, i. 244 *b*. Vacant spaces necessary between the particles of *fluid* bodies, i. 245 *a*. An account of the softness of *fluid* bodies, i. 246 *a*. A *fluid* body must have its parts actually moved, i. 248 *a*. and diversly agitated, i. 249 *a*. Some *fluid* bodies will not admit of mixtures, i. 251 *b*. The surfaces of *fluid* bodies made to change, i. 252 *a*. The method of hardning one *fluid* body by another, i. 264 *b*. A *fluid* body is always divisible into bodies equally *fluid*, i. 272 *a*. The nature of a *fluid* body, iv. 342 *b*. In *Fluids* the lower parts are pressed by the upper, ii. 417 *a*. A lighter *Fluid* may gravitate upon a heavier, ii. 420 *a*. The reason of the emersion of lighter bodies in heavier *Fluids*, ii. 424 *b*. A body immersed in a *Fluid* sustains a lateral pressure from the *Fluid*, ii. 433 *b*. How the pressure of *Fluids* may be communicated to one another, ii. 435 *b*. The superficial figures of *Fluids* iv. 1 *a*. Encompassed with other *Fluids*, iv. 3 *b*. Confining *Fluids* have distinct surfaces, iv. 4 *b*. An account of the reflective power of *Fluids*, iv. 6 *b*. Bodies made to flow, resemble *fluid* bodies, iv. 9 *b*. The effect of *fluid* bodies upon solid ones, iv. 254 *b*. The motion of *fluid* bodies by the impulse of solids, iv. 262 *a*. The insensible motions of *Fluids* on inorganical bodies, iv. 265 *a*. Invisible *Fluids* operate upon congruous solids, iv. 274 *a*. Dry bodies may become *fluid* by fire, i. 363 *a*. The differing pressure of heavy solids and *Fluids*, iii. 298 *a*. The pressure upon bodies by ambient *Fluids* considered, iii. 299 *b*. The uniformity of the pressure of *fluid* bodies on solid ones, iii. 301 *b*. *Fluids* in a human body anatomically considered, v. 706 *b*.

FLUIDITY, the nature of it examined, i. 349 *b*. The doctrine of it explained, i. 136 *a*. Mr. *Hobbes*'s opinion concerning it examined, i. 149 *a*. The history of *Fluidity* and firmness, i. 240 *b*. The *Fluidity* of bodies considered, i. 241 *b*. Promoted by the agitation of the air, i. 244 *a*. The *Fluidity* of water examined, ii. 298 *a*.

FLUX, remedy for a violent *Flux*, v. 312 *b*. *Fluxes* cured by fresh butter melted, i. 546 *b*.

FLUX-POWDERS used in the fusion of ores, v. 29 *a*.

FLYING, a book upon the art of *Flying*, v. 294 *b*.

FOETUS, whether the *Fœtus* respires in the womb, i. 71 *a*. The circulation of the blood in a *Fœtus* before the use of respiration, i. 454 *b*. A way of preserving small *Fœtus's*, ii. 543 *a*. At what time a human *Fœtus* is informed with a rational soul, iv. 416 *a*. The nourishment of the *Fœtus*, with curious remarks concerning it, iv. 540 *b*.

FOG, strange *Fogs* on the coast of *Cormandel*, v. 188 *b*.

FOGEL, Monsieur, extract of a letter from him, v. 394 *b*.

FOLIATING, an account of *foliating* glass, iii. 175 *b*.

FOOT, the use of the *Foot* explained by *Galen*, i. 428 *b*. The effect of tickling the *Foot*, i. 537 *b*.

FOOT-BALL, an experiment by it to prove the weight of the atmosphere, i. 99 *a*. The nearer it is to the top of a mountain, it swells the more, i. 129 *a*.

FORAMEN OVALE, its nature and design explained, iv. 541 *a*.

FORCE, the great expansive *Force* of freezing water, iii. 373 *a*.

FORM, substantial *Forms* considered, i. 261 *a*. They are scholastick chimæras, iv. 57 *a*. Things are discriminated by their *Forms*, i. 319 *a*. The origin of *Forms* and qualities according to the corpuscular philosophy, ii. 451 *a*. Doctrine of *Forms* and qualities obscurely treated by schoolmen, ii. 455 *b*. What is properly to be meant by substantial *Forms*, ii. 458 *b*. Experiments touching the origin of *Forms* and qualities, ii. 460 *a*. The nature of a *Form* explained, ii. 469 *a*. *Form* is an essential modification of matter, ii. 475 *b*. Examen of the origin and doctrine of substantial *Forms*, ii. 476 *a*. The doctrine of substantial *Forms* inconsistent with true philosophy, ii. 476 *b*. Explanation of that doctrine by the schools, ii. 477 *a*. Whether *Form* be a substance, examined, ii. 478 *a*. Arguments of the schools to prove the doctrine of substantial *Forms*, ii. 478 *a*. Physical arguments in proof of substantial *Forms*, ii. 479 *a*. Other arguments in proof of that doctrine, ii. 479 *b*. Phænomena in philosophy answered, without imploying substantial *Forms*, ii. 482 *b*. The doctrine of substantial *Forms* an useless theory, *ibid*. What is properly meant by the origin of *Forms*, ii. 483 *a*. Experiments about the production and reproduction of *Forms*, ii. 484 *a*. The mechanical production of *Forms* illustrated, ii. 486 *b*. Experiments touching the origin of *Forms* and qualities, ii. 502 *a*. The constantest sort of *Forms* may be generated and destroyed, ii. 515 *b*. Free considerations on subordinate *Forms*, ii. 526 *a*. Subordinate *Forms* explained after the corpuscularian principles, ii. 526 *b*. What is a *Form*, and what are the bodies endowed with it, ii. 527 *a*. The difference of specific and preparatory *Forms*, ii. 528 *a*. How far the souls of creatures are the true *Forms* of their bodies, ii. 528 *b*. The substantial *Form* of a dead body explained, ii. 529 *a*. The supervening of a new force does not always destroy the old, ii. 529 *b*. A previous *Form* may be reduced to its former functions, ii. 530 *a*. The doctrine of *Forms* by *Sennertus* examined, ii. 530 *b*. A particular inquiry into the nature of specific *Forms*, ii. 531 *a*. Bodies endowed with partial *Forms*, ii. 532 *a*. The *Form* is a convention of accidents whereby the matter is stamped and denominated, ii. 532 *b*. The qualities remaining in bodies that have lost their specifick *Form*, ii. 533 *b*. The doctrine of subordinate *Forms* applied to inanimate bodies, ii. 536 *a*. The difficulty of deciding the nobleness of *Forms*, ii. 536 *b*. *Form* attributed to bodies on account of some eminent property, ii. 537 *a*. Experiments of this observation, ii. 537 *b*. Objections against the admitting subordinate *Forms* answered, ii. 538 *b*. The supervening *Form* modifies the operations of the *Form* pre-existent, ii. 539 *a*. The actions of a body that harbours specifick *Forms* considered, ii. 539 *b*. and explained by examples, ii. 540 *a*. Particulars to prove that the specifick *Form* is the eminentest in bodies, ii. 540 *b*. The dominion and subjection between *Forms* considered, ii. 541 *a*. The nature of substantial *Forms*, v. 44 *a*. They are enemies to true philosophy, v. 354 *b*. Substantial *Forms* not concerned in the production of divers particular qualities, iii. 568 *a*.

FORTREE, Mr. his treatise of the English interest and improvement, v. 500 *a*.

FORTUNE, a competent *Fortune* explained, ii. 206 *a*. The vulgar opinion concerning the power of *Fortune* exploded, iv. 364 *a*. Reflections on the favourites of *Fortune*, ii. 170 *b*. Greatness of mind consists not in the gifts of *Fortune*. Accidents ascribed to *Fortune* that are the effects of providence, v. 224 *a*. The inconstancy of *Fortune* explained, v. 224 *b*. An inquiry into the nature of what is called *Fortune*, *ibid*.

FOSSIL, effluvia emitted by *Fossils*, iv. 278 *a*. *Fossils* impregnated with medicinal and fugitive salts, iv. 278 *b*. Some account of marchasitical *Fossils*, iv. 279 *b*. Mischievous *Fossils*, their effect on human bodies, iv. 292 *a*. Hydrostatical way of estimating *Fossils*, v. 25 *b*. They often partake of metallick ingredients, v. 26 *b*. The use of finding the specifick gravity of *Fossils*, v. 27 *a*. *Fossils* distinguished from metalline ores, v. 27 *b*. Their weight to be examined hydrostatically, v. 32 *b*. Volatile salts obtained from *Fossils*, i. 379 *a*. Experiments of compressing air by freezing, ii. 292 *a*. *Fossils* endowed with medicinal virtues, v. 7 *a*. The reason of the different weight in *Fossils*, v. 8 *a*. A trial of the metalline nature they contain, v. 26 *a*. The *Fossils* in the country of *Liege*, v. 393 *b*.

FOUNTAIN, an account of a new hydro-pneumatical fountain, iii. 10 *a*.

FOURNIER, his account of a vast bank of ice, ii. 303 *a*. A description of the straight of *Weigats*, ii. 310 *b*. His remarks upon the declination of the needle, i. 222 *a*. His account of the growth of coral, i. 276 *a*.

FOWL, *Fowls* in *Ireland* that taste like fish, iv. 306 *b*. *Fowls* fed by the flesh of vipers, v. 300 *a*.

FOWLER, God compared to a skilful *Fowler*, ii. 98 *b*.

FOX, a white *Fox* changes colour in summer, ii. 36 *a*.

FOXCROFT, Mr. his letter to Mr. *Boyle* concerning a carbuncle shining in the dark, v. 636 *b*.

FOXING, a way of *foxing* of fish, iii. 184 *a*.

FRACASSATI, his experiments of injecting acid liquors into blood, ii. 554 *a*. Some account of his character, v. 251 *b*.

FRÆLICHIUS, his experiment on Mount *Carpathus*, iv. 263 *a*.

FRAMPTON, Mr. his advice to King *Charles* the Second, v. 359 *a*.

FRANCE, the designs of that crown, v. 341 *b*. That King's answer to the Dutch embassador, v. 367 *a*.

FRANCIS RENATUS SLUSIUS, extract of his letters, v. 372 *b*.

FREENESS of the divine love explained, i. 169 *b*.

FREE-WILL, the notion of the Jews concerning it, i. 178 *a*. The nature of it explained, iv. 41 *a*.

FREEZING, salt of blood hinders water from *Freezing*, iv. 199 *a*. Account of the *Freezing* of the serum of blood, iv. 200 *b*. The manner of the *Freezing* of water, iv. 258 *b*. The *Freezing* of bodies by snow and salt, ii. 258 *a*. By snow and oil of vitriol, ii. 259 *a*. By acid and urinous spirits, ii. 259 *b*. The *Freezing* of snow alone, ii. 260 *a*. Of snow with wine and ale, ii. 260 *b*. How *Freezing* breaks a vessel of glass, ii. 269 *a*. How *Freezing* is produced in bodies, ii. 272 *b*. Opinions on the breaking of a glass-vessel by *Freezing*, ii. 276 *b*. The dimensions that water gains by *Freezing*, ii. 285 *b*. The expansive force of *freezing* water, ii. 289 *b*. Experiment of *freezing* a pot to a joint-stool by the fire-side, ii. 359 *a*. An account of *Freezing*, ii. 381 *a*. Experiments on the *Freezing* of liquors, spirits, salts, &c. ii. 382 *a*. On the addition of weight made in bodies by *Freezing*, ii. 386 *b*. The helps and letts in *Freezing*, ii. 387 *a*. The effects of *Freezing* upon weather-glasses, ii. 389 *a*. The remedy for *Freezing* in men, ii. 389 *b*. Effect of *Freezing* upon wine and beer, ii. 392 *b*. The phænomena of an experiment about *Freezing*, ii. 393 *a*. The expansive force of *freezing* water, ii. 395 *b*. The *Freezing* of sage, rosemary, juice of lemons, snow-water, &c. ii. 396 *b*. The great expansive force of *freezing* water, iii. 373 *a*. *Freezing* by snow and salt made by circular motion, v. 472 *b*. Experiment on the *Freezing* of water, v. 355 *a*. On *freezing* animals to death, ii. 349 *b*.

FRENCH, addicted to swearing, v. 211 *a*. A *French* gentleman cured of that vice, v. 217 *b*. The *French* King barbarous to his subjects, v. 416 *b*. Reflections upon his distempers, v. 417 *a*.

FRESHNESS of water examined, v. 199 *b*.

FRICTION, cures performed by *Friction* in *Brasil*, i. 540 *b*. The motion bodies put into by *Friction*, iv. 270 *b*.

FRIEND, the seeing of our *Friends* one of the joys of heaven, i. 184 *a*.

FRIENDSHIP, a part of the joys of heaven consists in *Friendship*, i. 187 *a*.

FRIGORIFICK, a new *frigorifick* experiment, ii. 547 *a*.

FROG, experiment by *Frogs* in an exhausted receiver, iii. 115 *b*. By a large *Frog* in a plated receiver, iii. 116 *b*. Air produced in *Frogs* spawn, v. 113 *a*. A *Frog* cut out of a muscle of a wench's back, v. 405 *a*. The respiration of *Frogs* under water examined, i. 465 *b*. The motions of *Frogs* with their hearts cut out, i. 466 *b*. *Frogs* found in water under the ice, ii. 339 *b*. A host of black *Frogs* devoured by ducks, v. 461 *a*. Account of the drowning of *Frogs*, v. 439 *b*. *Frogs* and toads found complete in human bodies, iv. 414 *a*. The curious contexture of the eyes of *Frogs* examined, iv. 524 *b*.

FROG-SPAWN, an experiment with it in three recipients, iv. 142 *a*. An account of it *in vacuo*, iv. 143 *a*. A trial upon it in an empty receiver, iv. 128 *b*.

FROMUNDUS, his account of the noise of great guns, iv. 262 *b*.

FROST, the operation of *Frost* upon metals, ii. 278 *a*. What depth it pierces in the earth, ii. 295 *a*. And into the water, ii. 296 *a*. The cause of the dissolution of *Frost* and snow, ii. 306 *a*. The effect of

Frost

Froſt upon ſolid bodies, ii. 339 *b*. On wood, ſtones, metals, ii. 340 *a*. Whether *Froſts* are occaſioned by winds, ii. 376 *a*. The good and bad effects of *Froſt*, ii. 386 *b*. The effect of *Froſt* in *Greenland*, *Siberia*, *&c*. ii. 402 *a*. The *Froſt* upon glaſs-windows explained, ii. 261 *a*. *Froſt* and ſnow in the midſt of ſummer, ii. 318 *b*. The effects of *Froſt* upon the air, ii. 319 *b*.

FROTH, an inquiry into the whiteneſs of *Froth*, ii. 20 *b*. Experiments by mixtures in the raiſing of *Froth*, ii. 27 *a*.

FRUIT, experiments on the production of air in *Fruits*, iv. 110 *b*. *Fruits* produce leſs air in artificial air, iv. 114 *b*. *Fruits* putrify in common air, iv. 118 *b*. Bruiſed *Fruit* produce leſs air *in vacuo* than ſound ones, iv. 148 *b*. The taſte of *Fruits* preſerved in raiſins of the ſun, iv. 149 *b*. Fermented liquors uſeful to preſerve *Fruit*, iv. 151 *b*. A way of preſerving *Fruits*, i. 493 *b*. Several ſorts of *Fruit* upon the ſame tree, i. 216 *a*. An account of the changes of colour in *Fruit*, ii. 6 *a*. Reflections on the gathering of *Fruit*, ii. 160 *a*. The colour of *Fruits* altered by artificial air, iv. 117 *b*. Diſſected *Fruits* ſooneſt produce air, iv. 132 *b*. Air produced from *Fruits* in part deſtroyed, iv. 144 *b*. The difference between whole and bruiſed *Fruits*, iv. 146 *b*. Bruiſed *Fruits* do not produce air ſo ſoon as entire, iv. 143 *a*. Experiments *in vacuo* on *Fruits* whole and entire, iv. 147 *b*. *Fruits* cannot be long kept in pulp of apples, iv. 150 *b*. The differing qualities of the parts of the ſame *Fruit*, ii. 500 *a*. *Fruit* will ripen after it is gathered, ii. 534 *b*. *Fruits* growing at the bottom of the ſea, iii. 388 *a*. The taſte of *Fruits* changed by maturation, iii. 590 *a*. *Fruits* change their colours as they advance in maturity, v. 468 *b*.

FRUITION, the unſatisfiedneſs of tranſitory *Fruitions* explained, i. 166 *b*. The *Fruition* of our deſires ſatisfied by the joys of heaven, i. 181 *b*.

FUGA CONTRARII, reaſons for not admitting it, ii. 372 *a*.

FUME, an inquiry into the *Fumes* of diſtilled liquors, ii. 62 *a*. The *Fumes* in deep pits are hot, iii. 102 *a*. *Fumes* ariſing from acid ſpirits and ſpirit of blood, iv. 189 *a*. The various *Fumes* diſtinguiſhed under ground, iv. 278 *a*. The effect of *Fumes* aſcending from the bowels of the earth, iv. 285 *a*. Of the *Fumes* of ſublimate and crude quickſilver, iv. 290 *b*. New diſeaſes cauſed by ſubterraneal *Fumes*, iv. 296 *a*. Solid bodies may by art be reduced to *Fumes*, iv. 297 *b*. The tincturing of precious ſtones by mineral *Fumes*, iii. 223 *a*. The effect of permeating *Fumes*, iv. 212 *b*. Membranes penetrable by *Fumes*, iv. 213 *a*. The tinging of copper by *Fumes* of ſmoaking liquor, iv. 221 *a*.

FUMIGATION, ſome of the effects of it ſhewn, i. 539 *a*.

FUNICULAR HYPOTHESIS examined, i. 76 *a*. A more particular inquiry into it, i. 80 *a*.

FUNICULUS, the hypotheſis of it explained, i. 86 *a*. The generation of a *Funiculus* particularly deſcribed, i. 91 *b*. It has its ſpring inwards, i. 92 *a*. Many objections againſt the hypotheſis of a *Funiculus*, i. 92 *b*.

FURNACE, the nature of *Furnaces* for melting of ore, v. 196 *b*. The improvement of chymical *Furnaces* conſidered, i. 513 *a*. A cheaper way of heating *Furnaces*, i. 514 *b*.

FUSION, an account of the fuſion of metals, i. 243 *a*. Of the *Fuſion* of ſalt petre by fire, i. 247 *a*. The *Fuſion* of ore particularly examined, v. 196 *b*. The *Fuſion* of ſilver and copper explained, iii. 600 *a*.

FUTURE STATE, proper remarks on the felicities of it, v. 723 *b*. The increaſe of our knowledge and happineſs in a *Future State*, v. 731 *b*.

G.

GAGES, to find when the air is drawn out of the receiver, iii. 23 *a*. Particularly deſcribed, iii. 23 *b*. Filled either with mercury or liquor, iii. 25 *a*. Deſcription of the mercurial *Gage*, iv. 100 *b*. The quality of the air in that engine, iv. 101 *a*.

GALAXY, a multitude of bright little ſtars, iii. 536 *b*.

GALEGA, its uſe againſt the bite of a viper, iv. 295 *a*.

GALEN, his opinion of ſpecific medicines, iv. 304 *b*. His account of a piony-root, iv. 322 *a*. Of the effect of the jaſper, iv. 323 *b*. His remark upon compounded medicines, iv. 330 *b*. Upon the virtues of bolarmony, iv. 337 *a*. His opinion upon the power of nature, v. 53 *b*. His opinion of the growth of lead, i. 358 *a*. His opinion of the meaneſt of God's works, i. 428 *b*. He compoſed hymns to the Creator's praiſe, i. 454 *b*. His admiration of the ſtructure of human bodies, i. 455 *b*. His celebration of the divine attributes, i. 458 *a*. His opinion of the raſhneſs of experiments, i. 464 *a*. The uſe he made of the diſſection of brutes, i. 466 *a*. He confeſſes the difficulties of phyſick, i. 522 *b*. His account of amulets, i. 535 *a*. His opinion of ancient phyſicians, i. 582 *b*. Of the earth's being informed by a ſoul or mind, iv. 375 *a*.

GALILEO, his opinion of the weight of air to water, i. 56 *a*. The inventor or improver of teleſcopes, iii. 139 *a*. His diſcovery of the line made by a bullet from a cannon, iii. 158 *a*. His remark on the deſcent of a bullet, iii. 160 *a*. His account of the reſiſtance of bodies, iii. 164 *b*. His diſcoveries by teleſcopes, v. 63 *a*. Pretends to have been the inventor of the teleſcope, iii. 437 *a*. Remarks upon a paradox of his, a point is equal to a circle, iii. 516 *a*.

GALL of vipers, its effect upon a dog, v. 527 *a*.

GALLICAN CHURCH, declares againſt the uſurpations of *Rome*, v. 418 *b*.

GALLS, experiment by the infuſion of broken *Galls* and a ſolution of vitriol, ii. 31 *b*. Not neceſſary to the making of ink, ii. 32 *a*. A powder of *Galls* and copperas, iii. 151 *a*. Experiment on ſerum of blood and infuſion of *Galls*, iv. 173 *b*. The trial of mineral waters by *Galls*, iv. 233 *b*. Remarks on examining mineral waters by *Galls*, iv. 237 *b*. The proportion of *Galls* in trying of mineral waters, iv. 238 *a*. No certainty in trying of waters by *Galls*, iv. 238 *b*.

GAMESTERS ought not to complain of fortune, v. 224 *b*.

GAMING, the occaſion of curſes, v. 224 *a*.

GANGES, the weight of the water in that river, v. 18 *b*.

GANGRENE, cured by oil of turpentine, iv. 328 *b*. A cure for *Gangrenes* occaſioned by cold, ii. 389 *b*.

GARDENER's watering-pot, an experiment by it concerning a vacuum, i. 122 *a*. Meditations upon the art of a *Gardener*, ii. 158 *a*.

GARMENT, ſtains taken out of dyed *Garments*, iii. 153 *a*.

GAS, the uſe of the Helmontian *Gas*, v. 334 *a*. The experiment of mixing the *Gas*, iii. 243 *b*.

GASCONY, the poiſon of ſpiders in that province, i. 226 *a*.

GELLY produced from ſpirit of urine and a certain ſolution, iv. 312 *b*.

GASSENDUS, his opinion of motion, i. 124 *a*. Concerning the nature of the ſun-beams, i. 141 *b*. An account of his *Syntagma philoſoph. Epicuri*, i. 194 *a*. His account of the growth of coral, i. 276 *a*. His explication of whiteneſs upon mechanical principles, ii. 23 *b*. His account of the nature of blackneſs, ii. 28 *a*. Of two of his experiments, ii. 63 *a*. His opinion of poliſhing of bodies, iv. 220 *b*. His remark on the motion of the Earth, iv. 342 *a*. His life of *Epicurus*, v. 257 *a*. His opinion of the bigneſs of the earth, i. 433 *b*. Of the *primum frigidum*, ii. 310 *b*. Of nitre as the cauſe of cold, ii. 314 *a*. His character and way of writing, iii. 358 *b*. His argument to evince the poſitive nature of cold, iii. 359 *b*. His remark upon putting the hand in hot and cold water, iii. 366 *b*. Of the effect of cold upon an adiaphorous body, iii. 369 *a*. His reaſon for the ſaltneſs of the ſea, iii. 381 *a*. His opinion of duration, iii. 525 *a*. Of the peculiar properties of time and place, v. 663 *a*.

GASTO CLAVEUS, his experiment upon pure gold and ſilver, i. 303 *b*. Remarks upon that experiment, i. 304 *a*.

GAZERPOLI, the quality of a mine ſo called, i. 287 *a*.

GEMS, of what originally formed, iv. 219 *a*. The poroſity of natural tranſparent *Gems*, iv. 223 *a*. The effect in poliſhing of *Gems*, iv. 224 *a*. *Gems* heated by attrition, iv. 275 *a*. A *Gem* to ſtop bleeding, iv. 338 *b*. The counterfeiting of *Gems* inquired into, v. 8 *b*. The ſpecific weight of *Gems* of the ſame name, v. 9 *a*. Whence proceeds the virtue of *Gems*, v. 84 *b*. The origin of *Gems* from fluid materials, v. 95 *a*. The uſe of *Gems* in phyſick examined, i. 505 *a*. The origin and virtues of *Gems*, iii. 214 *a*. Incredible accounts of the properties of *Gems*, iii. 216 *b*. The diaphaneity of *Gems* conſidered, iii. 217 *a*. They were either fluid bodies, or made of ſubſtances once fluid, iii. 217 *b*. The geometrical and determinate ſhape of *Gems* examined, iii. 218 *a*. The inward texture of *Gems* proves they were once fluid, iii. 219 *a*.

Thin

Thin plates discovered in *Gems*, iii. 219 *b*. *Gems* deprived of their colours by fire, iii. 220 *a*. *Gems* often found in veins of metals, iii. 221 *a*. The colours of *Gems* not essential to them, iii. 221 *b*. The same *Gem* differingly coloured, iii. 222 *a*. *Gems* partly coloured and partly not, iii. 222 *b*. Solid *Gems* may include in them heterogeneous matter, iii. 223 *a*. Mineral bodies mingled with transparent *Gems*, iii. 224 *b*. The shape of transparent *Gems* owing to the mold in which they were cast when fluid, iii. 228 *a*. The coagulation of the liquid matter of *Gems* about stable bodies, iii. 229 *a*. Mineral substances extracted from fine *Gems*, iii. 230 *a*. A conjecture about the causes of the virtues of *Gems*, iii. 231 *b*. The production of transparent *Gems*, iii. 232 *b*. The virtues of *Gems* deduced from the commixture of mineral corpuscles, iii. 233 *a*. The cause of the medical virtues that belong to *Gems*, iii. 233 *b*. Whether *Gems* are digested by the stomach, iii. 234 *b*. Their virtues ascribed to the mineral substances whereof they consist, iii. 236 *a*. *Gems* included in the rocks where they are digged for, iii. 237 *b*. Why intire *Gems* are in part of one colour, and in part of another, iii. 238 *a*. Transparent *Gems* produced at several times, iii. 239 *a*. The successive generation of the parts of *Gems* mechanically proved, iii. 239 *a*.

GENERATION of air, an account of it, v. 111 *a*. *Generation* and corruption the extremes of motion, v. 125 *a*. An account of the *Generation* of pearls, v. 291 *a*. *Generation* physically consider'd, ii. 471 *a*. *Generation* and corruption of bodies from whence deduced, ii. 472 *a*.

GENESIS and the Apocalypse are reciprocal commentaries, ii. 107 *a*.

GENEVA, an account of Mr. *Boyle*'s tracts published at *Geneva*, iv. 49 *a*.

GENTILITY not obtained by sin, v. 214 *a*.

GEOGRAPHY improved by mathematicks, iii. 159 *a*.

GEOMETRY, the author's reasons for not being conversant in it, i. 2 *a*. Its use in mathematicks, iii. 156 *b*. Improved by the knowledge of figures, iii. 157 *b*. The celestial bodies discovered by *Geometry*, iii. 159 *a*. It forces us to admit what we cannot believe, iv. 58 *b*.

GEORGE, ST. idolatrously invoked in the installation of knights of the garter, v. 414 *b*.

GERAT DE VEER, author of the Dutch voyage to *Nova Zembla*, ii. 238 *a*. His account of the freezing of strong beer, ii. 274 *a*. Of the strange effects of cold, ii. 328 *b*. His remark on prodigious pieces of ice, ii. 346 *a*.

GERHARDUS, his account of the growth of silver, i. 358 *a*. Of iron, iii. 461 *b*.

GERMAN chymists accurate in their experiments, i. 212 *a*. The tincturing of the *German* Spa with galls, iv. 238 *a*. *German* Spa-water, the weight of it, iv. 243 *b*. It will not curdle milk, iv. 245 *b*.

GHETALDUS, his finding the proportion between a sphere and a cylinder, iii. 157 *b*. An account of his *Archimedes promotus*, v. 11 *a*. Of some of his experiments, v. 23 *a*.

GHUR, inquiry concerning the nature of it, v. 197 *a*.

GIDDINESS OF THE HEAD, some account of it, i. 537 *b*.

GILBERT, discover'd the magnetism of the terrestrial globe, iii. 89 *a*. and the various phænomena of the load-stone, iv. 233 *b*.

GILDING of silver-wire with gold explained, iii. 312 *a*.

GILLY-FLOWER, experiment on *Gilly-flowers* and common air, iv. 117 *a*.

GINGER, dysenteries cured by fumes of *Ginger*, i. 538 *b*.

GIORNALE DE LITERATI, the subjects contained in it, v. 390 *b*.

GIRDLE, the effect of mercurial *Girdles*, iv. 281 *a*.

GLACIAL NOCTILUCA, the reason of the name, iv. 74 *b*. The subtilty of parts in the *Glacial Noctiluca*, iv. 79 *a*.

GLACIATION, water expanded by *Glaciation*, v. 50 *b*. Bodies not united by *Glaciation*, i. 310 *b*. Water extended by *Glaciation*, ii. 269 *a*. The cause of it in water, iii. 363 *b*.

GLANDULÆ MILLIARES, an account of them, iv. 208 *a*.

GLANVILLE, Mr. a letter to him concerning witchcraft, v. 245 *a*. His dedication to the Royal Society, v. 328 *b*. His answer to *Mineral Inquiries*, v. 367 *b*. His way of writing, v. 488 *a*. Letters to Mr. *Boyle*, v. 627 *b*. Design of writing a history of witches and apparitions, v. 628 *a*.

GLASS, its great strength to resist the pressure of the atmosphere, i. 16 *a*. Experiment in the air pump by a *Glass*-egg, i. 38 *a*. The close texture of *Glass*, i. 53 *b*. The adhesion of flat *Glasses* explained, i. 143 *b*. An experiment upon the grinding of *Glass*, i. 255 *b*. Upon the sticking of flat pieces of *Glass*, i. 256 *b*. Upon what the solidity of *Glass* depends, i. 257 *b*. An efflorescence of a saltish taste upon the surface of *Glass*, i. 288 *a*. Vessels of *Glass* will break of themselves, i. 288 *b*. An inquiry into the reason of it, i. 289 *a*. The various colours appearing on pieces of *Glass*, ii. 47 *b*. An experiment of reflections from coloured *Glasses*, ii. 48 *b*. Different appearances of colour upon *Glass*, ii. 70 *a*. Colours appearing in the *Glasses* of metals, ii. 72 *a*. The way of colouring of *Glass*, ii. 75 *b*. Reflections on a prismatical *Glass*, ii. 180 *b*. A speedy way of breaking flat *Glasses*, iii. 11 *b*. *Glass*-plates broke by the spring of uncompressed air, iii. 14 *a*. The breaking of a *Glass* drop in an exhausted receiver, iii. 55 *a*. Smell emitted from pieces of *Glass* rubbed together, iii. 68 *b*. *Glass* acquires an attractive virtue by heat, iii. 69 *a*. A *Glass* to discover the particles of air in water, iii. 118 *b*. A receipt to foliate *Glass*, iii. 176 *a*. Experiment on a sphere of *Glass* illuminated, iv. 10 *b*. An account of a shining liquor in a cylindrical *Glass*, iv. 30 *b*. Of a phosphorus burning in a *Glass* hermetically sealed, iv. 86 *b*. Shining through a coloured *Glass*, iv. 88 *a*. The pores of *Glass* penetrable by fire, iv. 93 *a*. *Glass* broken by compressed air, iv. 130 *b*. An account of the porosity of *Glass*, iv. 226 *a*. The different sorts of *Glass*, iv. 226 *b*. *Glass* corroded by a distilled liquor of vitriol, iv. 227 *a*. Common *Glass* not ordinarily permeable by chymical liquors, iv. 227 *a*. Gold will sweat through *Glass*, iv. 228 *a*. The permeableness of *Glass* by corporeal substances, iv. 228 *b*. *Glass* pervaded by particles roving in the air, iv. 229 *a*. The painting and staining of *Glass*, iv. 229 *b*. The tinging of *Glasses* quite through with red, iv. 230 *a*. The staining of *Glass* with the colour of rubies, iv. 230 *b*. A vessel of *Glass* to weigh liquors, iv. 243 *a*. The percussion of glass by sounds, iv. 256 *a*. The reason why *Glass* cracks of it self, iv. 267 *b*. The pressure of the finger on the orifice of a *Glass*, iv. 269 *b*. Offensive steams emitted by *Glass*, iv. 271 *a*. A *Glass* broken by the tone of the voice, iv. 274 *a*. An experiment on the brittleness of *Glass*, iv. 274 *b*. The examining of liquors by a globular *Glass*, v. 14 *a*. An account of hammer'd *Glass*, v. 102 *b*. *Glass* expanded by summer air, v. 160 *b*. An account of frozen *Glass*, v. 180 *a*. Quicksilver passes through *Glass*, v. 233 *b*. The nature of *Glasses* hermetically sealed, v. 253 *a*. The trial of good *Glass*, v. 296 *a*. Account of parabolar object-*Glasses*, v. 349 *a*. *Glass* a body more undestroyable than gold, i. 304 *b*. Green *Glass* not to be dissolved by the fiercest fire, i. 310 *a*. *Glass* may be obtained from vegetables, i. 317 *b*. Is a mixed body made so by fire, i. 334 *b*. Made of bare ashes brought to fusion, i. 347 *a*. The ingredients of making *Glass* the common way, i. 416 *a*. The tincture of antimonial *Glass*, i. 427 *b*. A man put to death for making malleable *Glass*, i. 513 *b*. The texture of *Glass* alter'd according as it is baked, i. 535 *b*. Experiment of a *Glass*-egg dipped in water, ii. 241 *b*. *Glass* affected by the frost, ii. 240 *b*. Beaten *Glass* reckoned among poisons, ii. 463 *b*. An improvement of *Glass*-stopples, iii. 197 *b*. The perviousness of *Glass* to the effluxions of the load-stone consider'd, iii. 316 *a*. To ponderable parts of flame, iii. 350 *a*. The pores of glass pervaded by some matter more subtile than air, iii. 482 *a*. The most accurate way of making spherical *Glasses*, v. 538 *b*.

GLASS-BUBBLES blown at the flame of a lamp, and hermetically sealed, will not break, i. 11 *b*.

GLASS-EATER, account of one, i. 486 *b*.

GLASS-MEN sometimes unsuccessful, i. 218 *a*

GLAUBER had several ways of making gold, i. 215 *a* His history of salt-petre, i. 229 *a*. His character, v. 266 *a*. His mercury of *Luna*, i. 400 *a*. Some account of his furnaces, i. 513 *b*. Account of his preparations of hartshorn, i. 567 *a*. Of his preparing sal-armoniack, i. 569 *b*. His preparation of *sal mirabilis* examined, ii. 511 *b*. Of his carbunculus, ii. 512 *b*.

GLOBE, mutations in the celestial and terrestrial *Globe*, iii. 94 *a*. The lower part of the terrestrial *Globe* unknown, iv. 282 *b*. The subterraneal parts of the *Globe* full of noxious minerals, iv. 296 *b*. This *Globe*

a physical point in comparison of the universe, iv. 341 *b*. The mundane *Globes* of small proportion to the interstellar part of the universe, iv. 342 *b*. The celestial *Globes* are peculiar systems, iv. 345 *b*. The circuit of the terrestrial *Globe*, i. 433 *b*. Various conjectures concerning the internal part of the terrestrial *Globe*, iii. 438 *a*. Periodical motions and commotions within the terrestrial *Globe*, iii. 472 *b*. Some account of the bigness of the terrestrial *Globe*, v. 687 *a*.

GLOBE, a brass *Globe* of four inches diameter, to shew all the motions of the heavens, v. 569 *a*.

GLORY, the end of God's creation his own *Glory*, i. 430 *a*.

GLOVE, the nature of a perfumed *Glove*, iii. 79 *b*. The effect of perfumed *Gloves* upon the female sex, iv. 318 *b*. The strong perfume of Spanish *Gloves*, iii. 320 *b*.

GLOW-WORMS, observations concerning them, v. 355 *a*. Their light depend upon their life, and ends with it, ii. 557 *b*. What happened to the life of *Glow-worms* in an exhausted receiver, iii. 262 *a*. A variation and improvement of the foregoing trial, iii. 263 *a*.

GLUE, whether bodies stick together by a sort of *Glue*, i. 261 *a*. An account of a particular kind of *Glue*, iii. 175 *a*.

GLYSTERS of the smoke of tobacco, a cure for the cholick, i. 539 *a*.

GNAT, experiments by insects turned into *Gnats*, iii. 127 *b*. An attempt made upon *Gnats in vacuo Boyliano*, iii 265 *a*.

GNOMON, curious remarks upon the shadow of it, ii. 150 *a*.

GOA, account of diving for fresh water from the bottom of the sea, iii. 379 *b*. *Goa* stones in the heads of serpents, iv. 337 *b*.

GOAD, Dr. his recommendation of *Morley*'s *Art of Memory*, v. 423 *b*.

GOAT, the benefit arising from the proper management of *Goats*, v. 454 *b*. Account of their milk, skins, pastures, and remedies for their diseases, v. 455 *a*.

GOD, the love of *God* particularly explained, i. 159 *a*. *God* the proper object of love, i. 160 *a*. Lovely in himself before the creatures had a being, i. 160 *b*. Is lovely above comparison, as well as he is above it, i. 161 *a*. Incommunicable in his attributes by a superiority of nature, i. 161 *b*. The love of *God* due by the prerogative of his nature, i. 167 *a*. The manner of extending his goodness, i. 172 *a*. He receives no benefit from our services, i. 173 *a*. His favours are not requitable, i. 174 *a*. His happiness can admit of no accession from our wishes, i. 175 *a*. His love is like his essence immutably eternal, i. 175 *a*. He is never tired by importunity, i. 176 *a*. Has an attentive eye upon the amorous soul, i. 176 *b*. His Design of sending crosses and misfortunes, i. 179 *a*. He deals with our hopes and fears to engage us to serve him, i. 180 *b*. The methods of his administration cleared in the other world, i. 185 *a*. The enjoyment of *God* in heaven, i. 185 *b*. The angels are by their nature qualified to serve him, i. 189 *a*. Our praises of him fall short of his perfections, i. 189 *b*. He will accept of what we are able to perform, i. 190 *a*. *God* speaking in Scripture not tied to rules of rhetorick, ii. 98 *a*. The word of *God* is properly termed light, i. 103 *a*. The deriding of *God* a heinous crime, ii. 128 *a*. A sublime description of his power and other attributes, ii. 131 *b*. Imperfectly discover'd by the light of nature, ii. 190 *b*. The nature of *God* is supra-intellectual, iv. 40 *b*. And will never be fully comprehended, iv. 43 *b*. The works of *God* are inexplicable, iv. 51 *b*. His nature and attributes supra-intellectual, iv. 52 *a*. He made man of a bounded capacity, iv. 52 *b*. Allowable to search into his perfections, iv. 53 *b*. He is neither mortal nor corruptible, iv. 58 *b*. Difficult to conceive how he knows men's actions, iv. 59 *b*. The nature of *God* without composition, iv. 62 *b*. There are no accidents in *God*, iv. 64 *a*. Free-will hard to be reconciled with *God*'s prescience, iv. 67 *b*. He knows at once the whole extent of truth, iv. 68 *a*. The veneration man's intellect owes to *God*, iv. 339 *a*. *God* may have perfections unknown to us, iv 339 *b*. And not expressed in the visible world, iv. 340 *a*. His wisdom in the conduct and government of the world, iv. 346 *b*. In contriving and executing the redemption of mankind, iv. 349 *b*. The inexhaustible fecundity of *God*'s nature, iv. 350 *a*. *God* the fountain of all perfections in his creatures, iv. 352 *a*. The superiority of *God*'s intellect to man's, iv. 352 *b*. The being of *God* discover'd by his works, v. 42 *b*. His majesty condescends to the meanest of his works, v. 45 *b*. Is defined to be an infinite extension or space, v. 415 *b*. The end of *God*'s creation his own glory, i. 430 *a*. The power of *God* conspicuous in his creatures, i. 433 *b*. The goodness of *God* for his favourite man, i. 437 *a*. The knowledge of *God* preferable to the knowledge of his creatures, i. 460 *a*. *God* being a saviour retains the relation of a creator, i. 462 *b*. The perfection and attributes of *God* the noblest objects of speculation, iii. 408 *a*. Not fully to be comprehended by reason, iii. 515 *a*. Remark on his raising the dead and the creation of matter out of nothing, iii. 515 *b*. As lord of the universe he is able to invalidate all the axioms of natural philosophy, iii. 516 *b*. *God* not bound by the common rules of natural agents, iii. 417 *a*. He might have destroyed *Adam* and *Eve* before their fall, iii. 517 *b*. The testimony of *God* concerning himself demands our belief, iii. 529 *b*. The uses and necessity of contemplating the attributes of *God*, iv. 353 *a*. *God* is superior to all his works, iv. 354 *a*. The effects of our admiration of *God*, iv. 355 *b*. The superiority of *God*'s intellect to human reason, iv. 356 *b*. The agency of *God* impeach'd by ascribing things to nature, iv. 361 *b*. The wisdom of *God* in the fabrick of the universe, iv. 362 *a*. and fixing established laws for the government of it, iv. 362 *b*. Cautions to be used in the praising of *God*, iv. 357 *a*. The high veneration our intellects owe to *God*, iv. 357 *b*. *God* not obliged to make corporeal things in the best manner he could, iv. 385 *b*. *God* is an omniscient, an independent and just being, iv. 386 *a*. The faculties and powers given by *God* to the animal creation, the reason of them, iv. 386 *b*. *God* sometimes acts by signal and manifest interpositions, iv. 398 *a*. The different conceptions of idolaters and infidels concerning *God*, iv. 422 *a*. The agency and operations of *God* explained, iv. 422 *b*. The admirable wisdom of *God* in settling the laws of the universe, iv. 423 *a*. The praises and thanks due to him on that account, iv. 423 *b*. The wisdom of *God* proved from the motion of the heavenly bodies, iv. 522 *b*. The ends of *God* in the creation of the world, according to Scripture, iv. 528 *b*. *God* is able by the motions of matter to set to work many subordinate engines, iv. 530 *b*. The ends of *God* in the bodies of animals deserve admiration, iv. 546 *a*. His design in forming the veins, nerves, and arteries, iv. 546 *b*. He may have designs in his works above the reach of our conjectures, iv. 547 *b*. The variety of his corporeal works manifests his wisdom, iv. 548 *b*. Remarks of the power and omnipotence of *God*, v. 658 *a*. *Quicquid est in* Deo, Deus *est*, v. 671 *a*. *God* is a singular being in many respects, v. 671 *b*. The attributes of *God* different from the notions we frame of the creatures, v. 672 *b*. *God* has a right to our veneration both vocal and real, v. 714 *b*. His right to the highest gratitude for various reasons, v. 718 *a*. Obligations and motives to the love of *God*, v. 719 *a*. *God* the producer of motions, sounds, the fountain of light, &c. v. 722 *b*.

GOLD, an account of pale *Gold*, i. 207 *a*. *Gold* of *Malacasse*, i. 207 *b*. The nature of foliated *Gold*, i. 212 *b*. Crude *Gold* melted by the spirit of sea-salt, i. 225 *a*. The minute parts of it will fly to the top in *aqua regis*, i. 128 *b*. Many ways of dissolving *Gold*, i. 243 *b*. The parts of it scattered in fair water, i. 249 *b*. The corpuscles of *Gold* and silver always in motion, i. 282 *b*. The way to make dirty *Gold* look bright, ii. 16 *a*. A method to refine *Gold*, ii. 34 *a*. The colour of foliated *Gold* obverted to the light, ii. 44 *a*. *Gold* dissolved *in aqua regia* dyes a purple, ii. 76 *b*. The degradation of *Gold*, iv. 13 *a*. The change of other metals into *Gold*, iv. 14 *a*. *Gold* difficult to be destroyed, iv. 15 *a*. An experiment concerning the degradation of *Gold*, iv. 17 *a*. *Gold* always attended with its specifick gravity, iv. 17 *b*. An account of depraved *Gold*, iv. 18 *a*. Solution of *Gold* precipitated with spirit of human blood, iv. 202 *b*. *Gold* how much heavier than copper or water, iv. 219 *b*. Not destitute of pores, iv. 220 *a*. Will sweat through glasses, iv. 228 *a*. Experiment with galls upon a solution of refined *Gold*, iv. 239 *a*. Foliated *Gold* set on fire by a burning-glass, iv. 254 *a*. The effect of *aqua regis* upon *Gold*, iv. 287 *a*. The operation of tincture of *Gold*, iv. 332 *a*. Observations about native *Gold*, v. 29 *b*. Spar of *Gold*, the nature of it, v. 30 *a*. *Gold* found in coppermines, v. 30 *b*. The fineness of *Gold* explored by hydrostaticks, v 31 *a*. *Gold* disguised into a reddish earth,

earth, v. 33 *b*. Picked out of the sand of rivers, v. 34 *a*. A way to sublime *Gold*, v. 34 *b*. A comminution of *Gold* into powder, v. 94 *a*. To dissolve crude *Gold* with dry bodies, v. 97 *b*. A solution of *Gold* by a saline liquor, v. 98 *a*. Mercury to give hot with *Gold*, v. 98 *b*. Uncommon way of making a calx of *Gold*, v. 99 *b*. *Gold* found in the island of *Teneriff*, v. 171 *a*. *Gold* found in iron and tin ore, v. 196 *a*. The amplitude and variety of its works, v. 244 *b*. The dissolvent of *Gold* inquired into, v. 302 *a*. Whether a body may be made more ponderous than *Gold*, v. 383 *a*. The pores of *Gold* may be filled with quicksilver, v. 384 *b*. *Gold* not to be analyzed into elementary bodies, i. 299 *b*. Ways of distinguishing and altering *Gold*, i. 300 *b*. and reducing it to its fixed substance again, i. 301 *a*. *Gold* loses nothing of its weight by fire, i. 303 *b*. The separating of *Gold* and silver melted together, i. 305 *b*. Colliquated *Gold* and silver not separated by fire, i. 309 *b*. *Gold* not to be separated into salt, sulphur and mercury, i. 324 *b* The three principles of the chymists not separated from *Gold*, i. 325 *a*. True mercury not to be extracted from *Gold*, i. 325 *b*. Pure *Gold* in the mines of *Hungary*, i. 360 *b*. A menstruum to destroy refined *Gold*, i. 366 *b*. Antimonial mercuries operate on *Gold*, i. 401 *b*. Mercury of *Gold*, i. 402 *a*. *Gold* far heavier than quicksilver, i. 405 *b*. Mercury will easily amalgam with *Gold*, i. 410 *a*. *Gold* volatilized with impregnated quicksilver, i. 410 *b*. The keeping *Gold* in decoction with animated mercury, i. 411 *a*. Volatile *Gold* able to increase the gravity of mercury, i. 411 *b*. The elevation of corporal *Gold* by mercury, i. 412 *b*. *Gold* extracted from a mineral earth, i. 501 *a*. The use of *Gold* in medicine examined, i. 506 *a*. Calcination of *Gold* by amalgamations with mercury, i. 516 *a*. The nature and use of foliated *Gold*, i. 576 *a*. *Gold* not twenty times as heavy as water of the same bulk, ii. 440 *a*. The trial of true and sophisticated *Gold*, ii. 463 *a*. The essential properties of true *Gold*, ii. 469 *b*. Crystals obtained from *Gold* dissolved in *aqua regis*, ii. 489 *b*. The texture of *Gold* altered by a particular menstruum, ii. 513 *b*. Experiment on the dissolution of *Gold*, ii. 514 *a*. *Gold* not indestructible by art, ii. 515 *b*. Silver produced from *Gold*, ii. 515 *b*. The fixedness of *Gold* destroyed by *menstruum peracutum*, ii. 516 *b*. Volatile *Gold* explained, ii. 517 *a*. *Gold* made to fulminate like gun-powder, iii. 195 *a*. *Gold* made to ascend in the form of fumes, iii. 244 *a*. The extensibility and divisibility of *Gold*, iii. 312 *a*. Observations about the growth of *Gold*, iii. 462 *a*. The various disguises of *Gold*, iii. 541 *a*. Whether there be any such thing as a mercury that will heat with *Gold*, iii. 558 *a*. The fixed body of *Gold* made volatile, iii. 613 *b*. Several menstruums capable to volatilize *Gold*, iii. 617 *a*. The transmutation of running mercury into *Gold*, iii. 621 *a*.

GOLD-BEATER'S SKIN, some account of it, iii. 196 *b*.

GOODNESS of God conspicuous in his creatures, i. 437 *a*.

GOOSE, the production of *Soland Geese*, v. 405 *a*.

GOOSE-BERRIES, experiment with them in common air, iv. 127 *a*. On *Goose-berries in vacuo*, iv. 135 *a*. In an emptied receiver, iv. 136 *b*. Contain a great quantity of air, iv. 137 *a*. *Goose-berries in vacuo* fortified against external air, iv. 137 *b*. Produce their air regularly, iv. 138 *a*. Experiment on air produced from *Goose-berries in vacuo*, iv. 139 *b*.

GOSPEL, contains all things necessary to salvation, ii. 117 *a*. The difference between the law and the *Gospel*, ii. 188 *b*. The manner and quickness of its propagation, v. 54 *b*. The triumphs of it foretold by the Prophets, v. 55 *a*. The propagation of it by miracles, v. 56 *a*. The *Gospel* perfective of human nature, v. 67 *b*. The propagation of the *Gospel* in foreign parts, v. 243 *b*. The design of a fund for propagating the *Gospel*, v. 586 *b*.

GOVERNMENT, the art of it difficult and noble, ii. 195 *b*. Causes of the subversion of *Government*, ii. 196 *b*.

GOVERNORS, an inquiry into the nature and use of them, ii. 195 *b*.

GOUT, a medicine to mitigate the pain of it, iv. 192 *b*. Example of the cure of the *Gout*, i. 483 *b*. The *Gout* cured by a fright, i. 528 *a*. By puppies lying in the bed, i. 531 *b*. The effect of that distemper, iv. 315 *a*. Cured by bleeding in the great toe, v. 439 *b*.

GRACE, the dispute between Calvinists and Arminians about divine *Grace*, i. 177 *b*.

GRAFT, different sort of *Grafts* upon the same tree, i. 216 *a*. The *Grafts* of cherry-trees, their different qualities, i. 219 *b*. Remark upon the *Grafts* of trees, i. 357 *a*.

GRAFTING, an account of it from *Normandy*, v. 391 *a*.

GRAIN, diamonds have a *Grain* like wood, v. 83 *b*. A *Grain* or flaky contexture in precious stones, iii. 219 *b*.

GRAIN, the difference of Roman *Grains* from French *Grains*, v. 23 *b*.

GRAIN, *Grains* of the salt of blood, their figure, iv. 169 *a*. The weight of a *Grain* of Scotch gold, v. 30 *b*. The effect of a *Grain* of gold reduced to powder, v. 94 *b*.

GRANATE powder'd, an experiment upon it, v. 9 *b*. The specifick gravity of the stone, v. 26 *b*. The metalline nature of *Granates*, v. 94 *b*. Their shape not regular, iii. 228 *a*. The weight of American *Granates*, iii. 230 *a*. A rich solution obtained from crude *Granates*, iii. 230 *b*.

GRAND-CAIRO, the nature of the plague there, i. 539 *b*. The decrease of it there on the overflowing of the *Nile*, i. 582 *b*. The air of that place considerably cold in winter, ii. 322 *b*. The plague there particularly consider'd, iv. 288 *a*.

GRANDEES, reflections on their power and titles, ii. 177 *a*.

GRAND-PREZ, Monsieur, his observation of the pæony root, i. 223 *a*.

GRANULATING OF METALS, the method of doing it, iii. 182 *a*.

GRAPE, the producing of air in dried *Grapes*, iv. 106 *b*. In bruised *Grapes*, iv. 107 *a*. In unripe *Grapes*, iv. 111 *a*. Experiment on unripe *Grapes* and common air, iv. 114 *b*. On crude *Grapes* with factitious air, iv. 115 *a*. On dried *Grapes* in an exhausted receiver, iv. 131 *b*. On crude *Grapes* fortified against outward air, iv. 138 *b*. Air sooner produced by unripe *Grapes* bruised than unbruised, iv. 148 *a*. Juice of crude *Grapes* will not preserve fruits, iv. 150 *b*. Various distinct substances extracted from *Grapes*, i. 327 *a*. Various changes in the juice of *Grapes*, i. 368 *a*. A kind of sapa produced from distilled *Grapes*, i. 389 *a*. A strong acid produced from *Grapes* by distillation, i. 389 *a*.

GRASS, observations on *Grass* found in the wind-pipes of some animals, ii. 403 *a*.

GRASSHOPPER, the case of one in a vacuum, iii. 132 *b*.

GRATIAN, extracts from his editions of the canon law, v. 413 *a*.

GRATITUDE, reflections on *Gratitude* to God, ii. 171 *a*. Our obligations to it explained, iii. 420 *a*. Motives and obligations to our *Gratitude* to God, v. 716 *b*. The duty more particularly enforced, v. 720 *b*.

GRAVER, the trial of one that could not be softned, i. 219 *a*. An account of the tempering of *Gravers*, iii. 148 *b*. The way of graving a fine writing by *Gravers*, iii. 182 *b*.

GRAVITATION of bodies upon one another consider'd, ii. 444 *b*. An inquiry into the *Gravitation* of the air, v. 343 *a*.

GRAVITY, the cause of it examined, ii. 420 *a*. *Gravity* of the air, experiment concerning it, i. 9 *a*. Concerning its *Gravity* before and after its expansion under water, i. 38 *b*. The proportion of *Gravity* between quicksilver and water, i. 57 *a*. The *Gravity* of the air proved by an experiment of a blown bladder, i. 126 *a*. *Hobbes*'s objection against that experiment, i. 127 *a*. No satisfactory account given of *Gravity*, i. 198 *b*. The *Gravities* of liquors examined, iii. 17 *b*. The subsiding of water and mercury according to their *Gravities*, iii. 18 *b*. *Gravity* of the air and water tried by a sealed bubble, iii. 61 *a*. The specific *Gravity* of human blood, iv. 167 *b*. Of the spirit of human blood, iv. 181 *a*. The specific *Gravity* of a mineral water, iv. 242 *b*. The specific *Gravity* of fossils, v. 3 *a*. The intensive *Gravity* of bodies found by hydrostaticks, v. 13 *a*. The specific *Gravity* of different waters examined, v. 18 *b*. Of gold examined, v. 31 *a*. The use of examining the specific *Gravity* of ores, v. 34 *b*. A table of the specific *Gravity* of drugs and minerals, v. 36 *a*. *Gravity* a principle that drives bodies towards the center, v. 50 *a*. The *Gravity* of the hygroscope examined, v. 114 *a*. The *Gravity* of bodies proceeds from their texture, i. 349 *b*. Way of changing the specifick *Gravity* of metals, i. 406 *a*. The varying *Gravity* of the atmosphere in the same place, i.

ii. 243 *b*. The *Gravity* of water cannot be abolished, iii. 290 *a*. The *Gravity* of sea-water tried, iii. 386 *a*. Volatile salts add little to the *Gravity* of sea-water, iii. 387 *b*. The particular opinions concerning it examined, v. 546 *b*.

GRAUNT, Dr. his observations on the bills of mortality, v. 335 *a*.

GREASE, the effect of the smell of the *Grease* of the wheels of a hackney-coach, iii. 327 *b*. A way to take *Grease* out of cloth, ii. 16 *a*.

GREATNESS OF MIND promoted by Christianity, v. 65 *a*. In what manner understood by the vulgar, v. 66 *a*. *Greatness of mind* and of condition different, v. 66 *b*. The genuine mark of *Greatness of mind*, v. 71 *a*. *Greatness of mind* promoted, *&c.* the second part, v. 74 *a*.

GREATRIX, the stroaking doctor, an account of him, v. 338 *b*. A relation of some of his cures, v. 352 *b*. His hand struck dead twice for his unbelief, v. 469 *b*.

GREEK, the sense of the *Greeks* about the doctrine of transubstantiation, v. 389 *b*.

GREEN, ways to produce a *Green* colour, ii. 50 *b*. Produced from a mixture of bise and orpiment, ii. 51 *b*. and from salts and acid, ii. 55 *b*. *Green* glass used in the grinding of dioptric glasses, iii. 173 *b*.

GREENFINCH, experiment by drowning it, iii. 121 *a*. Of its living in rarified air, iii. 124 *a*.

GREENLAND, the tides, wood, *&c.* of that country, 5. 326 *a*. Account of the ice in *Greenland*, ii. 286 *a*. The colour of the inhabitants, ii. 35 *b*. The terrible breakings of the ice there, iv. 262 *b*. Snow there on midsummer night, ii. 318 *b*. The diversity of weather in that place, ii. 322 *b*. The cold of that country, ii. 400 *b*.

GREGORIUS in Arabick, and Latin, some account of it, v. 422 *b*.

GRESHAM-COLLEGE, *Hobbes*'s notion of their studies and experiments, i. 119 *b*. A character of the members, i. 121 *a*. Unhandsomely treated by Mr. *Hobbes*, i. 148 *b*.

GREY-COLOUR, how produced, ii. 48 *a*.

GREY-HOUND, remarks on the description of a *Grey-Hound*, v. 640 *b*.

GRINDERS of glass for optic experiments, remarks on them, iii. 620 *a*. The way of cementing glass by *Grinders*, iii. 180 *b*.

GRIZOLETTE, a hard stone, a grain discover'd in it, iii. 219 *b*.

GROAT, a way to slit an old *Groat*, iii. 179 *b*.

GROOVE, inquiries concerning the depth, *&c.* of a *Groove*, v. 194 *a*.

GROSSNESS of parts, one cause of the firmness of bodies, i. 254 *a*.

GROTIUS, his notion of spirits, iv. 352 *a*. Is translated into Arabick, v. 421 *b*.

GROTTA DI CANI, of *Naples*, some account of it, iv. 279 *a*.

GROTTO, cures performed in the serpentine *Grotto* at *Rome*, i. 525 *b*.

GROUND-IVY, why called ale-hoof, its virtue, v. 457 *b*. Its various and excellent qualities, iv. 336 *a*.

GROUNDS proper for the preservation of sheep, v. 448 *b*.

GROWTH of metals in their ore examined, iii. 459 *a*.

GRUFF, an account of the *Gruffs* at *Minedeep*, v. 157 *a*.

GUANCHIOS, a people of the island *Teneriff*, v. 173 *a*. Their food and way of life, v. 174 *a*.

GUDGEON, experiment whether *Gudgeons* will live under frozen water, ii. 345 *b*. By one in an exhausted receiver, iii. 119 *b*.

GUIACUM, the nature of that wood, iii. 163 *b*. The various changes in it by fire, i. 302 *b*. The saline parts of the spirit of *Guiacum* examined, i. 303 *b*. The use of *Guiacum* in consumptions, i. 545 *a*.

GUIDOTT, Dr. his remarks on the nature of water turned with galls, v. 648 *b*.

GUILDERS, an account of their trade, iii. 149 *b*.

GUINEA, an account of the weather in that country, v. 160 *b*. The way to keep water cool there, v. 169 *a*. The corrupting quality of the air of that place, v. 184 *b*.

GUINEA, an instrument to examine *Guineas*, iii. 548 *b*. A way to distinguish true *Guineas* by the help of water, v. 23 *a*.

GUISE, Mr. his character and abilities, v. 627 *a*.

GUM will sweat out of old wainscot, i. 253 *b*. An account of *Gum Laccæ*, iv. 185 *b*. *Gum* of plumb-tree, the use of it in ulcers, v. 440 *b*. *Gum* Arabic eases the sharpness of urine, iv. 327 *b*. Account of a reddish *Gum* to preserve insects, i. 469 *b*.

GUN, the boring the barrels of *Guns*, iii. 39 *b*. Remarks on the turning of great *Guns*, iv. 253 *a*. The effect of the discharging of great *Guns*, iv. 255 *a*. *Guns* exposed to the air grow rusty, v. 121 *b*. Cased over to preserve them from the dew, v. 122 *a*. Experiment on freezing water in the barrel of a *Gun*, ii. 396 *a*. The method of levelling *Guns*, iii. 161 *a*.

GUNNER, his use of Gun-powder, i. 199 *b*.

GUN-POWDER, takes fire in a glass closely stopped, i. 21 *a*. Why walls that inclose fired *Gun-powder* are blown asunder, i. 96 *b*. The reason of its expansion when fired, i. 115 *b*. An account of the invention of it, iii. 149 *a*. *Gun-powder* fired by a phosphorus, iv. 12 *a*. The effects of it, iv. 84 *b*. The velocity impressed by *Gun-powder* upon a bullet, iv. 342 *b*. The surprising effects of *Gun-powder*, v. 50 *a*. Martial affairs altered by the discovery of *Gun-powder*, i. 463 *b*. The blowing up of rocks by *Gun-powder*, iii. 181 *b*. The three ingredients that make *Gun-powder*, iii. 199 *b*. An attempt to fire *Gun-powder in vacuo* with the sun-beams, iii. 251 *b*. To fire *Gun-powder in vacuo* by a hot iron, iii. 252 *a*. Another way of firing *Gun-powder in vacuo Boyliano*, iii. 252 *b*. To fire *Gun-powder in vacuo* by the help of sparks, iii. 253 *a*. Fired *Gun powder* will not fire the contiguous grains *in vacuo Boyliano*, iii. 259 *b*. Differing attempts to fire *Gun-powder in vacuo*, iii. 260 *a*. The multitude of particles of smoke emitted from half a grain of *Gun-powder*, iii. 313 *b*. *Gun-powder* thrown into water makes it cold, iii. 572 *a*.

GYPSUM, used in *Malaga* wines, iii. 193 *a*.

H.

HABERFIELD, Dr. his way of curing cancers and the king's-evil, i. 482 *b*.

HADES, the place of departed souls, an account of it, v. 411 *b*.

HÆMATITES, English, an account of the weighing of it, v. 6 *a*. It participates of iron or steel, v. 26 *b*.

HÆMORRHAGE, the methods of stopping it, iv. 212 *a*. A remedy against *Hæmorrhages* at the nose, iv. 338 *a*.

HÆMORRHOIDAL VEINS, the flowing of blood at them considered, iv. 410 *a*.

HÆMORRHOIDS, cured by wearing a certain ring, i. 525 *a*. By an ointment of *aurum fulminans*, i. 526 *a*. The business of a physician when they are violent, iv. 413 *a*.

HAIL, an account of *Hail* in the island of *Ceylon*, v. 166 *b*. A dreadful storm of *Hail* in *Italy*, v. 305 *b*. The generation of *Hail* examined, ii. 361 *a*. Account of the strange size of *Hail*, ii. 362 *a*.

HAIR, whether *Hairs* are hollow, iv. 217 *a*. The tickling of a *Hair* upon the face, iv. 260 *b*. The effect of sulphureous exhalations upon the *Hair*, iv. 282 *a*. A Horse-*Hair* used in hydrostatical observations, v. 4 *b*. The *Hair* of the head changed white by fear, i. 536 *b*. A way of easily taking off the *Hair*, iii. 184 *a*. Instances of persons choaked with a *Hair*, iv. 387 *b*.

HALLIFAX-HILL, an experiment upon a cylinder of water tried there, i. 100 *a*.

HALO, the production of *Halo* in the exhausted receiver, iii. 56 *a*.

HAMAN, his character, ii. 165 *a*. Some account of him, ii. 186 *a*.

HAMMER'D GLASS, an account of it, v. 102 *b*.

HAND, the effect of stroaking with a dead man's *Hand*, iv. 322 *b*. The *Hand* called by *Aristotle* the organ of organs, iv. 344 *a*. A wen cured by a dead man's *Hand*, v. 441 *a*. The curious contrivance of the parts of the *Hand*, i. 454 *b*. Tumors cured by a dead man's *Hand*, i. 532 *a*. The effect of cold upon the *Hand* considered, iii. 362 *b*. The cold felt by the *Hand* thrust into cold water, explained, iii. 364 *a*.

HANDICRAFTS, some account of them, iii. 138 *b*.

HANNIBAL, a remark upon him, v. 71 *a*.

HAPPINESS, not perfect in this world, i. 460 *b*. It consists in the satisfaction of the mind, v. 735 *a*.

HARDNESS of atoms considered by Mr. *Hobbes*, i. 151 *a*. Of bodies owing to the rest of their parts, i. 153 *a*. The unequal *Hardness* of diamonds, i. 287 *a*. A particular inquiry into the *Hardness* of diamonds, v. 83 *a*. The *Hardness* of ice considered, ii. 301 *b*. *Hardness* given to bodies by petrifick liquors, iii. 235 *a*.

HARE, *Hares* in *Muscovy* white in winter, ii. 26 *a*. The colour of the *Hares* in *Muscovy* and *Livonia*, ii. 400 *b*.

HARMONY of the authors of Scripture, ii. 107 *b*. Of the organs in animals, v. 288 *a*.

HARTENIUS, his account of the various kinds of whales, i. 436 *a*.

HARTLIB, Mr. his letters to Mr. *Boyle*, v. 256 *a*. An account of his mnemonical books, v. 431 *a*.

HARTMAN's preparation of spirit and oil of soot, i. 558 *b*. His directions concerning preparations from soot, i. 559 *a*. Account of his preparations of hartshorn, i. 567 *a*.

HARTSHORN, the coagulation of the spirit of *Hartshorn* considered, i. 272 *b*. Solid *Hartshorn* reduced to a mucilaginous substance, i. 275 *a*. An experiment of white *Hartshorn* distilled in a glass retort, ii. 32 *a*. On *Hartshorn* burnt *in vacuo*, iv. 131 *a*. Heated *in balneo Mariæ*, iv. 159 *a*. Spirit of *Hartshorn* will pierce through glass, iv. 228 *a*. The effect of *Hartshorn* in distillation, iv. 335 *b*. Crude *Hartshorn* more operative than magistery, i. 509 *b*. The preparation and virtues of essence of *Hartshorn*, i. 512 *a*. Its nature and properties explained, i. 565 *b*. Three ways of distilling it, i. 566 *a*. Whether a fixed salt be extracted from *Hartshorn*, i. 567 *a*. The use of the spirit of *Hartshorn* and the dose, i. 567 *b*. Whether the salts resemble the figure of the *Hartshorn*, i. 568 *a*. How to keep the spirit and salt of *Hartshorn*, i. 568 *b*. Whether *Hartshorn* retains any thing of the flame to which it is exposed, iii. 342 *a*.

HARVEY, Dr. his problem concerning respiration, i. 70 *a*. His excellent treatise of generation, i. 221 *a*. How he came to discover the circulation of the blood, iv. 539 *b*.

HASSIAN CRUCIBLES, their nature and use, iv. 222 *a*.

HATCHING of eggs, the nature of it explained, ii. 498 *a*. More particularly examined, v. 255 *b*.

HAWKINS, Sir R. his account of the putrefaction of the sea, iii. 384 *b*.

HAY, old and dry, prevents the rot in sheep, v. 447 *b*.

HEAD, a way to make a *Head* like the life, iii. 177 *b*. The *Head*-ach cured by the smell of volatile alkalies, iv. 191 *b*. By spirit of human blood, iv. 194 *a*. A remedy for scabby *Heads*, iv. 210 *b*.

HEALER from *Ireland*, some account of him, v. 335 *b*.

HEALTH, curious reflections upon it, ii. 167 *a*. The value and benefit of it, i. 553 *b*. Affected by the operations of the air, iii. 307 *a*.

HEARING, the aids of *Hearing* considered, v. 368 *b*.

HEART, the motion of the *Heart* perceived through a hole in the chest, i. 65 *b*. The sort of heat that resides in the *Heart*, i. 70 *a*. Experiment upon the *Heart* of an eel, iii. 120 *b*. The *flamma vitalis* in the *Heart*, iv. 31 *b*. The motion of the *Heart* seen through the thorax, iv. 214 *a*. Specific medicines operate up on the *Heart*, iv. 314 *b*. Moderate the circulation of the blood through the heart, iv. 318 *a*. The fibres of the *Heart* affected by specificks, iv. 318 *b*. The veins of the *Heart* transposed, v. 315 *a*. The motion of the *Heart* in a live dog dissected, v. 321 *b*. The pulse of the *Heart* continued by blowing, v. 323 *a*. The cause and manner of the *Heart*'s motion examined, i. 466 *b*. The *Hearts* of vipers beat out of their bodies, i. 467 *b*. A stone cut out of the heart of a Scotch nobleman, v. 532 *b*,

HEAT, the reason of rarifaction by *Heat* explained, i. 114 *b*. The *Heat* and cold of an aguish-fit, ii. 167 *b*. The effect of *Heat* in the use of cupping, iii. 45 *a*. The production of *Heat* by attrition, iii. 56 *b*. The description of *Heat*, iii. 80 *a*. Degrees of *Heat* to be found in mines, iii. 96 *b*. An account of *Heat* and cold in the submarine regions, iii. 105 *b*. Noctiluca's made to shine by *Heat*, iv. 72 *b*. Inquiry into the *Heat* of the blood, iv. 166 *b*. The propagation of motion in solid bodies by *Heat*, iv. 259 *b*. The dilatation of metals by *Heat*, iv. 269 *b*. *Heat* produced in glass by friction, iv. 270 *a*. By subterraneal bodies, iv. 286 *a*. Uncommon experiment about *Heat* and cold, v. 97 *a*. Of the *Heat* and coldness of the air, v. 160 *a*. The effects of *Heat* not easily distinguished, i. 302 *b*. The effect of *Heat* upon bodies examined, i. 309 *a*. The various phænomena produced by *Heat*, i. 327 *b*. Preternatural *Heats* produced in the blood, i. 476 *a*. The effect of *Heat* in distilling of medicines considered, i. 575 *a*. The spring of the air increased by *Heat*, ii. 255 *a*. The diffusion of *Heat* tends chiefly upwards, ii. 268 *a*. *Heat* in the bowels of the earth considered, ii. 308 *b*. In the bottom of mines, ii. 309 *a*. The vicissitudes of *Heat* and cold in the same day, ii. 353 *a*. *Heat* in the stomach not always the cause of digestion, ii. 360 *b*. The earth warmed by subterraneal *Heat*, ii. 364 *a*. The *Heat* of cellars in winter considered, ii. 370 *a*. In what sense the word *Heat* is understood, iii. 359 *a*. *Heat* in the fire is a positive quality, iii. 367 *a*. The spring or pressing power of the air increased by *Heat*, iii. 488 *b*. *Heat* produced by mixing salt-petre with oil of vitriol, iii. 571 *b*. *Heat* consists in the local motion of the small parts of a body mechanically modified by certain conditions, iii. 575 *a*. The mechanical origin of *Heat*, iii. 575 *a*. The nature of mechanical *Heat* particularly explained, iii. 576 *a*. The *Heat* observed in quicksilver on the affusion of cold water, iii. 576 *b*. Instances of the production of *Heat* from the natural effects of local motion, iii. 579 *a*. Whence proceed *Heats* suddenly produced in mixtures, iii. 581 *b*. *Heat* may be graduated by the hydrostatick, v. 476 *b*. How it may be graduated by weights, v. 478 *a*. Philosophical inquiries concerning *Heat*, v. 488 *b*.

HEAVEN, in what manner it is to be hoped for, i. 179 *b*. An elegant description of the pleasures of it, i. 180 *b*. The sight of our friends one of the joys of *Heaven*, i. 184 *b*. Some remarks on the outermost *Heaven*, iv. 62 *b*. Generations and corruptions in *Heaven*, v. 51 *a*. The *Heavens* supposed to be a fluid body, i. 349 *b*. The employment of the blessed in *Heaven*, i 442 *b*. Opinions concerning the interstellar part of *Heaven*, iii. 438 *b*. Whether the blessed know one another in *Heaven*, iv. 453 *a*.

HEBREW, graces in the *Hebrew* language lost by a translation, ii. 95 *b*. *Hebrew* words and phrases of different significations, ii. 96 *a*. Remarks upon the *Hebrew* language, ii. 121 *b*.

HEIGHT of the atmosphere examined, i. 56 *b*. Observations on the *Height* of mountains, iii. 33 *b*. A way to take the *Height* of a church, iii. 178 *b*.

HELIACAL STONES, an account of them, v. 498 *a*.

HELENS, ST. the healthfulness of the air of that island, i. 582 *b*. The effect of the air of that island, v. 188 *b*.

HELL, whether the fear of it be a justifiable motive of men's actions, i. 180 *a*.

HELMONT, his account of the stone, i. 211 *b*. His preparation of steel, ii. 71 *a*. His opinion of the spirit of human blood, iv. 180 *b*. To cure the epilepsy, iv. 193 *b*. His use of white briony root, iv. 209 *b*. His remark on sulphur of vitriol, iv. 333 *b*. His *Ignis Gehennæ*, i. 307 *a*. Account of his universal dissolvent, i. 307 *b*. His experiment on the plant of a willow-tree, i. 313 *b*. His opinion of the origination of compound bodies, i. 314 *a*. His account of the *Balsamus Samech* of *Paracelsus*, i. 316 *a*. His remark on the chymical anatomizing of bodies, i. 325 *a*. On the reduction of simple oil, i. 331 *b*. His saying concerning fire, i. 334 *a*. His process of oil of cinnamon, i. 334 *b*. His name for chymists, *Philosophers by the fire*, i. 347 *b*. His opinion of simple medicines, i. 354 *a*. Of reduction of stones into mere salt, i. 362 *b*. Of the dissolution of sulphur and salt-petre, i. 366 *a*. On the production of lixiviate salts, i. 379 *b*. His experiment by the abstraction of the liquor alkahest, i. 406 *a*. His way of extracting mercury from metals, i. 408 *a*. His process on the transmutation of bodies, i. 414 *b*. Account of the generation of the stone in human bodies, i. 473 *a*. His mistake about the stone, i. 477 *a*. An account of his immortal liquor, i. 485 *b*. His argument from the providence of God answer'd, i. 488 *a*. The virtue of his laudanum, i. 488 *b*. His character of poisonous simples, i. 502 *a*. A commendation of his medicines, i. 520 *a*. His advice for the improvement of physick, i. 520 *b*. His remedy for persons bewitch'd, i. 526 *b*. His judgment of the *Arcana* of physick, i. 581 *b*. His experiment on the weight of ice, ii. 333 *a*. Of turning oil of vitriol into allom, ii. 492 *b*. Of the virtue of the alkahest, ii. 521 *b*. The way of preparing the laudanum of *Helmont* the son, iii. 507 *a*. His remark on the virtue of the alkahest, iii. 613 *b*. Account of the transmutation of mercury into gold, iii. 621 *a*.

HELVETIA, the fruits and produce of that country, v. 273 *a*.

HEMISPHERE, an account of clouds in the southern hemisphere, iii. 92 *b*.

HEN-

HEN-EGGS, an experiment with them in the air-pump, i. 37 *b*. A sort of *Hens* without rumps, ii. 36 *b*. The use of *Hen*'s dung in diseases, v. 444 *a*. Account of their natural affection to their young, v. 692 *b*.

HEN-SPARROW, an experiment by it concerning respiration, i. 63 *a*.

HENRICUS AB HEER, his account of the Spaw-waters, i. 551 *b*.

HENRY the fifth of *England*, his character, ii. 198 *b*. *Henry* the fourth, remark on an act in his reign, v. 246 *a*.

HENSHAW, Mr. his account of frog's spawn, v. 329 *a*.

HERACLITUS, his opinion of a mean cottage, i. 428 *b*.

HERBS, the figure of the salts in *Herbs*, v. 342 *b*. To prevent being burnt by molten lead, v. 395 *b*. To preserve the fumigated juices of *Herbs*, i. 516 *b*.

HERCULES arraigned as a magician, v. 437 *a*.

HERETICKS are like tops, v. 320 *b*.

HERMAPHRODITE, account of one in *London*, v. 377 *a*.

HERMES TRISMEGISTUS, his saying of the creation and government of the world, i. 458 *a*.

HERMETICAL WEATHER-GLASSES, a particular account of them, ii. 249 *a*.

HERMIONE, her character, i. 160 *b*.

HEROD, many princes of that name, ii. 99 *b*. *Herod Agrippa*, an account of him by *Josephus*, v. 69 *b*.

HERRINGS, an account of pickling of them by the Hollanders, iii. 145 *b*.

HEVELIUS, Mr. some account of him, v. 308 *b*. His observations on a comet, v. 330 *a*. Remarks upon his Prodromus, ii. 345 *a*.

HEWES's POWDER, the pernicious effects of it, v. 519 *a*.

HIGHMORE, Dr. his observation concerning the lungs, i. 64 *b*. His opinion of respiration, i. 67 *a*. Some account of his character, v. 248 *a*.

HILDANUS, his remark on the plague, iii. 89 *a*. His way of breeding a callus in a broken bone, iv. 316 *b*.

HILLS OF ICE, the nature of them explained, ii. 286 *b*.

HIPPOCRATES, his opinion of the use of air, i. 66 *a*. Of the cause of the plague, iv. 292 *a*. A dangerous aphorism of his, i. 464 *a*. His opinion of the juices of the body, i. 474 *a*. His aphorism *Ars longa, vita brevis*, i. 522 *a*. *Ventres hyeme esse calidiores*, ii. 360 *b*. His account of the formation of a human body, iv. 374 *b*.

HIPPOPOTAMUS, the tooth of one, a cure for the cramp, iv. 322 *a*.

HISTORY of trades of great use, iii. 172 *a*. Memoirs for the natural *History* of human blood, iv. 161 *a*. Titles for the natural *History* of human urine, iv. 165 *b*. *History* of the spirit of human blood, iv. 176 *b*. Memoirs for the *History* of mineral waters, iv. 232 *a*. Titles of inquiry for such a *History*, iv. 235 *a*. *History* of mineral water considered as a medicine, iv. 248 *b*. Experiments in natural *History*, v. 77 *a*. The general *History* of the air, v. 105 *a*. The use and design of that *History*, v. 106 *a*. Heads for the natural *History* of a country, v. 191 *a*.

HOBBES, his objection against the spring of the air answer'd, i. 76 *b*. His opinion of experimental philosophy, i. 119 *a*. and of immaterial substances, i. 119 *b*. His hypothesis of a plenum opposed, i. 122 *a*. His notion of motion disputed, i. 124 *a*. His censure of the Cartesian doctrine, i. 125 *b*. Rejects the hypothesis of the weight and spring of air, i. 126 *a*. His objections to the experiments to prove the weight of the air, i. 126 *a*. His notion of *motus circularis simplex*, i. 130 *a*. His explication of the Torricellian experiment, i. 133 *b*. His opinion of *fortissimus conatus circularis* in the receiver, i. 137 *b*. His explication of the damps in mines, i. 140 *b*. Of the adhesion of two flat pieces of marble, i. 143 *a*. His notion of fluidity and firmness consider'd, i. 149 *a*. He examines into the hardness of bodies, i. 151 *a*. His opinion of the diaphaneity of glass or crystal, i. 151 *b*. Concerning the generation of flesh within the muscles of a human body, i. 153 *a*. His book *de Cive* answer'd, v 361 *a*. His opinion concerning cold examined, ii. 253 *b*. His reason for the ascent of water in a weather-glass, ii. 254 *a*. That reason examined, ii. 255 *a*. His opinion of the congelation of water, ii. 280 *b*. His doctrine touching cold examined, ii. 373 *a*. His opinion on that subject, ii. 373 *b*. How water is congealed by cold, ii. 374 *a*. His opinion confuted, ii. 374 *b*. His account of the coldness of wind, ii. 377 *a*. Of turning water into ice, ii. 377 *b*. His reason of the freezing of water with snow and salt, ii. 378 *a*. Why cold is more remiss in cloudy than in clear weather, ii. 378 *b*. Why ice is lighter than water, ii. 379 *a*. Animadversions on Mr. *Hobbes*'s *Problemata de vacuo*, iii. 476 *a*. His opinion of the corporiety of the Deity and the plenitude of the world, iii. 476 *b*. His discourse on the adhesion of two flat polished marbles examined, iii. 478 *a*. His reasons for the divulsion of them, iii. 479 *b*. For drawing asunder the opposite parts of a piece of wax, iii. 480 *b*. His remarks on the *Machina Boyliana* examined, iii. 481 *b*. He compares it to a pot-gun, iii. 483 *b*. His proof that the space in the exhausted receiver, which the vacuists suppose partly empty, is full of air, iii. 484 *a*. Men killed in mines by the force of a wind, according to *Hobbes*, iii. 483 *b*. His remark upon a vacuum in general, iii. 486 *b*. Upon the penetration of quicksilver by the air, iii. 487 *a*. His explication of the Torricellian experiment examined, iii. 489 *a*. Opinion of a circular wind produced by suction, iii. 491 *b*. His maxim, that nothing is removed but by a body contiguous and moved, examined, iii. 520 *b*.

HOLLY, the uses and virtue of free *Holly*, v. 454 *a*.

HOLY GHOST, the sin against the *Holy Ghost* cannot now be committed, v. 410 *a*.

HOLY THISTLE, the use of that herb in distempers, v. 457 *a*.

HOMER's ILIAD written on parchment, and inclosed in a nut-shell, v. 700 *a*.

HONEY, experiment by mixing honey and water, iii. 87 *b*. Sometimes hurtful as poison, iv. 326 *b*. Diluted with succory good for the sight, v. 247 *a*. *Honey* fermented with a due proportion of water, i. 387 *a*. Story of a lady's aversion to *Honey*, i. 541 *b*. *Honey* and sugar afford acid spirits by distillation, iii. 615 *b*.

HOOK, an air-pump invented by *R. Hook*, i. 5 *a*. His method for writing a natural history, v. 349 *b*. His instrument for weighing of bodies, v. 355 *b*. For discovering the pressure of the air at sea, v. 378 *b*. For the observation of the weather at sea, *&c.* v. 389 *b*. Letters from him to Mr. *Boyle*, v. 530 *a*.

HORATII, the play acted upon that subject, v. 383 *b*.

HORN, scrapings of black horn appear white, ii. 39 *b*. Account of a *Horn* in a woman's forehead, iv. 411 *a*. An hydrostatic fitted to a horn, the use of it, v. 468 *b*.

HORROX, Mr. his character, v. 248 *b*.

HORSE, reflections on a stumbling *Horse*, ii. 163 *a*. On taking up *Horses* from grass, ii 180 *a*. A *Horse*-hair used in hydrostatical observations, v. 4 *b*. An account of *Horses* working in mines, v. 186 *b*. Of a strange distemper among the *Russian* horses, v. 188 *b*. A remedy for the plague in horses, v. 290 *a*. Reason of the blindness in *Horses* eyes, v. 382 *a*. A stone taken out of a *Horse*, v. 394 *a*. The use of *Horse*-dung in diseases, v. 444 *a*. Urine of *Horses* impregnated with common salt, i. 385 *b*. Lame *Horses* cured by weapon-salve, i. 532 *b*. The medicinal effect of warts upon the legs of *Horses*, i. 539 *a*.

HORSE-DUNG, the use of it in medicine, i. 507 *b*. Digestions by the warmth of *Horse-dung*, i. 515 *b*.

HORSE-HAIRS in water not depressed by the weight of the superincumbent water, ii. 443 *a*.

HOUGHTON, Mr. a remark upon the danger of his writings, v. 508 *b*.

HOUNDS, their quickness of smell, iv. 56 *b*. Their sagacity after their game, iii. 332 *b*.

HOUR-GLASS, an account of a water *Hour-glass*, v. 271 *a*.

HOUSE, to compare the temperature of different *Houses*, and differing rooms in the same *House*, iii. 398 *b*. *Houses* set on fire by hot weather, v. 168 *b*. No *Houses* of office at *Madrid*, v. 181 *b*.

HOWLINGS of the damned sound forth the divine praises, i. 173 *b*.

HUDSON's-BAY, some account of the trade there, ii. 229 *a*. The way of interrring in that place, ii. 229 *b*. Remarks upon the air on that coast, v. 165 *b*.

HUETIUS, his character, v. 392 *b*.

HUGENIUS, the inventer of a curious dial, i. 63 *b*.

HUMAN BODY consider'd as an engine, i. 537 *a*. Affected in a meer mechanical manner, i. 540 *a*. The operation of medicines upon it, i. 547 *b*. The number, variety, *&c.* of the integrant parts of a dead *Human Body*, v. 644 *b*.

HUMILITY OF BODIES particularly explained, i. 248 *b*.
HUMILITY a sign of a great mind, v. 73 *a*. Promoted by the contemplation of God's creatures, v. 717 *a*.
HUMOUR, the translation of peccant *Humours* from one place to another, iv. 211 *a*. The several *Humours* of the eye anatomically explained, v. 697 *b*.
HUNGARIAN MINES, the seat of them, ii. 309 *b*.
HUNGARY, an account of the mines there, iii. 96 *a*. The effect of various steams in the mines of *Hungary*, iv. 280 *a*. The fatal effect of expirations from a gaping ground in *Hungary*, ii. 367 *b*.
HUNTINGTON, Dr. ROBERT, his letters to Mr. *Boyle*, v. 618 *a*. His observations on the Irish translation of the Bible, v. 619 *a*.
HURRICANES, in the American islands, iii. 90 *b*. Remarkable observations about *Hurricanes*, v. 96 *a*. An account of a *Hurricane* off the coast of *Mozambique*, v. 104 *b*. At *Porta nova*, v. 128 *b*. About the Leeward Islands, v. 375 *a*. In the Caribbee Islands, iii. 472 *a*.
HUSBAND-MAN, his art and knowledge, iii. 145 *a*.
HUSBANDRY improved by natural philosophy, iii. 141 *b*. By nitre, iii. 142 *b*. By hydrostaticks, iii. 144 *b*. The advancement of it inquired into, v. 262 *a*.
HUSKS, the burying of plates of copper in the *Husks* of grapes, i. 369 *a*.
HUSSEY, Mr. WILLIAM, his letters to Mr. *Boyle*, v. 617 *b*.
HUTCHINSON, Mr. his melting of lead-ore with sea-coal, v. 644 *a*.
HYDE, Dr. his letters to Mr. *Boyle*, v. 580 *a*. His design of explaining the Pentateuch by eastern authors, v. 581 *b*.
HYDRAULO-PNEUMATICAL FOUNTAIN, an account of it, iii. 11 *a*.
HYDROMEL, the way of making it, i. 491 *a*.
HYDROMETER employ'd to wind up a pendulum, v. 569 *b*.
HYDROSTATICAL THEOREM explained, iii. 34 *a*. The way of performing *Hydrostatical* trials, v. 5 *a*. The uses of an *Hydrostatical* solid, v. 15 *a*. The *Hydrostatical* way of examining the weight of bodies, v. 18 *b*. Stereometry applied to the *materia medica*, v. 19 *a*. *Hydrostatical* way of estimating ores, v. 25 *a*. Of exploring gold, v. 31 *a*. *Hydrostatical* paradoxes made out by new experiments, ii. 409 *a*. The occasion of their being written and published, ii. 410 *b*. The confirmation of *Hydrostatical* proportions by physical experiments, ii. 411 *b*. *Hydrostatical* problem concerning a cylindrical stick, &c. ii. 425 *a*. An *Hydrostatical* law concerning the weighing of bodies, ii. 544 *b*. *Hydrostatical* discourse against the objections of Dr. *Henry More*, iii. 268 *a*. In *Hydrostatical* things nature has her balance as well as art, iii. 278 *b*. The *Hydrostatical* principles of a new essay introduced, iii. 547 *a*.
HYDROSTATICKS of use in husbandry, iii. 144 *b*. A particular theorem in *Hydrostaticks*, iii. 164 *b*. Their principles how applied, iii. 166 *a*. Applied to the *materia medica*, v. 1 *a*. The trial of spirituous liquors by *Hydrostaticks*, v. 15 *a*. The use of *Hydrostaticks* to a sagacious physician, v. 17 *a*. The negative use of *Hydrostaticks*, v. 27 *a*. *Hydrostaticks* applied to the examining of ores, v. 34 *b*. What are properly the subjects of *Hydrostaticks*, v. 348 *b*. The nature and usefulness of that part of philosophy, ii. 410 *b*.
HYGIEINAL part of physick examined, i. 489 *a*.
HYGROSCOPE, a statical *Hygroscope* proposed to be tried, iii. 393 *a*. Used to discover the changes of the air as to moistness and dryness, iii. 393 *b*. The way of turning a spunge into an *Hygroscope*, iii. 394 *b*. A brief account of the utilities of *Hygroscopes*, iii. 395 *a*. Alteration of weather discover'd by the *Hygroscope*, iii. 396 *b*. Affected by winds, clouds, frost, snow, &c. iii. 398 *b*. Discovers approaching rain, iii. 399 *b*. The most proper body to make a *Hygroscope*, v. 537 *a*. An account of the increase or lessening of its gravity, v. 114 *a*. The make and figure of a *Hygroscope*, v. 115 *a*. It gives notice of the mutation of the air, v. 115 *b*.
HYPERBOLE's used in expressing God's perfections, i. 167 *a*. The way to use them with propriety, ii. 143 *a*.
HYPOCRISY, a description of that vice, ii. 184 *a*.
HYPOCRITE, a particular character of a *Hypocrite*, ii. 183 *b*. 184 *a*. *Hypocrites* discovered at the day of judgment, iv. 348 *b*.
HYPOSTATICAL, the three hypostatical principles of the chymists, ii. 39 *b*. Not one principle separated from bodies by fire, i. 308 *b*. The proofs of the three *hypostatical* principles examined, i. 344 *b*. The doctrine of those principles unsatisfactory, i. 347 *a*.
HYPOTHESIS, Cartesian, concerning the air, i. 36 *a*. The requisites of a good *Hypothesis* considered, i. 153 *b*. The speculative devisers of *Hypotheses* of little use, i. 199 *b*. Observations upon the Atomical and Cartesian *Hypotheses*, i. 228 *a*. The *Hypothesis* of a spirit diffused through the mass of matter considered, i. 261 *b*. The advantages of the corpuscular *Hypothesis*, iii. 76 *a*. The *Hypothesis* of alkali and acidum, iv. 186 *a*. The mechanical *Hypothesis* accommodated to specific medicines, iv. 308 *a*. An account of the Antipascalian *Hypothesis*, v. 326 *b*. The Cartesian *Hypothesis* of a rainbow, v. 372 *b*. A remark on the *Hypothesis* of chymists, i. 297 *b*. The *Hypothesis* of *Paracelsus*, i. 298 *a*. The chymical *Hypothesis* exploded, i. 300 *a*. The *Hypothesis* of the *tria prima*, vain and imperfect, i. 347 *b*. The chymical *Hypothesis* consists of narrow principles, i. 348 *b*. The Epicurean *Hypothesis* examined, i. 448 *a*. The *Hypothesis* of cold difficult to be fixed, ii. 239 *a*. Reasons for writing and publishing the *History of Cold*, ii. 239 *b*. The *Hypothesis* of forms and qualities explained, ii. 460 *a*. A confirmation of the corpuscularian *Hypothesis*, ii. 521 *a*. Occasional thoughts about the excellency and grounds of the mechanical *Hypothesis*, iii. 404 *a*. The corpuscularian *Hypothesis*, the ordinary extent of its discoveries, iii. 437 *a*. The conditions of a good *Hypothesis* explained, iii. 444 *a*. *Hypotheses* of philosophers concerning things repugnant to theological truths, iii. 519 *b*. Reflections on the *Hypothesis* of alkali and acidum, iii. 603 *a*. The *Hypothesis* explained, iii. 603 *b*. Too narrow and insufficient to explain the phænomena of qualities, iii. 606 *a*. The different *Hypotheses* concerning electrical attraction, iii. 647 *a*. The Peripatetick *Hypothesis* of the eternity of the world, iv. 389 *a*. The Epicurean *Hypothesis* concerning motion, iv. 394 *b*. What conclusions are to be formed from the different conclusions of astronomers, v. 687 *b*. The manifest advantages of the Copernican *Hypothesis* over all the rest, v. 689 *a*.
HYSTERICAL FITS, a specific remedy against them, iii. 81 *a*. The smell of the spirit of human blood of use, iv. 191 *b*. The spirit of hartshorn, iv. 337 *b*. Burnt feathers, the smoke of tobacco, i. 538 *b*. *Hysterical* women affected by cold, ii. 375 *a*. A cure for *hysterical* fits by spirit of sal-armoniack, iii. 326 *b*.

I.

JABORAND, poisons cured by an infusion of the root, i. 524 *a*.
IAGO, ST. account of the weather of that place, v. 651 *a*.
JAGRA, a drink used by the Indians, i. 494 *b*.
JALAP, melted by the heat of the air, v. 170 *a*.
JAMAICA, an account of the air of that island, v. 160 *b*. The excessive heat there, v. 166 *a*. The corrupting quality of the air, v. 179 *a*. No frost nor snow there, ii. 238 *a*. The quality of *Jamaica* pepper, v. 632 *a*.
JAMES, Captain, some account of him, ii. 229 *b*. and of his writings, ii. 239 *a*. His relation of meat and drink not spoiled by cold, ii. 273 *a*. Of the preservation of dead bodies by cold, ii. 273 *b*. Of the forming of hills of ice, ii. 311 *b*. On the refraction of the air, ii. 320 *a*. On the power of cold to restrain the effects of fire, ii. 326 *a*. His account of excessive cold, v. 169 *b*. Some observations in his northern voyage, v. 176 *a*. On the appearance of new stars, v. 178 *a*.
JAMES the first, in danger of losing his nose and ears by cold, ii. 389 *b*. His remark on Christianity, v. 437 *b*.
JANIPA, a fruit in the Caribbee islands, its qualities, iii. 541 *b*.
JASMIN, experiment upon flowers of *Jasmin* and spirit of urine, ii. 56 *b*.
JASPER-STONE, its effect upon the stomach, iv. 324 *a*. The power of *Jasper* to stanch blood, i. 526 *b*.
JAVA, the effect of the moon in that country, v. 128 *a*.
JAUNDICE, turmerick a remedy for it, iv. 184 *b*. Castile soap of use in the *Jaundice*, iv. 329 *b*. A remedy for

for the yellow *Jaundice*, v. 317 *a*. Another by *Paracelsus*, i. 530 *a*.

ICICLES hydrostatically examined, v. 3 *b*.

ICE from the frozen lixivium of a plant, i. 216 *b*. The experiment of burning with *Ice* as with a glass lens, i. 217 *a*. The difference between solid *Ice* and fluid water, i. 246 *a*. *Ice* is formed of particles of water reduced to rest; it loses its weight by evaporation, iii. 66 *a*. The nature of an *Ice*-house, iii. 97 *a*. *Ice* not found in the second region of the earth, iii. 98 *b*. No *Ice* in the bottom of the sea, iii. 109 *b*. An account of the manner of water turning into *Ice*, iv. 258 *b*. The terrible breakings of *Ice* in *Greenland*, iv. 262 *a*. An account of swallows inclosed in *Ice*, v. 103 *b*. On the *Ice* at *Hudson's-Bay*, v. 165 *b*. The cause of mountains of *Ice*, v. 325 *b*. Account of beer frozen to *Ice*, i. 311 *b*. The value of *Ice* in the island of *Congo*, ii. 238 *a*. Vinous spirits turned to *Ice* by cold, ii. 265 *a*. The levity of *Ice* in respect of water, ii. 279 *b*. The height and depth of pieces of *Ice* considered, ii. 286 *a*. The *Ice* at *Hudson's-Bay* and *Nova-Zembla*, ii. 287 *a*. The way of making *Ice* in *Persia*, ii. 294 *b*. Of turning water and snow into *Ice* in *Russia*, ii. 295 *a*. The way of making cups of *Ice*, ii. 296 *b*. Experiments and observations touching *Ice*, ii. 299 *a*. The cohesion of the parts of *Ice* examined, ii. 299 *b*. The dissolution of *Ice* occasioned by salt, ii. 300 *a*. The taste of *Ice* made of sea-water, ii. 301 *b*. The height and depth of mountains of *Ice*, ii. 302 *a*. The vast extent of pieces of *Ice*, ii. 303 *a*. The azure colour of *Ice*, ii. 303 *b*. The great noises on the breaking of *Ice*, ii. 304 *a*. The duration of *Ice* considered, ii. 304 *b*. Experiments on the duration of *Ice* in various liquors, ii. 305 *b*. Trial of a cold liquor heated by *Ice*, ii. 305 *b*. Islands of *Ice*, in what manner formed, ii. 311 *b*. *Ice* dissolved by nitre and salt-petre, ii. 315 *a*. Experiment to try the weight of *Ice*, ii. 331 *b*. Of thawing *Ice* in inclosed vessels, ii. 333 *b*. Account of the duration of *Ice*, ii. 346 *a*. The figures of plants not discovered in the *Ice* from water extracted from them, ii. 349 *b*. The figurations of *Ice* examined, ii. 351 *a*. Water thinly spread soon turns to *Ice*, ii. 351 *b*. The qualities and properties of *Ice* considered, ii 386 *b*. The use of *Ice*, ii. 387 *b*. The thickness of *Ice* on the banks of the *Thames*, in *London* streets, *&c.* ii. 390 *a*. The liquor of thawed salt-water *Ice* fit for use, ii. 297 *a*. Account of vast tracts of *Ice* in the frigid zone, ii. 397 *a*. The figure of the *Ice* on glass-windows explained, ii. 401 *a*. Whether *Ice* and water be not distinct kinds of bodies, ii. 485 *a*. The qualities of *Ice* scarce believed in hot countries, iii. 187 *a*. *Ice* under ground in *Muscovy* all the year, iii. 391 *a*. A way of heating cold liquors with *Ice*, iii. 582 *a*.

ICICLES hydrostatically examined, v. 3 *b*.

ICY, observations on the *icy* noctiluca, iv. 70 *a*. The particular qualities of that phosphorus, iv. 74 *b*. The dissolution of the *icy* noctiluca, iv. 76 *a*. Experiment on the *icy* phosphorus in *aqua fortis*, iv. 77 *a*. The virtue of the *icy* noctiluca in impregnating other liquors, iv. 86 *a*. The *icy* noctiluca may be made hot, iv. 84 *a*.

IDA, an account of the air on that mountain, v. 167 *a*.

IDENTITY, the notion of it not easily penetrated, iii. 539 *a*.

IDLENESS, the nature and danger of it, ii. 147 *a*.

IDOLATRY, the worship of the sun and moon the most ancient *Idolatry*, iv. 374 *a*.

IDOLS and images the same, v. 414 *a*.

JEHOVAH, that name reverenced by the Jews, v. 209 *a*.

JERICHO, the rebuilding of that city examined, v. 218 *b*. A remark on the rose of *Jericho*, ii. 533 *a*.

JEROM, St. his opinion of self-destruction, iv. 428 *a*.

JERUSALEM, our Saviour's prophecy concerning it, ii. 100 *a*.

JESUITS, some account of them, v. 418 *b*. Their method of publishing books to insnare the vulgar, v. 482 *a*. Their reflections on the Cartesian doctrine, v. 330 *b*. *Jesuit*'s powder, a specific against agues, iv. 305 *b*.

JESUS CHRIST, his miracles particularly considered, v. 659 *a*.

JET, its specific gravity, v. 27 *a*. Oil obtained from *Jet*, iii. 237 *b*.

JEWS, the rites and customs of the *Jews* in a great measure lost, ii. 96 *b*. They evade the texts relating to the Messias, ii. 106 *a*. Mistaken in their notions of him, v. 54 *b*. Their hopes of recovering the Holy Land, v. 351 *b*. Their designs in *Arabia* and *Palestine*, v. 353 *a*.

JEWELLER, a way for them to discover false gems, v. 11 *b*.

IGNIS LAMBENS, an account of it, iv. 32 *a*. The reason of an *Ignis fatuus*, iv. 35 *a*.

IGNORANCE, essay of men's great *Ignorance* of the uses of natural things, iii. 185 *a*. *Ignorance* prevents the discovery of God's wisdom and goodness, v. 729 *b*.

ILVA, the loadstone found in that island, i. 222 *a*. The present generation of metals there, i. 358 *a*.

IMAGE, the case of *Images* in churches, v. 413 *a*. Condemned by the Old Testament, v. 413 *b*. Reasons for retaining of *Images*, v. 413 *b*. The danger of *Images* to religion, v. 414 *a*.

IMAGINATION, its way of acting, iv. 45 *b*. How things are incomprehensible by *Imagination*, iv. 63 *b*. Instances of the power of *Imagination*, i. 536 *b*. It is supposed to be seated in the brain, v. 700 *b*.

IMMATERIAL THINGS, the right way of judging of them, iii. 525 *b*.

IMMORTALITY of the soul considered, v. 43 *b*.

IMMUTABILITY OF GOD, an inquiry into it, iv. 346 *a*.

IMPOSTHUMES, how carried off, iv. 215 *a*.

IMPREGNATION, the diversifying of mercury by spiritual *Impregnation*, i. 409 *a*.

IMPROPRIATIONS, some account of them, v. 243 *b*.

INCALESCENCE, the nature of it in the bowels of the earth, iii. 102 *b*. *Incalescence* of impregnated mercuries with gold, i. 410 *a*. The reason of the *Incalescence* of lime explained, iii. 577 *a*.

INCANTATION, some diseases proceed from *Incantation*, affirmed by *Sennertus*, iii. 452 *b*.

INCARNATION, God signally expressed his love by the *Incarnation* of his son, i. 170 *b*.

INCH, the weight of a cubic *Inch* of water, v. 133 *b*. Of quicksilver, *ibid.*

INCOMPREHENSIBLE, the notion of it, iv. 46 *b*. How God is *incomprehensible*, iv. 52 *a*. In what sense things may be called *incomprehensible*, v. 670 *a*.

INDIANS, an apology for many of their barbarous customs, ii. 220 *a*.

INDICO used in dying, i. 217 *a*.

INDIES, the state of physick in the *Indies*, i. 528 *b*. The making of vinegar in the *Indies*, i. 534 *a*. Hot days and cold nights there, ii. 353 *a*.

INDRAUGHT, a strange *Indraught* of the sea on the coasts of *Sumatra*, v. 104 *a*.

INDURATION of bodies particularly considered, i. 276 *a*. Experiment concerning the natural *Induration* of a soft body, i. 279 *b*.

INCRUSTED SPRING, an account of it, v. 158 *a*.

INFANT, forms of speaking that relate to the birth of *Infants*, ii. 96 *a*.

INFERIORS not to pronounce upon affairs of state, ii. 196 *b*.

INFIDELITY, the cause of the great corruption and wickedness of the age, v. 711 *b*.

INFINITE, the notion of philosophers concerning it, iv. 47 *a*.

INFLAMMABILITY of bodies, the nature and cause of it, i. 397 *a*. The cause of it in mixed bodies, i. 234 *b*. The *Inflammability* of the noctiluca explained, iv. 82 *a*. The essence of the chymists sulphur consists in the *Inflammability*, i. 337 *b*.

INFLAMMABLE SPIRITS, their nature, i. 386 *b*.

INFLAMMABLENESS of human blood inquired into, iv. 167 *a*.

INFLEXION of a direct motion into a curve explained, v. 356 *b*.

INFUSION of galls in trying mineral waters, iv. 237 *b*. Whether a mineral water be vitriolate, iv. 238 *b*. The effect of the *Infusion* of galls and iron-stone, iv. 247 *b*. The emetick *Infusion* of glass of antimony and *crocus metallorum* considered, iii. 317 *a*.

INGRATITUDE, a heinous sin against God, v. 718 *a*.

INGREDIENTS in compounded medicines, their effect, iv. 330 *a*. The constant and permanent *Ingredients* of the air, v. 107 *b*. The *Ingredients* of mixed bodies according to *Paracelsus*, i. 298 *a*. The multitude of *Ingredients* in *Recipe's* examined, i. 503 *b*. The confounding of *Ingredients* in medicines, i. 505 *a*.

INHABITANTS, to be considered in the history of a country, v. 192 *a*.

INJECTION of saline liquors into the veins, v. 252 *a*. The *Lues Venerea* cured by the *Injection* of liquors into the veins, v. 374 *a*.

INK, ſome account of it, ii. 31 *b*. May be deprived of all its blackneſs, ii. 38 *b*. A method to write without *Ink*, iii. 151 *a*. Whether the ſerum of blood would make inviſible *Ink*, iv. 201 *b*. Inviſible *Ink* made by the ſpirit of blood, iv. 204 *a*. Good *Ink* depends on the proportion of galls, iv. 237 *b*. Experiment with writing-*Ink* and ſpirits of ſalt, v. 85 *b*. The making of *Ink* by a decoction of plants, i. 499 *b*. Experiment of making an inviſible *Ink*, ii. 379 *a*.

INNOCENCY will triumph at laſt, v. 69 *a*.

INOCULATION of trees explained, ii. 499 *b*. Different ſorts of fruit upon the ſame tree by *Inoculation*, ii. 500 *a*.

INQUIRY, a free *Inquiry* into the received notion of nature, iv. 361 *a*.

INSECTS are relieved by air through their pores, i. 72 *a*. Are not ſo eaſily deſtroyed as perfect animals, i. 72 *b*. The hatching the eggs of *Inſects*, iii. 126 *b*. The caſe of creeping *Inſects* in a vacuum, iii. 131 *b*. Phænomena by winged *Inſects* in a vacuum, iii. 132 *a*. *Inſects* breathe in air highly rarified, iv. 128 *b*. Few produced in dry weather, v. 185 *a*. The admirable workmanſhip of them, i. 428 *a*. Ways of preſerving *Inſects*, i. 469 *a*.

INSTALLATION, the order of *Inſtallation* of Knights of the Garter, v. 414 *b*.

INSTINCT of animals particularly conſidered, iv. 541 *a*. The nature and power of it curiouſly examined, v. 92 *a*. 690 *b*.

INSTRUMENT, the uſe of mathematical *Inſtruments*, iii. 165 *b*. *Inſtrument* to filtrate air through water, iv. 104 *a*. To diſtill *in vacuo*, iv. 105 *b*. A new Eſſay-*Inſtrument*, with the uſe thereof, iii. 547 *a*. Proper to examine gold and other metals, iii. 547 *b*. The conſtruction of this *Inſtrument* deſcribed, iii. 548 *a*. Its uſe relating to metals, iii. 551 *a*.

INTELLECT, is both a looking-glaſs and a ſenſory, iv. 48 *b*. Its power of judging, iv. 48 *b*. It judges of things intuitively, iv. 63 *b*. The veneration man's *Intellect* owes to God, iv. 339 *a*. The *Intellect* is a bounded faculty, v. 62 *a*. Our *Intellects* diſproportionate to the ſublimeſt truths, v. 64 *b*.

INTERPRETERS of Scripture, their method, ii. 95 *b*.

INTERROGATION, points of *Interrogation* wanting in the original copies of the New Teſtament, ii. 105 *b*.

INVENTIONS frequently diſcovered by chance, i. 461 *a*.

INUNCTIONS, mercurial, their effects, i. 483 *a*.

JOB, his character from God himſelf, ii. 158 *b*.

JOHANNA, the effect of the air on that iſland, v. 188 *a*.

JOHNSON, BEN, a ſaying of his, ii. 90 *a*.

JOSEPH, the effect of his being ſold into *Egypt*, ii. 199 *a*. His temptation deſcrib'd, ii. 186 *b*.

JOURNAUX DES SÇAVANS, their character, v. 351 *a*.

JOYS OF HEAVEN accurately deſcribed, i. 180 *b*. They are eternal, always new, and never ſurfeit, i. 186 *a*. They are inexhauſtible, i. 186 *b*. Are the nobleſt part of recompence to virtue, v. 68 *b*.

IRELAND, no poiſonous creatures in that iſland, iv. 284 *b*. Silver mines in that country, v. 242 *b*. Philoſophical inquiries relating to a hiſtory of *Ireland*, v. 261 *b*.

IRIS, obſervations on the colours of a priſmatical *Iris*, ii. 42 *b*. Experiments to vary the colours in the *Iris*, ii. 49 *a*.

IRISH SLATE, its virtue and uſe, v. 634 *b*.

IRON, experiment in the air-pump on red-hot *Iron*, i. 19 *a*. Upon *Iron* caſt into a phial of ſpirit of nitre, i. 234 *b*. A bar of *Iron* held to the north point of the mariner's compaſs, i. 284 *a*. The cracking of glaſſes by a red-hot *Iron*, i. 289 *a*. Smells emitted by cold-ſhare *Iron*, iii. 66 *b*. Turned *Iron* emits a ſmell, iii. 68 *a*. *Iron* obtains the qualities of magnetic bodies, iii. 84 *a*. The nature of the air in an *Iron* pit, iii. 97 *b*. Ways of improving iron and ſteel, iii. 148 *b*. *Iron* in ſome qualities preferable to gold, iv. 14 *b*. An inquiry into the poroſity of *Iron*, iv. 219 *b*. *Iron* ore more uſeful than other metals, iv. 234 *b*. The ſolution of *Iron*-ſtone mixed with infuſion of galls, iv. 247 *b*. *Iron* in *Sweden* in the form of red mud, v. 33 *a*. The effect of the air upon bars of *Iron*, v. 122 *a*. Of cold upon chains of *Iron*, v. 180 *a*. The abundance of *Iron* in the foreſt of *Dean*, v. 197 *a*. *Iron* turned into glaſs by fire, i. 310 *a*. The preſent generation of *Iron*, i. 358 *a*. A hot *Iron* applied to the bite of a viper, i. 478 *a*. Whether *Iron* expoſed to freezing air will produce ice in water, ii. 271 *a*. *Iron*-hoops frozen in pieces by cold, ii. 275 *a*. *Iron*-gates conſumed by a peculiar wind, ii. 324 *a*. *Iron* made brittle by the froſt, ii. 340 *b*. Red-hot *Iron* pneumatically tried, ii. 557 *b*. The changes made in *Iron* by fire, iii. 195 *b*. The way of gilding *Iron* with water-gold, iii. 198 *b*. The operation of flame upon *Iron*, iii. 343 *b*. The weight of bodies expoſed to fire, iii. 344 *a*. Obſervations about the growth of *Iron*, iii. 461 *a*. That *Iron* ſhould ſwim, not repugnant to reaſon, iii. 518 *a*. The agitation of the parts in hot *Iron*, iii. 576 *a*. Senſible to the touch, iii. 579 *a*. and to the eye, iii. 579 *b*. The change of magnetiſm in *Iron* produced by mechanical operations, iii. 646 *b*. *Iron* changed into copper by the water of a mine in *Hungary*, v. 566 *b*.

IRON-MOLDS taken out of linnen, v. 421 *a*.

ISLANDS of ice, the cauſe of them, v. 326 *a*.

ISLINGTON, the weight of the ſeveral *Iſlington* waters, iv. 243 *b*.

ISSUE, monthly *Iſſues* cured by a blood-ſtone, iv. 324 *a*.

ITALIAN, a ſtory of the beaſtlineſs of an *Italian*, v. 223 *b*.

ITALY, a vicious country, v. 301 *a*.

JUDAS, ſome account of him, ii. 188 *a*.

JUDE, St. his account of the body of *Moſes*, ii. 106 *b*. The latter part of his epiſtle recommended to ſcoffers of religion, ii. 128 *b*.

JUDGE, the deſcription of an able *Judge*, v. 58 *b*.

JUDGEMENT, ſome account of the day of *Judgement*, iii. 418 *a*. *Judgements* threatned in Scripture by ſigns of darkneſs in the ſun, v. 496 *a*. Suſpenſion of *Judgment* an uneaſy thing, iv. 58 *a*. The manifeſtation of the divine wiſdom at the day of *Judgement*, iv. 348 *a*.

JUGG, the matter of dark-coloured *Juggs* will ſtrike fire with ſteel, i. 418 *a*.

JUGLERS in ſtate-affairs, v. 236 *a*.

JUICE, effects from the *Juice* of grapes variouſly ordered, i. 327 *a*. The vinous ſpirit in the *Juice* of grapes, examined, i. 386 *b*. The production of gems owing to a lapideſcent *Juice*, iii. 219 *a*. Curiouſly figured bodies made out of a petreſcent *Juice*, iii. 225 *b*. *Juice* of crude grapes its effect, iv. 150 *b*. The operation of the nutrimental *Juice* in animals, iv. 207 *b*. The uſe of weighing the *Juices* of herbs and fruits, v. 17 *b*. *Juice* of grapes produces a volatile ſpirit, i. 390 *a*. The *Juices* of the body proper to be examined by the naturaliſt, i. 470 *b*. The corroſiveneſs of ſome *Juices*, i. 474 *a*. The effect of the *Juices* of lemons and barberries, i. 475 *a*. Some *Juices* of the body like fretting ſalts, i. 475 *b*.

JUNGIUS, Dr. of *Hamburgh*, an account of him, v. 262 *b*. His protonoetical philoſophy, v. 266 *a*. An account of his manuſcripts, v. 393 *a*.

JUNIPA, the fruit of that tree uſed by the *Indians* to black their ſkins, iii. 467 *b*.

JUNIPER, an experiment upon *Juniper* berries and ſalts, ii. 57 *a*. On the ſurface of water covered with oil of *Juniper*, iv. 9 *a*.

JUNIUS converted by reading the firſt chapter of *John*, ii. 136 *a*.

IVORY burnt makes a deep black, ii. 32 *a*. The poroſneſs of *Ivory* proved, iv. 216 *a*. The uſe of black *Ivory*, and how made, iii. 196 *b*.

JUPITER, obſervation on *Jupiter*'s belts, v. 309 *b*.

JUSTICE as eſſential to God as his mercy, i. 173 *a*.

JUSTINIAN, ſome account of him, v. 357 *a*.

IVY-BERRIES, the virtue of the powder of *Ivy-berries*, i. 507 *b*.

K.

KELLS, or cobwebs upon the ground, ſome account of them, v. 448 *a*.

KEMB, Major, ſome account of him, v. 236 *b*.

KENT, the quality of the mines in *Kent*, v. 197 *b*.

KENTMANNUS, his account of the foſſils of *Miſnia*, v. 28 *b*.

KEPLER, his opinion of clouds, iii. 32 *a*.

KERGENUS, his uſe of precipitating medicines, iv. 314 *a*.

KESSENS, a Mahometan writer, his ſaying of *David*, ii. 121 *a*.

KEY, the fitting of a *Key* to a lock, iv. 269 *b*. The nature of qualities illuſtrated by the example of a lock and *Key*, ii. 462 *b*.

KIDNEY, an account of the ſtone in the *Kidney*, iv. 315 *b*. Inſtances of the cauſe of the ſtone in the *Kidneys*, i. 472 *a*.

KING, of the Jews, obliged to read and write the book of the Law, ii. 130 *a*. The Bible has been ſtudied by many kings, ii. 133 *b*. A ſtratagem of the French *King*, v. 383 *b*.

KING, Dr. his account of the transfusion of sheep's blood into a man's arm, v. 638 *a*.
KING'S-EVIL, a remedy for it, i. 438 *b*. Cured by a single simple specific, i. 523 *a*. Healed by the licking of a dog, i. 531 *b*. Another remedy, iv. 328 *a*. Cured by an herb, i. 481 *a*.
KIRCHER, his observation of various refractions in the air, i. 28 *a*. His description of musical engines, i. 34 *b*. His trial of the divining wand, i. 220 *a*. His account of the reproduction of shell-fish, i. 238 *a*. His description of *Lignum Nephriticum*, ii. 45 *b*. His account of a strange fish in the *Streights*, iv. 264 *a*. Of the correspondence between some liquors and some sounds, iv. 266 *a*. His remarks on an eruption of mount *Vesuvius*, iv. 293 *a*. An account of a hygroscope invented by him, v. 115 *b*. Other particulars of his discoveries, v. 301 *a*. Some remarks on his *Mundus Subterraneus*, v. 336 *a*. His inquiry into the nature of sounds, v. 338 *a*. His character by Sir *Robert Southwell*, v. 405 *a*. His large treatise on the loadstone, i. 427 *b*. His account of the *Tarantula*, i. 541 *a*.
KITLING new *kitned*, an experiment by it, iii. 116 *b*.
KLANDERS, a running vermine that spoil the corn, particularly describ'd, v. 652 *a*. *b*.
KNIFE, the effect of drawing a *Knife* different ways over a loadstone, i. 218 *b*. A simile taken from *Knife-Blades*, iii. 630 *a*.
KNOT-GRASS, a remedy for the rot in sheep, v. 448 *a*.
KNOWLEDGE, the use and benefit of physical *Knowledge*, iii. 177 *a*. *Knowledge* acquired by ratiocination, iv. 45 *a*. The distinction of primary and illative *Knowledge*, iv. 50 *a*. The *Knowledge* of man considered, iv. 53 *a*. The prerogative of God's *Knowledge* consists in knowing himself, iv. 352 *b*. A settlement for the promotion of *Knowledge*, v. 300 *b*. A scheme for the improvement of *Knowledge* in *France*, v. 325 *a*. How our *Knowledge* ought to be employed, i. 462 *a*. The imperfection of our *Knowledge* in physical matters, iii. 434 *a*. Our *Knowledge* of the globe of the world of a small extent, iii. 438 *a*. Natural *Knowledge* consistent with inquiries into divine mysteries, iii. 445 *b*. The wonderful extent of the divine *Knowledge*, iii. 353 *b*. Our *Knowledge* of abstracted objects imperfect, v. 663 *a*. Different orders of intellectual beings endowed with differing measures of *Knowledge*, v. 671 *b*. Curious remarks on the advancement of our *Knowledge* in a future state, v. 732 *a*.
KOLLS, small turnips, an account of them, v. 262 *a*.
KRAFT, Mr. a particular account of his experiments, iv. 10 *a*. His gummous noctiluca, iv. 20 *b*. The inventor of gummous and liquid noctiluca's, iv. 21 *b*. His way of kindling gunpowder, iv. 32 *a*.
KRATSHMER, his medicine against the stone, v. 271 *b*. An account of his anagrams, v. 274 *a*.
KUFFLER, Dr. his improvement in husbandry, v. 284 *b*. Some account of his fireworks, v. 331 *a*.

L.

LABOUR, a remedy against hard *Labour* in women, i. 546 *b*.
LACCA of vegetables, some account of it, ii. 77 *a*. Its different colours, ii. 78 *b*.
LADDER, the operation of the air on *Ladders* used in mines, iii. 475 *b*.
LADY, a remark of a *Lady* upon love-letters, ii. 126 *b*. *Ladys* of the greatest beauty conversant in the Scripture, ii. 134 *a*. The different tastes of beauty and wit in young *Ladys*, ii. 222 *b*.
LAKE, a *Lake* in *Scotland* that will not freeze, ii. 391 *b*. Figured substances raised from the bottom of a *Lake* in *Ireland*, iii. 241 *a*.
LAMB, the nursing and breeding of *Lambs*, v. 450 *b*. An experiment by a *Lamb*'s bladder to prove the gravity of the air, i. 9 *b*.
LAMP of strange contrivance, iii. 165 *a*. An account of a new *Lamp*, iv. 38 *a*. *Lamp-Furnaces* their use, i. 513 *a*.
LANCASTER, Sir *John*, his account of a strange plant in the *East Indies*, ii. 491 *b*.
LAND, methods for the improvement of *Land*, iii. 143 *a*. By turning streams of water, iii. 144 *b*.
LANGHORN, Sir *William*, his account of sea-water under the line, iii. 385 *b*.
LANGUAGE, the difficulty of translating the Hebrew *Language*, ii. 96 *b*. A fashion in *Language* as in clothes, ii. 143 *a*.
LANSBERGIUS, PHILIPPUS, his system of the planets and fixed stars, i. 434 *a*.
LAPIDES CANCRORUM, an account of them, i. 218 *a*.
LAPIDESCENCE of bodies accounted for by chymists, i. 275 *b*.
LAPIS CALAMINARIS turns copper into brass, ii. 76 *a*. The effect of spirit of blood on the *Lapis Armenus*, iv. 204 *b*. The virtue of *Lapis Calaminaris* upon acids, iv. 311 *a*. The quality of the *Lapis Nephriticus*, iv. 324 *a*. *Lapis Lazuli*, an account of the weighing of it, v. 6 *b*. *Lapis specularis*, a way to reduce it to powder, iii. 182 *a*. Remark on the solution of *Lapis Calaminaris*, iii. 242 *b*.
LAPIS CANCRORUM resolved into its first milk, i. 502 *b*.
LAPIS NEPHRITICUS, the character of this Indian stone, i. 524 *a*. The effect of the *Lapis Sanguinaris*, or blood-stone, i. 524 *b*. Of the *Lapis Porcinus*, ibid. The *Lapis Butleri*, i. 563 *a*.
LARD, a piece of it a cure for warts, i. 531 *b*.
LARK, an experiment by a *Lark* in the air-pump to try the nature of respiration, i. 63 *a*. Discourse on the mounting, singing, and lighting of *Larks*, ii. 183 *a*. Pneumatical experiment by a *Lark*, iii. 124 *a*. On two *Larks* with a piece of beef, iv. 154 *b*. The catching of *Larks* by looking-glasses, ii. 217 *b*.
LATON, experiment by a cylinder of *Laton*, iii. 52 *b*.
LATRON, or Egyptian nitre, an experiment upon it, iv. 246 *a*.
LAUDANUM, the use of Helmontian *Laudanum*, v. 444 *b*. An account of the two sorts of it, and the way of preparing it, iii. 507 *a*. The success of Mr. *Boyle*'s *Laudanum* in various diseases, v. 525 *a*. &c. *Laudanum* of *Paracelsus*, an account of it, i. 488 *a*. *Laudanum opiatum* a cure for a pleurisy, i. 545 *b*. The *Laudanum* used by *Paracelsus*, i. 199 *b*.
LAUNAY, Monsieur, his essay on light, time, and void, v. 377 *a*.
LAVOUR, HENRY, a quaker, his Latin epigram in honour of Mr. *Boyle*, v. 504 *b*.
LAURENSBERGIUS, his account of a menstruum to dissolve gold, i. 316 *a*.
LAW, the summary of the moral *Law*, v. 67 *b*. The *Law* about printing books, v. 253 *b*. The popish canon *Law* translated into French, v. 412 *b*. The medical *Laws* in the book of Leviticus consider'd, v. 421 *a*. *Law* is a notional rule of acting according to the declared will of a superior, iv. 367 *a*. The knowledge of the ceremonial *Law* useful to Christians, ii. 188 *b*. The *Law* of the land perverted to bad purposes, ii. 111 *a*. The opinion of the Jews concerning their law, ii. 116 *b*.
LAWRENCE, ANTHONY, his great improvement of orchards, v. 502 *a*.
LAZARUS the glass-eater, some account of him, i. 487 *a*.
LEACH, the continuance of a *Leach* alive in a vacuum, iii. 131 *a*.
LEAD, made to ascend in the open air, i. 250 *a*. The effects of the vapour of melted *Lead*, i. 269 *b*. Glass of *Lead* used in making counterfeit gems, ii. 76 *b*. The effect of the solution of *Lead* in spirit of vinegar, ii. 79 *b*. Black *Lead* a mineral *sui generis*, v. 27 *a*. Experiment on *Lead*-ore devoid of spar, v. 29 *a*. The nature of spar of *Lead*, v. 30 *a*. Native gold found in *Lead* mines, v. 30 *b*. The three orders of *Lead*-ores examin'd, v. 34 *b*. Experiment by mixing the red elixir with *Lead*, i. 321 *b*. The mercury of *Lead* fixed into perfect gold, i. 343 *a*. The various changes it receives by fire, i. 355 *a*. Instances of the growth of *Lead*, i. 358 *a*. A sulphureous liquor obtained from *Lead*-ore, i. 396 *b*. *Lead* turned into quicksilver, i. 401 *b*. Account of the weighing of *Lead* in water, ii. 424 *a*. The operation of the fire upon *Lead*, with regard to weight, iii. 349 *a*. Observations about the growth of *Lead*, iii. 460 *a*. The increase of the weight of *Lead* upon churches examined, iii. 460 *b*. *Lead* has no elastic power, i. 124 *b*. Different sorts of it, i. 207 *b*. The various colours appearing in melted *Lead*, ii. 9 *b*. *Lead* calcined turns into minium, ii. 32 *b*. An experiment on *Lead* in an exhausted receiver, iv. 139 *a*. The fluidity of mercury arrested by fumes of *Lead*, iii. 573 *b*. *Lead* retains heat longer than other metals, v. 489 *a*. Account of the melting of *Lead*-ore, and slag of *Lead* with sea coal, v. 644 *b*.
LEAF, the appearances of colour in the leaves of trees, ii. 12 *a*. Meditations on the *Leaves* of a tree, ii. 159 *a*. *Leaves* of a golden colour near gold mines, iii.

iii. 102 *a*. A way to take the figure of a *Leaf* on white paper, iii. 178 *a*. *Leaves* of oak will colour mineral waters, iv. 238 *a*.

LEAKS, the effect of them in water-pumps, iii. 21 *a*. *Leaks* in ships stopped by powder'd beef, iii. 193 *b*.

LEARNING, remarks upon the *Learning* of the East, ii. 122 *a*. A scheme for the improvement of *Learning*, v. 279 *a*. Advanced by the art of memory, v. 429 *a*. Discouragements to the study of experimental *Learning*, iii. 155 *b*.

LEATHER full of pores, iv. 209 *b*. Account of its being tann'd without bark, iii. 172 *b*.

LEAVEN, experiment of paste kneaded with *Leaven, in vacuo*, iv. 157 *b*.

LEES OF WINE will produce a volatile salt, i. 390 *a*.

LEG, a broken *Leg* cured by the odour of broth, i. 535 *b*. A pain seemingly felt in the instep and toes of a *Leg* cut off, v. 568 *b*.

LEGNAN-VELL, a sweet wood, v. 172 *b*.

LEGUMENS distilled afford an acid spirit, i. 388 *b*.

LEMERY, Monsieur, his letter to Mr. *Boyle*, v. 645 *a*.

LEMON-PEEL, an experiment concerning it, ii. 17 *a*. Upon a *Lemon* and common air, iv. 123 *a*. The opposition of the spirit of human blood to the juice of *Lemons*, iv. 189 *a*. Juice of *Lemon* squeezed upon the surface of blood, iv. 197 *b*. The operation of the air upon a *Lemon*, v. 179 *b*.

LEMSTER-OAR famous for the finest wool, v. 452 *b*.

LENARD, NICHOLAS, his treatise of the cause of purgation, v. 302 *a*.

LENTICULAR GLASS, an experiment upon it, ii. 25 *b*.

LEO AFRICANUS, his remarks on the plague, iv. 284 *b*.

LEOPOLD, brother to the duke of *Florence*, his character, v. 403 *b*. His studies and experiments, v. 404 *a*.

LETHARGY, the case of a youth dying of a *Lethargy*, v. 522 *b*.

LETTER, reflections upon a *Letter* concerning the king's coronation, i. 188 *a*. *b*. *Letter* to Mr. *Oldenburgh* concerning experiments, v. 75 *a*. Extract of a *Letter* from Fort *St. George*, v. 128 *b*. An hydrostatical *Letter*, iii. 289 *a*. A *Letter* concerning ambergrease, and its being a vegetable production, iii. 355 *a*. *Letter* to Mr. *Hartlib*, concerning effluviums in the air, v. 124 *a*. To Mr. *Oldenburgh*, concerning a statical baroscope, v. 130 *b*. From Mr. *Locke* to Mr. *Boyle*, v. 157 *a*. From Mr. *Warner*, v. 164 *a*. Mr. *Williams*'s *Letter* to Mr. *Boyle*'s executors, v. 204 *a*. *Letters* of Mr. *Boyle* to several persons, v. 229 *a*. To Mr. *Oldenburgh*, v. 247 *b*. *&c*. *Letters* from several persons to Mr. *Boyle*, v. 256 *a*. *Letters* from Sir *W. Petty* to Mr. *Boyle*, v. 296 *b*. From Mr. *Oldenburgh*, v. 299 *a*. From *John Evelyn* Esq; v. 397 *a*. From Mr. *Robert Southwell*, v. 403 *a*. From Bishop *Barlow*, v. 406 *b*. Mr. *Boyle*'s *Letter* to Bishop *Barlow*, v. 407 *a*. *Letters* from Dr. *Sharrock* to Mr. *Boyle*, v. 418 *b*. From Dr. *Pococke*, v. 421 *b*. From Dr. *Beale*, v. 423 *a*. From Sir *Robert Moray*, v. 510 *b*. From Dr. *Wallis*, v. 511 *a*. From Mr. *Stillingfleet*, v. 516 *b*. From Dr. *Lower*, v. 517 *a*. From Mr. *Hooke*, v. 530 *a*. From Dr. *Ralph Cudworth*, v. 549 *a*. From Mr. *Seaman*, v. 549 *a*. From Dr. *More*, v. 550 *b*. From Mr. *R. Baxter*, v. 552 *b*. From Lady *Ranelagh*, v. 556 *b*. From Mr. *Locke*, v. 565 *b*. From Mr. *Aubrey*, v. 571 *b*. From Mr. *Colepresse*, v. 573 *a*. From Dr. *Hyde*, v. 580 *a*. From Dr. *Peter du Moulin*, v. 594 *b*. From Mr. *Winthrop*, v. 596 *a*. From Sir *Paul Rycaut*, v. 597 *a*. From Dr. *Bernard*, v. 598 *b*. From Sir *John Finch*, v. 601 *a*. From the Earl of *Winchelsea*, v. 601 *b*. From Dr. *Sall*, v. 602 *b*. From Lord *Massareene*, v. 608 *a*. From Dr. *Narcissus Marsh*, v. 608 *b*. From Mr. *Avery*, v. 614 *b*. From Mr. *William Mainston*, v. 617 *a*. From Mr. *William Hussey*, v. 617 *b*. From the Bishop of *Corke*, v. 618 *a*. From Dr. *Huntington*, v. 618 *b*. From Mr. *James Tyrrel*, v. 620 *a*. From Mr. *Dalrymple*, v. 621 *b*. From the Countess of *Warwick*, v. 622 *a*. the Countess of *Cork*, v. 623 *b*. Mr. *Charles Boyle*, ibid. The Lady *Clencartie*, v. 624 *a*. From Dr. *Burnet*, v. 624 *a*. From Mr. *Benjamin Denham*, v. 626 *a*. From Dr. *Fell*, v. 627 *a*. From Mr. *Joseph Glanville*, v. 627 *b*. From Dr. *Wilkins*, v. 629 *a*. Mr. *Mallet*, v. 630 *a*. Dr. *Worsley*, v. 630 *b*. Dr. *Pope*, v. 631 *a*. From Mr. *Codrington*, v. 631 *b*. Mr. *Povey*, v. 632 *a*. Dr. *Boyle*, v. 632 *b*. Dr. *Collins*, v. 633 *a*. Mr. *Cooke*, v. 635 *b*. Mr. *Endicott*, v. 636 *a*. Mr. *Foxcroft*, v. 636 *b*. From Mr. *Austen*, v. 637 *a*. the Bishop of *Limerick*, v. 637 *b*. Dr. *King*, v. 638 *a*. Mr. *Smith*, v. 638 *b*. Dr. *Sydenham*, v. 639 *b*. *G. Agricola*, v. 640 *b*. Mr. *Coxe*, v. 641 *b*. Mr. *Hoar*, v. 642 *a*. Dr. *Plot*, v. 643 *a*. Dr. *Marshall*, v. 643 *b*. Mr. *Hodgson*, v. 644 *a*. From the Earl of *Burlington*, v. 644 *b*. Dr. *Hutton*, Monsieur *Lemery*, v. 645 *a*. Dr. *Toope*, v. 645 *b*. Mr. *William Penn*, v. 646 *a*. Mr. *John Clayton*, v. 646 *b*. Mr. *Percival*, the Earl of *Perth*, v. 647 *a*. Mr. *Joseph Hill*, v. 647 *b*. Earl of *Winchelsea*, Dr. *Guidott*, v. 648 *a*. Mr. *Brattle*, v. 649 *a*. Mr. *Mackrith*, v. 649 *b*. Mr. *Leuwenhoek*, v. 652 *a*. Mr. *John Love*, v. 653 *b*. Mr. *Ellys*, Mr. *Woodward*, v. 654 *b*.

LETTICE, the growing of *Lettice* in a receiver, v. 331 *b*.

LEUCIPPUS, his notion of culinary fire, i. 331 *b*.

LEVIATHAN, *Hobbes*'s, prejudicial to religion, i. 119 *a*.

LEVITY, experiments of the positive or relative *Levity* of bodies under water, iii. 293 *a*. Whether a Trencher ascends from the bottom of a vessel of water, from a positive principle of *Levity*, iii. 294 *a*. Positive *Levity* not implanted in sublunary bodies, iv. 383 *b*.

LIBAVIUS, his description of mercury, i. 342 *a*.

LIBERAL, the moon an emblem of a *liberal* person, ii. 157 *a*.

LIBERTINES IN RELIGION, their practice and characters, iii. 510 *b*. A proper way of writing against them, iii. 512 *a*. *Libertines in Religion* describ'd, v. 47 *b*.

LICE, whether they die when they pass the line, v. 186 *b*.

LIEGE, the fossils of that country, v. 393 *b*.

LIFE, the several miseries of human *Life*, i. 178 *b*. Is a kind of fine flame fanned by the air, v. 323 *a*. A word of doubtful signification with regard to plants and animals, ii. 535 *b*. Motives in the Bible to a virtuous *Life*, ii. 112 *a*. The praise of a single *Life*, v. 400 *a*. Remarks on the principal inconveniences of a vicious *Life*, v. 727 *a*. The advantages of a virtuous *Life*, v. 728 *a*.

LIGAMENTS of a human body examined, v. 703 *b*.

LIGHT, a strange phænomenon of *Light* in the receiver inquired into, i. 58 *a*. Why the *Light* of bonfires is seen when the fires are not, i. 59 *b*. *Light* consists of atoms so minute, as to pierce through the narrow pores of glass, i. 87 *b*. *Light* the means of distinguishing colours, ii. 7 *a*. Different *Light* reflected from the surface of bodies, ii. 11 *a*. particularly from bodies black and white, ii. 15 *a*. The beams of *Light* reflected by opacous bodies, ii. 18 *b*. Inquiries concerning the modifications of *Light*, ii. 23 *a*. The different reflexions of *Light* from white and black marble, ii. 29 *a*. An experiment by altering the *Light* in its passage to the eye, ii. 42 *a*. *Light* produced in an opacous body, ii. 81 *b*. The production of *Light* in an exhausted receiver, iii. 53 *b*. The reflexion of *Light* from liquors, iv. 5 *a*. *Light* the first corporeal thing that was made, iv. 23 *b*. An account of the *Light* in aerial noctiluca's, iv. 24 *b*. The nature and variation of that *Light*, iv. 25 *a*. An account of *Light* in putrid bodies, iv. 26 *b*. Emitted from putrid fish, iv. 26 *b*. The continuance of *Light* from a luminous liquor, iv. 29 *a*. Is produced by intense heat, iv. 34 *b*. The use of the internal *Light* in the human intellect, iv. 64 *a*. The production of a blazing *Light*, iv. 72 *b*. Of *Light* in common water, iv. 78 *b*. The use and excellency of *Light*, iv. 88 *b*. *Light* passes through the pores of glass, iv. 228 *b*. Its operation on disposed bodies, iv. 264 *b*. *Light* from the planets descends directly upon our atmosphere, v. 125 *b*. Papers of experiments of *Light*, v. 373 *b*. From what chymical principle flows *Light*, i. 350 *a*. The relation between *Light* and air in shining wood and fish, ii. 555 *a*. The opinions of the Cartesians, the Peripateticks, and the Epicureans, concerning *Light*, iii. 340 *a*. Whether *Light* be corporeal, tried by experiments, iii. 340 *b*. *Light* adds no divinity to the bodies endowed with it, iv. 379 *a*.

LIGHTNESS, the reason of the *Lightness* of mineral water, iv. 242 *b*.

LIGHTNING, the wonderful effects of it, iv. 254 *a*. An inquiry into the nature and consequences of *Lightning*, v. 122 *a*. The effect of dreadful *Lightning* on ship-board, v. 123 *b*. And on the branches of trees, v. 124 *a*. The appearance of *Lightning* through a thick

thick cloud, v. 177 *a*. Various changes produced in bodies by *Lightning*, iii. 324 *b*. Its effect in discolouring of money, iv. 212 *b*.

LIGNUM VITÆ, an account of its nature in working, i. 284 *b*. The qualities of *Lignum nephriticum*, ii. 44 *a*. An experiment upon it, ii. 45 *a*. Observation on the infusion of this wood, ii. 46 *a*. The tincture of *Lignum nephriticum*, iv. 229 *b*. Experiment with *Lignum nephriticum* and spirit of salt, v. 85 *b*. The colour of that wood exposed to the air, v. 182 *a*.

LILIUM CONVALLIUM, its nature and quality, v. 291 *a*.

LIMB, the loss of a limb in all animals not irreparable, i. 468 *a*.

LIME made into mortar by time grows harder than stone, i. 279 *b*. A compost made of turf and unslacked *Lime*, v. 267 *b*. The slaking of *Lime* by hot Liquors, iii. 191 *b*. Salt-petre obtained from old *Lime*, iii. 465 *b*. The reason of the incalescence of *Lime*, iii. 577 *a*.

LIMEN-EURETICA, a part of navigation, iv. 60 *a*.

LIMESTONE, the effect of it on the fruitfulness of land, iv. 278 *a*.

LINDAMOR, a letter to him concerning the love of God, i. 157 *a*.

LINE, the physical *Line* of light explained, ii. 27 *a*. The *Lines* of the salient water in an experiment explained, iii. 11 *b*. The effect of parabolical *Lines* in burning-glasses, iii. 158 *a*. A *Line* endlesly divisible, iv. 41 *a*. The endless divisibility of a strait *Line* not to be conceived, iv. 53 *a*. The *Line* described by moving smoke, v. 255 *a*. The quality of the air under the *Line*, v. 179 *a*.

LINEA CONCHOIDES of *Nicomedes*, iv. 60 *b*.

LINEN, pestilential contagion preserved in it, iii. 320 *a*. A way to take spots out of *Linen*, iii. 152 *a*. Why holes in *Linen* appear black, ii. 29 *a*.

LINNET, pneumatical experiment by a *Linnet*, iii. 124 *a*.

LINSCHOTEN, his observation on the generation of diamonds, i. 357 *b*.

LINSEED-OIL, its use in pneumatical empyema's, iv. 328 *b*.

LINUS, FRANCISCUS, his objections answered, i. 76 *a*. His character, i. 77 *b*. His opinion of the air, i. 78 *a*. His chief argument against the spring of the air, i. 80 *b*. His exceptions particularly answered, i. 81 *b*. His second objection considered, i. 82 *a*. His first argument examined, i. 82 *b*. An examination of his last experiment, i. 84 *a*. His notion of a vacuum, i. 88 *a*. The explanation of his Funiculus, i. 89 *b*. His notion of rarifaction examined, i. 94 *a*. His account of condensation disputed, i. 96 *b*. His objections against Mr. *Boyle*'s experiments answered, i. 105 *a*. His hypothesis of indivisibles considered, i. 117 *b*.

LION, whether frightned at the crowing of a cock, iv. 264 *a*.

LIP, the *Lip* in a receiver, the use of it, i. 5 *b*.

LIQUOR, particles of air included in the closest and most ponderous liquors, i. 32 *b*. An experiment in the air-pump by a peculiar sort of *Liquor*, i. 43 *a*. The experiment of a curious chymical *Liquor*, i. 61 *a*. A *Liquor* that dissolves crude gold, i. 213 *a*. *Liquor* of mixed nitre, the effects of it, i. 236 *a*. *Liquor* obtained from calcined bodies, i. 243 *a*. The *Liquor* accommodates itself to the inward surface of the vessel, i. 246 *a*. The difference between a fluid body and a wetting *Liquor*, i. 248 *a*. Experiments concerning the mingling of *Liquors*, i. 253 *a*. They are disposed to mingle by the texture of their parts, i. 266 *a*. An account of a petrescent *Liquor*, i. 278 *b*. Of the different appearances of colour in *Liquors*, ii. 12 *a*. How *Liquors* alter the colour of bodies, ii. 15 *b*. The various effect of the same *Liquor* upon various bodies, ii. 17 *b*. Black *Liquors* made of bodies not black before, ii. 40 *a*. Colourless *Liquors* when dispersed into fumes, will shew a colour, ii. 50 *a*. Experiments of the changes of colour in *Liquors*, ii. 54 *a*. The elevation of *Liquors* by suction explained, iii. 16 *b*. The gravities of *Liquors* examined, iii. 18 *a*. Remarks on the ascension of tincted *Liquors*, iii. 37 *a*. The raising of *Liquors* by a syringe, iii. 43 *b*. Effluvia emitted by *Liquors*, iii. 65 *a*. The superficial figures of contiguous *Liquors*, iv. 1 *a*. The reflection of light from *Liquors*, iv. 5 *b*. A *Liquor* affording an aerial noctiluca, iv. 24 *a*. Observations upon such *Liquors*, *ibid.* and the light they emit, iv. 27 *b*. The continuance of the light from a luminous *Liquor*, iv. 29 *a*. That *Liquor* made to shine by heat, iv. 29 *b*. and by a vertiginous motion, iv. 30 *a*. Is impregnated by a volatile alkali, iv. 32 *b*. The effect of its being tried in an air-pump, iv. 33 *a*. Of its being spread by concussion, iv. 35 *a*. The nature of tenacious *Liquors*, iv. 72 *a*. *Liquor* sealed in a bolt-glass, iv. 72 *b*. Observations on a shining *Liquor*, iv. 73 *b*. On a luminous *Liquor* in a vessel of refined silver, iv. 81 *b*. Shining *Liquor* set on fire by the sun-beams, iv. 83 *a*. The qualities of *Liquor* of amber, iv. 95 *a*. The preservation of bodies in compressed *Liquors*, iv. 149 *b*. *Liquors* may grow sour without evaporation of spirits, iv. 150 *a*. Fermented *Liquors* useful to preserve fruit, iv. 151 *b*. A distilled *Liquor* from salt of spirit of human blood, iv. 199 *a*. Bottles pervaded by spirituous *Liquors*, iv. 221 *b*. Glasses injured by corrosive *Liquors*, iv. 228 *a*. The varying the shades of colours in mineral *Liquors*, iv. 239 *b*. A *Liquor* that will turn black with a solution of vitriol, iv. 240 *b*. Experiment with arsenical *Liquor* and solution of common sublimate, iv. 241 *b*. The great difficulty of weighing *Liquors*, iv. 243 *a*. The correspondence between some *Liquors* and some sounds, iv. 266 *a*. Historical account of a self-moving *Liquor*, iv. 299 *a*. A particular relation of its motion, iv. 299 *b*. The colours of it, iv. 300 *a*. The continuance of its motion, iv. 300 *b*. The poison of a *Liquor* emitted by a spider, iv. 304 *b*. The bad effect of spirituous *Liquors*, iv. 317 *a*. The weighing of *Liquors* in water, v. 10 *a*. The qualifications of solids in the examen of *Liquors*, v. 13 *b*. The examining of *Liquors* by a globular glass, v. 14 *a*. A trial of the spirituosity of *Liquors*, v. 14 *b*. The specific weight of several different *Liquors* examined, v. 16 *a*. The method of weighing one *Liquor* in another, v. 17 *a*. The uses of examining *Liquors* by weight, v. 17 *b*. An account of a vomitive *Liquor*, v. 90 *a*. Of a *Liquor* that increased with the moon, v. 103 *a*. A strange *Liquor* obtained from tin-glass, v. 103 *b*. To keep *Liquors* cool in the Torrid Zone, v. 168 *b*. A *Liquor* to impregnate seed-corn, v. 260 *a*. drawn from the sun-beams, v. 284 *b*. A *Liquor* useful in anatomy, v. 294 *b*. Simplest *Liquors* have the least refraction, v. 323 *a*. A *Liquor* to provoke urine, purge the blood, &c. v. 380 *b*. Account of an universal dissolvent *Liquor*, i. 307 *b*. A *Liquor* to dissolve gold, i. 333 *a*. How fermented *Liquors* are changed by fermentation, i. 335 *a*. Distilled *Liquors* called spirits, examined, i. 342 *b*. Dry bodies may be reduced to *Liquors* by fire, i. 363 *a*. The producing of colours by an adiaphorous *Liquor*, i. 392 *a*. The criterion of *Liquors* by the taste not certain, i. 413 *a*. Mineral bodies turned into aqueous *Liquors*, i. 413 *b*. The sinking of bodies in *Liquors* examined, i. 416 *a*. A terrestrial substance may lurk in limpid *Liquors*, i. 472 *b*. A *Liquor* may be made to dissolve the stone, i. 485 *b*. A strange *Liquor* drawn from common bread, i. 487 *b*. Ways of preserving *Liquors*, i. 492 *a*. Of fuming *Liquors* with sulphur, i. 516 *b*. The many changes of *Liquors*, i. 534 *a*. Preparations of saline and sulphureous fetid *Liquors*, i. 571 *a*. The effect of different *Liquors* used in weather-glasses, ii. 250 *b*. Expansion of *Liquors* in vessels occasions their bursting, ii. 277 *a*. Trials of the contraction of *Liquors* by cold, ii. 279 *a*. Experiments to separate *Liquors* by congelation, ii. 348 *a*. The expansion of *Liquors* frozen, and the breaking of bodies wherein they are inclosed, ii. 385 *b*. The concentration of coloured *Liquors*, ii. 389 *b*. The æquilibrium of *Liquors* examined, ii. 419 *a*. Experiment on the pressure of *Liquors* contained in pipes, ii. 432 *a*. How far insipid *Liquors* may work as menstruums upon earthy bodies, ii. 522 *a*. The *Liquor* of boiled mackarel shining in the dark, v. 473 *b*.

LISTER, Dr. his account of mineral waters, iv. 232 *b*.

LITHARGYRUM AURI explained, i. 298 *b*.

LITHOTOMIST, the Irish *Lithotomist*'s receipt for the stone in the bladder, i. 555 *a*.

LITMASE used by painters, an account of it, ii. 70 *a*.

LITTLENESS of bodies necessary to make them fluid, i. 242 *a*.

LIVER, the redness of the blood not to be ascribed to the *Liver*, i. 468 *a*.

LIXIVIATE SALTS, their nature explained, ii. 78 *b*. They alter the colour of human blood, iv. 198 *a*. Are destroyed by the operation of fire, i. 383 *b*.

LIXIVIUM, the effect of a frozen *Lixivium* of burned ashes, i. 216 *b*.

LIZARDS, their tails grow after they are struck off, i. 468 *a*.

LOADSTONE, an experiment in the air-pump upon it, i. 22 *a*. Its effluvia admitted into a glass hermetically sealed, i. 25 *a*. Is an emblem of the divine constancy, i. 176 *a*. The effect of drawing a knife various ways over a *Loadstone*, i. 218 *b*. A method to try th

strength

strength of it, i. 260 *a*. The attractive virtue of the *Loadstone* in an exhausted receiver, iii. 40 *a*. An account of the weight of *Loadstones*, iii. 67 *a*. Loses nothing of its weight by effluvia, iii. 69 *b*. The effect of heating and cooling it, iii. 87 *b*. The porosity of the *Loadstone*, iv. 223 *a*. It acts by the emission of insensible particles, iv. 258 *a*. Does not lose its virtue when exposed to the air, iv. 282 *b*. The preparation of the arsenical *Loadstone*, iv. 294 *a*. The *Loadstone* a heteroclite mineral, iv. 345 *b*. Applied to medicinal uses, v. 6 *b*. The *Loadstones* of several countries different in weight, v. 8 *a*. Specific gravity of *Loadstones* examined, v. 26 *b*. The effect of a weak *Loadstone* upon steel, v. 50 *b*. Experiments upon the *Loadstone* by fire, v. 79 *a*. The effect of refrigeration upon a heated *Loadstone*, v. 79 *b*. The soul of the *Loadstone* examined, v. 80 *a*. The reviving of a disanimated *Loadstone*, v. 80 *a*. Various experiments upon the *Loadstone*, v. 80 *b*. *&c*. The effect of *Loadstones* made red-hot, v. 80 *b*. Of a *Loadstone* heated, and cooled in cold water, v. 81 *a*. Experiment on powder'd *Loadstone* and spirit of salt, v. 82 *a*. The attractive virtue of a *Loadstone* upon granates, v. 94 *b*. A rock of *Loadstones* in the isle of *Anglesey*, v. 363 *a*. The several authors that treat of the *Loadstone*, i. 427 *b*. Undiscovered experiments on the *Loadstone*, i. 428 *a*. The *Loadstone* more serviceable to man than the diamond, i. 437 *b*. The discovery of *America* owing to the *Loadstone*'s polarity, i. 463 *b*. The effect of cold upon *Loadstones*, ii. 390 *b*. The virtue of the *Loadstone* capp'd with steel, iii. 191 *a*. The effect of the *Loadstone* upon human bodies, iii. 234 *a*. The strange effect of the effluvia of the *Loadstone*, iii. 326 *a*. The strange properties of the *Loadstone*, why believed, iii. 523 *b*. Some effects of it seem repugnant to the received philosophy and the course of nature, iii. 528 *a*. The way of depriving a *Loadstone* of the power of attracting martial bodies, iii. 644 *a*. The magnetical operations of the *Loadstone* changed and altered, iii. 644 *b*. The story of a bar of iron turned into a *Loadstone* examined, iii. 645 *b*. The corruption of the magnetical virtue in a *Loadstone* considered, iii. 646 *b*. The various uses of the *Loadstone* to mankind, iv. 532 *b*.

LOAF-SUGAR scraped with a knife, will strike fire, iv. 253 *b*.

LOBE, a supernumerary *Lobe* found in the lungs, i. 220 *b*.

LOBSTER, the claws of *Lobsters* grow after they are broke off, i. 468 *a*. The shining of the inside of the shells of *Lobsters*, v. 503 *a*.

LOCAL MOTION, the particular effects of it, iv. 252 *b*. Difficult to define what it is, v. 61 *b*.

LOCK, the nature of qualities illustrated by the example of a *Lock* and key, ii. 462 *b*.

LOCKE, Mr. *John*, his letters to Mr. *Boyle*, v. 565 *b*. His remarks on *Burnet*'s *Theory of the Earth*, v. 621 *a*. His register of the air in *Oxford*, v. 136 *a*.

LOCKS OF HAIR, attracted by the flesh of the face, iii. 651 *a*.

LOCO-MOTIVE FACULTY proceeds from the animal spirits furnished by the brain, v. 702 *a*.

LOCUS CONSERVAT LOCATUM, that maxim explained, iv. 390 *a*.

LOGICK, an account of the use of it, ii. 152 *b*.

LOGWOOD, the effect of the infusion of *Logwood*, ii. 80 *a*. The way of fixing of *Logwood*, v. 306 *a*.

LONDON, a survey of it after the fire, v. 358 *a*. The improvement of it by navigation, arts, sciences, *&c*. v. 506 *a*. Remarks on the desolation made by the fire of *London*, v. 561 *b*. The occasion of that fire explained, v. 563 *a*.

LONGING IN WOMEN, some account of it, i. 536 *a*.

LONGITUDE and latitude of places, v. 191 *a*.

LOOKING-GLASS will crack of itself, i. 288 *b*. Reflections on a *Looking-glass* with a rich frame, ii. 178 *b*. The making of flexible *Looking-glasses*, iii. 174 *b*. The effect of a cylindrical *Looking-glass* upon a picture, i. 453 *a*. Spherical *Looking-glasses* made of iron-balls, ii. 465 *a*.

LORRAINER that eats glass, stones, *&c*. an account of him, i. 486 *b*.

LOT resisted the influence of bad examples, v. 71 *b*.

LOVE, Mr. account of his translating Monsieur *Leger*'s history of the *Waldenses*, v. 654 *a*.

LOVE, motives to the *Love* of God, i. 155 *a*. The nature of it explained, i. 157 *a*. *Love* is necessary to marriage, i. 158 *a*. The author's reason for writing on seraphic *Love*, i. 159 *b*. The *Love* of God is the greatest command of the law and gospel, i. 161 *b*. In what manner it ought to be regulated, i. 162 *a*. Is no hindrance to any other duty, i. 162 *b*. The uneasiness of mortal *Love*, i. 163 *b*. The effects of sensual *Love*, i. 165 *a*. Fervent *Love* is a kind of devotion misaddressed, i. 166 *b*. The greatness of the divine *Love*, i. 169 *b*. The particular manner of God's expressing his *Love*, i. 170 *a*. The sufferings of Christ an effect of divine *Love*, i. 171 *b*. The disinterestedness of the divine *Love*, i. 172 *a*. Our impotence to requite it, i. 174 *b*. The constancy of the divine *Love*, i. 175 *a*. The advantageousness of God's *Love*, i. 178 *b*. His *Love* does not die with us, i. 179 *b*. The *Love* of Christ particularly considered, i. 183 *b*. The care we are to take in properly placing our *Love*, i. 187 *b*. *Love* the subject of plays and romances, ii. 152 *b*. The effects of unruly *Love*, ii. 192 *b*. The praise of conjugal *Love*, v. 400 *a*. Proper motives and obligations to the *Love* of God, v. 718 *a*.

LOVER, the anxieties of a disconsolate *Lover*, i. 165 *b*. The inconstancy of *Lovers* explained, i. 166 *b*. The passion of a true *Lover* described, ii. 134 *a*.

LOUIS, ST. an account of the air of that island, v. 167 *a*.

LOWER, Dr. his character, v. 371 *a*. His reason for the blindness in horses eyes, v. 282 *a*. His letters to Mr. *Boyle*, v. 517 *a*. His method of transfusing blood out of one animal into another, ii. 550 *a*. Trials proposed to Dr. *Lower* for improving the transfusion of blood, ii. 552 *a*.

LOZENGES melted by the air under the line, v. 179 *b*.

LUBECK, a proposal to settle trade in that place, v. 290 *b*.

LUCAN, the effect of repeating two lines of that poet, iv. 264 *b*.

LUCIFEROUS, an account of a *luciferous* substance, iv. 22 *b*. By agitation made to burn, iv. 32 *b*. The effect of its being tried in an air-pump, iv. 33 *a*.

LUCRETIUS, his explication of the world's original, i. 447 *b*. Was distracted when he wrote his poem, i. 449 *b*. He wholly excludes a divine providence, i. 172 *b*.

LUDOLF, an account of him and his character, v. 294 *a*.

LUDUS, the preparation of it good for the stone, v. 274 *a*.

LUES VENEREA, an inquiry concerning it, iv. 296 *a*. Cured by injecting liquors into the veins, v. 374 *a*.

LULLY, *Raymund*, his process concerning mercurification, i. 403 *b*. His reducing the whole body of silver into mercury, i. 405 *b*. His way of extracting mercury from perfect bodies, i. 408 *a*.

LUMINOUS, an account of a curious *luminous* matter, iv. 11 *a*.

LUNA CORNEA, a preparation of silver, experiment concerning it, ii. 506 *b*. *Luna Cornea* by distillation, v. 98 *a*.

LUNA FIXA, an account of it, i. 215 *a*. *Luna fixa* wants nothing but the yellowness of gold, ii. 469 *b*.

LUNGS, in what manner they are moved in respiration, i. 64 *b*. How the air is driven into them, i. 65 *a*. Compared to a bladder, *ibid*. Are invested with a membrane with pores as big as large peas, i. 65 *b*. Fish have no *Lungs*, i. 70 *b*. An account of their adhesion to the thorax, i. 221 *a*. A remedy for diseases of the *Lungs*, iv. 331 *a*. The *Lungs* of a viper particularly explained, v. 326 *b*. Experiment on the *Lungs* of a human fœtus, v. 347 *a*. On blowing up the *Lungs* of a dog, v. 369 *b*. Stones found in the *Lungs*, v. 382 *b*. Observations on the *Lungs* of vipers and dogs, i. 466 *b*. A remedy for ulcers of the *Lungs*, i. 545 *a*.

LUST, the nature and danger of it, ii. 180 *b*. Its pernicious tendency and consequences, ii. 205 *b*.

LUTE, its age before it comes to perfection of sound, i. 285 *a*. An account of the breaking of *Lute-strings*, iv. 211 *a*.

LUTHER, his wish, ii. 114 *a*.

LYES, a lixivium of it applied to syrup of violets changes it green, iii. 193 *a*.

LYSIMACHUS, his folly censured, v. 221 *a*.

LYTHARGE, the various uses of it, iii. 171 *a*. Is employed to reduce sand to a glass, v. 34 *a*. The *Lytharge* of silver explained, i. 304 *b*.

M.

M.

MACCU-BUY, a tree in *Ireland*, its pernicious effect, iii. 338 *a*.
MACE, experiment of the noctiluca and oil of *Mace*, iv. 77 *b*.
MACHIAVEL, his account of the plainness of his style, ii. 120 *b*.
MACHINA BOYLIANA, some account of it, iii. 250 *a*. What happens to animals in that engine, iii. 366 *a*. Mr. *Hobbes*'s remarks upon it, iii. 482 *b*. A difficulty concerning it explained, iii. 503 *a*. The proper use of that machine, iii. 123 *b*. Its nature and use made easy, iv. 70 *a*.
MACHINE for concave glasses, v. 296 *a*.
MACKAREL, experiments on boiled *Mackarel* shining in the dark, v. 473 *a*.
MACREUSE dissected in *France*, v. 393 *a*.
MACROCOSM, the use of the contemplation of it to the Christian virtuoso, v. 685 *b*.
MADAGASCAR, the metals to be found in the island of *Madagascar*, i. 207 *b*.
MADDER, an experiment upon *Madder* and an alkalizate solution, ii. 57 *a*.
MADRID, the purity of the air there, v. 181 *a*.
MÆBIUS, his opinion of respiration, i. 67 *a*.
MAESTRICHT, a blind man there that distinguishes colours, v. 339 *b*.
MAGDEBURGH EXPERIMENT, some account of it, i. 93 *b*. Concerning the admission of water into the receiver, i. 115 *b*. The weight of the air proved by the *Magdeburgh Experiment*, i. 126 *a*. A particular account of the air in that *Experiment*, i. 132 *a*.
MAGICK, a kind of heavenly *Magick* in some passages of Scripture, ii. 136 *b*. Remarks on a theological *Magick*, v. 732 *a*.
MAGISTERY, the nature of it particularly explained, i. 403 *b*. What is meant by *Magistery* of vegetables, ii. 78 *a*.
MAGISTRATES obliged to execute the laws, v 205 *b*.
MAGNANIMITY not to be judged by vulgar notions, v. 67 *b*.
MAGNENUS, his observation concerning manna, iii. 91 *b*.
MAGNES ARSENICALIS, a remedy for the plague, iv. 293 *b*.
MAGNET, the meaning of the word explained, iii. 470 *b*. Of celestial and aerial *Magnets*, iii. 471 *a*. The reason of the position of *Magnets* to north and south, v. 363 *b*.
MAGNETICAL PHÆNOMENA, the seeming incredibility of them, iii. 527 *b*. The abolition of *magnetical* virtue in a body endowed with it, considered, iii. 646 *a*. Whether the parts of the terrestrial globe be *magnetical*, v. 546 *b*. *Magnetical* attraction in the effluvia of the loadstone, i. 142 *b*. *Magnetical* experiments by fire, v. 79 *a*. Steel and iron *magnetical* bodies, v. 79 *b*. The *magnetical* effluvia of the earth, iii. 84 *a*.
MAGNETISM, medicines working by *Magnetism*, i. 530 *a*. The mechanical production of *Magnetism*, iii. 643 *a*.
MAHOMET, his division of mankind, v. 207 *b*.
MAID, a particular description of a milk-*Maid*, ii. 185 *a*. Instance of a *Maid* obtaining her sight after eighteen years blindness, i. 424 *a*. One cured of diseases by hymeneal exercises, i. 482 *a*. The case of a *Maid* that vomited a stone, v. 654 *b*.
MAIGNAN, his opinion of the weight of quicksilver, i. 89 *a*. His experiment concerning antiperistases, ii. 372 *a*.
MAIMBOURGH, Mr. an account of a book of his, v. 591 *a*.
MAIMONIDES, his opinion that the sun and stars are animated beings, iv. 375 *b*.
MAIZ, the fruitfulness of Indian *Maiz*, iii. 144 *a*.
MALAYAN GOSPELS, some account of them, v. 583 *a*.
MALT, a way to dry *Malt*, v. 272 *a*. Account of the drying of *Malt*, iii. 169 *a*.
MAN, the empire of *Man* promoted by mathematicks, iii. 156 *a*. The power of *Man* improved by mechanicks, iii. 162 *a*. *Man* is a created and limited being, iv. 42 *b*. The body of *Man* a wonderful engine, iv. 343 *b*. *Man* particularly bound to celebrate the divine attributes, v. 45 *b*. His obligations to the wisdom and power of God, v. 46 *b*. The dignity of the nature of *Man*, i. 425 *b*. The dominion of *Man* over the creatures, i. 429 *b*. The world made for the use of *Man*, i. 431 *a*. The whole creation serviceable to *Man*, i. 437 *b*. *Man* instructed in devotion by the creatures, i. 439 *a*. He is born the priest of nature, i. 441 *b*. The body of *Man* not possible to be produced by chance, i. 449 *b*. *Man* made after the divine image, i. 456 *b*. To give God the honour of his creatures is the first duty of *Man*, i. 462 *a*. Things seemingly hurtful to *Man*, prove beneficial to him, iv. 532 *b*. The uses of the several parts of the creation for the service of *Man*, iv. 533 *a*. The productions of the terraqueous globe designed for the use of *Man*, iv. 535 *a*. The inanimate parts of the globe made for *Man*'s service, iv. 536 *b*. The parts of *Man*'s body not like those of other animals, iv. 549 *a*. The mechanism of *Man*'s body not to be judged of only by the structure of the visible parts, iv. 549 *b*. The empire of *Man* over inferior creatures, iii. 141 *a*. The original and nature of the body of *Man* discovered by revelation, iii. 412 *a*. The dignity of *Man*, and whether the creatures were made for his use, iv. 529 *a*. *Man* by his reason capable to manage the creatures to his use, iv. 531 *b*. *Man* a greater wonder than any of the visible creatures he admires, v. 723 *a*.
MANAR, the bottom of the sea there, iii. 110 *a*.
MANCHINELLO-TREE in the West-Indies, of a poisonous quality, iii. 338 *a*.
MANDIOCA, a plant, the use and qualities of it, i. 490 *a*. Beer made of it by the Americans, iii. 196 *a*. The particular properties of the root of that plant, i. 439 *a*. The nature of it particularly considered, v. 691 *a*.
MANDRAKE-APPLES, their effluvia procure sleep, iii. 337 *a*.
MANELPHUS, his sentiments of congelation, ii. 334 *a*.
MANGANESE, made use of to glaze clay-vessels, v. 32 *b*. Employed in clarifying of glass, ii. 75 *b*. Of service to the business of potters, iii. 168 *a*.
MANNA drawn from the incision of ash-trees, i. 491 *b*. Is produced from trees in *Calabria*, iv. 296 *b*. The differing states of Mosaick *Manna*, v. 56 *a*.
MANUAL TRADES obliged to the natural philosopher, iii. 147 *b*.
MANUSCRIPT, the use of the beautiful colouring in *Manuscripts*, v. 424 *a*. An account of an Arabian *Manuscript*, iv. 326 *b*.
MARASMUS cured by a sympathetick medicine, i. 531 *a*.
MARBLE, an experiment of two flat pieces of polished *Marble* sticking together, i. 45 *a*. *Marble-Stones* broken by water freezing in them, i. 61 *b*. The reason why two flat *Marbles* are kept together by pressure of the ambient air, i. 110 *a*. Mr. *Hobbes*'s opinion of the sticking together of two flat pieces of *Marble*, i. 143 *b*. An experiment of the pressure of the air by two *Marbles*, i. 258 *a*. The adhesion of two *Marbles* particularly explained, i. 259 *b*. Diversity of light reflected from different planes of *Marble*, ii. 11 *a*. The motion of the finger discerned through a piece of *Marble*, ii. 19 *a*. An experiment by a speculum of black *Marble*, ii. 29 *a*. Black *Marble* harder and solider than white, ii. 30 *a*. The disjoining of two *Marbles* by withdrawing the pressure of the air, iii. 62 *b*. The smell emitted by breaking of black *Marble*, iii. 67 *a*. The virtue of flat polished *Marble*, iii. 83 *b*. White *Marble* artificially stained, iii. 148 *a*. A *Marble* abounds with internal pores, iv. 220 *b*. The staining or colouring of white *Marble*, iv. 223 *a*. The perfuming of *Marble*, iv. 282 *b*. The weight of *Marble* in water, v. 4 *b*. Of white *Marble* in air and water, iii. 237 *a*. The experiment of the adhesion of two flat polished *Marbles* particularly explained, iii. 479 *a*. Why two coherent *Marbles* sustained horizontally in the air are not to be forced asunder, iii. 481 *a*. A discovery of *Marble* in its embryo, v. 577 *b*.
MARBLE-BINDING, the nature of it explained, iii. 171 *a*.
MARBLE-PAPER, the way to make it, iii. 180 *a*.
MARCH, the proverb of *March* dust explained, iv. 285 *b*.
MARCHASITES found in the body of a stone, i. 278 *a*. Are disposed to be vitriolated, i. 285 *b*. Emit a strong smell, iii. 68 *a*. The porosity of these hard stones, iv. 223 *a*. *Marchasite* dissolved put into tincture of galls, iv. 247 *b*. The quality of *Marchasite* distilled, iv. 279 *b*. Experiments upon powdered *Marchasites*, iv. 286 *a*. *Marchasites* seemingly impregnated with gold and silver, v. 28 *a*. The method of trying of *Marchasites*, v. 28 *b*. They may afford a medicine for fevers, v. 29 *a*. Be employed to make vitriol, v. 32 *b*. Running mercury afforded by an English *Marchasite*, i. 401

i. 401 *b*. *Marchasites* swell and burst by the moistness of the air, iii. 402 *b*. Of *Marchasites* found in the middle of flints, &c. v. 497 *b*. The internal structure of broken *Marchasites*, iii. 227 *b*.

MARCUS PAULUS VENETUS, his account of a ruby, ii. 82 *b*.

MARE, a story of an Italian and a *Mare*, v. 223 *b*. The foaling of a mare by superfœtation, v. 377 *a*.

MARKS black and white in the skin how taken out, iv. 209 *a*. The distinguishing *Marks* of bodies, iii. 169 *a*.

MARRIAGE, serious reflections upon it, iv. 439 *b*. Something in praise of it, v. 400 *b*. Proper reflections concerning it, v. 240 *a*. Love absolutely necessary to *Marriage*, i. 158 *b*. It is properly compared to a lottery, i. 166 *a*.

MARROW supplied by alimental juice, iv. 216 *a*.

MARS, the conversion of *Mars* about his axis, v. 357 *a*. The effect of serum upon filings of *Mars*, iv. 173 *a*. Experiment of spirit of blood and filings of *Mars*, iv. 184 *a*.

MARSH, Dr. *Narcissus*, his letters to Mr. *Boyle*, v. 608 *b*. His opinion of the Jansenists preface to the New Testament, v. 609 *a*. His zeal for the teaching of Irish, v. 609 *b*. His account of his Irish grammar, v. 610 *a*. and of the Irish translation of the Bible, v. 612 *b*.

MARTINUS, his account of water-mills in *China*, iii. 44 *b*.

MARTYRS refuse to swear by the genius of the emperor, v. 209 *b*.

MASCON, some account of the Demon of *Mascon*, v. 245 *b*.

MASSEREENE, Lord, his letters to Mr. *Boyle*, v. 608 *a*. His account of the strange appearance of a star, and of an earthquake, v. 608 *b*.

MATCH, experiment in the air-pump on a piece of match, i. 19 *b*.

MATERIA MEDICA improveable by simple medicines, iv. 330 *a*. Hydrostatical stereometry applied to the *Materia Medica*, v. 19 *a*. The search of nature adds much to the *Materia Medica*, i. 500 *b*. Hydrostaticks applied to the *Materia Medica*, v. 1 *a*.

MATERIA PRIMA, its nature and qualities examined, i. 320 *b*.

MATERIA SUBTILIS, its effect in passing through solid bodies, i. 282 *b*. An experiment on its motions and sensibility, iii. 47 *b*. Hydrostaticks the *Materia Subtilis* particularly considered, i. 116 *a*.

MATERIALS employed upon experiments considered, i. 205 *a*.

MATHEMATICAL OBSERVATIONS, the uncertainty of them, i. 223 *b*. Propositions generally believed, iv. 60 *a*.

MATHEMATICIANS perplexed by the affections of numbers, iv. 44 *a*.

MATHEMATICKS, their use in promoting experimental philosophy, iii. 156 *a*. Of great service to philosophers in general, iii. 156 *b*. Are great improvements to reason, iii. 157 *a*. and to the knowledge of dioptricks, iii. 159 *a*. The proper use of mixed *Mathematicks*, iii. 162 *a*.

MATTER, the modes and qualities of *Matter* ought to be deduced from the primitive affections of it, i. 198 *b*. Qualities derived from *Matter* and local motion, iii. 76 *b*. The general affections of *Matter*, iii. 77 *a*. *Matter* is endlessly divisible, iv. 40 *b*. Is moved by an immaterial substance, iv. 59 *b*. The shining of noctilucal *Matter*, iv. 72 *a*. The velocity of celestial *Matter*, iv. 342 *b*. *Matter* in what manner determined to motion, iv. 346 *a*. Is no more than an engine void of intellect and will, iv. 347 *a*. The motions and principles of *Matter* known to God, iv. 352 *b*. The difference between *Matter* immanent and *Matter* transient, i. 321 *b*. Upon what depend the affections of *Matter*, i. 353 *b*. *Matter* barely put into motion could not produce living creatures, i. 361 *a*. The Deity not excluded from intermeddling with *Matter*, i. 444 *a*. *Matter* cannot move itself, i. 448 *a*. One universal *Matter* common to all bodies, ii. 460 *b*. The three essential properties of *Matter*, ii. 461 *b*. *Matter* chiefly modified by local motion, ii. 471 *b*. Bulk, figure, motion, or rest, the principal affections of *Matter*, ii. 475 *a*. Unguided *Matter* could not unite into the bodies of perfect animals, ii. 483 *b*. *Matter* preserved from annihilation by God, ii. 484 *a*. *Matter* and motion the primary principles, iii. 451 *a*. The motion and figure of *Matter*, iii. 457 *b*. Great difficulties in forming proper ideas of it, iii. 524 *b*. *Matter* immediately produced out of nothing, iii. 530 *b*. Multitudes of effluvia emitted by a small portion of *Matter*, iii. 321 *b*.

MATTHEWS's PILL, the virtue of it, v. 444 *b*. His corrector, an account of it, iv. 200 *a*.

MATURATION, the taste of fruits altered and improved by *Maturation*, iii. 590 *a*.

MAURICIUS, an account of the hurricanes in that island, v. 129 *a*.

MAGO, salt made in that island, i. 225 *a*.

MEASURE of the expansion and contraction of liquors by cold, ii. 285 *a*. An account of an universal *Measure*, v. 328 *a*.

MEATS meliorated by natural philosophy, i. 493 *a*. The way of preserving *Meats* for long voyages, i. 493 *b*. Of preserving raw *Meats*, i. 494 *a*. Salt meats may be so diluted as to be inoffensive, i. 548 *a*. The solution of *Meats* by acid menstruums, examined, i. 468 *b*. Account of *Meat* frozen in cold countries, ii. 275 *b*.

MECHANICAL, excellency and grounds of the *mechanical* hypothesis, iii. 449 *b*. The intelligibleness of *mechanical* principles and explications, iii. 450 *b*. *Mechanical* hypothesis consistent with other true hypotheses of nature, iii. 452 *b*. *Mechanical* account of particular qualities, iii. 569 *a*. The *mechanical* origin of heat and cold, iii. 570 *a*. Observations about the *mechanical* productions of taste, iii. 586 *a*. The *mechanical* origin and production of volatility, iii. 609 *a*. Of fixity, iii. 619 *a*. Of corrosiveness, iii. 624 *a*. Causes of chymical precipitation, iii. 635 *a*. *Mechanical* production of magnetical qualities, iii. 643 *b*. Of electricity, iii. 647 *a*. The phænomena of the universe chiefly explained by *mechanical* principles, iv. 397 *b*. *Mechanical* disciplines useful to natural philosophy, iii. 162 *a*.

MECHANICKS, their nature and use, iii. 162 *a*. Of what advantage to the naturalist, iii. 163 *a*. and to the solution of sundry phænomena, iii. 164 *a*.

MEDALIST, his examination of *Medals*, v. 62 *b*.

MEDICAL qualities described, iii. 73 *b*.

MEDICAMENTS, practising with them dangerous, v. 298 *a*.

MEDICINA HYDROSTATICA, v. 1 *a*.

MEDICINAL virtue of bodies, in what it consists, v. 15 *b*. *Medicinal* qualities of the spirit of human blood, iv. 190 *a*.

MEDICINES for various distempers, iii. 146 *a*. The manner of operation of chalybeate *Medicines*, iv. 185 *a*. The advantages of simple *Medicines*, iv. 301 *a*. Why a *Medicine* is called specific, iv. 303 *b*. The various kinds of operation of specific *Medicines*, iv. 308 *b*. The effect of appropriated *Medicines*, iv. 309 *a*. Why a *Medicine* does not act the same way on all diseases, iv. 309 *b*. Objections against specific *Medicines* answered, iv. 310 *a*. The effect of precipitating *Medicines*, iv. 314 *a*. The blood rarified by specific *Medicines*, iv. 317 *b*. They operate through the capillary vessels, iv. 320 *b*. The advantages of simple *Medicines*, iv. 325 *a*. The disadvantage of compounded *Medicines*, iv. 327 *a*. *Medicine* improved by natural philosophy, v. 88 *a*. and by chymical experiments, v. 90 *a*. Impregnated mercury may prove a good *Medicine*, i. 412 *a*. The correction of poisonous *Medicines*, i. 501 *b*. The multitude of ingredients in *Medicines* examined, i. 503 *b*. The benefit of simple *Medicines*, i. 504 *a*. The different effects of *Medicines* inwardly and outwardly applied, i. 526 *a*. The offensiveness of chymical *Medicines* considered, i. 575 *a*. The reason of the unsuccessfulness of *Medicines*, i. 578 *b*. The repugnant operations of various *Medicines*, iii. 201 *a*. *Medicines* may operate without any consumption of themselves, iii. 316 *b*. Wrong estimates of *Medicines* made in physick, i. 372 *b*. The qualities of *Medicines* discovered by chymistry, i. 498 *b*. The confounding of ingredients in *Medicines*, i. 505 *a*. *Medicines* drawn from unpromising bodies, i. 506 *a*. Of preserving *Medicines* with sugar, i. 516 *b*. An apology for the use of magnetical *Medicines*, i. 532 *a*. Description of simple *Medicines* without the advice of the apothecary, v. 457 *a*.

MEDIOCRITY in devotion an imperfection, i. 161 *a*.

MEDITATION, the difficulty of writing *Meditations*, ii. 140 *a*. Particular observations concerning them, ii. 142 *b*. The nature and use of them, ii. 144 *a*. Reasons for publishing them, ii. 145 *a*. A discourse concerning occasional *Meditations*, ii. 146 *a*. The delight and benefit of *Meditation*, ii. 147 *b*. Time improved by *Meditation*, ii. 148 *a*. The various subjects of *Meditations*, ii 148 *b*. They surprise those whose thoughts they are, ii. 149 *a*. They are the proofs and effects of skill, ii. 149 *b*. The difficulties of *Meditation* answered, ii. 150 *b*. The subjects of occasional *Meditations*, ii. 151 *a*. Much eloquence not expected in occasional

occasional *Meditations*, ii. 151 *a* They improve the faculties of the mind, ii. 151 *b*. *Meditations* suggested by a storm, ii. 154 *b*. The benefit of *Meditations* to the will and affections, ii. 155 *b*. They arise from the meanest things in nature, ii. 156 *a*. From the variety of objects on the earth, ii. 158 *a*. Upon the skill of a gardener, ii. 158 *a*. On the blossoms and leaves of trees, ii. 159 *a*. The beginning and progress of *Meditation*, ii. 161 *a*. *Meditations* on the beginning of an ague, ii. 166 *a*. On the heat and cold of an aguish fit, ii. 167 *a*. Upon the approaches of death, ii. 174 *b*.

MEDIUM, all things are known with or without a *Medium*, iv. 44 *b*. The transmission of cold through indisposed *Mediums*, ii. 297 *b*.

MEDLARS, the ripeness of them explained, ii. 473 *b*.

MEDULLA OBLONGATA, its nature and use, v. 702 *a*.

MELANTHIUM, a cure for catarrhs, i. 535 *a*.

MELETETICKS, a security against idleness, ii. 148 *a*. Improve the faculty of the mind called *Wit*, ii. 153 *a*. Occasion a suppleness of style, ii. 153 *b*.

MELON, the size of the *Melons* in *Russia*, ii. 322 *a*.

MEMBRANES under the shells of eggs, their contexture, iv. 208 *b*. *Membranes* of the inward parts of bodies are porous, iv. 209 *b*. An experiment to prove it, iv. 213 *b*.

MEMOIRS for the natural history of human blood, iv. 161 *a*. Appendix to the *Memoirs* for the *History of Human Blood*, iv. 196 *a*. For the *Experimental History of Mineral Waters*, iv. 231 *a*.

MEMORY, curious account of it, iv. 59 *a*. The art of artificial *Memory*, v. 423 *b*. The beginning of the decay of *Memory*, v. 424 *a*. The art of *Memory* a kind of clock-work or wheel-engine, v. 426 *b*. The progress of the art of *Memory*, *ibid*. Faults undeservedly charged upon the *Memory*, v. 427 *a*. It bears the fault of a dull apprehension, v. 427 *b*. The improvement of the *Memory*, v. 428 *a*. Particular helps to *Memory*, v. 428 *b*. The *Memory* of an old woman, *ibid*. Learning improved by the art of *Memory*, v. 429 *a*. The proper topicks for *Memory*, v. 429 *b*. The *Memory* roused by conscience, v. 430 *a*. The *Memory* of brute animals, *ibid*. Rules for the improvement of *Memory*, v. 430 *b*. The use of it in reading of books, v. 432 *b*. What kind of *Memory* most useful to learning, v. 437 *a*. The thoughts on a death-bed the best art of *Memory*, ii. 174 *a*. *Memory* supposed to be seated in a part of the brain, v. 701 *b*. The unaccountable operations of that faculty curiously described, v. 701 *b*.

MENASSEH BEN ISRAEL, his opinion that the stars are animated beings, iv. 375 *b*.

MENDIP, the quality of the mines in those hills, v. 197 *b*.

MENENIUS AGRIPPA, his fable, i. 327 *b*.

MENSES, the time of their happening to women, iii. 93 *b*.

MENSTRUUM, the effects of a bad *Menstruum*, i. 211 *b*. The unsuccessfulness of experiments owing to bad *Menstruums*, i. 212 *b*. A *Menstruum* called the Stygian water, i. 234 *a*. Corrosive *Menstruums* hardly to be washed off from medicines, i. 238 *b*. The stomachical *Menstruum* of animals, i. 242 *b*. The coagulation of a *Menstruum* upon a firm body, i. 269 *a*. The same *Menstruum* will have contrary effects, i. 270 *a*. The method of making the permeating *Menstruum*, iv. 212 *b*. *Menstruums* for the dissolution of metals, iv. 224 *a*. An account of subterraneal *Menstruums*, iv. 286 *a*. The various kinds of *Menstruums* and their different operations, iv. 308 *b*. They do not act according to their degree of acidity, iv. 309 *a*. The different quality of acid *Menstruums*, iv. 311 *b*. *Menstruums* proper to dissolve gummous bodies, v. 15 *b*. The *Menstruum* of gold inquired into, v. 302 *a*. An insipid *Menstruum* to dissolve gold, i. 316 *a*. The reason of *Menstruums* acquiring a red colour, i. 341 *b*. Strange alterations produced by potent *Menstruums*, i. 374 *a*. A *Menstruum* operating upon gold, i. 402 *a*. The solution of metals by acid *Menstruums*, i. 468 *b*. The different operations of *Menstruums* examined, i. 487 *a*. A *Menstruum* prepared from common bread, i. 487 *b*. The power of *Menstruums* in promoting distillation, i. 516 *a*. The power of noble *Menstruums*, i. 520 *b*. Other *Menstruums* beside acid, urinous, and alkalizate, i. 521 *b*. A *Menstruum* to alter the texture of gold, ii. 513 *b*. *Menstruum peracutum*, the effects of it, ii. 514 *a*. *Menstruums* proper for the solution of bodies, iii. 627 *a*. The power of corroding taken away by changing the mechanical texture of a *Menstruum*, iii. 628 *a*. The sympathy between the *Menstruum* and the body it is to work upon considered, iii. 628 *b*. The efficacy of a *Menstruum* depends upon mechanical circumstances, iii. 630 *b*. The qualifications for a body to become corrodible by a *Menstruum*, iii. 631 *a*. Bodies swimming in a *Menstruum* explained, iii. 637 *b*. Several methods of weakning the *Menstruum*, iii. 640 *b*. The precipitation of bodies by debilitating the *Menstruums* they swim in, iii. 641 *b*.

MENSURATION, the hydrostatical way of *Mensuration* of bodies, v. 24 *b*.

MERCURIAL CYLINDER of one inch diameter, its weight, iii. 39 *b*. Description of the *Mercurial* gage, iv. 100 *b*. Blindness cured by a *mercurial* powder, i. 550 *b*.

MERCURIFICATION of metals considered, i. 403 *c*. The ways of *Mercurification* delivered by *Paracelsus*, *Helmont*, and *Lully*, i. 407 *b*.

MERCURIUS CORPORUM, an account of it, i 342 *b*.

MERCURIUS DULCIS, an account of it, i. 266 *b*. The medicine called *Mercurius Vitæ*, ii. 16 *b*. A further account of it, ii. 38 *a*. The effect of *Mercurius dulcis* skilfully prepared, iv. 320 *a*. The ingredients that compose it, iv. 331 *b*. Is a remedy for the dysentery, iv. 332 *a*. Remark on the common preparation of *Mercurius dulcis*, i. 310 *a*. The reason of that name, i. 364 *b*. Its nature and operation, iii. 630 *a*. Its effect upon the stomach and guts, v. 587 *b*.

MERCURIUS TRISMEGISTUS, his advice concerning religion, i. 441 *a*.

MERCURIUS VITÆ, the best way of correcting it, i. 518 *a*.

MERCURY, its motion in the tube of an air-pump, i. 23 *a*. An experiment of a *Mercury* that becomes either fluid or solid, i. 272 *a*. Solutions of *Mercury* will change colours, ii. 68 *b*. The raising of *Mercury* by the spring of the air, iii 6 *a*. The motions of the *Mercury* by the spring of the air, iii. 7 *a*. Raised in a tube by the expansion of the air, iii. 8 *a*. The raising of it in unequal tubes by the spring of the air, iii. 9 *a*. It rises in tubes in proportion to the weight of the atmosphere, iii 15 *a*. The raising of *Mercury* and water by the spring of the air, iii. 18 *a*. The subsidence of *Mercury* in the tube of the Torricellian experiment, iii. 26 *a*. The height of pure *Mercury* in barometers, iii. 27 *b*. Its height varies according to the weight of the atmosphere, iii. 28 *a*. Its motion in the Torricellian experiment, iii. 29 *a*. Remarks upon the *Mercury* in a travelling baroscope, iii. 30 *a*. The height of *Mercury* in a barometer at the top and bottom of a hill, iii. 31 *b*. Its height in a portable barometer, iii. 35 *b*. Is found like quicksilver in some bodies, iv. 321 *b*. Crude *Mercury* a cure for the pox, iv. 335 *a*. The weighing of *Mercury* in water, v. 10 *b*. All *Mercuries* not of the same weight, v. 11 *a*. Running *Mercury* drawn from a marcasite, v. 28 *b*. Experiment with *Mercury* precipitated and spirit of salt, v. 86 *a*. *Mercury* grown warm with silver, v. 98 *b*. To grow hot with gold, v. 99 *a*. An account of a yellow *Mercury*, v. 105 *a*. Of a running *Mercury*, of a lovely green, v. 105 *b*. The reason of its falling and rising in a baroscope, v. 132 *b*. A calendar of the ascent and falling of the *Mercury*, v. 343 *a*. Whether *Mercury* changes its weight, v. 346 *b*. Running *Mercury* disguised by the chymists, i. 304 *a*. A true *Mercury* not to be separated from metals, i. 325 *b*. Difficult to find what the chymists mean by it, i. 330 *a*. Any thing the chymists do not understand, they call *Mercury*, i. 334 *b*. It is defined by volatility and effumability, v. 341 *b*. The *Mercury* of animals and vegetables examined, i. 342 *a*. The difference between running *Mercury* and distilled spirits, i. 342 *b*. Whether *Mercury* be obtained from metals and minerals, i. 399 *a*. Divers processes to make *Mercuries* of bodies, i. 399 *b*. Impostures of chymists concerning the productions of *Mercury*, i 400 *a*. True running *Mercury* obtainable from metals and minerals, i. 400 *b*. The trial of metalline *Mercuries*, i. 401 *b*. The pre-existence of running *Mercury* in metals, i. 402 *b*. *Mercuries* of metals are not extracted principles, i. 403 *a*. *Mercuries* of bodies are rather magisteries than extracts, i. 403 *b*. Running *Mercury* made solid by the air, i. 404 *a*. The reason why *Mercury* joins so easily with metals, i. 404 *b*. Whence *Mercury* and metals derive their ponderosity, i. 405 *a*. Why the *Mercury* of metal is heavier than the metal that afforded it, i. 405 *b*. *Mercury* turned into red powder by fire, *ibid*. Distilled *Mercury* heavier than common *Mercury*, i 406 *a*. The dissimilitude of running

Mercury

Mercury, i. 408 *b*. Whether the running *Mercuries* of the chymists are homogeneous, i. 408 *b*. The diversifying of *Mercury* by impregnation, i. 409 *a*. *Mercury* may be spiritually impregnated, i. 409 *b*. The nature of incalescent *Mercuries*, i. 410 *a*. Amalgams of *Mercuries* spiritually impregnated with calx of gold, i. 410 *b*. The weighing of *Mercury* hydrostatically, i. 411 *b*. *Mercuries* may be impregnated more ways than one, i. 412 *a*. Water obtained from distilled *Mercury*, i. 414 *a*. Account of a real *Mercury* of antimony, i. 427 *a*. All the phænomena of *Mercury* not to be explained, i. 443 *b*. The palsy cured by a preparation of *Mercury*, i. 545 *a*. The difficulty of keeping *Mercury* suspended in tubes, ii. 427 *b*. *Mercury* so disguised as to pass for stone, iii. 243 *b*. Infused in water or wine, a cure for the worms, iii 317 *b*. *Mercury* found in the heads of those employed about it, iii. 330 *a*. True running *Mercury* obtained from colcothar, iii. 471 *b*. The possibility of an incalescent *Mercury*, iii. 559 *a*. An experiment of *Mercury* growing hot with gold, iii. 600 *a*. Its inherent quality of penetrating and growing hot with gold, iii. 562 *a*. Many ways of preparing such a *Mercury*, iii. 563 *a*. The transmutation of running *Mercury* into gold, iii. 621 *a*. Crude *Mercury* dissolved by spirit of salt, iii. 632 *a*. It refuses to descend without the compression of a bubble of air, v. 461 *b*. The ascent of the *Mercury* does not strictly indicate the weight of the air, v. 474 *b*.

MERCY, God's most obliging attribute, v. 438 *a*.

MERIT, the doctrine of *Merit* explained, i. 177 *b*.

MERRET, Dr. account of his treatise concerning cold, ii. 380 *a*. Some particulars of his character, v. 249 *b*.

MERSENNUS, his opinion concerning the expansion of the air, i. 15 *a*. His method of weighing of air, i. 55 *b*. His account of the weight of air to water, i. 56 *a*. Of sound in bells and other instruments, iii. 54 *b*. Of the noise of a piece of ordnance, iii. 159 *b*. His account of measuring time, iii. 160 *b*. Complains of the difficulty of weighing liquors, iv. 243 *a*. His account of the swiftness of a cannon-shot, iv. 256 *a*. His opinion of the weighing of bodies, v. 2 *b*. His trial of the specific weight of liquors, v. 16 *a*. His method of weighing liquors in water, v. 16 *b*. His weighing of solids in water, v. 21 *a*. His way of hydrostatically examining floating solids, v. 22 *a*. Is not confident in his experiments, v. 23 *b*. His character, i. 553 *a*.

MESSIAS, the extent of his kingdom foretold, v. 55 *b*.

METAL, the solution of *Metals* in aqua fortis, i. 74 *a*. Remarks upon the fluidity of melted *Metals*, i. 246 *b*. The variety of colours in *Metals* explained, ii. 71 *b*. The colours arising from calcined *Metals*, ii. 72 *a*. The adventitious colours upon *Metals* by saline liquors, ii. 72 *b*. The colours of *Metals* changed by precipitating salts, ii. 74 *a*. Copious and hurtful steams emitted from *Metals*, iii. 66 *b*. An account of the transmutation of *Metals*, iv. 15 *b*. An experiment upon *Metal* imbased, iv. 18 *b*. *Metals* are not destitute of pores, iv. 224 *a*. Are capable of being perfumed, iv 225 *b*. The melting of *Metal* by lightning, iv. 254 *a*. Flame of spirit of wine acts upon the hardest *Metals*, iv. 257 *b*. Vessels of *Metal* broken by frozen water, iv. 259 *a*. The shrinking of the mixtures of *Metals*, iv. 267 *b*. *Metals* rise into the air by way of exhalations, iv. 297 *a*. Enquiries concerning the working of *Metals*, v. 196 *b*. Before and after the melting, v 197 *a*. Making and destroying of *Metals* examined, v. 258 *a*. The extraction of mercury and sulphur from *Metals*, i. 326 *a*. *Metals* were not produced altogether at once, i. 357 *b*. Account of the generation of *Metals*, i. 359 *a*. Running *Mercury* not pre-existent in *Metals*, i. 402 *b*. *Metals* may not be bodies perfectly homogeneous, i. 405 *a*. The mercuries of *Metals* lighter than the *Metals* that afforded them, i. 406 *b*. The effect of frost upon *Metals*, ii. 340 *b*. A transmutation of one *Metal* into another, ii. 515 *b*. The operation of fire upon *Metals* with regard to weight experimentally treated, iii. 345 *a*. &c. The uses of an essay-instrument in relation to metals, iii. 551 *a*. Observations on the growth of *Metals* in their ore, iii. 459 *a*. To precipitate the corpuscles of a *Metal* out of a menstruum, iii. 637 *a*.

METALLINE SOLUTIONS used to produce a green colour, ii. 51 *a*. Bodies propagate their nature, i. 449 *a*. Of some *metalline* precipitations, i. 499 *b*. The blasting flame of a *metalline* substance *in vacuo Boyliano*, iii. 255 *b*. An instrument to estimate the quality of *metalline* mixtures, iii. 552 *b*.

METAPHYSICAL NOTIONS perplex the mysteries of religion, ii. 201 *a*.

METAPHYSICKS, the difference between stable and permanent beings in *Metaphysicks*, v. 662 *b*. The nature of *Metaphysicks* that treat of immutable truths, examined, v. 681 *a*.

METEORS, their nature examined, ii. 360 *b*. *Meteors* seen in the air near mines, ii. 368 *a*. Sometimes produced by the occursions of subterraneal effluvia, iii. 335 *b*.

METHOD of the Bible particularly examined, i. 103 *b*.

METHODUS MEDENDI, it may be alter'd and improved, i. 523 *a*. More particularly consider'd, i. 544 *a*.

METHUSELA contemporary with *Adam*, v. 72 *a*.

MEZERAY, his account of a plague in *France*, iv. 291 *b*.

MICROCOSM, the study of it useful to a Christian virtuoso, v. 694 *a*.

MICROSCOPE discovers the rough surface of bodies, ii. 10 *b*. The phænomena of colours explain'd by *Microscopes*, ii. 12 *b*.

MIDDLE STATE, the place of departed souls, v. 411 *b*. Believed by Jews and Christians, v. 412 *a*. Confirmed by the testimony of Scripture, v. 412 *b*.

MIDI, the difficulty of breathing on *Pic de Midi*, iii. 125 *a*.

MILESSOW, a mountain foreteller of storms, v. 190 *a*.

MILK, the way of turning *Milk* into curds, i. 268 *a*. Curdled by oil of vitriol, i. 268 *b*. Experiment on the expansion of *Milk*, iii. 128 *a*. New *Milk* to take spots out of linnen, iii. 152 *b*. Experiment on *Milk* in an empty receiver, iv. 133 *b*. The particular effects of it, iv. 134 *a*. *Milk* useful to the preservation of flesh, iv. 155 *b*. The effect of *Milk* on the bodies of children, iv. 315 *a*. The excellent quality of *Milk* as a medicine, iv. 327 *b*. Butter made of sheep's *Milk*, v. 448 *b*. The several ways of dividing new *Milk*, i. 365 *b*. The effect of new *Milk* sweetned with sugar-candy, i. 548 *a*. Observations on *Milk* found in veins instead of blood, ii. 403 *a*. The effect of the *Milk* of the nurse upon the child, ii. 470 *b*. Of infusing *Milk* into the veins of a dog, v. 527 *b*.

MILKMAID, discourse on a *Milkmaid* singing to a cow, ii. 184 *a*. A description of her, ii. 184 *b*.

MILKY, the perforations of the *Milky* way, iii. 93 *a*.

MILL, an account of water-*Mills* in China, iii. 144 *b*. The use of a *Mill* in dividing corn, i. 374 *a*. Comparison drawn between a living creature and a *Mill*, ii. 532 *b*.

MILLEPEDES, sore eyes cured by *Millepedes* infused in beer, v. 524 *b*. The use and success of them in the pains of the stone, i. 485 *a*. The virtue and effect of a preparation of *Millepedes*, i. 508 *a*. In the cure of the stone, catarrhs, cancers, and other distempers, i. 508 *b*.

MILT, a remedy for the obstructions of the *Milt*, v. 577 *b*.

MIND, the faculties of it improved by meditation, ii. 152 *a*. And by occasional reflections, ii. 153 *a*. The inconstancy of the *Mind* represented by the moon, ii. 157 *b*. The temper of the *Mind* on the approach of death, ii. 173 *a*. The power and faculty of the eye of the *Mind*, iv. 48 *b*. The conceptions of the *Mind* distinguished, iv. 49 *a*. The *Mind* knows the extent and imperfections of her own faculties, iv. 50 *a*. Its faculty of drawing consequences, iv. 50 *b*. The *Mind* of man is of a limited capacity, iv. 52 *b*. The *Mind* remiss in examining things, iv. 63 *a*. The use of the light of the *Mind*, iv. 64 *b*. A temper of *Mind* required in a student of divinity, v. 56 *b*. Christianity promotes greatness of *Mind*, v. 65 *a*. The character of a great *Mind*, v. 67 *a*. The usefulness of natural philosophy to the *Mind* of man, i. 423 *a*. The faculties of the *Mind* to be employed in the contemplation of nature, i. 425 *b*. The passions of the *Mind* act upon the body, i. 536 *a*. Examples of presence of *Mind* in times of danger, v. 456 *a*. The activity of the *Mind* of man, ii. 148 *b*. Innocence and contentment depend upon the *Mind*, ii. 185 *b*.

MINE, candles extinguished in *Mines* by steams of air, i. 28 *a*. *Mines Royal* belong to the king, i. 30 *b*. The subterraneal air in *Mines*, iii. 95 *b*. The lower region in *Mines* hot, iii. 96 *b*. The prodigious depth of some *Mines*, iii. 104 *b*. Medicinal waters found in *Mines*, iv. 234 *b*. The various smells to be distinguished in *Mines*, iv. 278 *a*. *Mines* continually repair'd

pair'd by mineral exhalations, iv. 282 *b*. The blowing up of a *Mine* charged with gunpowder, iv. 342 *b*. Whether there are gold *Mines* properly so called, v. 29 *b*. Air produced in *Mines* by running water, v. 113 *a*. Change of weather foretold at the bottom of *Mines*, v. 130 *a*. The air in a deep tin-*Mine*, v. 170 *a*. Articles of inquiries touching *Mines*, v. 193 *a*. The signs of *Mines* inquired into, v. 193 *b*. The ways of working of *Mines*, v. 195 *a*. A particular inquiry into *Mine*-damps, v. 305 *b*. Heat in the bottom of *Mines*, ii. 309 *b*. & 356 *a*. Answers to queries touching the *Mines* in *Devonshire* and *Cornwal*, v. 574 *a*. Account of a strange liquor dropping from the roof of a *Mine*, v. 497 *b*.

MINERAL, the history of *Mineral* waters, iv. 231 *a*. The various *Mineral* substances contained in the earth, iv. 232 *b*. The method of writing on *Mineral* waters, iv. 233 *a*. Titles of inquiry for the history of *Mineral* waters, iv. 235 *a*. Of *Mineral* water consider'd as a medicine, iv. 248 *b*. *Mineral* waters affected by rain, iv. 250 *a*. The nature and quality of *Mineral* earths, iv. 282 *a*. The effect of *Mineral* waters in their native simplicity, iv. 336 *b*. The operation of the air on *Mineral* substances, v. 179 *b*. Changes made in them by the air, v. 185 *a*. Enquiries concerning the *Minerals* of a country, v. 193 *b*. The way to examine *Mineral* waters, v. 201 *a*. *Mineral* bodies turned into aqueous liquors, i. 413 *b*. A person bewitched cured by an appended *Mineral*, i. 526 *b*. Hot *Minerals* in deep mines, ii. 309 *b*. Account of the multitude of different bodies in the *mineral* kingdom, v. 689 *b*.

MINERALOGY improved by the hydrostatical way of estimating ores, v. 25 *b*.

MINERALS, a difference in those of the same kind, i. 206 *b*. Many sorts blended in the same lump of matter, i. 207 *a*. A sort of *Mineral* from whence vitriol is made, i. 279 *b*. The variety of colours in *Minerals*, ii. 72 *b*. Obtained by different menstruums, ii. 74 *a*. The effect of *Mineral* substances in tinging of glass, ii. 75 *b*. An account of *Minerals* on the side of wells, iii. 99 *b*. Difference in the maturity of *Minerals*, iii. 100 *a*. *Minerals* not destitute of pores, iv. 219 *a*. Water impregnated by *Minerals*, iv. 233 *a*. Many *Minerals* abound with a martial nature, iv. 234 *a*. To know what *Mineral* impregnates a liquor, iv. 239 *b*. To try the wholesome or dangerous qualities of *Minerals*, iv. 240 *b*. The various smells emitted by *Minerals*, iv. 278 *b*. *Minerals* more noxious than wholesome, iv. 279 *a*. Emit effluvia for a long time, iv. 282 *b*. Will by re-action cause refrigeration, iv. 285 *a*. Some countries void of noxious *Minerals*, iv. 290 *a*. Specifics afforded by *Minerals*, iv. 323 *a*. *Minerals* endowed with physical virtues, v. 3 *a*. A way of exploration of *Minerals*, v. 25 *b*. *Mineral* gold found in *Jamaica*, v. 30 *a*. Circumstances relating to the profit of *Minerals*, v. 35 *a*. The effect of the air on solid *Minerals*, v. 182 *b*. *Minerals* not made of the three chymical principles, i. 359 *b*. What substances are obtained from *Minerals* by fire, i. 360 *a*. Of sulphur obtained from *Minerals*, i. 397 *a*. The figures in *Minerals* how produced, i. 449 *a*.

MINISTER, the moon an emblem of a true *Minister*, ii. 156 *b*.

MINIUM, an experiment upon it, iii. 36 *b*. Its loss of weight exposed to the sun-beams, iv. 149 *a*. Is lead powder'd by the fire, i. 321 *a*. The effect of spirit of vinegar put upon *Minium*, iii. 556 *a*. The effect of the solution of *Minium* upon tincture of red-rose leaves, ii. 79 *b*. Upon tincture of log-wood, ii. 80 *a*.

MINT, experiment on a sprig of *Mint* growing in rainy weather, i. 394 *a*.

MIRACLES, not done by Christ for his own relief, i. 170 *b*. The nature and use of Christ's *Miracles*, i. 459 *a*. The opinion of Epicureans and other infidels concerning the Christian *Miracles*, iv. 363 *a*. The belief of *Miracles* founded upon the veracity and power of God, v. 657 *a*. *Miracles* are a proof of the Christian religion, v. 48 *b*. Are absolutely necessary to support Christianity, v. 52 *b*. Believed by historical experience, v. 53 *a*. Accomplish'd predictions are permanent *Miracles*, v. 56 *a*.

MIRANDOLA, Prince of, his account of making gold, i. 215 *a*. Of the eloquence of Scripture, ii. 124 *a*.

MISCHIEF, four grand *Mischiefs* that afflict mankind, v. 732 *a*.

MISLETOE of the oak powder'd, a cure for the epilepsy, i. 517 *a*. The character and use of *Mistletoe* of the hazel, i. 527 *b*.

MISSIONARIES, the end and design of their voyages, v. 390 *b*.

MIST, account of the nature of *Mists*, v. 116 *a*.

MISTION, a particular account of it, i. 318 *a*. The Stoical notion of it, i. 319 *a*. The opinion of *Aristotle* and the chymists concerning it, i. 319 *b*. *Mistion* is an union *per minima* of two or more bodies of differing denominations, i. 320 *a*. Various opinions concerning the nature of it, i. 322 *a*.

MISTRESS, like the sensitive plant, i. 165 *b*.

MITE, the necessity of air to the motion of *Mites*, iii. 133 *b*. An account of their motion, iii. 134 *a*. Their curious contexture examined, i. 436 *a*. Hair discovered upon the legs of *Mites* with a microscope, iii. 310 *b*.

MITHRIDATE, some account of it, iv. 330 *a*.

MIXED BODIES, how far divisible, i. 328 *a*. Secondary sort of *Mixed Bodies*, i. 332 *b*. New sorts of *Mixed* substances made by fire, i. 334 *b*. An inquiry into the nature of *Mixed Bodies*, i. 318 *b*. The *miscibilia* may be separated from a *Mixed Body*, i. 319 *a*. The opinion of *Aristotle* and the chymists concerning *Mixed Bodies*, i. 320 *a*.

MIXTURE, observations upon the *Mixtures* of chymical liquors, i. 252 *b*. The changes of consistence produced by *Mixture*, i. 254 *a*. Different qualities arise from the *Mixture* of bodies, iii. 75 *b*. A proper description of *Mixture*, iii, 77 *a*. Experiment on *Mixtures* in compressed air, iv. 102 *b*. Strange effects from the *Mixture* of bodies, iv. 325 *b*. *Mixture* of bodies not elementary, i. 322 *a*. Various *Mixtures* that mechanically produce heat and cold, iii. 574 *a*. Whence proceed heats suddenly produced in *Mixtures*, iii. 581 *b*.

MNEMONICAL TABLE, v. 423 *a*.

MNEMONICKS, v. 426 *a*.

MOBBY, a drink in *Barbadoes*, some account of it, i. 514 *a*.

MODEL for rebuilding the city of *London*, v. 359 *a*.

MODUS OPERANDI beyond comprehension, iv. 46 *b*. What is meant by the *Modus* of a thing, iv. 58 *b*. The *Modus's* of corporeal things transcend our reason, iv. 61 *a*.

MOHAIR, an engine to water *Mohairs*, v. 267 *a*.

MOISTURE, experiment on the efficacy of the air's *Moisture*, iii. 400 *a*. Its effect on the bodies of animals, iii. 401 *a*.

MOLD, the way of making *Molds* for the impression of medals, iii. 199 *b*.

MOLE, an experiment by *Moles* in an air-pump, i. 112 *a*. The eyes and feet of *Moles* examined, i. 435 *a*. The reason of the smallness of their eyes, iv. 525 *b*. Of the figure of their feet, iv. 527 *a*.

MONARDUS, his account of *lignum nephriticum*, ii. 44 *a*. Of the effect of the blood-stone, iv. 324 *a*. And of several other stones, i. 524 *b*.

MONCK, General, some account of him, v. 292 *b*.

MONEY, the proof of counterfeit *Money*, i. 197 *b*. The discolouring of *Money* by lightning, iv. 213 *a*. The nature and use of it, v. 232 *b*.

MONKEY, account of one that emitted a musky scent, iii. 594 *b*. Remark on the skeleton of a *Monkey*, i. 470 *a*.

MONMOUTH, Countess of, her character, v. 237 *a*.

MONSTERS, the production of them examined, iv. 388 *a*.

MONSTER, born at *Fisherton*, an account of it, v. 315 *b*. Another near *Oxford*, v. 318 *b*.

MONTZ, DE, his account of the temperature of sea-water, iii. 106 *a*.

MOON, hills, &c. discern'd in the *Moon*, by telescopes, ii. 13 *a*. Particular contemplations upon the *Moon*, ii. 156 *b*. The emblem of an ungrateful person, ii. 157 *a*. Of the inconstancy of the mind of man, ii. 157 *b*. The *Moon* enlightened by the earth, iv. 66 *b*. Spots in the *Moon* explained by *Galileo*, v. 63 *a*. An observation about the influence of the *Moon*, v. 96 *b*. A liquor that increased with the *Moon*, v. 103 *b*. The effect of the *Moon* on human bodies, v. 128 *a*. The *Moon's* motion about the earth explained, v. 356 *b*. Experiment whether the beams of the *Moon* are cold, ii. 336 *a*.

MOORS, the skill of the *Moors* in making weapons, iv. 225 *b*.

MORALISTS, an account of their way of writing, ii. 114 *b*.

MORALITY, books of *Morality* will not make men virtuous, ii. 15 *a*.
MORAY, Sir *R.* his remarks upon a comet, v. 330 *a*. His letters to Mr. *Boyle*, v. 510 *b*.
MORE, the objections of Dr. *Henry More* considered, iii. 268 *a*. His opinion of the gravity and pressure of the air, iii. 271 *b*. His hypothesis confuted, iii. 272 *b*. His notion of the action of the atmosphere on two flat marbles, iii. 273 *b*. Of the pressure of the atmosphere, iii. 274 *a*. Of the gravitation of liquors, iii. 276 *a*. His experiment against the gravitation of the elements, iii. 276 *b*. His opinion of the gravitation of water examined, iii. 280 *a*. Of the pressure of water upon a tadpole, iii. 281 *b*. His *principium hylarchicum* considered, iii. 288 *b*. Letters from him to Mr. *Boyle*, v. 550 *b*. His opinion of the pernicious effects of the Cartesian philosophy upon religion, v. 551 *b*.
MORELLUS, his remarks on the plague, iv. 291 *b*.
MORGANE, their appearance near the Sicilian streight, v. 177 *a*.
MORHOFIUS, his story of a Dutch vintner, iv. 274 *a*.
MORINUS, his remark on the air in mines, iii. 96 *a*. His account of the air in the mines of *Hungary*, iii. 104 *a*.
MORLEY, *Caleb*, his improvement of artificial memory, v. 423 *b*. Account of his mnemonical rolls, v. 431 *b*.
MORNING, a description of the *Morning*, ii. 182 *b*. The effect of red *Mornings* in *Scotland*, v. 176 *a*.
MOROCCO, an account of the air there, v. 114 *b*. The nights very cold, v. 160 *b*. The winds exceeding hot, v. 166 *a*.
MORTIFICATION, of acids, an account of it, iv. 311 *a*.
MOSCHUS, the founder of the atomical hypothesis, i. 315 *a*.
MOSCOW, the depth of frost in the earth there, ii. 295 *b*. The effect of sharp cold in *Moscow*, ii. 318 *b*. The cellars of *Moscow* hot in winter, ii. 356 *b*. Remarks upon the cold of that country, iii. 98 *a*.
MOSES, his doctrine of the origin of concretions, i. 300 *b*. He makes water the material cause of the universe, i. 315 *a*.
MOSS of a dead man's skull, its virtue to stop blood, iv. 212 *a*. A story concerning it, i. 538 *b*.
MOTE, the reason of *Motes* swimming up and down in the air, i. 59 *b*. Of their appearing in bright and sparkling colours, ii. 18 *b*.
MOTHER, distempers of the *Mother*, a cure for them, i. 551 *b*.
MOTION, is a circle of bodies moving together, i. 50 *a*. *Motion* of restitution, *Hobbes*'s opinion concerning it, i. 123 *b*. The solid parts of living bodies not exempt from *Motion*, i. 253 *b*. *Motion* alters the contexture of bodies, i. 270 *b*. Contributes to the hardning of fluid bodies, i. 279 *b*. The *Motion* of the corpuscles of hard bodies explained, i. 283 *a*. *b*. The colours of bodies change by putting their parts into *Motion*, ii. 17 *a*. The effect of local *Motion* upon matter, iii. 76 *b*. The great variety of *Motion*, iii. 78 *a*. The nature of it understood by geometry, iii. 160 *a*. How the soul is concerned in the *Motion* of the body, iv. 61 *a*. An essay on languid and unheeded *Motion*, iv. 251 *a*. The great effects of languid and unheeded *Motion*, iv. 252 *a*. *Motion* communicated to solid bodies by the air, iv. 254 *a*. The effect of *Motion* in small invisible bodies, iv. 256 *b*. The propagable nature of *Motion*, iv. 259 *a*. The propagation of *Motion* in solid bodies by heat, iv. 260 *a*. The reason of the tremulous *Motion* occasioned by earthquakes, iv. 260 *a*. The effect of *Motion* in organical bodies, iv. 260 *b*. Local *Motion* propagated through different mediums, iv. 261 *a*. *Motion* propagated at a distance through a yielding medium, iv. 261 *b*. The invisible *Motion* of fluids on the bodies of animals, iv. 263 *a*. On inanimate and inorganical bodies, iv. 265 *a*. An inquiry into the intestine *Motions* of bodies, iv. 269 *a*. The stupendous quality of local *Motion*, iv. 341 *b*. The quantity of *Motion* among quiescent bodies, iv. 342 *a*. The *Motion* of fluid bodies examined, iv. 342 *b*. The velocity of the *Motion* of celestial matter, iv. 343 *a*. Local *Motion* the chiefest of second causes, iv. 346 *a*. Other worlds may have peculiar laws of *Motion*, iv. 346 *b*. Generation and corruption the extremes of *Motion*, iii. 125 *a*. A discovery of the perpetual *Motion*, v. 280 *b*. The inflexion of a direct *Motion* into a curve, explained, v. 356 *a*. From what chymical principles *Motion* flows, i. 349 *b*. *Motion* is one great principle of things, i. 361 *a*. The nature of local *Motion* according to the corpuscularian philosophy, ii. 460 *b*. Local *Motion* the grand agent of all that happens in nature, ii. 461 *a*. Bodies act upon one another by local *Motion* only, ii. 468 *b*. Local *Motion* has the greatest interest in the modifying of matter, ii. 471 *b*. *Motion* the chief mood or affection of matter, ii. 474 *b*. *Motion* considered as a primary principle, its nature and effect, iii. 452 *a*. The effect of variously determined *Motion* in portions of matter, iii. 456 *a*. Mr. *Hobbes*'s opinion about matter and *Motion* examined, iii. 520 *b*. Instances of the production of heat from the natural effects of local *Motion*, iii. 579 *a*. The increase of *Motion* in the penetrating corpuscles of a liquor contributes to its solutive power, iii. 627 *a*. The laws of *Motion* established at first by the divine wisdom, iv. 373 *a*. The distinction of local *Motion* into natural and violent, considered, iv. 393 *b*. The first efficient cause of *Motion* explained, iv. 417 *b*. Inquiry into the *Motion* of the parts of gold and diamonds, v. 494 *a*. The nature of local *Motion* difficult to be conceived, v. 668 *b*. *Motion* in the several parts of a human body particularly considered, v. 710 *a*.
MOTUS CIRCULARIS SIMPLEX confuted by Dr. *Ward*, i. 130 *a*. Mr. *Hobbes*'s explanation of it, i. 152 *b*.
MOULDINESS, the quantity of it depends on the quantity of the air, iv. 121 *b*. Not produced but in compressed air, iv. 123 *b*. Air sometimes unfit to produce *Mouldiness*, iv. 148 *b*.
MOULTON, account of images set up in the church of that place, v. 415 *a*.
MOUNTAIN, an appendix about the height of *Mountains*, iii. 32 *a*. Remarks on measuring the height of *Mountains*, iii. 33 *b*. On respiration upon high *Mountains*, iii. 124 *b*. The appearance of the Pyrenean *Mountains*, v. 185 *b*. The *Mountains* of ice accounted for, v. 325 *b*. Compression of the air felt no more at the bottom of *Mountains* than on the top, iii. 300 *a*.
MOURNING, the custom of going into *Mourning*, ii. 212 *b*.
MOUSE, an experiment by one concerning respiration, i. 63 *b*. To try the rarity and density of the air, iii. 126 *a*.
MOUTH, the *Mouths* of animals suited to their aliments, and their respective natures, iv. 544 *b*.
MOZAMBIQUE, the effect of the heat in that country, v. 168 *b*.
MULE foaled by superfœtation, v. 377 *a*.
MULLERIUS, his account of the velocity of a fixt star, iv. 342 *a*.
MULLI, a Peruvian tree, the use of it, i. 494 *b*.
MULSUM, injected into the orifice of wounds, iv. 214 *b*.
MUN, Mr. a character of his demonstrations concerning foreign trade, v. 508 *b*.
MURDER, testimony required by our laws concerning *Murder*, iii. 531 *a*.
MUSCLE, a frog cut out of the *Muscle* of a wench's back, v. 405 *a*. The nature and use of the *Muscles* of a human body, v. 704 *a*.
MUSCOVITES, their opinion of anatomy, i. 466 *a*.
MUSCOVY, the transparency of *Muscovy* glass, ii. 19 *a*. A strange discovery of stars in *Muscovy*, v. 178 *a*. The extreme cold of that country, ii. 326 *b*. The fertility of it owing to the deep snows, ii. 368 *b*.
MUSCULUS MARSUPIALIS, its excellent contrivance, i. 454 *a*. *Musculus Pectoralis* wanting in a body, v. 315 *b*.
MUSHROOMS produced by the *Lapis Lyncurius*, iii. 245 *b*.
MUSICAL INSTRUMENTS affected by wet weather, iii. 402 *b*.
MUSICK, the great variety of it, iii. 78 *b*. It arises from very simple causes, iii. 147 *a*. Is improved by the doctrine of proportions, iii. 161 *a*. Its effect upon serpents in the *East-Indies*, iv. 273 *b*. In curing the Tarantula, i. 540 *b*. An expeditious way of teaching *Musick*, v. 539 *b*.
MUSK, the scent of *Musk* heightned by the steams of a house of office, iii. 192 *b*. Head-achs occasioned by the smell of *Musk*, iii. 326 *b*. Perfume made by a mixture of *Musk* and amber-grease, iii. 594 *b*.
MUSK-DUCKS emit a sweet smell, iii. 593 *b*.
MUSK-RATS in *Muscovy*, their nature, iii. 593 *b*.
MUSK-SEED, an account of it, iii. 593 *b*.
MUSTARD-SEED, the effect of a distillation of it, iii. 613 *a*. A volatile salt obtained from *Mustard-seed*, i. 379 *a*.
MYSTERIES OF RELIGION will be understood in heaven, i. 184 *b*. Are unavoidably obscure, ii. 101 *a*. Hidden

den *Mysteries* of nature may be hereafter discovered, iv. 43 *b*. *Mysteries of Religion* to be warily and dexterously proposed, v. 666 *a*. That *Mysteries* are incomprehensible, is no objection against religion, v. 669 *a*. Reasons why *Mysteries* should be believed, though they cannot be conceived, v. 671 *b*. *Mysteries of Religion* with regard to reason, examined, v. 60 *a*. Their meaning in the Old and New Testament explained, v. 62 *b*.

N.

NAIL, *Nails* of men are porous, iv. 215 *b*. Poison hid under the *Nails* by the African Blacks, iv. 307 *a*. The *Nails* will grow in dead men, ii. 535 *a*. A wound by the rust of a *Nail*, v. 441 *a*.

NAME, men ambitious of a good *Name*, ii. 128 *b*. The *Name* of God ineffable to the Jews, iv. 340 *b*. A good *Name* a desireable thing, v. 68 *b*. The taking the *Name* of God in vain condemned, v. 208 *b*. Reverence to be given to the *Name* of God, v. 209 *b*. God's *Name* taken in vain by curses, v. 223 *b*. The way of the chymists in trifling with *Names*, i. 330 *a*. The *Names* of the principles of the chymists examined, i. 337 *b*. The *Name* of the family put first among the Chinese, v. 591 *b*.

NAPELLUS, an herb, the poison of it corrected, i. 502 *b*.

NAPHTA, uncoagulated, found in lumps of amber, v. 250 *b*.

NAPLES, the sulphureous exhalations in that country, v. 122 *b*.

NATURAL PHILOSOPHY, its various uses, iii. 153 *b*. The topicks of a *Natural* history, iv. 163 *a*. Subjects relating to *Natural Philosophy*, v. 75 *a*. Heads of inquiries for a *Natural* history, v. 192 *b*. The use and character of *Natural Philosophy*, i. 423 *a*.

NATURALIST, his use and benefit to the husbandman, iii. 145 *a*. and to common artificers, iii. 147 *a*. To the introducing of new trades, iii. 149 *a*. Mathematicks of use to the *Naturalist*, iii. 156 *a*. His skill improved by mechanicks, iii. 162 *b*. and by his insight into trades, iii. 167 *a*. By observations in the shops of craftsmen, iii. 169 *b*. A *Naturalist* contributes to the improvement of trades, iii. 170 *a*. Supplies artificers with materials, iii. 172 *b*. The particular trades to be improved by the *Naturalist*, iii. 174 *a*. The pen of a *Naturalist* like a merchant's ship, iv. 89 *a*. The proper method of his inquiries, iv. 163 *a*. Is fond of receiving information, v. 56 *b*. The knowledge of *Naturalists* tends to the evincing of a Deity, i. 453 *a*. and to examine the juices of the body, i. 470 *b*. To assist the physician in judging of diseases, i. 471 *b*. His service to illustrate pathology, i. 476 *b*. The therapeutic part of physick improved by the *Naturalist*, i. 480 *a*. The qualities of the air discovered by the *Naturalist*, i. 496 *b*. The reputation and writings of a *Naturalist* how liable to be abused, iii. 442 *a*. Whether and how a *Naturalist* should consider final causes, iv. 517 *a*. The business of a *Naturalist* to inquire how particular effects are produced, iv. 550 *a*. The search into final causes should not hinder a *Naturalist* from the indagation of efficients, iv. 551 *b*.

NATURE, its aversation to a vacuum, i. 48 *b*. Its power to shun or replenish a vacuum, is limited, i. 49 *b*. The reason of the axiom, *Nature abhors a vacuum*, i. 87 *a*. Further considerations on that axiom, i. 259 *b*. The changes of the course of *Nature* not difficult to God, ii. 190 *a*. Materials for the history of *Nature*, iii. 140 *b*. Advantages from the studying of *Nature*, iii. 154 *b*. *Nature* eludes the subtilty of human reason, iii. 155 *a*. Trades are the history of *Nature*, iii. 167 *b*. The *Nature* of things difficult to be found out, iv. 59 *a*. The simplicity of the divine *Nature*, iv. 62 *b*. *Nature* often plays the apothecary, iv. 335 *a*. Represented by some as a goddess, v. 53 *b*. The mysteries of religion not discovered by the light of *Nature*, v. 57 *a*. *Nature* makes decompounded bodies, i. 317 *a*. Decompounded bodies among the works of *Nature*, i. 332 *b*. Made in the bowels of the earth, i. 365 *b*. The way of *Nature*'s producing mixed bodies, i. 369 *b*. *Nature* outdone by chymical operations, i. 373 *b*. Whether *Nature* affords a true elementary earth, i. 417 *b*. The contemplation of *Nature* improved, i. 423 *b*. The truths of *Nature* worth the study of philosophers, i. 425 *a*. The praise of *Nature* by *Seneca*, i. 495 *b*. *Nature* to be admired in her smallest works, i. 428 *a*. The knowledge of *Nature* cherishes devotion, i. 429 *a*. The curious works of *Nature* described by *Seneca*, i. 430 *b*. The knowledge of *Nature* useful to human life, i. 432 *b*. The study of *Nature* does not lead to a disbelief of God, i. 442 *b*. The phænomena of *Nature* not explained by the excluders of a Deity, i. 444 *a*. The philosophy of *Nature* not explained by the Epicureans, i. 447 *a*. The contemplation of *Nature* leads to the knowledge of God, i 456 *b*. The study of *Nature* improved by the divine favour, i. 460 *b*. The various uses of the knowledge of *Nature*, i. 463 *a*. The works of *Nature* not sufficiently considered nor known, iii. 186 *a*. The delightfulness and advantages of the study of *Nature*, iii. 429 *a*. The wonders of *Nature* in the animal creation, iii. 430 *a*. A free inquiry into the received notion of *Nature*, iv. 361 *a*. The reason of this inquiry, iv. 361 *b*. *Nature* is not God's vicegerent in the government of the world, iv. 363 *a*. The common notion of *Nature* prejudicial to God's glory and the discovery of his works, iv. 363 *b*. Various opinions concerning the meaning of the word *Nature*, iv. 365 *a*. The significations of the word *Nature* expressed by various other terms, iv. 366 *a*. What is meant by the law of *Nature*, iv. 367 *a*. The definition of *Nature* by *Aristotle* examined, iv. 367 *b*. The use of the word *Nature* according to Scripture, iv. 368 *b*. Angels more proper to govern the world by subordination than *Nature*, iv. 369 *a*. Various axioms and epithets applied to *Nature*, iv. 369 *b*. A description to express the vulgar notion of *Nature*, iv. 370 *a*. Forms of speech concerning the common notion of *Nature* explained, iv. 370 *b*. Impossible to give an unexceptionable definition of *Nature*, iv. 371 *b*. The universal and particular *Nature* of things explained, iv. 372 *a*. The notion of the Peripateticks and Epicureans concerning *Nature*, iv. 372 *b*. The vulgar notion of *Nature* pernicious to religion, iv. 374 *a*. *Nature* idolized as a Divinity by poets and philosophers, iv. 377 *a*. The veneration for what is called *Nature* of dangerous importance, iv. 379 *b*. Such a *Nature* does not exist, nor is it necessary it should, iv. 380 *a*. The received notion of *Nature* not useful to explicate physical phænomena, iv. 380 *b*. More easily explained or understood, iv. 381 *a*. It is destructive to the foundations of religion, iv. 381 *b*. Divers phænomena do not agree with the common notion of *Nature*, iv. 382 *a*. The difference between *Nature* and providence explained, iv. 385 *a*. An inquiry into the care and wisdom of *Nature*, iv. 388 *a*. Why philosophy relied so much on the received notion of *Nature*, iv. 389 *a*. The appetite of *Nature* to restore bodies to their former state, considered, iv. 392 *b*. The strange and critical efforts of *Nature* in certain diseases, iv. 395 *a*. The performances of *Nature* in the common crisis's of distempers, examined, iv. 396 *b*. The general axioms concerning *Nature* accounted for, iv. 399 *b*. In what sense *Nature* may, or may not be said to act at all, iv. 400 *a*. What is meant when things are said to be done according to the course of *Nature*, iv. 400 *a*. The distinction between the laws of *Nature* and the custom of *Nature*, iv. 400 *b*. In what sense things are said to be preternatural, or contrary to *Nature*, iv. 401 *a*. *Nature* not a principal and distinct agent, but a kind of compounded accident, iv. 401 *b*. *Omnis Natura est conservatrix sui*, that axiom explained, iv. 401 *a*. *Natura sine suo nunquam excidit*, considered, iv. 403 *a*. *Natura semper agit per vias brevissimas*, the meaning of that maxim, iv. 408 *a*. *Natura semper facit quod optimum est*, the sense of that sentence, iv. 405 *a*. *Natura abhorret à vacuo*, explained, iv. 405 *b*. *Natura est morborum medicatrix*, considered, iv. 407 *b*. Things ascribed to *Nature* belong rather to the mechanisms of macrocosm and microcosm, iv. 408 *a*. How *Nature* acts in the cure of wounds and diseases, iv. 411 *a*. The fury of *Nature* to be pacified by the physician, iv. 413 *a*. How far *Nature* is concerned in the welfare and recovery of sick persons, iv. 414 *a*. *Nature* seems to transmit to the child the impressions of the parent's disease, iv. 414 *b*. Whether *Nature* be a substance or an accident, iv. 415 *a*. The opinion of *Nature*'s being an incorporeal substance examined, iv. 416 *a*. Whether it be a corporeal substance, iv. 416 *b*. or of an order superior to mere matter, iv. 417 *a*. Whether the phænomena of the universe are answered by recurring to *Nature*, iv. 418 *b*. The vulgar word *Nature* pernicious to solid philosophy, iv. 421 *a*. Why *Nature* furnishes men's bodies with double parts of the same kind, iv. 540 *b*. The God of

Nature

Nature to be found by the ſtudiers of *Nature*, v. 721 *a*. The ſtudy of *Nature* uſeful to increaſe our knowledge, v. 723 *b*.

NAVEL, purging by applying outwardly to the *Navel*, iv. 321 *b*.

NAVIGATION SUBMARINE, an account of it, iii. 174 *b*.

NEATS TONGUES ſalted with ſalt-petre, i. 494 *a*.

NEEDLE excited by a loadſtone, its motion in the receiver, i. 142 *a*. The reaſon of the *Needle's* pointing to the poles, i. 171 *b*. The declination of the *Needle* obſerved in *America*, i. 221 *b*. Why it reſpects the poles by the approach of a load-ſtone, iii. 75 *b*. The variation of the magnetic *Needle*, iii. 90 *a*. The poiſing of the *Needle*, iii. 165 *a*. To regulate the uncertainty of magnetic *Needles*, v. 194 *b*. The effect of holding a *Needle* to the poles of a load-ſtone, i. 535 *a*. The declination of the *Needle* conſiderably alters, iii. 187 *b*. The effect of applying a ſteel *Needle* to the load-ſtone, iii. 192 *a*. Remark on the variation of the magnetic *Needle*, iii. 445 *b*.

NEGATIVE CONCEPTION explain'd, iv. 49 *b*. *Negatives* not to be framed about privileged things, iv. 57 *b*. From whence proceed *negative* propoſitions, iv. 61 *a*.

NEHEMIAH, his excellent anſwer, ii. 147 *b*.

NEGROES, the reaſon of their blackneſs conſider'd, ii. 34 *b*. Very few are natives of *America*, ii. 35 *a*. Their blackneſs owing to a ſeminal impreſſion, ii. 36 *b*. It goes no further than the outward ſkin, ii. 37 *a*. The *Negroes* way of cheating in the gold trade, v. 31 *b*.

NEIGHBOUR, the love of God conſiſtent with the love of our *Neighbour*, i. 162 *a*.

NEPHRITIC WOOD, obſervations on the tincture of it, ii. 46 *b*. The virtues of a *Nephritic* ſtone, ii. 84 *b*. The effect of an inflammable ſpirit upon *Nephritic* patients, iv. 319 *a*. The quality and effect of the *Nephritic* ſtone, iv. 324 *a*. The efficacy of *Nephritic* ſtones, i. 524 *b*.

NERVE, blood found in the ſubſtance of a *Nerve*, i. 220 *b*. Spirit of human blood uſeful in convulſions of the *Nerves*, iv. 193 *b*. Whether there be nutrition by the *Nerves*, v. 89 *a*. The figure and uſe of the optic *Nerve*, iv. 547 *a*. The liquor in the *Nerves* examined, v. 517 *b*.

NEST, curious remarks upon the *Neſts* of birds, iv. 542 *b*. *Neſts* of an excellent taſte in the *Eaſt-Indies*, iv. 543 *a*.

NEW-ENGLAND, the change of the air there, iii. 91 *a*. Not infected with the plague, iv. 289 *b*. The ſeverity of the cold in that country conſider'd, ii. 352 *b*.

NEW-HAMPSHIRE, an account of the air there, v. 167 *b*.

NEWTON, Mr. extract of a letter of his, v. 396 *b*.

NHANBY, a Braſilian herb, its virtue againſt poiſon, i. 542 *b*.

NICOLAUS FONTANUS, his obſervation of a boy without lungs, i. 65 *a*.

NIGHT very cold in *Morocco*, v. 160 *b*.

NILE, account of the inundation of that river, v. 341 *b*. Its overflowing proved to ariſe from a natural cauſe, iii. 335 *a*.

NITRE, an experiment upon common *Nitre*, i. 230 *b*. The different forms of it, i. 231 *a*. The ſeveral qualities of fixed *Nitre*, i. 232 *a*. The change in the colour of fixed *Nitre* conſider'd, i. 233 *b*. *Nitre* in diſtillation yields fumes that are blood-red, i. 234 *a*. The ſmell and taſte of fixed *Nitre*, i. 234 *a*. The inflammableneſs of it conſider'd, i. 235 *a*. A ſpirit of *Nitre* corrodes ſilver, i. 236 *a*. Whether the air is concern'd in the figuration of *Nitre*, i. 237 *b*. Fixed *Nitre* in a moiſt cellar will run into liquor, i. 246 *b*. Liquor of *Nitre* may coagulate into a ſtable body, i. 263 *b*. Some account of ſpirit of *Nitre*, iii. 75 *b*. *Nitre* is the life of vegetables, iii. 142 *b*. Experiment with *aqua fortis* and fixed *Nitre*, iv. 139 *b*. With ſpirit of blood mixed with ſpirit of *Nitre*, iv. 203 *a*. A way to calcine *Nitre*, iv. 258 *a*. It emits plentiful effluvia into the air, iv. 282 *b*. A ſtone out of a man's body diſſolved by ſpirit of *Nitre*, iv. 312 *a*. Experiment on bezoar-ſtone with ſpirit of *Nitre*, v. 92 *a*. The air impregnated with volatile *Nitre*, v. 117 *a*. An account of Egyptian *Nitre*, i. 381 *b*. *Nitre* of a cleanſing abſterſive quality, i. 381 *b*. The way to make an alkali out of *Nitre*, i. 382 *a*. Half its weight of alkalizate ſalt obtained from fixed *Nitre*, i. 382 *b*. Fixed ſalt of *Nitre* made without firing of it in the air, i. 383 *a*. Spirit of *Nitre* made acid by fire, i. 387 *b*. Spirit of *Nitre* obtained from ſalt-petre, i. 388 *a*. Camphire made liquid by ſpirits of *Nitre*, i. 404 *a*. The freezing of ſnow mixed with ſpirit of *Nitre*, ii. 260 *b*. Whether cold proceeds from *Nitre* in the air, ii. 313 *a*. A preparation of vitriolate *Nitre*, ii. 512 *a*. An exploſion made with ſpirits of *Nitre* and wine, iii. 206 *a*. The colour of fumes ariſing from rectified ſpirit of *Nitre*, iii. 330 *b*. The way of fixing ſpirits of *Nitre*, iii. 623 *a*.

NOAH, inflexible to bad examples, v. 72 *a*. Was a preacher without converts, v. 72 *b*.

NOCTILUCA, an account of an aerial *Noctiluca*, iv. 19 *a*. The virtue of a gummous *Noctiluca*, iv. 21 *a*. The German *Noctiluca*, iv. 22 *a*. The uſes of conſtant *Noctiluca's*, iv. 23 *a*. The concurrence of the air to the ſhining of *Noctiluca's*, iv. 26 *a*. Reaſons for the light of *Noctiluca's*, iv. 27 *a*. The quenching of a *Noctiluca* by water, iv. 29 *a*. Additional obſervations on the aerial *Noctiluca's*, iv. 30 *a*. The way of preparing it, iv. 35 *b*. May be made of a dry pulverable ſubſtance, iv. 36 *a*. Made by a diſtillation of human urine, iv. 37 *a*. Experiments on the icy *Noctiluca*, iv. 70 *a*. An account of the author's tract about *Noctiluca's*, iv. 70 *b*. *Noctiluca's* formed from reſidence of urine, iv. 71 *b*. The particular qualities of the *Noctiluca*, iv. 74 *a*. The effect of its being immerſed in water, iv. 75 *b*. Remarks on the diſſolution of the icy *Noctiluca*, iv. 76 *a*. Experiments on the *Noctiluca* with oils, iv. 77 *b*. Experiment of the *Noctiluca* dropt in water, iv. 79 *b*. The emiſſion of ſmoke by the *Noctiluca*, iv. 81 *a*. The ſtrange continuance of its light, iv. 82 *b*. The multitude of parts contained in it, *ibid*. Set on fire by the ſun-beams, iv. 83 *a*. The effect of beating it in a glaſs-mortar, iv. 83 *b*. Experiment on burning other bodies with the *Noctiluca*, iv. 84 *a*. Experiment with the *Noctiluca* and flowers of ſulphur, iv. 85 *a*. The effect of the *Noctiluca* upon dry wood, iv. 85 *b*. Experiment of a *Noctiluca* ſealed in a glaſs-egg, iv. 86 *a*. Of its ſhining through a coloured glaſs, iv. 87 *b*. And ſet on fire in a receiver, iv. 88 *b*.

NORMANDY, an anatomical account from thence, v. 390 *b*.

NORTHERN, the temperature of the air in the *Northern* ſea, iii. 106 *a*.

NORTHALL WATER, the weight of it, iv. 243 *b*.

NORTH-WIND, the various effects of it in different countries, iii. 398 *a*.

NORTH-WEST PASSAGE, the diſcovery of it, v. 345 *b*.

NORWAY, gold extracted from *Norway* talc, i. 209 *b*.

NOSE, a ſpecific for bleeding at the *Noſe*, iv. 323 *a*.

NOTHING *comes from nothing*, not univerſally true, iv. 65 *a*.

NOTION, ſome account of gradual *Notions*, iv. 48 *a*.

NOVA ZEMBLA, account of the *Dutchmen* that winter'd there, i. 311 *a*. Three voyages made thither by the *Dutch*, iii. 238 *b*. The higheſt degrees of cold upon the land, ii. 310 *b*. No leaves nor graſs in thoſe parts, ii. 321 *a*.

NUBECULA, a ſhining one diſcover'd in the ſky deſcrib'd, v. 572 *a*.

NULLUM VIOLENTUM DURABILE, that maxim explained, iv. 392 *b*.

NUMBER, the uſe of double progreſſion in *Numbers*, iii. 158 *a*. The affections of *Numbers* difficult to be conceived, iv. 44 *a*. No *Number* can be greater than infinite, iv. 64 *b*. Of *Numbers* proceeding in geometrical proportion, iv. 66 *a*. A kind of infinity in *Numbers*, v. 670 *b*.

NUMIDIA, rarely affected with the plague, iv. 289 *b*.

NUT, experiment on *Nut*-kernels in an empty receiver, iv. 135 *b*.

NUTRITION, a particular account of the *Nutrition* of animals, iv. 207 *b*.

O.

OAK, the particular virtues of the ſpirit of *Oak*, ii. 67 *a*. *Oaks* growing over mines of vitriol, their quality, iv. 283 *b*. The effect of leaves of *Oaks* upon Chalybeate waters, iii. 193 *b*. A great *Oak* dug out of the middle of a ſalt-mine, iii. 467 *a*.

OAKLY in *Buckinghamſhire*, an account of the air of that place, v. 115 *a*.

OATH, unnecessary *Oaths* forbid by the third commandment, v. 206 *a*. Their effect upon persons and nations, v. 207 *b*. One *Oath* is enough to damn, v. 208 *b*. Every idle *Oath* to be accounted for, v. 209 *a*. An *Oath* a species of divine worship, v. 209 *b*. A frequency of *Oaths* depreciates their authority, v. 211 *a*. The plea of repeating another's *Oaths* consider'd, v. 212 *b*. *Oaths* called gentlemens sins, v. 213 *a*. Cannot be defended by custom, v. 217 *a*. Forfeiture for *Oaths* a remedy against them, v. 220 *a*. *Oaths* like powder in a granado, v. 221 *b*. Not abolished by the Gospel, v. 221 *b*. Sins too venial to beget despair, v. 222 *b*. The *Oath* of allegiance taken by the Papists, v. 418 *a*.

OBEDIENCE, our obligations of *Obedience* to the divine will explained, iii. 419 *b*. *Obedience* to governors explained, ii. 195 *b*.

OBELISK, the way of raising an *Obelisk* by wet ropes, iii. 183 *b*.

OBJECT, the ways of *Objects* appearing to the eye, iii. 159 *b*. What are properly *Objects* of contemplation, iv. 40 *a*. *Objects* beyond the comprehension of our intellects, iv. 42 *b*. How *Objects* operate upon our senses, iv. 61 *a*.

OBJECTIONS against the pressure of the upper parts of water on the lower answer'd, iii. 271 *b*. The *Objections* of Dr. *More* answer'd, iii. 271 *b*. A reply to *Objections* offer'd against the resurrection, iii. 540 *b*.

OBSCURITY of Scripture objected and answer'd, ii. 99 *b*. Is lessened by reading it, ii. 102 *a*. The *Obscurity* of a part should not deter from perusing the whole, ii. 103 *a*.

OBSERVATIONS on aerial Noctiluca's, iv. 24 *a*. Additional *Observations* on the aerial Noctiluca, iv. 30 *a*. The use of barometrical *Observations*, ii. 449 *b*. An *Observation* of a spot in the sun, iii. 213 *a*. On shining flesh without any sensible putrefaction, iii. 304 *a*. Observations on the growth of metals in their ore, iii. 459 *a*. About vitiated light, iv. 552 *a*.

OCCASIONAL REFLECTIONS, ii. 162 *a*. &c.

OCCULT QUALITIES, an account of them, iii. 73 *b*.

OCULUS MUNDI, a gem, an account of it, ii. 85 *a*. The transparency of it, iv. 222 *b*. Its appearances in a vessel of fair water, v. 95 *b*.

ODORIFEROUS SALTS, the medicinal quality of them, i. 577 *a*.

ODOROUS corpuscles lodge in the pores of solid bodies, iv. 225 *b*. *Odorous* smells over the veins of minerals, iv. 279 *a*. With two bodies, neither of them *odorous*, to produce a strong urinous smell, iii. 591 *a*.

ODOURS of mineral waters considered, iv. 244 *a*. The operation of the air on the *Odours* of substances, v. 181 *a*. Improvement in the theory of *Odours*, v. 368 *b*. Instances of purging by the *Odour* of potions, i. 535 *b*. The strange effect of *Odours*, i. 538 *a*. *Odours* depend upon the texture of bodies, ii. 503 *a*. Retain the genuine scent of the spices or herbs that afforded them, iii. 331 *a*. Observations about the mechanical production of *Odours*, iii. 591 *a*. Of producing *Odours* each of them quite different from that of any of the ingredients, iii. 591 *a*. The production of some *Odours* by local motion, iii. 591 *b*. Experiments of changing *Odours* by various mixtures, iii. 592 *a*.

OECONOMY of Scripture excepted against, ii. 98 *b*.

OFFA ALBA of *Helmont*, i. 380 *a*. How prepared, i. 472 *b*.

OFFICE OF COMMUNICATION, an account of it, v. 256 *a*.

OIL, the use of sallad *Oil* in the working of an air-pump, i. 6 *b*. The effect of *Oil* in the experiment upon flat marbles, i. 259 *a*. Water will not insinuate into *Oil* of cinnamon or cloves, i. 277 *a*. Chymical *Oils* apt to produce a red colour, ii. 59 *a*. The surface of *Oil* convex, iv. 2 *a*. The drops of *Oil* round, iv. 3 *b*. Their various shapes upon the surface of liquors, iv. 4 *a*. Experiment on the surface of *Oil*, iv. 6 *a*. On the distillation of essential *Oil*, iv. 90 *a*. The particular effects of it, iv. 90 *b*. Experiment upon *Oil* in dilated air, iv. 140 *a*. On *Oil* made *per deliquium*, and spirit of wine, iv. 141 *b*. The nature of the *Oils* afforded by human blood, iv. 170 *a*. Experiment with unrectified *Oil* of human blood, and *Oil* of vitriol, iv. 170 *b*. The mixing spirit of blood with *Oil* of petreolum, iv. 187 *b*. A tincture drawn from the *Oil* of amber, iv. 192 *a*. A way to preserve beer by *Oils*, v. 270 *a*. The receipt of a wonderful *Oil*, v. 289 *a*. An *Oil* to cure ricketing diseases, v. 301 *b*. *Oils* of different qualities produced from the same bodies, i. 309 *a*. Chymical *Oils* never without taste, i. 338 *a*. The nature of the chymical *Oils* of things examined, i. 339 *b*. The different *Oils* of the same vegetables, i. 340 *a*. *Oil* not a primogenial and incorruptible body, i. 341 *a*. Chymical *Oils* strongly affect the taste, i. 378 *a*. The production of *Oils*, i. 393 *b*. *Oil* made by transmutation of water, i. 394 *a*. An *Oil* extracted from spirit of wine and *Oil* of vitriol, i. 394 *b*. Sulphur produced from *Oil* of turpentine and *Oil* of vitriol, i. 395 *b*. The virtue of *Oils* extracted from human blood, i. 561 *b*. Of odoriferous chymical *Oils*, i. 578 *a*. Whether *Oils* contract by congelation, ii. 279 *a*. Experiment concerning the freezing of essential *Oils*, ii. 394 *b*. A parcel of *Oil* lighter than water may be kept in water without ascending in it, ii. 436 *b*. The use of *Oil* in the stopping of pipes in aqueducts, iii. 194 *b*. *Oil* obtained from fossils, iii. 237 *b*. Essential *Oils* retain the taste of the bodies from whence they are produced, iii. 331 *a*.

OIL-OLIVE, an experiment upon it to try the fluidity of bodies, i. 244 *a*. Of a strange penetrating scent, i. 339 *b*. but almost tasteless, i. 364 *a*. Of a sharp acrimonious nature, i. 545 *b*. Preparation of balsam made with *Oil-Olive*, i. 572 *b*. The way of administring it, i. 573 *a*.

OINTMENT, the particles of it pierce through the pores, iv. 211 *b*.

OKERS in *England*, rich in iron, v. 33 *b*.

OLAUS MAGNUS, his character and writings, ii. 238 *b*. His strange account of the use of train-oil, ii. 263 *b*. Of the force and strength of ice, ii. 301 *a*. His account of travelling in northern countries, ii. 24 *b*.

OLAUS WORMIUS, his account of the breaking of brass by cold, ii. 275 *a*. His opinion of the carbuncle, ii. 82 *a*. His remark upon the turquois, ii. 84 *b*.

OLD, a wonder to see an healthy *old* man, ii. 167 *a*. A story of an *old* man bit with a tarantula, i. 541 *a*.

OLDENBURGH, Mr. letters to him from Mr. *Boyle*, v. 247 *b*. Letters from him to Mr. *Boyle*, v. 299 *a*. Some account of his travels, v. 299 *b*. Of the plague in *London*, v. 330 *b*. His account of his circumstances, v. 358 *a*. and of his imprisonment, v. 364 *a*. Of his great labour and narrow fortune, v. 375 *b*. His account of Mr. *Boyle*'s history of cold, ii. 231 *a*.

OLEUM GLACIALE of antimony, its effects, i. 242 *a*. *Oleum Vitriolinum*, v. 302 *a*.

OLEARIUS, his account of the hardiness of the Russians, ii. 336 *a*. Of the way of multiplying ice in *Persia*, ii. 351 *b*.

OLIVER the protector, an account of his speech, v. 273 *a*. He is overturned in a coach, v. 279 *b*.

OLYMPUS, the nature of the air on the top of that mountain, i. 68 *a*.

OMRAMS in the court of the Great Mogul, admirers of the new philosophy, v. 504 *b*.

ONIONS, experiment on *Onions* and common air, iv. 116 *a*. and factitious air, iv. 116 *b*. The effect of those experiments, iv. 120 *b*. Experiment on *Onions* in a receiver not exactly shut, iv. 146 *b*.

OPERATION, the excellent use of chymical *Operations*, i. 373 *b*.

OPIATE, the inconveniences of some *opiate* preparations, iv. 333 *a*. The effect of distilling *Opiates* upon apothecaries apprentices, iii. 337 *a*.

OPINIONS faintly probable, to be warily assented to, iv. 57 *b*. Ought to be regulated by the rules of reason, iv. 61 *b*. Contradictory *Opinions* about privileged things, iv. 69 *a*. *Opinions* have their fatal seasons and vicissitudes, iii. 443 *a*. Old *Opinions* have been forsaken upon new discoveries, i. 200 *b*.

OPIUM, its effect outwardly applied, iv. 321 *a*. The properties of it in medicine, i. 439 *a*. The best way to correct *Opiums*, i. 517 *b*. It does not sensibly refrigerate water, ii. 248 *b*. The surprizing effect of *Opium*, v. 50 *a*. The good and bad qualities of it, v. 691 *a*.

OPORINUS, his account of the laudanum of *Paracelsus*, i. 488 *a*.

OPTIC GLASSES, the true use of them, i. 168 *b*. Remark on the grinding of them, iii. 189 *a*. Concave and convex, the use of them, iii. 197 *a*. The situation of the *optic* nerves, v. 517 *a*.

ORANGE, experiment on pieces of *Orange* and common air, iv. 115 *b*. and with compressed air, iv. 121 *a*. On pieces of *Orange* in an an empty receiver, iv. 133 *a*. On the juice of *Orange* squeezed upon human

human blood, iv. 198 *a*. A way of making *Oranges* in wax, iii. 182 *a*.
ORATORY, the two parts of it, ii. 124 *a*.
ORB, the opinion of solid *Orbs* changed for that of a fluid æther, iii. 444 *a*.
ORDINANCE against heresies and blasphemies, v. 235 *b*.
ORDNANCE, windows broken by the discharge of *Ordnance*, iv. 254 *b*.
ORE, the different sorts of it, i. 208 *a*. The way to examine the *Ores* of minerals, ii. 75 *b*. The way of separating the silver *Ore*, iii. 177 *a*. A hydrostatical way of estimating *Ores*, v. 1 *a*. The weighing of *Ores* particularly examined, v. 27 *b*. Flux-powders used in the fusion of *Ores*, v. 29 *a*. A lump of *Ore* of pure gold, v. 29 *b*. *Ore* lies disguised in the form of earth, v. 33 *a*. The nature and qualities of *Ore* examined, v. 195 *a*. More particularly inquired into, v. 196 *a*. The ways of working the *Ore*, v. 196 *a*. An *Ore* made of lead and antimony, i. 396 *b*. The regeneration of metals in their *Ore* exposed to the air, iii. 459 *a*. Various sorts of *Ore* in the mines of *Devonshire*, v. 573 *b*.
ORGAN, the effect of the sound of it, iv. 266 *a*. Rules to be observed in making an *Organ*, iii. 199 *a*.
ORGAN OF SENSE, why so called, ii. 466 *a*. Strange impressions on the *Organs* of smelling, hearing, and seeing, iii. 332 *a*.
ORGANICAL parts of living bodies not to be imitated, i. 238 *a*. The *Organical* harmony in the bodies of animals, v. 288 *b*.
ORIGEN, his opinion that the stars are animated beings, iv. 375 *b*.
ORIGIN of forms and qualities, according to the corpuscular philosophy, ii. 451 *a*. Of substantial forms taught by the Peripateticks, ii. 476 *a*. The *Origin* of springs, fountains, lakes, waters, &c. v. 463 *a*. Curious remarks on the *Origin* of mankind, v. 730 *b*.
ORPIMENT mixed with bise will produce a green colour, ii. 51 *b*. Sublimed, its colour, ii. 62 *b*. The various kinds of it, and their effect, iv. 292 *a*. When worn in amulets, iv. 292 *b*.
ORTHELIUS, his account of a liquor distilled from the ore of *Magnesia*, ii. 250 *b*.
OSSIFRAGUS LAPIS, the qualities of it, i. 549 *b*.
OSTEOCOLLA, a stone to cure broken bones, iv. 316 *b*. The virtue of it, v. 441 *a*.
OTTO GERICHE, his way of emptying vessels of air, i. 4 *a*.
OUD, the signification of it in the Persian language, v. 581 *a*.
OVIEDO, his remark on the pearl-fishing in the island *Cubagna*, iii. 283 *a*.
OUNCE, the grains contained in a Roman ounce, v. 23 *b*.
OWL, dissection of the eye of an *Owl*, v. 365 *a*. The particulars of the experiment, v. 376 *b*.
OX-BONES, observations upon them, iv. 216 *b*. *Ox-eyes*, experiments upon them, i. 455 *a*. The effect of freezing an *Ox*'s eye, ii. 273 *b*.
OX-EYES, the circumstances of a gentlewoman with *Ox-Eyes*, iv. 554 *a*.
OXFORD, a register of the air by Mr. *Locke* in *Oxford*, v. 136 *a*. The quality of the air there, v. 184 *b*.
OXY-ODAR, charcoals made of the wood of it are white, ii. 33 *a*.
OXYMEL, a remedy for tough phlegm, iv. 312 *a*.
OYSTER, experiment by an *Oyster* in an exhausted receiver, iii. 119 *a*. On *Oysters* in four receivers, iv. 153 *a*. Our way of eating *Oysters*, ii. 220 *a*. Account of frozen *Oysters* stewed, v. 489 *b*.

P.

PÆONY-ROOT, an amulet against the falling-sickness, i. 222 *b*. The proper time of gathering the roots, v. 568 *a*.
PAINS in the body presage changes in the air, i. 28 *a*.
PAINSWICK, the nature of stone dug there, v. 180 *a*.
PAINTERS, their art in mixing colours, ii. 48 *a*. Their way of painting the concaves of the roofs of churches, v. 221 *b*.
PAINTING, the art of *painting* glass, iv. 229 *a*.
PALLADIUS, remarks on his book *de Insitione*, v. 471 *b*.
PALSIES cured by mercury, i. 545 *a*. The story of a *Palsy* occasioned by a fall from a horse, v. 88 *b*. By a sudden fright, v. 89 *b*.
PANACÆA DUPLICATA of the Duke of *Holstein*, its virtue, i. 506 *b*.
PANAROLA, DOMINICUS, his testimony of the weapon-salve, i. 530 *b*.
PAPER all in a flame without being burnt, i. 212 *b*. Experiment upon paper concerning colours, ii. 41 *b*. The colour of white *Paper* by candle-light, ii. 43 *b*. Experiment on *Paper* rubbed over with oil, iii. 86 *a*. Strange characters written on *Paper*, iv. 11 *a*. Lucid characters on white *Paper*, iv. 31 *b*. *Paper* smeared with luciferous matter, its effect, iv. 33 *a*. Set on fire by an icy phosphorus, iv. 84 *b*. The transparency of *Paper* made by oil, iv. 222 *b*. To try the quality of minerals by staining of *Paper*, iv. 240 *a*. *Paper* penetrated by the corpuscles of the atmosphere, iv. 280 *b*. A way to stain *Paper* with red spots, v. 87 *a*. Pictures and embossed work made of *Paper*, iii. 195 *b*.
PAPIN, Monsieur, an account of him, iv. 96 *b*. He is employed about experiments, iv. 97 *a*. Will produce air without ferment, iv. 113 *a*.
PAPISTS differ about the fundamentals of religion, v. 415 *b*
PARABLE, the value and use of *Parables* in Scripture, ii. 109 *b*. They were frequently used by Christ, ii. 145 *b*.
PARACELSUS, his opinion concerning the air, i. 69 *a*. His extraordinary cures by laudanum, i. 199 *b*. His account of the different sorts of talc, i. 209 *b*. His advice in the indagation of colours, ii. 56 *a*. He opposes the doctrine of the four elements, i. 298 *a*. The universe, according to him, composed of salt, sulphur and mercury, i. 335 *b*. His account of metalline and mineral salts, i. 343 *b*. He attributes colours to salt, i. 352 *b*. His fantastick way of writing, i. 370 *a*. His way of drawing sulphurs from metals, i. 397 *b*. Of extracting mercury from all metals, i. 407 *b*. His treatise of worms, i. 429 *a*. His celebration of God's works, i. 458 *a*. His opinion of the curableness of diseases, i. 481 *a*. His excellencies and defects examined, i. 488 *a*. He confesses the difficulty of being a good physician, i. 522 *b*. His account of the virtues of his electrum, i. 525 *a*.
PARADISE, the place of departed souls, v. 111 *b*.
PARADOX about calcination and calces, iii. 353 *a*. Of the natural and preternatural state of bodies, especially the air, iii. 390 *a*. The cause of attraction by suction, a *Paradox*, iii. 493 *a*. Hydrostatical *Paradoxes* made out by new experiments, ii. 409 *a*. The occasion of their being written and published, ii. 411 *b*. Hydrostatical *Paradox* demonstrated by *Stevinus*, ii. 430 *a*. A chymical *Paradox* grounded on experiments, iv. 89 *a*.
PARADOXICAL APPENDIX to the Sceptical Chymist, i. 536 *a*.
PARÆUS, his remark on the nails of a dead body, ii. 535 *a*.
PARCHMENT, writing taken out of *Parchment*, iii. 153 *a*.
PARENTHESES, the effect of omitting or misplacing them, ii. 105 *b*.
PARIACACA, the strange quality of the air of that mountain, i. 535 *b*.
PARIS, a design for the reformation of it, v. 36[illegible] *b*.
PARKER, Dr. his treatise of the divine authority of the law of nature, a character of it, v. 50[illegible] *b*.
PARLIAMENT, an account of some affairs in *Parliament*, v. 289 *b*.
PARONYCHIA, *folio rutaceo*, its effect upon a tumour in the throat, iv. 328 *a*. Its use and quality in the king's-evil, i. 523 *a*. Account of its other properties, i. 438 *b*.
PARSLEY, an herb hurtful to the eyes, iv. 326 *b*. It causes pains and inflammations, i. 503 *b*.
PARTHENISSA, a character of that romance, v. 630 *a*.
PARTICLES of air interspersed in the pores of water, i. 31 *a*. Experiment on the discovery of aerial *Particles* in water, iii. 118 *a*. *Particles* of air like slender wires, v. 108 *b*. Account of aqueous *Particles* in the air, v. 113 *b*.
PARTRIDGE, white in winter and grey in summer, v. 182 *a*.
PASCAL the younger, his trial of the Torricellian experiment, i. 10 *a*. His experiment *de vacuo* made by water, i. 28 *b*. Concerning the pressure of the air, i. 84 *b*. His experiment upon the descent of the quicksilver, i. 98 *a*. On the sustaining of water by the weight of the atmosphere, iii. 17 *a*. His imitation of the

the Torricellian experiment, iii. 22 *a*. His account of weighing the air, v. 159 *b*. Mr. *Pascal*'s book of the æquilibrium of liquors, and of the weight of the mass of the air examined, ii. 414 *a*. and censured, ii. 414 *b*. His experiment on the sinking of solid bodies in water, ii. 439 *a*. On the pressure of water upon animals, ii. 447 *a*.

PASSION, the use and abuse of the *Passions*, ii. 192 *a*. The *Passions* of the mind affect the body, v. 89 *a*. Sins committed in *Passion* examined, v. 212 *a*. The operation of the *Passions* upon the mind, i. 536 *a*.

PASTE, experiment upon *Paste*, iv. 109 *a*. With leaven or ferment, iv. 112 *a*. With spirit of wine, iv. 112 *b*. Without spirit of wine, *ibid*. On *Paste* included *in vacuo*, iv. 131 *b*. On *Paste* diluted without leaven, iv. 134 *b*. The colour of paste *in vacuo*, iv. 157 *a*.

PATHOLOGICAL part of physick, i. 471 *a*.

PATHOLOGY greatly assisted by chymistry, i. 473 *b*. Improved by zoology, i. 476 *b*.

PAUL, ST. the method of St. *Paul* in writing his epistles, ii. 104 *a*. He reasons as acutely as *Aristotle*, ii. 105 *a* Is censured for impropriety of speech, ii. 121 *b*. His testimony of the Scriptures, ii. 134 *b*. An account of his preaching, ii. 136 *b*.

PAUL'S, ST. experiments from the top of *St. Paul*'s, v. 536 *a*. Other trials from thence, v. 305 *b*.

PEA, *Peas* planted in parallel lines, their different appearances, ii. 11 *b*. Experiment on green *Peas* with spirit of wine, iv. 113 *b*. *Peas* will produce air *in vacuo*, iv. 128 *a*.

PEACH-BUDS and BLOSSOMS, their nature and qualities explained, ii. 500 *a*. Concerning the production of air in *Peaches*, iv. 111 *b*. Experiment on *Peaches* in common air, iv. 118 *a*. On *Peaches* with an infusion of raisins, iv. 149 *b*. On *Peaches* with pulp of apples, iv. 150 *b*. Wine hinders the fermentation of *Peaches*, iv. 152 *a*.

PEACOCK, its nature and quality, v. 490 *a*. The colours of the half-moon in a *Peacock*'s tail curiously examined, v. 693 *b*.

PEAR, an experiment of *Pears* growing upon an apple-tree, i. 216 *a*. The producing of air in *Pears*, iv. 107 *a*. They putrify without air, iv. 118 *b*. Their taste acid, iv. 119 *a*. Experiment on *Pears* included *in vacuo*, iv. 119 *a*. On *Pears* in a vacuous receiver with a mercurial gage, iv. 135 *a*. Air produced in *Pears* by fits, iv. 139 *a*. Experiment on whole *Pears* in a vacuous receiver, iv. 147 *a*. On butter-*Pears* with pulp of apples, iv. 150 *b*. The effect of the prickled *Pear* of *America*, iv. 306 *b*.

PEARL, the dissolution of seed-*Pearl* in an acid menstruum, i. 42 *b*. An account of the production of *Pearls*, iii. 108 *a*. Of fishing for *Pearl*, iii. 108 *b*. The specific gravity of *Pearls*, v. 7 *b*. The use of weighing oriental seed-*Pearls*, v. 12 *a*. An account of a monstrous *Pearl*, v. 96 *b*. The chymical analysis of *Pearls*, v. 100 *b*. An account of the generation of *Pearls*, v. 291 *a*. The making of oriental *Pearl*, v. 291 *b*. Powder of *Pearl* more operative than magistery, i. 509 *b*. Account of *Pearl*-fishing in the island *Cubagna*, iii. 283 *a*.

PEAT, the charring of it for chymical uses, i. 515 *a*.

PEBBLES emit copious steams, iii. 234 *a*.

PECQUET, his remark upon the quicksilver in the Torricellian experiment, i. 129 *b*. His discovery of the *Lactea thoracica*, i. 461 *a*.

PEDIGREES, the proper use of them in Scripture, ii. 109 *a*.

PENCIL, the effect of its being dipped in a luminous liquor, iv. 31 *b*.

PENDULUM, its vibration tried in the air-pump, i. 40 *a*. Two like *Pendula*, the vibrations tried in the receiver, i. 142 *b*. The use of a *Pendulum* to measure time, iii. 160 *b*. To take the height of a church, iii. 178 *b*. To measure the depth of a well, iii. 179 *a*. Remark upon the motion of *Pendulums*, iv. 263 *b*. An inquiry into the matter of figured *Pendulums*, v. 319 *a*. An examination of *Pendulums*, v. 395 *a*. The measuring of time by the vibrations of a *Pendulum*, iii. 184 *b*. Account of the strange vibration of a *Pendulum*, v. 534 *a*. Experiments for adjusting the length of *Pendulums*, v. 542 *b*.

PENMEN of Scripture could write nothing impertinent, ii. 108 *a*.

PENN, Mr. *William*, his account of the natives, the ores, plants, flowers, *&c.* of *Pensilvania*, v. 646 *a*.

PENOTUS, his preparation of a sulphureous balsam, i. 572 *a*.

PENTADES of experiments, v. 88 *b*.

PEOPLE, how they are to judge of affairs of state, ii. 196 *b*.

PEONY, the root a cure for the falling-sickness, i. 534 *b*.

PEPPER, a peculiar kind of it growing in *Jamaica*, i. 427 *a*. Crude *Pepper* good for the stomach, i. 354 *b*.

PEQUIN, account of the frost there, ii. 322 *b*.

PERCEPTION, what is meant by the evidence of *Perception*, iv. 63 *b*.

PERFECTION, some account of the divine *Perfections*, iv. 349 *b*. The *Perfections* of God motives to the love of him, i. 167 *a*.

PERFUME, the effect of *Perfumes* on hysterical women, iv. 305 *a*. Women thrown into fits by strong *Perfumes*, iv. 307 *b*. Their operation on hysterical women, iv. 326 *b*. Their strange effect upon a fisherman, i. 538 *a*. Faintnesses, swoons, *&c.* produced by *Perfumes*, iii. 326 *b*. The way of making a liquid *Perfume*, iii. 595 *a*.

PERFUMING OF METALS, an account of it, iv. 226 *a*.

PERICARPIA, the effect of them, iv. 211 *b*.

PERINO, a liquor, some account of it, i. 490 *a*.

PERIPATETICKS, their notion of a vacuum, i. 48 *a*. Their opinion concerning colours, ii. 21 *b*. Of the transmutation of the elements, i. 418 *b*. The disputes and controversies of the *Peripateticks* censured, ii. 456 *b*. The origin and doctrine of substantial forms taught by the *Peripateticks*, ii. 476 *a*. Their account of the producing of forms, ii. 477 *b*. Their peculiar sentiments concerning the air, v. 116 *a*. more particularly explained, v. 160 *b*. The use these philosophers make of experiments, i. 297 *b*. Their doctrine of the four elements defended, i. 301 *b*.

PERSECUTION, a proper inquiry into the nature of it, ii. 210 *b*. Remark on the *Persecution* of Protestants by the French King, v. 407 *b*. The belief and propagation of the gospel attended by *Persecution*, v. 55 *a*. Reflections upon the *Persecution* of the church, ii. 158 *a*.

PERSICARIA, or arsmart, its use in curing the stone, i. 484 *a*.

PERSPECTIVE, the art of it useful to the history of nature, iii. 161 *b*. Reflections on looking through a *Perspective*-glass, ii. 166 *a*.

PESTILENCE, account of the annual *Pestilence* at *Grand-Cairo*, iv. 288 *a*. Remark on the *Pestilence* of beasts, iv. 288 *b*.

PETREOLUM, the mixing spirit of blood with the oil of *Petreolum*, iv. 187 *b*.

PETRESCENT JUICE, the effect of it upon vegetables, iii. 233 *a*. Bodies sometimes not altered in bulk, shape, or colour, by the *petrescent Juice*, iii. 236 *b*. Lumps of stones filled up and hardned by a *petrescent* liquor, iii. 238 *b*. The operation of *petrescent* liquor upon vegetables and animals, *&c.* iii. 241 *b*.

PETRIFICATION, various examples of it, v. 303 *a*.

PETRONIUS, his satire upon his own time, i. 420 *a*.

PERU, the marvel of *Peru*, a plant, ii. 6 *a*.

PERUVIAN BARK, the properties of it, i. 438 *a*.

PERVIOUSNESS of glass with respect to ponderable parts of flame, iii. 350 *a*. In what the *Perviousness* of glass consists, iii. 352 *a*.

PETTY, Dr. his character, v. 256 *a*. His discoveries in anatomy, v. 264 *a*. His improvement of printing, v. 280 *b*. Letters from Dr. *Petty* to Mr. *Boyle*, v. 296 *b*. An apology for himself, v. 298 *b*.

PEWTER, the effect of freezing water in a *Pewter*-bottle, ii. 396 *b*. A *Pewter*-bottle let down into a deep sea, squeezed together by the pressure of the water, iii. 286 *b*. To discover the adulteration of *Pewter* with lead, iii. 552 *a*.

PHÆNOMENA of the air-engine explained, i. 11 *a*. Periodical *Phænomena*, iii. 93 *a*. *Phænomena* exhibited by mathematicks, iii. 157 *a*. Discovered by the doctrine of proportions, iii. 159 *b*. and by the use of mechanicks, iii. 163 *a*. An inquiry into the *Phænomena* of trades, iii. 167 *b*. Various *Phænomena* of aerial noctiluca's, iv. 25 *a*. Exhibited by an icy noctiluca, iv. 74 *a*. The *Phænomena* of mineral waters uncertain, iv. 250 *a*. Various *Phænomena* concerning the plague, iv. 291 *b*. The *Phænomena* of medicinal bodies explained, iv. 301 *b*. The *Phænomena* of the universe prove a Deity, v. 42 *b*. Performed by condensation and rarifaction, v. 125 *a*. Reasons of the superficial accounts of the *Phænomena* of nature, i. 372 *b*. They are not to be explained wholly by any principles, i. 443 *b*. The *Phænomena* of the universe appointed from the creation, i. 446 *a*. The *Phænomena* of nature how explained by Atomists, i. 450 *b*. *Phænomena* arising from the distillation of oil of vitriol

and spirit of wine, ii. 524 *b*. *Phænomena* in what manner to be explicated by naturalists, iii. 453 *a*. The seeming probability of some magnetical *Phænomena*, iii. 528 *a*. Most of the *Phænomena* of nature answered upon mechanical principles, iv. 419 *a*.

PHANTASM, whether the soul makes use of *Phantasms* in all its intellectual operations, v. 666 *a*.

PHENICIAN PHILOSOPHY, why so called, i. 228 *b*. They were the founders of the Greek *Philosophy*, i. 315 *a*.

PHILO, he calls the world a temple, i. 441 *b*.

PHILOSOPHER, the writings of no *Philosopher* equal to the Scripture, ii. 113 *a*. A *Philosopher* contributes to the improvement of trades, iii. 170 *a*. *Philosophers* mistake in judging of irreconcileable things, iv. 66 *a*. Their common way of writing systems, i. 194 *a*. The style they ought to use in their writings, i. 195 *b*. The *Philosophers* stone makes glass malleable, i. 514 *a*. *Philosophers* admit many things they cannot explicate, iii. 522 *b*. An experimental *Philosopher* compared to a diver, v. 48 *a*. His character particularly explained, v. 48 *b*. Especially qualified to receive religion, v. 56 *b*. Rational *Philosophers* act according to experience, v. 57 *b*. The mistakes of the old *Philosophers*, v. 58 *a*. The efficacy of the *Philosophers* stone, i. 406 *a*. The different sects and opinions of *Philosophers*, v. 673 *b*. Their notions concerning the world, the principles of bodies, a vacuum, v. 674 *a*. Reasons for the heathen *Philosophers* to exercise the noble acts of natural religion, v. 686 *a*.

PHILOSOPHIZING, the various methods of it, iii. 443 *a*. The practice of it among the followers of *Aristotle*, iii. 443 *a*.

PHILOSOPHY, experimental *Philosophy* requires a purse as well as a brain, i. 4 *a*. The inconveniences of systems of *Philosophy*, i. 193 *a*. The chief ends proposed in the study of *Philosophy*, i. 199 *a*. The meaning of the corpuscular *Philosophy*, i. 228 *b*. The usefulness of experimental natural *Philosophy*, iii. 135 *a*. Objection of its barrenness answered, iii. 140 *b*. How experimental *Philosophy* becomes useful to human life, iii. 141 *a*. Its use to the delights and gaieties of life, iii. 146 *b*. The advantages of it, iii. 154 *a*. A project for the improvement of it, iii. 155 *b*. It supplies the use of manual dexterity, iii. 177 *a*. Specific medicines reconcileable to the corpuscular *Philosophy*, iv. 301 *a*. Experimental *Philosophy* useful to Christianity, v. 37 *a*. Mechanical *Philosophy* built upon reason and experience, v. 41 *a*. Experimental *Philosophy* has great advantage of the scholastick, v. 43 *a*. *Philosophy* improved by supernatural revelation, v. 46 *b*. The litigious *Philosophy* of the schools, v. 47 *b*. Experimental *Philosophy* disposes men to receive religion, v. 56 *b*. *Philosophy* destroyed by substantial forms, v. 354 *b*. Improved by the assistance of memory, v. 429 *a*. The emptiness of the *Philosophy* of the chymists, i. 347 *b*. Usefulness of experimental natural *Philosophy*, i. 420 *a*. In reference to the mind of man, i. 423 *a*. In improving the understanding and increasing the power of man, i. 423 *b*. The study of natural *Philosophy* delightful and inoffensive, i. 424 *b*. The various objects of natural *Philosophy*, i. 426 *b*. The study of it does not encourage atheism, i. 430 *a*. Natural *Philosophy* and divinity are not at variance, i. 443 *a*. *Philosophy* and priesthood united in civilized nations, i. 457 *b*. The usefulness of *Philosophy* to our bodies and fortunes, i. 463 *a*. To the happiness and life of man, i. 464 *a*. The affinity between natural *Philosophy* and physick, i. 465 *a*. Meats meliorated by natural *Philosophy*, i. 493 *a*. The therapeutic part of physick assisted by *Philosophy*, i. 496 *a*. *Philosophy* contributes to the knowledge of diseases, i. 543 *b*. Introduction to the elements of the corpuscularian *Philosophy*, ii. 454 *a*. The imperfections of the Peripatetick *Philosophy*, ii. 457 *a*. The excellent advantages of the corpuscularian *Philosophy*, ii. 501 *b*. The advantages of *Philosophy* assisted by revelation, iii. 418 *b*. The study of *Philosophy* excluded by the study of divinity, iii. 427 *b*. Study of experimental *Philosophy* a laborious employment, iii. 428 *a*. Experimental *Philosophy* introduced upon the ruin of the Peripateticks, iii. 443 *b*. The principles of mechanical *Philosophy*, matter and motion, iii. 451 *a*. Natural *Philosophy* deduced by the chymists from salt, sulphur and mercury, iii. 453 *b*. Corporeal things explicated by mechanical *Philosophy*, iii. 456 *a*. The saying, *Such a thing is true in Divinity, but false in* Philosophy, examined, iii. 521 *b*. The ambiguous use of terms of disservice to *Philosophy*, iv. 419 *b*. Natural *Philosophy* improved by a right knowledge of nature, iv. 421 *b*. The ambiguity of the word *Philosophy*, v. 673 *a*. *Philosophy* is a comprehension of all the considerable parts of useful knowledge, v. 673 *b*. Sound *Philosophy* and orthodox divinity consistent, v. 675 *a*. The gradual improvement of *Philosophy*, v. 677 *a*. Human *Philosophy* distinguished from right reason, v. 678 *a*. Mere human *Philosophy* is not the adequate standard of human knowledge, v. 678 *b*. True *Philosophy* is reason improved by meditation, conferences, &c. v. 683 *b*. The glory of God advanced by operative *Philosophy*, v. 713 *a*.

PHLEBOTOMY, the benefits of it, v. 442 *b*. Of great service to women with child, iv. 302 *a*.

PHLEGM, remarks upon the nature of animal *Phlegm*, i. 315 *b*. The *Phlegm* of vitriol, vinegar, wine, &c. examined, i. 344 *a*. The produciblenes of *Phlegm* or water, i. 412 *a*. The nature of *Phlegm* particularly consider'd, i. 413 *a*. What is meant by *Phlegm* in chymistry, iv. 92 *b*. The effect of the *Phlegm* of oil of anniseeds upon minium, iv. 95 *a*. The nature of *Phlegm* arising from human blood, iv. 179 *a*.

PHLEGMONE upon the Uvula, a cure for it, i. 535 *a*.

PHOSPHORUS, an account of a strange *Phosphorus*, iv. 11 *b*. Experiment on a *Phosphorus* in an air-pump, iv. 12 *b*. Destroyed by the contact of the air, iv. 13 *b*. The various kinds of them, iv. 20 *b*. An account of artificial *Phosphorus's*, iv. 21 *a*. The preparation of a liquid *Phosphorus*, iv. 22 *b*. The concurrence of the air to the shining of *Phosphorus's*, iv. 26 *b*. Particular reasons for their shining, iv. 27 *a*. The way of making them, iv. 35 *b*. And of a *Phosphorus Hermeticus*, iv. 36 *b*. Observations on the shining steams of a liquid *Phosphorus*, iv. 73 *a*. The qualities of a solid and consistent *Phosphorus*, iv. 74 *b*. The effect of its being plunged in water, iv. 75 *a*. Remarks on the dissolution of the icy *Phosphorus*, iv. 76 *a*. Experiment of the icy *Phosphorus* in spirit of wine, iv. 80 *b*. The icy *Phosphorus* may be made hot, iv. 84 *a*. Will set gun-powder on fire, iv. 84 *b*. Experiment of a *Phosphorus* in a closed glass, iv. 85 *b*. To try to set a *Phosphorus* on fire, iv. 86 *a*. Whether its parts can pervade the pores of glass, iv. 87 *a*. A *Phosphorus* kindled by a burning-glass, iv. 88 *b*. An account of making the *Phosphorus*, v. 198 *a*.

PHRASE, how metaphorical *Phrases* may be used, i. 446 *a*.

PHYSICAL, the benefit of *physical* knowledge, iii. 177 *a*. The nature of *physical* propositions, iv. 65 *a*. A particular account of *physical* experiments, v. 77 *a*. *Physical* inquiries not expected to come up to demonstration, ii. 411 *b*. The relative nature of *physical* qualities, ii. 462 *b*.

PHYSICIANS, their notion of specific remedies, iv. 304 *b*. The usefulness of natural philosophy to *Physicians*, v. 88 *a*. *Physicians* sometimes act contrary to the designs of nature, iv. 412 *b*. A good *Physician* a friendly assistant to nature, iv. 413 *a*. The business of a *Physician* opposing or strengthening nature, iv. 413 *b*. The *Physician* improves his art from the naturalist, i. 465 *a*. The uses of hydrostaticks to *Physicians*, v. 17 *b*. Assisted by the naturalist in the knowledge of diseases, i, 471 *a*. The saying of a witty *Physician*, i. 496 *b*. Of a *Physician* at *Milan*, i. 497 *b*. How they ought to prescribe to poor patients, i. 506 *a*. Account of the Indian *Physicians*, i. 528 *b*. The caution of *Physicians* in prescribing specificks, i. 543 *a*. Their method of prescribing considered, i. 543 *b*. Cannot account for the operation of medicines, i. 547 *b*. Knowledge necessary in a *Physician*, i. 580 *b*. Account of a *Physician* to the Russian Emperor, ii. 229 *a*.

PHYSICK, meditations on the taking of *Physick*, ii. 169 *a*. Upon the medicines in a course of *Physick*, ii. 176 *a*. Mistakes in *Physick* from the doctrine of *Tria prima*, i. 372 *b*. The semeiotical part of *Physick*, i. 480 *a*. The charges of *Physick* inquired into, i. 503 *a*. Costly ingredients in *Physick* censured, i. 505 *a*. *Physick* improved by an insight into nature, i. 552 *b*. The disadvantages of chymical physick in the way of ministration, i. 579 *a*. The benefits of theology exceed those of *Physick*, iii. 431 *b*. The division of *Physick* into five parts, i. 465 *a*. The patheological part of *Physick*, i. 471 *a*. The uncertainty of *Physick*, i. 522 *a*. *Physick* was accounted a part of philosophy, i. 533 *b*. Reflections upon the ordinary method of *Physick*, i. 543 *b*. It begun and is rectified by experience, i. 549 *a*. The art of *Physick* referred to the Gods, i. 553 *b*.

PHYSICKS contribute to the pleasures of life, iii. 147 *a*. Discouragements to the study of *Physicks*, iii. 154 *a*. Mathematicks of use to *Physicks*, iii. 156 *b*. Chymistry

mistry useful to the speculative parts of *Physicks*, i. 374 *b*.

PHYSICO-CHYMICAL ESSAY, i. 230 *a*. Inquiry into the nature of mineral waters, iv. 236 *a*.

PHYSICO-MECHANICAL treatise of Mr. *Boyle* defended, i. 104 *a*. A continuation of *physico-mechanical* experiments, iii. 1 *a*. iv. 96 *a*.

PHYSICO-THEOLOGICAL considerations about the possibility of the resurrection, iii. 537 *a*.

PHYSIOGNOMY of natural bodies, iv. 239 *b*.

PHYSIOLOGICAL ESSAYS, some account of them, i. 191 *a*.

PHYSIOLOGY, the difficulties that attend the study of it, i. 193 *b*. The trivial truths of it not to be denied, i. 197 *a*. It is improved by the doctrine of proportions, iii. 160 *a*. The study of it approved and justified by religion, i. 425 *b*. Makes us acquainted with nature, i. 429 *a*. Gives us a dominion over the creatures, i. 429 *b*. It does not lead men into atheism, i. 443 *b*. Disposes us to celebrate the perfections of the Deity, i. 457 *b*. A studier of *Physiology* an utter enemy to atheistical principles, i. 458 *b*. The objections of atheists answered by *Physiology*, i. 459 *b*. It contributes to the improvement of arts, i. 464 *b*. Is assisted by the skill of mechanicks, i. 471 *b*.

PIC OF TENERIFF, its height, iii. 32 *b*. The highest mountain in the world, iii. 33 *a*. The effect of its effluvia on silver-money, iv. 281 *b*. An exact relation of it, v. 170 *b*. The vast extent of its shadow, v. 172 *a*.

PIC DE MIDI, remarks on the air of that mountain, v. 169 *b*.

PICKLING, powdering, and preserving, account of them, iii. 145 *b*.

PICTURE, the surveying of it by a cylindrical looking-glass, i. 453 *a*.

PIETY; motives to true *Piety* and devotion, v. 685 *a*.

PIG, the use of *Pigs*-dung, v. 444 *a*.

PIGEON, a spirit distilled from earth covered with *Pigeon*'s-dung, i. 388 *a*. The nature and quality of *Pigeon*'s-dung, iii. 142 *b*.

PIGMENT, the mixing of them, ii. 48 *a*. What colours may be produced by the mixing of *Pigment*, ii. 50 *b*. How small a parcel of *Pigment* will colour a colourless liquor, ii. 55 *a*. A diaphanous *Pigment* used in colouring of glass, iv. 230 *a*. The use of astringent vegetable *Pigments*, iv. 240 *a*. The nature and quality of mineral *Pigments*, v. 9 *a*.

PILES, a medicine against that distemper, v. 277 *a*.

PILLAR of marble broke to pieces by air agitated by heat, i. 55 *a*. The weight of a *Pillar* of the atmosphere, v. 134 *a*.

PILULÆ LUNARES, the preparation and virtues of them, i. 556 *a*. The dose, and how they are taken, i. 556 *b*. A remedy for the dropsy, the *genus nervosum*, and the palsy, i. 557 *a*. Some account of *Pilulæ perpetuæ*, iii. 234 *a*.

PIMPERNEL WATER, good for a pain in the head, v. 579 *a*.

PIN, a strange discovery of *Pins* in the body, v. 442 *b*.

PIONY-ROOT, the virtue and effect of it, iv. 322 *a*.

PIPE in the air-engine described, iii. iv. *b*.

PISO, his remark on some Brasilian plants, ii. 534 *b*. His caution in the making of sugar, i. 274 *b*. His account of stony plants on the coast of *Brasil*, i. 276 *b*. Of the state of physick in *Brasil*, i. 529 *a*.

PISTACHEOS, the virtues of the husk that covers the shell, v. 634 *b*.

PISTOL, the effect of cold on a *Pistol*-barrel filled with water, ii. 336 *b*. The effect of discharging a *Pistol* on Mount *Carpathus*, iv. 263 *a*. An experiment in the air-pump with a *Pistol* charged, i. 20 *b*.

PIT-COAL used in chymical furnaces, i. 514 *b*.

PLACE, difficult to understand what it is, v. 61 *a*. The notion of it according to *Aristotle*, iv. 62 *b*.

PLAGUE, an early symptom of the *Plague*, ii. 7 *b*. An amulet against the *Plague*, iv. 212 *a*. The *Plague* very rare in the *East-Indies*, iv. 284 *a*. An account of the *Plague* at *Grand-Cairo*, iv. 288 *a*. The nature of the *Plague* in the time of *David*, iv. 288 *b*. Whether the *Plague* proceeds from causes natural or supernatural, iv. 289 *a*. Some countries free from the *Plague*, iv. 289 *b*. A particular account of them, iv. 289 *b*. The several causes of the *Plague* exemplified, iv. 290 *a*. The *Plague* begins from noxious exhalations of the earth, iv. 290 *a*. Quicksilver ore a preservative against the *Plague*, iv. 290 *b*. Why some countries are exempted from the *Plague*, iv. 291 *a*. The great variety of *Plagues* accounted for, iv. 292 *a*. The *Plague* sometimes a natural disease, iv. 292 *b*. An approved remedy for the *Plague*, iv. 293 *b*. An antidote against the *Plague*, iv. 294 *b*. Reasons for the ceasing of the *Plague*, iv. 295 *a*. Variety of symptoms in the *Plague*, iv. 337 *a*. A way of foretelling the *Plague*, v. 186 *a*. The nature of the *Plague* at *Aleppo* and *Smyrna*, v. 189 *a*. A remedy for the *Plague* in horses, v. 290 *a*. *Borrhi*'s antidote against the *Plague*, v. 335 *a*. The opening of a body that died of the *Plague*, v. 370 *b*. The ceasing of the *Plague* at *Grand-Cairo*, i. 539 *b*. Occasioned by some nitrous corpuscles that attend the overflowing of the *Nile*, iii. 335 *a*. Account of *Plagues* confined to one sex or nation, iii. 469 *a*. Remark on the *Plague* in *London*, v. 543 *b*. The *Plague* discovered by an old woman thirty miles off, v. 495 *a*.

PLAISTER, the ingredients of it to mend a crack'd receiver, i. 17 *b*. The effects of a blistering-*Plaister*, iv. 211 *b*. Of mercurial *Plaisters*, iv. 281 *a*. An alexipharmic *Plaister* for the plague, iv. 293 *b*.

PLANE-TREE, remark on the fruit of it, ii. 534 *b*.

PLANET-STRUCK, the meaning of it, iv. 287 *b*. The plague not depending on the malevolent aspects of the *Planets*, iv. 289 *a*. The secondary *Planets* not visible to the eye, iv. 345 *b*. The use of a proper history of the *Planets*, v. 124 *a*. Some account of their influence, v. 124 *b*. Every *Planet* has its different light and qualities, v. 125 *b*. Their effect upon our spirits, v. 126 *a*. The physical use of the *Planets*, v. 126 *b*. Five more added to the septenary number of the *Planets*, iii. 444 *b*. New discoveries in the number of the *Planets* and fixed stars, v. 686 *b*.

PLANT, whether the figure of *Plants* appear in ice, i. 216 *b*. The watering of *Plants* by filtration, iii. 170 *b*. The different qualities of the same *Plant*, iv. 330 *b*. An account of resuscitable *Plants*, v. 102 *a*. The effect of the air in the vegetation of *Plants*, v. 185 *b*. The circulation in *Plants* explained, v. 395 *a*. They consist chiefly of transmuted water, i. 313 *a*. The substance of the *Plant* may taste of the dung, i. 357 *a*. Artificial ways of drying and preserving of *Plants*, i. 469 *a*. *Plants* destroyed by excessive cold, ii. 327 *b*. The effect of congelation upon *Plants*, ii. 348 *b*. The way of *Plants* growing in water explained, ii. 441 *b*. Account of a strange *Plant* in the *East-Indies*, ii. 491 *b*. *Plants* nourished in phials of water, ii. 498 *b*. Account of some Brasilian *Plants*, ii. 534 *b*. *Plants* produced by alkalizate ashes of the same *Plants*, iii. 539 *b*. The great number of the several species of *Plants*, v. 691 *b*.

PLASTIC POWER in nature to produce the consistence of stones, i. 275 *b*. An inquiry into the nature of the *plastic* principle, i. 322 *b*.

PLATERUS, his account of a particular wind, iv. 256 *b*. Of the nature of the plagues at *Basil*, iv. 290 *b*.

PLATO, his opinion of colours, ii. 21 *b*. His motto over the entrance of his school, iii. 159 *b*. His saying of God, iii. 166 *b*. and of the diagonal of a square, iv. 41 *a*. His saying of a theorem in geometry, v. 62 *a*.

PLATS, G. his remarks on the rot in sheep, v. 447 *b*.

PLAY, lucks at *Play* dispensed by providence, v. 224 *b*.

PLEAS in defence of customary swearing answered, v. 206 *b*.

PLENISTS, their opinion concerning a vacuum explained, i. 48 *a*. Concerning rarifaction by heat, i. 115 *a*. In what sense they believe a vacuum, i. 143 *b*.

PLEURISIES cured without phlebotomy, i. 523 *b*. By *laudanum opiatum*, i. 545 *b*.

PLICA POLONICA, an account of that disease, iv. 217 *a*.

PLINY, his observation upon authors, i. 201 *b*. *Pliny* the elder lost his life in the flames of *Vesuvius*, i. 424 *a*. Treats of philosophical matters, i. 553 *a*. The character he gives his wife, v. 400 *b*.

PLOT, Dr. his account of the curiosities and antiquities of *Oxfordshire*, v. 643 *b*.

PLUMS, experiment on the production of air in *Plums*, iv. 110 *b*. On *Plums* and artificial air, iv. 117 *b*. On dried *Plums* in an emptied receiver, iv. 135 *b*. On unripe *Plums*, iv. 136 *a*.

PLUTARCH, his remark upon some idolaters, ii. 128 *a*. His opinion of the *Primum frigidum*, ii. 308 *a*.

PNEUMATICAL EXPERIMENTS, iii. 114 *a*. Experiment of a duck and duckling in the exhausted receiver, iii. 114 *b*. Of a viper, iii. 115 *a*. Of a snake, iii. 115 *b*. Of frogs, *ibid*. By a kitling new-kittened, iii. 116 *b*. By shell-fish, iii. 119 *a*. By scale-fish, iii. 119 *b*. By two animals with wounds in the abdomen, iii. 120 *a*. By the separated heart of a cold animal, iii. 120 *b*. By a green-finch, a sparrow, a mouse, iii. 121 *a*. By drowning a viper, iii. 122 *b*. By animals in rarified air, iii. 125 *b*. On breathing on high mountains, iii. 123 *a*. On the rarity and density of the air, iii. 125 *b*. By tadpoles, iii. 126 *b*. By insects turned into gnats, iii. 127 *a*. On the expansion of the air by blood, iii. 128 *a*. On rarifaction of air unfit for respiration, iii. 128 *b*. Of the pressure of the air unfit for respiration, iii. 129 *b*. On house-snails, a slow-worm, and a leach, iii. 131 *a*. By caterpillars, flesh-flies, grashoppers, iii. 132 *b*. By rose-flies, butter-flies, iii. 133 *a*. By mites and ants, iii. 133 *b*.

PNEUMATICK ENGINE, proposals to try the effects of it in plants, seeds, &c. ii. 553 *a*.

POCOCKE, Dr. letters from him to Mr. *Boyle*, v. 421 *b*. His account of Arabick books and manuscripts, v. 422 *b*.

POETRY, the scandalous prostitution of it, ii. 126 *a*.

POISONS cured by appropriated antidotes, iv. 305 *a*. and by specific antidotes, iv. 336 *b*. The nature and quality of them, v. 299 *b*. Most *Poisons* contain their own antidotes, i. 438 *b*. The use of giving *Poisons* to brutes, i. 477 *b*. Of letting *Poisons* into the veins of beasts, i. 478 *b*. Of conveying *Poisons* into the mass of blood, i. 479 *a*. The correction of *Poisons* useful in medicine, i. 502 *a*. *Poisons* tamed by a preparation of salt of tartar, i. 518 *a*. Gratitude to God due for *Poisons* and poisonous creatures, v. 717 *a*.

POISONOUS CREATURES, no such in some countries, iv. 291 *a*. Remedy for the bite of *poisonous creatures*, iv. 338 *a*.

POISSON, P. his animadversions upon the nature of sounds, v. 388 *b*.

POLAND, the effect of frost upon wood in that country, ii. 339 *b*.

POLE, a Dutchman sailed within a degree of the North *Pole*, ii. 238 *a*. The nearness to the *Pole* not the cause of excessive cold, ii. 321 *a*. ii. 399 *b*.

POLEMAN, Mr. his character, v. 296 *a*.

POLEROON, a dispute about it, v. 345 *b*.

POMEGRANATE, an experiment upon the buds of the *Pomegranate*, ii. 62 *b*.

POMPION, experiment by weighing a *Pompion*, i. 312 *b*.

POMPHOLYX, a drug, its nature explained, i. 304 *b*.

POND, whether fish die in frozen *Ponds* for want of air, ii. 344 *a*.

PONDEROSITY of bodies depends not on their participation of mercury, i. 405 *a*. The *Ponderosity* of metals particularly examined, i. 407 *a*.

POPE is Antichrist, v. 408 *a*. The difference between the *Pope* and the French King, v. 409 *b*. The force of the *Pope*'s constitutions, v. 412 *b*. The *Pope*'s declaration about the Christian church, v. 414 *b*. Some account of his Holiness, v. 304 *b*.

POPERY, designs of bringing it in, v. 415 *a*.

PORCELLANE EARTH in *China*, its nature, i. 418 *a*. A way of sewing together pieces of *Porcellane*, iii. 149 *b*.

PORE, the number and subtilty of the *Pores* of bodies, iv. 206 *a*. *Pores* necessary to the augmentation of bodies, iv. 207 *b*. The effluvia of bodies discharged by the *Pores*, iv. 208 *a*. Effluvia enter the *Pores* from without, iv. 211 *a*. The corpuscles of plaister enter through the *Pores* of bodies, iv. 211 *b*. Bones proved to be full of *Pores*, iv. 216 *b*.

POROSITY of animal bodies, iv. 206 *a*. In what manner to inquire into the *Porosity* of bodies, iv. 207 *a*. The *Porosity* of the internal parts of bodies, iv. 211 *a*. Of animals proved by the application of amulets, iv. 212 *a*. The *Porosity* of bones, horns, &c. iv. 215 *b*. Of solid bodies examined, iv. 219 *a*. The reason of the *Porosity* of solid bodies, iv. 220 *a*. The *Porosity* of artificial gems made by fusion, iv. 222 *b*. The *Porosity* of glass inquired into, iv. 226 *a*.

PORPHYRY, the way of working of it examined, iii. 147 *b*.

PORT, the art of finding particular *Ports*, iv. 60 *a*.

PORTA, his opinion of the soul of the loadstone, v. 79 *b*.

PORTUGALS, their victory over the *Spaniards*, v. 304 *b*.

POST-CHARIOT in *France*, an account of it, v. 307 *b*.

POT, the freezing of a *Pot* to a joint-stool by the fire-side, ii. 359 *a*. The most proper earth for the making of *Pots*, v. 185 *a*.

POT-ASHES, the effect of a solution of *Pot-ashes*, i. 232 *b*. An experiment with *Pot-ashes* and *aqua fortis*, iii. 143 *a*. with *Pot-ashes* and serum of human blood, iv. 174 *b*. Solution of *Pot-ashes* made to freeze, ii. 263 *a*.

POTENTIAL COLDNESS referrable to mechanical principles, iii. 572 *a*.

POTION; of purging by the odour of *Potions*, i. 535 *b*.

POTOSI, the renascence of silver in the mines there, iii. 461 *b*.

POTTERN-ORE, an account of it, i. 207 *b*.

POWDER of alabaster made to boil and steam like a liquor, i. 247 *a*. A whitish *Powder* that destroys the fluidity of bodies, i. 269 *a*. *Powder* of projection turns gold into silver, i. 274 *a*. Impalpable *Powder* used by stone cutters, iii. 170 *b*. The *Powders* of sinking bodies hydrostatically weighed, v. 11 *a*. Experiment on the *Powder* of a black loadstone, v. 81 *b*. The experiment of a grain of gold reduced to *Powder*, v. 94 *b*. Wine made of a *Powder* thrown into water, v. 291 *b*. A sudorifick *Powder* against the plague, v. 370 *b*. A *Powder* to make Spa-water, v. 380 *a*. The quality of *Powder* obtained from the distilling of rain-water, ii. 520 *a*. Whether corrosive liquors work upon this *Powder*, ii. 522 *b*. An account of a strange *Powder*, iv. 16 *b*. An experiment with it upon gold, iv. 17 *a*. The quality of the *Powder* of human blood, iv. 167 *a*. The effect of spirit of blood upon *Powder* of blood, iv. 184 *b*. Trials of mineral waters by the *Powder* of galls, iv. 237 *b*.

POWER, a particular inquiry into the *Power* of God, iv. 341 *a*. His *Power* in governing the rapid motions of the universe, iii. 443 *a*. The plastic *Power* of the semen, iv. 345 *a*. God's *Power* conspicuous in the creatures, i. 433 *b*. The nature and extent of *Power* with regard to various agents considered, v. 657 *b*.

PRAISE, our *Praises* infinitely short of the divine perfections, i. 189 *b*. God is above all *Praise*, i. 190 *b*. The *Praises* of God celebrated by his creatures, i. 442 *a*. The sacrifice of *Praise* is honouring of God, i. 462 *b*.

PRATERS

PRATERS in company described, ii. 203 *a*.
PRAYER, a remedy against the sin of swearing, v. 219 *a*.
PREACHER, reflections on the vanity of some *Preachers*, ii. 179 *b*.
PREACHING, the nature and benefit of it, ii. 193 *b*.
PRECIPITANT, the effect of *Precipitants* on the fluid parts of the body, iv. 314 *a*. The body put into the liquor, its subsiding called the *Precipitant*, iii. 635 *b*.
PRECIPITATE, the effect of a *Precipitate* of gold and mercury, i. 279 *b*. Dissolved by water, iv. 257 *a*. The substance made to fall to the bottom of the liquor called the *Precipitate*, iii. 635 *b*. *Precipitate per se* fully explained, i. 404 *a*.
PRECIPITATING power of the spirit of human blood, iv. 186 *a*.
PRECIPITATION of specific medicines, an account of it, iv. 313 *a*. An instance of silent *Precipitation*, iv. 313 *b*. The dissolving of substances strictly united by *Precipitation*, iii. 542 *a*. Mechanical causes of chymical *Precipitation*, iii. 635 *a*. What is meant by *Precipitation*, ibid. The causes of it examined, iii. 636 *a*. The mechanical ways to account for *Precipitation*, iii. 636 *b*. The general causes of *Precipitation*, iii. 637 *a*. Various phænomena in experiments of *Precipitation*, iii. 638 *a*. The general way of the *Precipitation* of bodies out of the liquors they swim in, iii. 637 *a*. Instances of *Precipitation* by disabling the solvent to sustain the dissolved body, iii. 639 *a*. The uses of the doctrine of *Precipitations* well explained, iii. 642 *b*.
PRECIPITATUS DIAPHORETICUS, the quality and virtue of it, i. 497 *b*.
PREDESTINATION, not necessary to justify the greatness of God's love, i. 177 *a*. Various disputes concerning it, v. 439 *a*.
PREDICTIONS, in what manner expressed in Scripture, ii. 100 *b*. Concerning Christianity fully accomplished, v. 55 *a*. They are still accomplishing by the conversion of infidels, v. 56 *a*.
PRE-EXISTENCE of running mercury in metals, i. 402 *b*.
PREJUDICES of mankind, remarks upon them, iii. 519 *a*.
PRESCIENCE of God explained, i. 164 *b*. How reconcileable to free-will, iv. 41 *b*. The great difficulty of reconciling it, iv. 43 *a*. Not answered by the greatest wits, iv. 51 *b*. No objection against the Christian Religion, iii. 526 *b*.
PRESCRIPTIONS of physicians examined, i. 504 *b*.
PRESERVATION of bodies *in vacuo Boyliano*, iii. 504 *a*. Of white-bread, milk, violet-leaves, *&c.* iii. 505 *a. b.* &c. Reasons for gratitude to God for his preservation, v. 717 *a*.
PRESS, the proper use of Printing *Presses* in *England*, v. 446 *b*.
PRESSURE of the air, its variation, i. 47 *b*. Is concerned in many phænomena, i. 74 *b*. The sticking of bodies owing to the *Pressure* of the atmosphere, i. 256 *a*. The *Pressure* of the air acting as a spring, iii. 2 *a*. The force of the *Pressure* of the air, iii. 14 *b*. Made sensible to the touch, iii. 25 *b*. Remarks on the *Pressure* of the atmosphere in the Torricellian experiment, iii 34 *a*. Solid bodies ascend by the *Pressure* of the air, iii. 42 *a*. The ascent of liquors in a syringe owing to the *Pressure* of the air, iii. 43 *b*. The sticking of cupping-glasses owing to the *Pressure* of the air, iii. 44 *b*. The *Pressure* of the air on a pair of bellows, iii. 46 *b*. The disjoining of two marbles by withdrawing the *Pressure* of the air, iii. 62 *b*. The *Pressure* of the water at the bottom of the sea, iii. 111 *b*. The *Pressure* of air unfit for respiration, iii. 129 *b*. The *Pressure* of the air in *England* settled, iv. 101 *b*. The *Pressure* of the air at sea foretels storms, v. 378 *b*. The *Pressure* upon a body placed under water, examined, ii. 430 *a*. Experiment on the *Pressure* of liquors contained in pipes, ii. 432 *b*. A body immersed in a fluid sustains a lateral *Pressure* from the fluid, ii. 433 *b*. How the *Pressure* of air and water may be communicated to one another, ii. 435 *b*. The *Pressure* of the outward air communicated to bodies by very small passages, ii. 438 *b*. Objections against the *Pressure* of the upper parts of water on the lower answered, ii. 441 *a*. The *Pressure* of an ambient fluid upon animals considered, ii. 447 *a*. The pressure of the water on divers in great depths explained, iii. 284 *a*. The resistance of animals against the *Pressure* of the air proved, iii. 285 *b*. The *Pressure* of water on the corks of bottles in a deep sea, iii. 287 *a*. The *Pressure* of the spring of the air on bodies under water, iii. 296 *a*. The differing *Pressure* of heavy solids and fluids, iii. 298 *a*. Objections against the *Pressure* of the air answered, iii. 298 *b*. Reasons why bodies are not crushed by the *Pressure* of the atmosphere, iii. 299 *b*. The *Pressure* of the air at the tops and bottoms of mountains considered, iii. 300 *a*. The uniformity of the *Pressure* of fluid bodies on solid ones, proved by experiments, iii. 301 *b*. The ascension of liquors by suction depends upon the *Pressure* of the air, iii. 501 *b*.
PRETERNATURAL, in what sense things are said to be *preternatural*, iv. 401 *a*.
PRICKLE-PEAR in *America*, its nature and quality, iii. 541 *b*.
PRIDE in a philosopher, valuing himself upon his discoveries, considered, iii. 436 *b*. Objections made against Scripture are founded on *Pride*, ii. 98 *b*. The neglect of the Scriptures owing to *Pride*, ii. 131 *a*.
PRIESTHOOD, Christians are a royal *Priesthood*, v. 70 *a*.
PRIMA NATURALIA, what they are, ii. 470 *b*.
PRIMUM FRIGIDUM, experiments concerning it, ii. 307 *a*. Inquiry whether there be a *Primum frigidum*, ii. 307 *b*. Reasons against the earth's being the *Primum frigidum*, iii. 308 *a*. Whether water be the *Primum frigidum*, ii. 311 *a*. or the air, ii. 312 *b*.
PRIMUM MOBILE, the violence of its motion qualified by the Copernican system, v. 688 *b*.
PRINCIPLES, bodies not reduced by fire into their hypostatical *Principles*, i. 325 *a*. Bodies may be resolved into more *Principles* than three, i. 326 *b*. Earth and water are *Principles* of mixed bodies, i. 327 *b*. The three *Principles* of the chymists particularly discussed, i. 336 *b*. *Principles* ought to be similar and homogeneous, i. 337 *b*. The familiar phænomena of bodies not answerable by the three *Principles*, i. 348 *a*. The mercurial *Principle* of bodies, i. 350 *a*. The system of the three *Principles* a useful discovery, i. 353 *b*. Matter, motion and rest, the three *Principles* of the world, i. 361 *a*. No primogeneal *Principles* in the constitution of bodies, i. 369 *b*. The producibleness of chymical *Principles*, i. 372 *a*. The comprehensiveness of the corpuscular *Principles*, iii. 451 *b*. The nature and efficacy of chymical *Principles*, iii. 454 *b*. The phænomena of natural things must be explained by mechanical *Principles*, iii. 455 *b*. The chymical and corpuscularian *Principles* compared, iii. 601 *a*. An account of the several *Principles* of matter, iii. 77 *b*. The *Principles* of mixed bodies explained, i. 302 *a*. Chymical *Principles* produced *de novo*, i 312 *b*. The difference between material *Principles*, i. 321 *b*. Remarks on the three *Principles* of the chymists, i. 324 *b*.
PRINCES despise the Scripture from pride or laziness, ii. 130 *a*. The influence of their example considered, ii. 130 *b*.
PRINTING, the benefits arising from that invention, i. 421 *a*. An improvement of that art, v. 280 *b*.
PRISM, an experiment of the sun-beams trajected through a glass *Prism*, ii. 20 *a*. The reflections and refractions of light by a *Prism*, ii. 42 *b*. Experiments upon a *Prism* varnished over with transparent pigments, ii. 49 *b*. The colours of objects through a *Prism*, ii. 181 *b*. Experiment by an hexagonal *Prism* of crystal, v. 14 *a*. The colours of the rain-bow shewn by a *Prism*, iii. 197 *a*.
PRISMATICAL; reflections on a *prismatical* glass, ii. 180 *b*.

PRIVATION,

PRIVATION, the nature of it considered, iii. 363 *b*.
PRIVET-BERRIES, an experiment upon them, ii. 55 *b*.
PRIVILEGED THINGS, the notion of them explained, iv. 52 *b*. The knowledge of them of great use, iv. 53 *a*. Advice concerning judging in *privileged* subjects, iv. 55 *a*. How they are to be apprehended, iv. 55 *b*. What subjects are properly *privileged*, iv. 57 *a*. Negatives not to be framed about *privileged things*, iv. 57 *b*. Some *privileged things* above the reach of the understanding, iv. 65 *b*. How propositions about *privileged things* are to be judged, iv. 67 *b*. *Privileged things* to be supported by positive proofs, iv. 68 *a*. All objections about *privileged things* not to be answered, iv. 69 *b*.
PROBLEM, a mnemonical *Problem*, v. 423 *a*.
PROCESSES of chymists, some account of them, i. 399 *b*.
PRODUCIBLENESS of chymical principles, i. 372 *a*. Of salt, i. 376 *a*. Of sulphur, i. 393 *a*. Of inflammability, i. 397 *a*. Of phlegm or water, i. 412 *a*. Of earth, i. 415 *a*.
PRODUCTION, experiment on the *Production* of light, iii. 55 *b*. Of halo, and colours, iii. 56 *a*. Ways to help the *Production* of the air, iv. 106 *a*. To hinder the *Production* of air, iv. 108 *a*. Experiment about the *Production* and reproduction of forms, ii. 484 *a*. *Production* of heat and cold depends upon texture and other mechanical affections, iii. 571 *a*. The *Production* of acid salts, i. 378 *a*. Of volatile salts, i 379 *a*. Of lixiviate salts, i. 379 *b*. Of vinous spirits, i. 386 *a*. Of urinous spirits, i. 387 *a*. Of acid spirits, i. 387 *b*. Of oils, i. 393 *b*. Of inflammable spirits and consistent sulphur, i. 395 *a*. Of mercury, i. 398 *a*.
PROGRESSION, the use of it in numbers, iii. 158 *b*.
PROJECTION, some account of it, iv. 19 *a*.
PROOFS proportionate to the nature of things, iv. 68 *a*. Positive *Proofs* of one opinion compared with those of the other, iv. 69 *a*.
PROPORTION of force between the pressure of the air and the gravity of quicksilver, i. 24 *a*. The use of knowing *Proportions* between geometrical bodies, iii. 157 *b*. The great use of the doctrine of *Proportion*, iii. 159 *b*. An improvement to physiology, iii. 160 *a*. and to musick, iii. 161 *a*. The rule of *Proportion* explained, iii. 40 *a*. Syllogism founded on the doctrine of *Proportion*, iv. 45 *a*.
PROPHANENESS not repaired by the applause of wit, ii. 127 *b*. It is an unprofitable sin, ii. 128 *a*.
PROPHETS, some account of their manner of writing, ii. 104 *a*. The triumphs of the gospel foretold by the *Prophets*, v. 55 *a*.
PROPOSITIONS, negative, to be warily formed about privileged things, iv. 58 *a*. Odd *Propositions* deduced by geometricians, iv. 60 *b*. True *Propositions*, in what manner distinguished, iv. 64 *b*. How they are to be judged true or false, iv. 67 *a*.
PROPRIETATIS, ELIXIR, cures performed by it, v. 444 *a*.
PROSPER ALPINUS, his remarks on the plague at *Grand-Cairo*, iv. 288 *a*. A more particular relation of that plague, i. 539 *b*.
PROSPERITY, reflections upon it, ii. 163 *b*.
PROTASIS in rhetorick explained, ii. 142 *a*.
PROTESTANTS in *France* severely used by the French King, v. 407 *b*. Encouragement under their misfortunes, v. 416 *b*.
PROVENCE, an experiment upon a *Provence* rose and a saline spirit, ii. 57 *b*.
PROVIDENCE, the mysteries of it will be cleared in the other world, i. 185 *a*. The belief of a *Providence* a principle of revealed religion, v. 44 *b*. Divine *Providence* extends to the meanest creatures, v. 45 *a*. Proved from Cartesian principles, v. 45 *b*. From the experimental knowledge of God's works, v. 46 *a*. Reflection on *Providence* leads to revealed religion, v. 47 *a*. The nature of fortune and *Providence* examined, v. 224 *b*. The supernatural interpositions of divine *Providence* considered, iv. 363 *a*. The care of *Providence* in things of a general and important nature, iv. 387 *a*. The interposition of divine *Providence* in cases of life and death, iv. 398 *a*. A proof of *Providence* from the exquisite structure and symmetry of the mundane bodies, iv. 398 *b*. The seeming irregularities of *Providence* considered, iv. 399 *a*.
PRUNING, meditations upon the *pruning* of a fruit-tree, ii. 158 *a*.
PTOLEMEAN HYPOTHESIS concerning the motion of the fixed stars, iv. 342 *a*. That system changed and out of date, iii. 528 *b*. The *Ptolemean* system concerning the sun, i. 433 *b*.
PTOLEMY PHILADELPHUS procured a true copy of the law of *Moses*, iii. 409 *a*.
PUGH, Dr. his remarks on the island of *Teneriff*, v. 170 *b*.
PULEGIUM, the virtue of that *Plant*, iv. 327 *b*.
PULLET, account of the shining flesh of a *Pullet*, without sensible putrefaction, iii. 307 *b*.
PULSION, when a moved body precedes the movent, iii. 494 *a*.
PULTISS, to cure the kick of a horse, iv. 209 *b*.
PULVIS PATRUM, the virtue and use of it, v. 635 *a*.
PUMP, experiment on the raising of water in *Pumps*, iii. 20 *a*. *b*. Their difference on the tops of hills, iii. 22 *a*. The quality of *Pump*-water, v. 200 *b*. The ascension of water in *Pumps* examined, ii. 426 *b*. The reason of the ascent, ii. 427 *a*. *Pumps* will not raise water above thirty-five foot, iii. 445 *a*.
PUMP-MAKERS, their opinion of raising water, iii. 19 *b*.
PUPIL of the eye, its nature and use explained, iv. 409 *a*. A competent wideness of the *Pupil* requisite to distinct vision, iv. 524 *a*. The reason of the different figure of the *Pupil* in many animals, iv. 526 *a*. Its several uses anatomically explained, v. 699 *a*.
PURCHAS, his account of the plague, iv. 288 *b*.
PURGATIONES MENSTRUÆ, the reason of them, i. 445 *a*.
PURGATIVE, the working of *purgative* medicines not sufficiently explained, i. 199 *a*. Whence proceeds the *purgative* quality of English waters, iv. 246 *b*. Instances of the odour and exhalations of drugs being *purgative*, iii. 337 *b*. In what resides the *purgative* virtue of a simple, i. 353 *b*.
PURGE, a *Purge* given by outward application, iv. 210 *b*.
PURGING-WATERS retain their laxative virtue, iv. 244 *a*.
PURPLE-COLOUR, how produced, ii. 48 *a*. By logwood and sal-armoniack, ii. 64 *a*.
PUTREFACTION hindred by compressed air, iv. 121 *a*. An account of the *Putrefaction* of human serum, iv. 173 *b*. and of human blood, iv. 178 *a*. Ways of preserving bodies from *Putrefaction*, i. 470 *a*. Frozen bodies preserved from *Putrefaction*, ii. 273 *a*. From whence proceeds the *Putrefaction* of bodies, ii. 473 *a*. Volatile salts produced from *Putrefaction*, v. 118 *a*. A way to preserve bodies from *Putrefaction*, v. 316 *a*.
PUTTY, the way of making common *Putty*, ii. 39 *a*. Its effect upon pure glass, ii. 75 *a*. Its various uses, iii. 168 *b*.
PYE, Sir WILLIAM, famous for his memory, v. 429 *b*.
PYRENEAN MOUNTAINS, the quality of the air there, v. 166 *a*. Observations on the top of those mountains, v. 169 *b*. The different appearance of them, v. 185 *b*.
PYRITES, the nature of those stones, i. 305 *a*.
PYROPHILUS, who is meant by that name, i. 191 *b*.

PYTHAGORAS offers a hecatomb to the Muses, iv. 56 *b*. His great skill in astronomy, iv. 66 *b*. A worthy saying of his, i. 423 *a*. His joy for discovering a proposition in *Euclid*, iii. 418 *b*.

Q.

QUADRANTS, their use in taking of angles, v. 544 *a*.
QUAKERS, some account of them, v. 285 *b*.
QUALIFICATIONS by which a body is found to be volatile, iii. 610 *b*. Requisite to the fixity of bodies, iii. 619 *a*.
QUALITY, the history of particular *Qualities*, iii. 73 *a*. The sorts of physical *Qualities*, iii. 73 *b*. Objections against the Corpuscularian doctrine of *Qualities*, iii. 74 *a*. Different *Qualities* acquired by mixtures, iii. 74 *b*. *Qualities* change by altering the texture of bodies, iii. 75 *a*. and by an invisible agitation of the parts, iii. 75 *b*. The origin of *Qualities* whence derived, iii. 76 *b*. An account of the variety in the *Qualities* of bodies, iii. 79 *a*. The systematical *Qualities* of things, iii. 82 *a*. The *Qualities* acquired by bodies from unheeded agents, iii. 82 *b*. Cosmical *Qualities* supported by physical phænomena, iii. 83 *a*. Occult *Qualities* in specific medicines, iv. 303 *a*. May possibly in time be discovered, iv. 304 *a*. The different *Qualities* of bodies examined, i. 346 *a*. The *Qualities* of mixed bodies not explicable by the *tria prima*, i. 352 *a*. To be found in the elements of mixed bodies, i. 371 *a*. The pretence of occult *Qualities* used by the Aristotelians, i. 445 *a*. The *Qualities* of medicines discovered by chymistry, i. 499 *a*. Origin of forms and *Qualities*, ii. 451 *a*. Reasons for writing upon that subject, ii. 451 *b*. The nature of the *Qualities* of bodies a most useful and important subject, ii. 448 *a*. In what manner treated by *Epicurus* and *Lucretius*, ii. 458 *b*. What schoolmen understand by real *Qualities*, ii. 459 *a*. The nature of *Qualities* not explicable by the practical art of chymistry, ii. 459 *b*. The relative nature of physical *Qualities*, ii. 462 *a*. Sensible *Qualities* explained, ii. 463 *a*. *Quality* not always a real and physical entity, ii. 465 *a*. An imperfect definition of *Quality* by *Aristotle*, ii. 465 *b*. *Qualities* in bodies changed by the change of texture, ii. 468 *a*. Natural things generally operate by their *Qualities*, ii. 470 *a*. Sensible *Qualities* are the effects of the primary affections of matter, ii. 475 *a*. The different *Qualities* of parts of the same fruit, ii. 500 *a*. New *Qualities* produced in bodies by new textures, ii. 503 *b*. Experiments to prove it, ii. 505 *a*. Alterations of *Qualities* performed upon fluid bodies, ii. 524 *a*. Suspicions about hidden *Qualities* in the air, iii. 463 *a*. Experiments relating to those hidden *Qualities*, iii. 474 *a*. The mechanical origin of divers particular *Qualities*, iii. 565 *a*. Three ways of treating historically of particular *Qualities*, iii. 566 *a*. The *Qualities* of bodies to be explicated by mechanical principles, iii. 566 *b*. The various *Qualities* of bodies produced by mechanical operation, iii. 567 *a*. An argument in favour of the corpuscularian doctrine of *Qualities*, iii. 568 *a*. Heat and cold the most active of *Qualities*, iii. 570 *a*. Reflection on the chymists doctrine of *Qualities*, iii. 595 *a*. Their doctrine of *Qualities* particularly examined, iii. 596 *b*. The defects of the doctrine explained, iii. 599 *a*. *b*. The changes in the *Qualities* of metals, iii. 600 *a*. The scholastic doctrine of *Qualities* examined and confuted, iii. 601 *b*. Hypothesis of alkali and acidum insufficient to explain the phænomena of *Qualities*, iii. 606 *a*. The mechanical production of magnetical *Qualities*, iii. 643 *b*. Experiment touching the origin of *Qualities* and forms, ii. 496 *a*
QUANTITY, divisible *in infinitum*, iv. 41 *b*. Whether continued *Quantity* be made up of indivisibles, iv. 43 *a*. The endless divisibility of *Quantity* examined, v. 63 *b*.
QUARTAN AGUES, cured by the Peruvian bark, i. 481 *a*. By a plaister, i. 527 *b*. Occasioned by a melancholy humour settled in the spleen, iv. 414 *a*.
QUARTATION, an account of it, i. 319 *a*.
QUEEN of *France* brought to bed of a Moor, v. 324 *b*.
QUERCETAN's fantastick vegetable, v. 102 *b*. His description of mercury, i. 341 *b*. His character of the doctrine of three principles, i. 348 *b*. His famous experiment examined, ii. 384 *b*.
QUERIES concerning the printing of a Turkish Bible, v. 347 *b*.
QUICKLIME, the slacking of it in an exhausted receiver, iii. 57 *b*. Experiment with the serum of blood upon *Quicklime*, iv. 174 *a*. The distilling of concreted blood with *Quicklime*, iv. 201 *b*. *Quicklime* water a remedy for the spleen, iv. 215 *b*. Beat up with linseed-oil, an ointment for burns, iv. 328 *b*. Effect of distilling sal-armoniac with *Quicklime*, i. 317 *a*. The opinion of the chymists of dulcified *Quicklime*, i. 417 *b*. It will dissolve in divers menstruums, i. 418 *a*. Experiment on the heating of *Quicklime* in cold water, ii. 358 *b*. *Quicklime* exposed upon the cupel increased in weight, iii. 349 *b*. The heat in *Quicklime* on the affusion of cold water, iii. 576 *b*. Several experiments on *Quicklime*, iii. 578 *a*. On what depends the disposition of *Quicklime* to grow hot by water, iii. 578 *b*. Heat produced by sal-armoniack and *Quicklime*, iii. 584 *b*.
QUICKSILVER, its motion in the experiment *de vacuo*, i. 22 *a*. Rises or falls according to the temper of the air, i. 25 *b*. Its motion in the Torricellian experiment, i. 26 *a*. Its motion in an experiment concerning the altitude of the mercurial cylinder, i. 26 *b*. Whether it varies its height according to the tides, i. 27 *a*. It subsides proportionably as the air in the receiver is expanded, i. 28 *b*. The difference of weight between water and *Quicksilver*, i. 56 *b*. The surface of *Quicksilver* is convex, i. 57 *a*. It weighs fourteen times as much as the same bulk of water, i. 57 *a*. An account of it in the Torricellian experiment, i. 85 *a*. The phænomenon of its descent explained, i. 89 *a*. The reason of its descent at the top and feet of hills, i. 97 *b*. The cause of the ascent of *Quicksilver* in the filtre considered, i. 147 *b*. *Quicksilver* precipitated *per se*, may be reduced to running mercury, i. 150 *b*. How mixed to stick to glass, i. 248 *b*. The fumes of it fasten upon gold, i. 250 *a*. *Quicksilver* will penetrate the pores of foliated gold, i. 251 *b*. The way to coagulate it by the vapour of melted lead, i. 269 *b*. To turn it into a red powder, i. 271 *a*. The distilling of *Quicksilver* in a cucurbit with a glass-head, ii. 26 *a*. An experiment upon *Quicksilver* dissolved in aqua fortis, ii. 74 *a*. On the raising of *Quicksilver* by the spring of the air, iii. 6 *b*. By suction explained, iii. 16 *a*. The specifick gravities of *Quicksilver* and water, iii. 17 *b*. The raising of *Quicksilver* by compressed air, iii. 26 *a*. By the weight of

water examined, iii. 26 *b*. The motions of *Quickſilver* under a preſſure of water, iii. 27 *a*. The reaſon of its not ſubſiding in an inverted tube, iii. 35 *b*. It is uſed to ſeparate the ore of gold and ſilver, iii. 177 *b*. The ſurface of it in a tube is protuberant, iv. 2 *b*. The ſurface of it on the withdrawing of the air, iv. 3 *a*. The reflective power of *Quickſilver*, iv. 7 *a*. The purifying of *Quickſilver* through the ſkins of animals, iv. 208 *a*. *Quickſilver* found in the cavity of men's bones, iv. 217 *b*. Will permeate pieces of wood, iv. 220 *b*. Smells emitted from *Quickſilver* ore, iv. 278 *b*. Ore of *Quickſilver* a preſervative againſt the plague, iv. 290 *b*. The effect of *Quickſilver* decocted in common water, iv. 307 *b*. The peculiar effect of *Quickſilver* upon gold, iv. 310 *a*. It operates through the pores of the ſkin, iv. 320 *b*. The method of weighing *Quickſilver* in water, v. 10 *b*. An account of *Quickſilver* of the colour of gold, v. 105 *a*. The weight of a cubic inch of *Quickſilver*, v. 133 *b*. *Quickſilver* will paſs through glaſs, v. 233 *b*. The reaſon of the height of the *Quickſilver* in droughts, v. 251 *a*. Whether *Quickſilver* will enter the pores of gold, v. 384 *b*. Experiments in the changing of *Quickſilver*, i. 301 *a*. The ſalt or ſulphur of *Quickſilver* examined, i. 304 *a*. A clear liquor like water obtained from *Quickſilver*, i. 317 *b*. *Quickſilver* reduced to a thin liquor mingleable with water, i. 335 *b*. Of tin and pewter turned into gold, i. 343 *a*. *Quickſilver* heavier than earth of the ſame bulk, i. 349 *b*. Turned into a red body by fire, i. 352 *b*. Precipitated into a powder is cathartical, i. 353 *a*. *Quickſilver* is altogether taſteleſs, i. 364 *a*. Tranſmuted into true gold, i. 393 *b*. Whether common *Quickſilver* be obtained from a mineral body, i. 399 *b*. Silver turned into *Quickſilver*, i. 401 *a*. Made a conſiſtent body by vapour of lead, i. 403 *a*. *Quickſilver* eaſily amalgams with metals, i. 404 *b*. The heavieſt of bodies except gold, i. 406 *a*. *Quickſilver* may be ſpecifically lighter than the metal that affords it, i. 406 *b*. A ſort of it made more ponderous than common *Quickſilver*, i. 406 *a*. Running mercury may differ from common *Quickſilver* by depuration, i. 408 *b*. The method of reviving *Quickſilver*, i. 409 *a*. Experiment by a *Quickſilver* that penetrates gold, i. 410 *a*. To prove that *Quickſilver* may be corporally impregnated, i. 410 *b*. The differences between common *Quickſilver* and mercuries ſpiritually impregnated, i. 411 *a*. *Quickſilver* is a body fluid and inſipid, i. 413 *a*. *Quickſilver* turned into an aqueous liquor, i. 413 *b*. The precipitation of it without addition, i. 416 *b*. Experiment on the ſuction of *Quickſilver*, i. 445 *b*. Of curing a cataract by *Quickſilver*, i. 483 *a*. An excellent medicine made of *Quickſilver* and antimony, i. 518 *a*. *Quickſilver* made to ſalivate by inunction, i. 525 *b*. The fluxing property of *Quickſilver*, i. 550 *a*. The medical efficacy of it, i. 554 *a*. *Quickſilver* congealed by ſteams of lead, ii. 248 *b*. A trial to make it freeze, ii. 264 *a*. *Quickſilver* ſuſpended by the weight of the external air, ii. 428 *a*. *Specula* made of drops of *Quickſilver*, ii. 465 *a*. *Quickſilver* fixed into a conſiſtent body, iii. 192 *a*. The inconvenience of withdrawing the air out of a receiver by *Quickſilver*, iii. 249 *b*. Made to aſcend by heat, will appear again in its own form, iii. 330 *a*. Whether *Quickſilver* is penetrated by the air, iii. 487 *a*. Experimental diſcourſe of *Quickſilver* growing hot with gold, iii. 557 *a*. Experiment on *Quickſilver* reduced to a powder, iii. 585 *a*. The preparation of it precipitated *per ſe* conſidered, iii. 620 *b*. The reaſon of the ſubſiding of *Quickſilver* in glaſs pipes conſidered, iv. 383 *a*.

QUIETISTS, a ſect of them in *Italy*, v. 418 *b*.

QUINCE, the way to preſerve *Quinces*, iii. 145 *a*.

QUINTENAYE, his way of improving fruit-trees, v. 249 *a*. His ſkill in gardening, v. 360 *a*.

QUINTESSENCE, a vital *Quinteſſence* in the air that reſtores the ſpirits, i. 69 *a*.

QUOTATIONS, apology for the frequent uſe of them, ii. 237 *b*.

R.

RABBI, the ignorance of the Jewish *Rabbies*, ii. 109 *a*. Their opinion of the ceremonial law, ii. 116 *b*. Their panegyrical precept concerning the law, ii. 118 *b*.
RABBIT, experiments on the eyes of white *Rabbits*, i. 455 *a*. The eye of a white *Rabbit* anatomically explained, v. 699 *b*.
RABINICAL learning, the use of it, ii. 100 *a*.
RACK, a liquor, some account of it, i. 492 *b*.
RADISH, experiment on two *Radishes*, *in vacuo*, iv. 140 *b*.
RADIX VIRGINIA, good against the poison of the rattle-snake, and resists putrefaction, v. 631 *a*.
RAILING, no confutation of opinions, i. 200 *b*.
RAIMUND LULLY, his remark on the reducing of quicksilver, i. 335 *b*.
RAIN, the drops of it of a round figure, iv. 3 *a*. *Rain*-water wholesome, iv. 160 *a*. Mineral waters affected by *Rain*, iv. 250 *b*. The trial of *Rain*-water by spirit of salt, v. 201 *b*. The quality and virtue of *Rain*-water ii. 498 *a*. Experiment by distilling of *Rain*-water, ii. 519 *b*. Whether *Rain*-water be a homogeneous body, ii. 522 *b*. *Rain*-water endowed with petrescent particles, iii. 240 *b*. Drops of *Rain* that made red crosses upon linen, iii. 336 *a*. The use of excessive *Rains* in some countries, iv. 533. *a*.
RAINBOW, the appearance of a *Rainbow* by means of a prism, ii. 21 *a*. The colours of the *Rainbow* shewn upon blown glasses, ii. 52 *b*. And other bodies, ii. 53 *a*. The Cartesian hypothesis of a *Rainbow*, v. 373 *a*.
RAIN-WATER distilled is heavy, i. 349 *a*.
RAISINS, the producing of air in *Raisins* of the sun, iv. 107 *a*. Experiment with *Raisins* of the sun and vinegar, iv. 109 *b*. Bruised and diluted with water, iv. 146 *a*. Put to the serum of human blood, iv. 178 *a*. Experiment with bruised *Raisins* and water, v. 112 *a*. Concerning fermentation by *Raisins*, v. 181 *a*. The distilling of *Raisins* fermented with water, i. 386 *b*. The way to make wine of *Raisins*, i. 491 *b*.
RALEIGH, Sir *Walter*, the properties of his stone, i. 438 *a*. The virtue of his cordial, i. 498 *b*. The genuine receipt to make it, i. 557 *b*. The proper dose of it, i. 558 *a*.
RAMISTS, their philosophy and books exploded at *Cambridge*, v. 483 *b*.
RANELAGH, countess of, Mr. *Boyle*'s letters to her, v. 234 *b*. *&c*. Her letters to Mr. *Boyle*, v. 556 *b*.
RANUNCULUS, its nature and qualities, i. 475 *b*.
RAREFACTION by distension, how explained by *Linus*, i. 90 *b*. Three several ways of explaining it, i. 93 *a*. Some account of the manner in which it is performed, i. 94 *a*. *b*. The account given of it by *Linus* exploded, i. 95 *b*. A table of the *Rarefaction* of the air, i. 102 *b*. A particular explication of it, i. 113 *a*. Vegetation hindered by *Rarefaction* of air, iv. 146 *b*. A discovery of the admirable *Rarefaction* of air without heat, iii. 203 *a*. Pneumatically proved by a glass-egg filled with water, iii. 204 *a*. The *Rarefaction* of water by an æolipile, iii. 313 *a*.
RARITIES, the value of them lost when they are known, ii. 2 *b*.
RARITY, the effect of the *Rarity* and density of the air on animals, iii. 125 *b*.
RASBERRY, to make an imitation of *Rasberry*-wine, iii. 589 *b*. Remarks on *Rasberry*-wine, iii. 79 *a*.
RAT, an ague cured by the sight of a *Rat*, i. 528 *a*.
RATIONAL SOUL, of a higher order than corporeal, v. 43 *b*.
RATTLE-SNAKES, a remedy for their poison, iv. 305 *b*. Their fang-teeth hollow, v. 319 *a*.
RAVEN, an account of a white *Raven*, ii. 36 *b*.
REA, Mr. an account of his hortulan labours, v. 285 *a*.
READING, the ill consequences of continual *Reading*, v. 297 *b*.
REALGAR, the steams of it affect the head, iii. 337 *b*.
REASON, a discourse of things above *Reason*, iv. 39 *a*. How to employ our *Reason* on things above our *Reason*, iv. 39 *b*. What things are properly above our *Reason*, iv. 40 *a*. Three sorts of things above *Reason*, iv. 40 *b*. The genuine exercise of *Reason*, iv. 43 *a*. Things may hereafter be more clearly discovered by *Reason*, iv. 43 *b*. How things above *Reason* are impenetrable to us, iv. 44 *b*. By *Reason* we perceive that some things are above *Reason*, iv. 47 *a*. How we can speak of things above *Reason*, iv. 49 *a*. When things are properly above *Reason*, iv. 50 *b*. *Reason* to be indulged in its inquiries, iv. 54 *a*. Advices in judging of things above *Reason*, iv. 54 *b*. Not every thing false that contradicts a dictate of *Reason*, iv. 60 *b*. The dictates of *Reason* the safest rules to act by, iv. 62. *a*. *Reason* ought to comport with sensible observations, v. 57 *b*. Abstracted *Reason*, a very narrow thing, v. 58 *a*. *Reason* acts by the information of experience, v. 58 *b*. In what manner concerned about the mysteries of religion, v. 60 *a*. Things above *Reason*, and contrary to it, explained, v. 60 *b*. The nature of things repugnant to *Reason*, v. 62 *a*. Things seemingly so, reconcileable to it, v. 62 *b*. To be above *Reason* is a respective thing, v. 63 *b*. What surpasses *Reason* may not be contradictory to it, v. 65 *b*. *Reason* promotes the study of philosophy, i. 425 *b*. The weakness of *Reason* unassisted by revelation, iii. 414 *b*. The reconcilableness of *Reason* and religion, iii. 509 *a*. *Reason* should give way to revelation, iii. 512 *b*. Is not renounced by embracing religion, iii. 513 *a*. The divine attributes and perfections incomprehensible by *Reason*, iii. 515 *b*. The distinction of *Reason in abstracto* and *in concreto* explained, iii. 518 *b*. Of a thing's being contrary to *Reason*, or contrary to the received opinions of philosophers, iii. 519 *b*. Not against *Reason* to admit things difficult to be proved, iii. 526 *b*. The manner of judging whether a thing be contrary to *Reason* or not, iii. 527 *a*. To believe what cannot be demonstrated by *Reason* is not an irrational assent, iii. 530 *a*. Christianity not contrary to *Reason* assisted by revelation, iii. 535 *b*. There may be truths incomprehensible to *Reason*, v. 669 *a*. *Reason* ought not to confine itself to the dictates of philosophy, v. 679 *a*. Two kinds of principles or dictates of *Reason*, v. 681 *a*. The various significations and applications of *Reason* and right *Reason*, v. 682 *a*. Revealed religion does not oblige us to forsake the true dictates of *Reason*, v. 682 *b*. The proper duty and office of *Reason*, v. 683 *a*.
REBELLION justified by the church of *Rome*, v. 411 *a*.
RECEIPT, Mr. *Boyle*'s *Receipts*; for coughs, the stone, sharpness of urine, the tooth-ach, iv. 468 *a*. For agues, yellow jaundice, black jaundice, dysentery, king's-evil, iv. 468 *b*. For fits of the stone, convulsions in children, the piles, obstructions, consumptions, iv. 469 *a*. For agues, women in labour, strengthening the bowels, the cramp, stanching of blood, hæmorrhoids, iv. 469. *b*. For the dysentery, sweetening the blood, films in the eyes, convulsions in children, bringing away the after-birth, strengthning the stomach, iv. 470 *a*. For ulcers in the breast, fits of agues, fluxes, and gripings, iv. 470 *b*. For the piles, outward contusion, slight excoriation, ulcerous inflammations, iv. 471 *a*. For a cough with tickling rheum, tooth-ach, a rupture, heart-burnings, a strain, a recent strain, iv. 471 *b*. For weakness in the joints, loosenesses, difficulty of hearing, ruptures in the belly, fits of the gout, iv. 472 *a*. For ulcers and sores, tumours, black jaundice, the stone, fits of the mother, iv. 472 *b*. For the gout, continual fevers, a fresh strain, chilblains, leprosy, iv. 473 *a*. For the cholic, cleansing the womb, the itch, fluxes and dysenteries, iv. 473 *b*. For a sore throat, the cholic, sharp humours, hæmorrhoids, the scurvy, iv. 474 *a*. For the apoplexy, a sore throat, a cancer not broken, thin rheums, dysentery, pleurisy, gums and teeth, iv. 474 *b*. For hoarseness, jaundice in children, arthritick pains, *prolapsus uteri*, heat in the eyes, a weak sight, tertian agues, iv. 475 *a*. For the chincough, falling sickness in children, sore throats, the cholic, the heat of fevers, iv. 475 *b*. For the worms in children, a whitloe, king's-evil, a fresh strain, the piles, a burn, iv. 476 *a*. For a fresh strain, the cholic, for opening an issue, a sore throat, heat in the stomach, iv. 476 *b*. For apoplectic fits, scorbutical aches, aches upon the sharebone, iv. 477 *a*. For pricking pains in the sides, an anasarca, for agues, iv. 477 *b*. For aguish distempers, for tertian and quartan agues, iv. 478 *a*. For heart burnings in the stomach, an asthma, difficulty of breathing, pains in the bowels, flaggy breasts, iv. 478 *b*. For a fresh bruise, stanching of blood from the nose, or any part of the body, iv. 479 *a*. For resolving extravasated blood, stanching blood in wounds, for burns, iv. 479 *b*. For burns and scaldings, for making blisters with or without cantharides, iv. 480 *a*. For costiveness, a cancer in the breast, contusions, chilblains, consumptions,

tions, iv. 480 *b*. For a cold, coughs, asthmatic coughs, consumptive coughs, ripening of phlegm, iv. 481 *a*. For preventing corns, for corns, convulsive fits in children, fits of the mother, iv. 481 *b*. For convulsive asthma's, fits of the cholic, fits of the mother, convulsive cholics, iv. 482 *a*. For pains in the sides, the cramp, the dropsy, a dysentery, iv. 482 *b*. For incontinency of urine, a diarrhœa, contusion in the eye, clammy humours of the eyes, for a pearl on the eye, iv. 483 *a*. For a blood-shot eye, for preserving the eye, inflammation of the eye, an erefypelas, iv. 483 *b*. For various disorders and distempers of the eyes, iv. 484 *a*. *b*. For Lady *Fitzharding*'s eye-water, iv. 485 *a*. For an *ophthalmia sicca*, iv. 485 *b*. For the epilepsy, convulsions and epilepsies in children, iv. 486 *a*. For malignant fevers, dysenterical fluxes, those caused by sharp humours, iv. 486 *b*. For fluxes of the belly, fluxes and whites, the bloody-flux, falling down of the fundament, iv. 487 *a*. For an incipient gangrene, a clyster, gripes in children, a gargle for a sore throat, iv. 487 *b*. For a gonorrhœa, for gouty pains, iv. 488 *a*. For scorbutical running gouts, a gonorrhœa, a head-powder for sharp humours, iv. 488 *b*. For dulness of hearing, the hæmorrhoids, iv. 489 *a*. *b*. For the itch in hands or face, the yellow jaundice, iv. 490 *a*. For the king's evil, the pains in the kidneys, scorbutic pains in the limbs, to increase the milk of nurses, iv. 490 *b*. The bite of a mad dog, disorders of the nervous system, the piles, scorbutic pains in the limbs, pains and aches, iv. 491 *a*. For strengthening weak parts, the French pox, the palsy, paralytic afflictions, iv. 491 *b*. For pimples within the eye-lids, the pleurisy, the small-pox, rheumatism, and the contraction of the limbs, iv. 492 *a*. To cause rest, for the scurvy, an excoriation, roughness of the skin or lips, the taking out the marks of gun-powder, for a weak sight, iv. 492 *b*. To strengthen the sight, to strengthen the stomach and chest, for a recent strain, iv. 493 *b*. For the stone in the reins and bladder, iv. 494 *a*. Various remedies for the stone, for the tooth-ach, iv. 494 *b*. For an aching tooth, to fasten the teeth, iv. 495 *a*. To fasten teeth loose from the scurvy, to prevent the tooth-ach, iv. 495 *b*. To ripen tumours, for tumours in the throat and knee, for a sore throat, iv. 496 *a*. Various remedies for a sore throat, iv. 496 *b*. For tettars and the itch, the thrush in children, a tenesmus, stoppage of urine, iv. 497 *a*. For retention of urine, suppression of urine, fits of vomiting, for ulcers and wounds, iv. 497 *b*. For outward ulcers, bitings of venomous creatures, voiding of blood, fresh wounds, iv. 498 *a*. For fresh wounds, the jaundice and worms in children, iv. 498 *b*. For white fluors, an *ulcus uteri*, for preserving the sight, a whitloe, for warts and tumours, for bloody water, iv. 499 *a*. For the king's-evil, distempers in the bowels, scrophula's, epilepsies, the stone, against fluxes, iv. 499 *b*. For convulsions in children, the dropsy, roughness of the lips, iv. 500 *a*. For making artificial wine, for a purge for delicate persons, for the stone, iv. 500 *b*. For the exfoliation of a carious bone, for madness, for preventing a gangrene, for tumours, driving away gravel and small stones, iv. 501 *a*. For whitloes, rheum in the gums, rheums in the eyes the stone, the thrush in children, iv. 501 *b*. For the yellow jaundice, agnes, the stone, exulcerations in the kidneys, the jaundice, iv. 502 *a*. The stone, the worms in children, breaking a sore breast, an ague, cankers in the mouth, stopping hæmorrhages, scrophulous eyes, iv. 502 *b*. For the scrophulous humours of children, iv. 503 *a*. Against a vertigo, iv. 503 *b*. For a violent cold, humours in the eyes, tooth-ach proceeding from rheums, iv. 504 *a*. For clearing the head, the dysentery, the dropsy, blood-shot eyes, iv. 504 *b*. A burn or scald in the eye, for the teeth and gums, tumours, hysterical affections, for clearing the womb, iv. 505 *a*. For corns, stanching of blood, the tooth-ach, agues, the cholic, iv. 505 *b*. For deafness, burns, the leprosy, the head-ach, the hiccup, the cholic, cleansing the womb, for the *furor uterinus*, iv. 506 *a*. For the sight, the scurvy, recent burns, tooth-ach, stone in the bladder, inflammation in the eyes, iv. 506 *b*. For the king's-evil, for expelling gravel, the king's-evil, for stopping a hollow tooth, iv. 507 *a*. For gleetings, the biting of a viper, the suppression of urine, an ague, for spleen and vapours, iv. 507 *b*. For fits of the head-ach, the itch, for sweetening the blood, for ulcers, for costiveness, the aching of a hollow tooth, iv. 508 *a*. For the bloody-flux, pleurisies, redness of the eyes, for a green wound, suppression of the *menses*, for preventing apoplectic fits, iv. 508 *b*. For scrophulous ulcers, a recent strain, inflammation of the eyes, asthmatic distempers, an ague, for tettars, iv. 509 *a*. For a gonorrhœa, a bruise of the eye, an erefypelas, whites in women, ulcers and sores, iv. 509 *b*. For want of sleep, convulsive fits, the piles, fluxes of the belly, iv. 510 *a*. For corns, burns and stanching of blood, bloody-flux, redness of eyes, iv. 510 *b*. For relaxation of the uvula, sharp rheums, for disaffections of the eyes, iv. 511 *a*. For the stone, fits of the mother, the cholic, cleansing the blood, scorbutic gums, fastening the teeth, iv. 511 *b*. For a contusion of the eye, for various pains and disorders of the eyes, iv. 512 *a*. *b*. For the bloody-flux, the dropsy, inflamed eyes, cleaning the teeth, an ague, king's-evil, iv. 513 *a*. For provoking urine, costiveness, gripes and fluxes, redness of eyes, a strain, asthmatic distempers, an erefypelas, iv. 513 *b*. For the whites in women, for corns, burns, and stanching of blood, redness of the eyes, relaxation of the uvula, sore eyes, iv. 514 *a*. For the stone, scorbutic gums, fastening the teeth, bruise in the eye, king's-evil, the stone, iv. 514 *b*.

RECEIPTS in physic, in what manner to be considered, i. 581 *a*. Common *Receipts* not to be despised, i. 583 *a*. *Receipts* in physic stuffed with many ingredients, i. 503 *a*.

RECEIVER in an engine to try the spring of the air described, i. 5 *b*. The air in the *Receiver* not pressed by the incumbent pillar of the atmosphere, i. 11 *a*. A *Receiver* not useless because it is cracked, i. 17 *b*. Not destitute of all bodies, though the air be sucked out, i. 25 *a*. Animals do not die in the *Receiver* for want of air, i. 66 *a*. The motion of the air in the *Receiver*, particularly considered, i. 137 *a*. No *Conatus fortissimus circularis* in the *Receiver*, i. 137 *b*. The breaking of blown bladders in an emptied *Receiver*, iii. 13 *a*. The bending of a springy body in an exhausted *Receiver*, iii. 22 *b*. To know when the air is drawn out of the *Receiver*, iii. 23 *a*. The ascension of liquors in an exhausted *Receiver*, iii. 36 *a*. The virtue of the loadstone in an exhausted *Receiver*, iii. 40 *b*. Trials of a brass syringe in a *Receiver*, iii. 41 *b*. The falling of bodies in an exhausted *Receiver*, iii. 32 *a*. Propagation of sounds in an exhausted *Receiver*, iii. 53 *a*. The breaking of a glass-drop in an exhausted *Receiver*, iii. 55 *a*. Experiment on the motion of mites in the *Receiver*, iii. 134 *a*. Factitious air transmitted from one *Receiver* into another, iv. 103 *a*.

RECEPTACULUM CHYLI blown into, continues the pulse of the heart, v. 323 *b*.

RECOILING of air from the ground, an experiment concerning it, i. 46 *a*.

RECONCILEABLENESS of reason and religion proved, iii. 509 *a*.

RED COLOUR produced by acid salts, ii. 55 *b*. And by alcalizate salts, ii. 59 *a*. And by bodies abounding in sulphureous parts, ii. 59 *b*. The effect of a *Red Colour* on elephants and turky-cocks, iv. 265 *a*.

REDDLE, the use of it in the measles and small-pox, v. 443 *b*.

REDEMPTION of mankind discovered by revelation, iii. 414 *a*. It is properly called the great mystery of godliness, iv. 349 *a*. The nature and design of the redemption of mankind, v. 731 *a*.

REDINTEGRATION, an experiment upon the *Redintegration* of nitre, i. 230 *b*. Of an analysed body, of consequence in philosophy, i. 237 *b*. Experimental attempts concerning the *Redintegration* of bodies, ii. 492 *a*.

REDUNDANCY, a good sign in a young writer, ii. 142 *a*.

REEVES, Mr. an account of his telescope, v. 344 *a*.

REFLECTIONS occasional on several subjects, ii. 138 *a*. The nature and use of them, ii. 144 *a*. The surprising delight of them, ii. 149 *a*. Are derived from the rock of nature, ii. 149 *b*. Not properly confined to divinity, ii. 151 *a*. The subjects of them, ii. 151 *b*. The effects of them upon the soul, ii. 161 *a*. *Reflections* on giving meat to a dog, ii. 162 *a*. On distilling spirit of roses in a limbeck, ii. 162 *b*. On wandering on *Mendip* hills, ii. 163 *a*. On one's making syrup of violets, ii. 209 *a*. On the sight of a paper kite in a windy day, ii. 210 *a*. On killing a crow in a hog-trough, &c. ii. 211 *a*. On the same subject, ii. 211 *b*. On a glow-worm included in a crystal phial, ii 212 *a*. On a court's being put into mourning, ii. 212 *b*. On hearing a lute tuned and played on, ii. 213 *b*. On being

being presented with a rare nosegay, ii. 214 *a*. On a child that cried for the stars, ii. 215 *b*. On a lady's fine closet, ii. 216 *a*. On a lark caught with day-nets, ii. 217 *a*. On a child's picking plumbs out of a piece of cake, ii. 218 *a*. On sweetmeats counterfeited in wax, ii. 219 *b*. On the eating of oysters, *ibid*. On a lanthorn and candle in a windy night, ii. 221 *a*. On the first audience of the *Russian* embassador, ii. 221 *b*. On the sight of roses and tulips growing near together, ii. 222 *b*. On the sight of a branch of coral, ii. 223 *b*. On seeing the effects of a burning glass, ii. 223 *b*. On finding a horseshoe in the highway, ii. 224 *a*. On the shop of an ugly painter full of pictures of handsome ladies, ii. 225 *a*.

REFINER, the metaphor of a *Refiner* judiciously used, i. 164 *b*. Their way of parting silver and copper, i. 217 *a*. The heat and cold of the several *Regions* of the air examined, ii. 359 *b*. *Refiner*, a particular account of that trade, iii. 142 *a*. The manner of its invention, iii. 194 *b*. Aqua fortis used by *Refiners*, iii. 171 *b*. Their way of recovering silver out of lace, and other mixtures, iii. 640 *a*.

REFINING, an account of the *refining* of silver, i. 212 *a*. Of the *refining* of gold, i. 212 *b*.

REFRACTION of the air explained, i. 28 *a*. Colours produced by *Refraction*, ii. 18 *b*. Necessary to the explication of colours, ii. 22 *a*. Account of the *Refraction* of spirit of wine, v. 310 *b*. Experiments on the *Refraction* of liquors, v. 323 *a*. More particular inquiries concerning it, v. 326 *b*. Tables of *Refraction* founded on experiment, v. 540 *b*. Trial of *Refraction* upon sallad oil, v. 541 *a*. The effect of the *Refraction* of the air, v. 176 *a*. With regard to the rising and setting of the sun, v. 176 *b*. *Refraction* of the sun and stars affected by the coldness of the air, ii. 319 *b*.

REFRIGERATION of the air, the cause of it, iv. 285 *a*. The effect on loadstones by perpendicular *Refrigeration*, v. 80 *a*. The *Refrigeration* of bodies considered, ii. 248 *b*. Produced by poisons, iii. 573 *a*.

REGALE, a dispute about it in *France*, v. 407 *a*.

REGION, the temperature of the subterraneal *Regions*, iii. 95 *a*. An account of a cold *Region* in the earth, iii. 96 *a*. The first *Region* of the earth, of a various temperature, iii. 96 *b*. The second *Region* of the earth cold, iii. 98 *b*. The quality of the air in the middle *Region*, iii. 99 *b*. The temperature in the third *Region*, iii. 100 *b*. An account of the two *Regions* of the sea, iii. 105 *b*.

REGISTER, Mr. *Townley*'s *Register* of the air, v. 135 *b*. Mr. *Locke*'s *Register* of the change of the weather, v. 136 *a*. An explication of that *Register*, v. 163 *a*.

REGULA COMBINATORIA, its use, iii. 158 *b*.

REGULUS of antimony, i. 209 *a*. *Regulus Martis Stellatus*, an account of it, iv. 9 *b*. The particular ingredients of the starry *Regulus*, i. 332 *b*.

RELAPSE in sin, the danger of it, v. 220 *b*. Meditation on a *Relapse* in a disease, ii. 175 *b*.

RELATION, comfortable thoughts on the death of *Relations*, v. 240 *b*.

RELATIONS concerning the bottom of the sea, iii. 110 *a*.

RELIGIO STOICI, some account concerning it, v. 320 *b*.

RELIGION and philosophy not incompatible, v. 37 *a*. Reasons for pleading in defence of *Religion*, v. 38 *b*. Philosophy leads to sentiments of *Religion*, v. 41 *b*. Natural *Religion* assisted by experimental philosophy, v. 47 *a*. Revealed *Religion* supported by miracles, v. 53 *a*. The quick progress of the Christian *Religion*, v. 54 *b*. Truths in *Religion* above Reason, v. 61 *a*. Christian *Religion* proposes the highest rewards to virtue, v. 70 *b*. Arms against the influence of bad example, v. 71 *b*. Is discountenanced by being ashamed to own it, v. 215 *a*. Stories of witchcraft of disservice to *Religion*, v. 244 *b*. The study of philosophy consistent with *Religion*, i. 425 *b*. The benefits of *Religion* surpass those of trade, riches, or physick, iii. 431 *b*. Our knowledge and faculties enlarged by *Religion*, iii. 434 *b*. The reconcileableness of Reason and *Religion*, iii. 509 *a*. The truth and name of *Religion* questioned, iii. 510 *a*. Reasons for defending it against libertines by a lay hand, iii. 511 *a*. To embrace *Religion*, we must not renounce our reason, iii. 513 *a*. *Religion* not repugnant to the true principles of natural philosophy, iii. 514 *a*. Christian *Religion* is that system of revealed truths clearly delivered in the Scriptures, iii. 515 *a*. Philosophical scruples against the mysteries of *Religion* considered, iii. 522 *b*. What degree of evidence *Religion* reasonably requires, iii. 530 *b*. *Religion* is supported by rewards and punishments, iii. 532 *a*. Is to be embraced, if it appears more likely to be true, than not to be true, iii. 532 *b*. Is supported by proofs sufficient to justify a rational man in the belief of it, iii. 535 *a*. *Religion* in danger from Hobbians, Stubbians, atheists, blasphemers, &c. v. 505 *b*. The grand objections against the truth of the christian *Religion* answered, v. 655 *a*. The abstruse nature of divers articles of *Religion* considered, v. 662 *b*. The complaint of the obscurity of *Religion* examined, v. 667 *a*. Persons of quality successful in writing upon religious subjects, ii. 89 *b*. The early study of it recommended, ii. 129 *a*. The passions ought to be governed by *Religion*, ii. 192 *b*. The state of the protestant *Religion* in *France*, v. 407 *b*. Natural *Religion*, the foundation of Christianity, v. 685 *b*.

REMEDIES, the corpuscular philosophy reconcileable with specific *Remedies*, iv. 303 *a*. Reasons for the admitting of specific *Remedies*, iv. 304 *b*. The nature and quality of external *Remedies*, iv. 310 *a*. Specific *Remedies* operate on a particular part, iv. 314 *b*. They rectify the state of the blood, iv. 317 *b*. The cheapness of chymical and Galenical *Remedies* stated, i. 509 *a*. Medicinal experiments, or a collection of choice and safe *Remedies*, iv. 464 *a*.

REPENTANCE, the nature of it, ii. 169 *b*. Not to be begun on a death-bed, ii. 174 *b*. The validity of a death-bed *Repentance* considered, ii. 175 *b*. *Repentance* ought not to procure shame, v. 214 *a*. Not to be discouraged by being derided, v. 215 *b*. The nature of *Repentance* inquired into, v. 216 *a*. The difficulties of it considered, v. 217 *b*. Is inconsistent with a purpose of relapsing, v. 220 *b*.

REPETITIONS in Scripture inquired into, ii. 110 *a*.

REPORT, a small collection of strange *Reports*, v. 75 *a*. Strange *Reports* in two parts, v. 101 *a*.

REPROOF, the methods of sweetening *Reproofs*, ii. 150 *a*. The benefit of *Reproof* by a friend, v. 220 *a*.

REPUTATION, reflections upon it, ii. 165 *a*.

RESIN, account of a metalline *Resin*, iv. 297 *b*.

RESISTANCE of water expanded by cold, ii. 289 *b*.

RESPIRATION, the nature of it tried by an experiment, i. 63 *a*. The difficulties concerning it proposed, i. 64 *b*. The use of it, i. 66 *b*. The necessity of the air in *Respiration* explained, i. 67 *a*. Air too much dilated, not serviceable to *Respiration*, i. 68 *a*. An experiment concerning *Respiration*, i. 70 *b*. Pneumatical experiments about *Respiration*, iii. 114 *a*. Continuation of experiments concerning *Respiration*, iii. 123 *a*. On *Respiration* upon high mountains, iii. 124 *b*. On the rarefaction of air unfit for *Respiration*, iii. 128 *b*. The nature and benefit of *Respiration*, v. 369 *b*. Whether the use of it be to cool the heart, i. 466 *a*.

REST, the absolute *Rest* of bodies considered, i. 281 *a*. Is properly a principle of things, i. 361 *b*.

RESTITUTION of bent springs, the reason of it, i. 124 *b*. *Hobbes*'s notion of the *Restitution* of bodies, i. 125 *a*. A particular inquiry into the *Restitution* of bodies, iii. 22 *b*.

RESURRECTION, physico-theological considerations about the possibility of it, iii. 537 *a*. The *Resurrection* not knowable by the light of nature, nor producible by physical agents, iii. 538 *a*. The mystical *Resurrection* in *Ezekiel* considered, iii. 540 *a*. Objections against the possibility of the *Resurrection* answered, iii. 540 *b*. The *Resurrection* proved from the power of God, and the authority of Scripture, iii. 543 *a*. The doctrine of that *Resurrection* may be variously explained, iii. 544 *a*. In what manner the *Resurrection* will be effected, iii. 545 *a*.

RESUSCITABLE, an account of *resuscitable* plants, v. 102 *a*.

RETINA of the eye, its use anatomically explained, v. 697 *a*.

REVELATION, prophecies in that book, the use of them, ii. 109 *a*.

REVELATION, the benefits of supernatural *Revelation*, v. 46 *b*. *Revelations* repugnant to reason examined, v. 63 *a*. The advantages of divine *Revelation*, iii. 410 *a*. Its use in promoting a virtuous life, ii. 113 *a*. Discoveries by *Revelation* to be believed, iv. 58 *a*. *Revelation* leads us to the knowledge of God, iv. 340 *b*. the creation of the world, the nature of man and other creatures, iii. 411 *b*. Our assent to *Revelation* does not reject the authority of reason, iii. 529 *b*. *Revelation* being part of the rule of right reason cannot be contrary to it, v. 683 *b*. The discoveries of it congruous and symmetrical to reason, v. 730 *a*. Rewards of virtue and a good conscience, v. 68 *a*.

RHEA, his book on the culture of flowers, v. 402 *b*.
RHETORICK of no use, but to please or persuade, ii. 123 *a*. The art of it not studied by the Chinese, ii. 123 *b*. Reflections on *Rhetorick* in sermons, ii. 179 *a*.
RHODES, an account of the weather at *Rhodes*, ii. 178 *a*.
RHODIUM, the sweetening quality of oil of *Rhodium*, iv. 192 *a*.
RHONE, the river, some account of it, i. 35 *a*.
RHUBARB, the nature and qualities of it considered, i. 148 *b*. Its effect upon the urine, iv. 306 *b*. Is purgative and astringent, iv. 336 *a*.
RIB, remarks upon *Adam*'s *Rib*, iii. 540 *a*.
RIBBON, a discovery of the colours of *Ribbon* by the touch, ii. 13 *b*. Experiment on a taffatee *Ribbon* with spirit of salt, v. 87 *a*.
RICCIOLO, his opinion of the height of the atmosphere, i. 9 *b*. His estimation of the weight of air, i. 55 *b*. On the height of the clouds, iii. 32 *a*. His problem concerning the vibration of a pendulum, iii. 160 *b*. His remark on the motion of the fixt stars, iv. 342 *a*.
RICE, an account of *Rice* sown in the water, iii. 144 *a*.
RICKETS, a remedy for the distemper, iv. 335 *a*. Cured by a preparation of colcothar, i. 523 *b*. A disease of a late date, iii. 92 *a*. Cured with medicated breads and beers, v. 421 *a*.
RING, the effect of certain chymical *Rings*, iii. 67 *a*. The operation of a metalline *Ring*, iv. 225 *b*.
RINGS in the grass, called Fairies dances, accounted for, v. 477 *a*.
RIVER, the surface of a *River* of different colours explained, ii. 25 *b*. The good and harm done by *Rivers*, ii. 191 *b*. The adjacent lands enriched by *Rivers*, ii. 193 *a*. The breaking out of a new *River*, iii. 94 *b*. Whether great *Rivers* freeze first at the bottom, ii. 338 *a*.
RIVERIUS, his account of the transplantation of diseases, i. 531 *a*.
ROCHAS, Monsieur de, his strange experiment upon water, i. 315 *b*.
ROCK-CRYSTAL, its specifick gravity, v. 3 *b*. Pieces of it strike fire between themselves, iv. 253 *b*. Used to explain the intensive gravity of liquors, v. 14 *a*.
ROCKS softened by fire, v. 158 *a*. The discovery of *Rocks* under water from the tops of hills, v. 539 *a*. The blowing up of *Rocks* by gunpowder, iii. 181 *b*.
ROME is mystical *Babylon*, v. 408 *a*.
ROOM, experiments in a darkened *Room*, ii. 42 *a b*. The use of a darkened *Room* for experiments, v. 698 *b*.
ROPE, the effect of watery particles upon a *Rope*, iv. 257 *b*. Account of a *Rope* shortened by water, iv. 281 *a*. A pestilential contagion preserved in *Ropes*, iii. 320 *a*. *Ropes* will shorten in moist weather, iii. 322 *a*. The effect of the moisture of the air upon a *Rope* tried by experiment, iii. 403 *a*. A way to know the weather by a weight upon a *Rope*, v. 114 *b*.
ROSE, *Roses* lose their colour by fume of sulphur, ii. 54 *b*. An experiment upon red *Rose* leaves, ii. 63 *b*. Reflections on the distilling of *Roses*, ii. 162 *b*. Experiment on *Roses* in common air, iv. 121 *a*. In compressed air, iv. 148 *b*. Experiment with red *Rose* leaves and spirit of salt, v. 85 *b*. An essential oil to be obtained from *Roses*, v. 100 *b*. A particular account of the planting of *Roses*, v. 262 *b*. Of the odour of the essence of *Roses*, v. 402 *b*. The oil of *Roses* like white butter, i. 339 *b*. A spirit drawn from fermented *Roses*, i. 514 *a*. The effect of the smell of *Roses* upon a lady, iii. 327 *a*. Upon an apothecary, iii. 327 *b*.
ROSE-BUSH, a particular account of the various sorts of *Rose-bushes*, i. 215 *b*. Experiment by Rose-flies in a vacuum, iii. 133 *a*.
ROSEMARY, the smoke of it settled to a level superficies, i. 241 *b*. The smell of it not impaired by freezing, ii. 335 *b*. Experiment on *Rosemary* with water, iv. 157 *b*.
ROYAL SOCIETY, a scheme for the improvement of it, v. 498 *b*.
ROT among sheep examined, with a cure for it, v. 520 *b*. More particularly considered, and remedies against it, v. 447 *a*.
ROTA ARISTOTELICA, the explication of it, i. 116 *a*. More exactly considered, i. 117 *a. b*. Appears difficult to the mathematicians, iv. 44 *a*.
RUBBING, bodies made odorous by *Rubbing*, iii. 324 *a*.
RUBY of sulphur, the way of making it, i. 571 *b*.
RUBY, *Rubies* vary their degrees of lustre, i. 287 *b*. They give no light in the dark, ii. 82 *b*. The electrical virtue of a *Ruby*, iii. 70 *b*. A *Ruby* void of colour, the reason of it, iii. 222 *a*.
RUE, the use of it in time of the plague, v. 444 *a*.
RULES not to be conceived in too general terms, iv. 61 *b*. The *Rules* of judging of things, iv. 62 *a*.
RUMINATING animals, why not provided with teeth, iv. 544 *b*.
RUNNET, its effect in turning milk into curds, i. 268 *a*.
RUSSIA, an account of the snow there, ii. 25 *a*. The colour of the hair among the *Russians*, ii. 35 *b*. The seasons and the weather in *Russia*, ii. 322 *a*. Effects of extreme cold in that country, ii. 328 *a*.
RUST, iron preserved from rust, iii. 148 *b*. The dangerous effect of the *Rust* of a nail, v. 441 *a*.
RUSTY-WELL, an account of it, v. 363 *a*.
RYCAUT, Sir *Paul*, his letters to Mr. *Boyle*, v. 597 *a*. His account of the state of *Ireland*, v. 597 *b*. He intends to write the history of the wars of *Hungary*, v. 598 *b*.

S.

SABBATH, the ancient institution of the *Sabbath* explained, i. 442 *b*.
SACCHARUM SATURNI, an account of it, ii. 74 *a*. The particular virtues of that medicine, iv. 333 *b*. The effect of *Saccharum Saturni* distilled, i. 321 *a*. An inflammable spirit obtained from it, i. 386 *b*.
SACK, the way to make *Sack* freeze, ii. 263 *a*. An inquiry into the reason of its freezing, i. 311 *a*.
SACRAMENTAL, the words in giving the *Sacramental* wine, *Drink ye all of it*, explained, ii. 108 *b*.
SAFFRON, the effect of the spirit of blood upon *Saffron*, iv. 184 *a*.
SAGA in *Germany*, account of the iron of that place, i. 358 *a*.
SAGE-BREAD, its virtue and use, v. 420 *b*.
SAIL, reasons for wetting the *Sails* of ships, iii. 87 *a*.
SAILING, with all winds, an account of it, v. 286 *b*.
SAINT, the souls of *Saints* are not in heaven till the day of judgment, v. 410 *a*.
SAL-ARMONIAC, experiment upon it, and *limatura cupri*, iv. 141 *b*. And filings of copper, iv. 142 *a*. On *Sal-Armoniac in vacuo*, iv. 143 *b*. And oil of vitriol, iv. 144 *b*. Of *Sal-Armoniac*, and spirit of human blood, iv. 188 *a*. *Sal-Armoniac*, of what made, iv. 188 *b*. Spirit of *Sal-Armoniac*, of use in fits of the mother, iv. 190 *b*. *Sal-Armoniac*, used in examining sand-gold, v. 32 *a*. The salts of *Sal-Armoniac* to be separated without fire, i. 306 *a*. To be found in urine, i. 399 *a*. *Sal-Armoniacum philosophorum* explained, i. 407 *b*. The power of *Sal-Armoniac* to carry up fixed bodies, i. 565 *a*. *Sal-Armoniac*, a succedaneum to hartshorn, i. 569 *a*. Way of preparing the spirit of it, i. 569 *b*. Infrigidating mixtures made with *Sal-Armoniac*, ii. 547 *a*. Cold produced by *Sal-Armoniac*, ii. 549 *b*. The piercing nature of the spirit of *Sal-Armoniac*, iii. 322 *b*. A trial made of spirit of *Sal-Armoniac* in an hermetically sealed glass, iii. 556 *b*. Heat produced by a dissolution of *Sal-Armoniac* in common water, iii. 580 *a*.
SAL-CIRCULATUM of *Paracelsus*, the effect of it, i. 378 *a*. Its quality more particularly explained, i. 331 *b*.
SAL MIRABILE GLAUBERI, an account of it, iv. 247 *a*. Its nature and use considered, ii. 512 *b*.
SAL TRIUM REGNORUM, the nature of it examined, iv. 334 *a*.
SALAMANDER, what the blood of the *Salamander* intends in chymistry, i. 234 *a*.
SALIA ENIXA, the nature of them, iv. 195 *a*. *Salia volatilia oleosa*, their nature and effect, iv. 195 *b*.
SALINE LIQUORS, the various motion and effects of them, i. 236 *a*. The qualities of *saline* spirits in distillation, iv. 179 *b*. The way of bringing the *saline* part of blood into a liquid form, iv. 191 *a*. The first *saline* concretions produced from atoms not *saline*, i. 377 *a*. The qualifications of a *saline* body, i. 377 *b*. The compositions and decompositions of *saline* particles, i. 383 *b*. What the chymists mean by a *saline* body, i. 338 *a*.
SALIVATION, the reason of it inquired into, ii. 41 *a*. Is raised by outward ointments, iv. 321 *a*.
SALL, Dr. his character, v. 234 *b*. His letters to Mr. *Boyle*, v. 602 *b*. His opinion of reprinting the New Testament in *Irish*, v. 603 *a*. And of its being read in that kingdom, v. 604 *b*. His zeal for printing the *Irish* Bible, v. 607 *b*.
SALLAD OIL, an experiment with it, to try the pressure of the outward air, i. 37 *a*. An experiment upon hot *Sallad Oil*, i. 44 *b*. By pouring *Sallad Oil* upon aqua

aqua fortis, i. 270 *a*. An account of the refraction of *Sallad Oil*, v. 321 *b*.

SALLUST, some account of his style, ii. 123 *b*.

SALT, an account of *Salts* in the air, v. 116 *a*. The air impregnated with the effluvia of common *Salt*, v. 117 *b*. The spirit of *Salt* found in virgin-earth, v. 117 *b*. To try what *Salts* abound in the air, v. 119 *a*. The effect of spirit of *Salt* upon copper, v. 119 *b*. Whether the air be impregnated with esurine *Salt*, v. 121 *a*. The operation of sea-*Salt* upon iron, v. 180 *a*. Experiment on different *Salts* dissolved in water, v. 189 *b*. The precipitating quality of common *Salt*, v. 199 *b*. The nature of fixed *Salt* drawn out of potters earth, v. 302 *a*. Whether *Salts* operate through a sealed glass, v. 348 *b*. The *Salt* of gold not to be found, i. 324 *b*. The virtues of the fixed *Salt* of calcined bodies, i. 338 *a*. The disparity of *Salts* examined, i. 338 *b*. An antipathy between elementary *Salts*, i. 339 *a*. *Salt* is the basis of solidity, i. 346 *b*. The fusibility of *Salt* the effect of heat, i. 351 *a*. The producibleness of *Salt*, i. 376 *a*. Whether *Salts* may be produced *de novo*, or destroyed, i. 377 *a*. The effect of the dissolution of *Salt* and sulphur, i. 377 *b*. Three sorts of *Salt*, the acid, the alcalizate, and the volatile, i. 378 *a*. Acid *Salts* not pre-existent in the body that affords them, i. 378 *b*. Lixiviate *Salts* destroyed by the operation of fire, i. 383 *b*. Common *Salt* produced from bodies different from it, i. 384 *a*. The taste of crude *Salt*, i. 387 *b*. The different operations of acid and alcalizate *Salts*, i. 499 *b*. The medicinal quality of aromatized *Salts*, i. 577 *a*. The doctrine of volatile *Salts* not fully opened, i. 578 *b*. The freezing of water by snow and *Salt*, ii. 258 *b*. Doubts and experiments touching the curious figures of *Salts*, ii. 488 *a*. Experiment on turning an acid *Salt* into an alkali, ii. 510 *a*. The sea made brackish by the dissolution of terrestrial *Salt*, iii. 382 *a*. The growth of *Salts* in bodies exposed to the air, iii. 465 *a*. The regeneration of *Salts* in bodies robbed of them, explained, iii. 466 *a*. Volatile *Salts* will not turn into air, i. 33 *a*. *Salt* of tartar, an experiment with it, to try the pressure of the air, i. 37 *b*. An account of sophisticated *Salt*, i. 206 *a*. Corrosive *Salts* may be dulcified by corroding bodies, i. 238 *b*. A quantity of liquor obtained from sea-*Salt*, i. 243 *b*. The white of an egg mixed with spirit of *Salt*, its effect, i. 264 *b*. From whence the coagulating power of *Salt* is derived, i. 273 *a*. The various properties and effects of *Salts*, ii. 47 *a*. Experiments by *Salts* upon syrup of violets, ii. 53 *b*. The use of *Salts* in the changing of colours, ii. 55 *b*. The operation of *Salts* upon vegetable substances, ii. 56 *b*. The several distinctions of *Salts*, ii. 66 *b*. The ascension of *Salts* along the sides of glasses, iii. 37 *a*. Remarks on the solution of sea *Salt*, iii. 38 *a*. Volatile *Salt* flies away by exhalation, iii. 65 *a*. The virtue of *Salts* in husbandry, iii. 144 *a*. Experiment with water and dissolved *Salt in vacuo*, iv. 139 *b*. Boiled flesh will keep long without *Salt*, iv. 156 *a*. The discovery of *Salt* in water, iv. 160 *b*. The volatile *Salt* of human blood, iv. 168 *a*. The figuration of that *Salt*, iv. 168 *b*. Experiment on volatile *Salt* of blood and spirit of nitre, iv. 169 *b*. The qualities of the fixed *Salt* of human blood, iv. 170 *b*. Experiment with spirit of *Salt* and spirit of human blood, iv. 182 *b*. *Salt* arising from a distillation of dried blood, iv. 197 *b*. Volatile *Salt* of blood dissoluble in water, iv. 198 *b*. Whether mineral water be impregnated with common *Salt*, iv. 244 *b*. The nature of the *Salt* found in purgative waters, iv. 246 *b*. The effect of spirit of *Salt* upon filings of steel, iv. 295 *a*. Experiments on bodies with spirit of *Salt*, v. 85 *a*. With filings of copper and spirit of *Salt*, v. 86 *b*. Of spirit of *Salt* poured on Egyptian nitre, i. 381 *a*. The virtue and qualities of an anomalous *Salt*, ii. 508 *b*.

SALT-PETRE, the various sorts of it, i. 210 *a*. The purifying of *Salt-Petre*, i. 229 *a*. The redintegration of *Salt-Petre* considered, i. 230 *a*. An experiment upon it, i. 231 *a.b*. Of a cold nature, and given in fevers, i. 233 *a*. The taste of it, i. 234 *b*. Produced from the coalition of bodies that are not inflammable, i. 235 *a*. The properties of *Salt-Petre* distilled, i. 236 *a*. The different qualities of its ingredients, i. 236 *b*. Whether *Salt-Petre* be of the same weight after distillation, i. 237 *b*. It consists of parts simple and unorganical, i. 237 *b*. Is given inwardly with safety, i. 239 *b*. It may be made fluid two several ways, i. 246 *b*. Is capable of fluidity, without the use of a liquor, i. 246 *b*. It may be made fluid or stable, i. 266 *b*. Gives a redness to neats tongues, ii. 77 *a*. Of great use in husbandry, iii. 142 *b*. A way to make *Salt-Petre* grow, v. 259 *a*. Observation on *Salt-Petre* divided by fire, i. 354 *b*. The generation of *Salt-Petre*, i. 359 *a*. The body of *Salt-Petre* turned into earth, i. 366 *a*. Experiment on the crystals of purified *Salt-Petre*, i. 377 *a*. The taste of purified *Salt-Petre*, i. 377 *b*. It may be made acid by distillation, i. 378 *b*. And turned into a fixed *Salt*, i. 380 *b*. *Salt-Petre* distilled with thrice its weight of earth, i. 382 *b*. Experiment by setting *Salt-Petre* on fire, i. 382 *b*. The way of its being generated in the earth, i. 388 *b*. Experiment of *Salt-Petre* distilled with clay, i. 416 *b*. Ice dissolved by *Salt-Petre*, ii. 314 *b*. Trial to make ice, by putting *Salt-Petre* into water, ii. 337 *b*. The operation of *Salt-Petre* in the corroding of bodies, iii. 627 *a*.

SALT-MARSHES, of use to sheep, v. 447 *b*.

SALTNESS of water examined, v. 199 *a*. Found to be in rain-water, v. 202 *a*. *Saltness* of the sea between *England* and *France* tried by experiments, iii. 386 *a*.

SALUBRITY and insalubrity of the air, iv. 276 *a*.

SAME, difficult to determine how a body may be said to be the *same*, iii. 538 *b*.

SAMOJEDS, their way of burying their dead, ii. 343 *a*. Their manner of cloathing, ii. 403 *b*.

SANCTORIUS, some account of his *Medicina Statica*, i. 495 *a*. His way of discovering the qualities of the air, i. 496 *b*. His trial whether the beams of the moon are hot or cold, ii. 336 *b*. His opinion of insensible transpiration, iv. 208 *b*.

SAND, an experiment upon black ink *Sand*, v. 33 *b*. Account of gold picked out of *Sand*, v. 34 *a*.

SAND-GOLD, its weight in water, v. 30 *b*. A particular account of it, v. 31 *a*. Chymical ways of examining of *Sand-Gold*, v. 31 *b*.

SANDARACH, or *red Arsenic*, the effects of it, iv. 281 *b*.

SANDERSON, Dr. his writing Cases of Conscience, v. 406 *b*.

SANDEVER, the effect of melting it in a strong fire, i. 384 *a*. The difference between *Sandever* and common alkalies, i. 384 *b*.

SANICLE, a proper remedy for ulcers, v. 440 *b*.

SAP, the rising of *Sap* in trees, iii. 37 *a*. The nature and operation of the *Sap*, iv. 207 *b*. Account of the qualities of the *Sap* in a vine, i. 367 *b*. The different qualities observed in the *Sap* of trees, i. 357 *a*.

SAPA, its taste and use, i. 389 *a*.

SAP-GREEN, an account of the making of it, ii. 58 *a*.

SAPID, experiments how far *sapid* bodies may be diluted, without ceasing to be so, iii. 336 *a*.

SAPOR, the qualification of a saline body, i. 377 *b*.

SAPOUR, the nature of it examined, i. 363 *b*.

SAPPHIR, an account of a remarkable *Sapphir*, v. 95 *a*.

SARUM, an experiment made at the spire of that cathedral, v. 164 *b*.

SATELLITES of *Jupiter* and *Saturn*, their figure, v. 539 *a*.

SATURDAY kept holy by the primitive Christians, i. 442 *b*.

SAVIOUR, remarks on the body of our *Saviour* after his resurrection, iii. 544 *b*. The supereminent dignity of our *Saviour* described, i. 183 *a*.

SAUL, the effect of his unction, v. 70 *a*.

SAUNDERSON, Captain, his way to make salt-petre, v. 266 *a*.

SBEUTIUS, Monsieur, some account of him, v. 255 *b*.

SCALE, a pair of *Scales* above the atmosphere, would weigh the air itself, i. 53 *a*. The use of *Scales* to judge of the effluvia of bodies, iii. 69 *a*. Account of *Scales* to weigh the air, v. 354 *a*.

SCALIGER, his story of a knight of *Gascony*, iv. 263 *b*. His saying concerning colour, ii. 23 *b*. A character of his way of writing, iii. 378 *b*.

SCARGILL, DAN. his recantation of Hobbism in *Cambridge*, v. 510 *a*.

SCARLET, the difficulty in the art of dying *Scarlet*, ii. 80 *a*.

SCARLET-DYE, a particular account of it, iii. 173 *b*.

SCENT, the *Scent* of men and deer lies long upon the ground, iii. 319 *a*. The reason of it assigned, iii. 319 *b*. Is strongest when assisted by the wind, iii. 323 *b*.

SCEPTICAL CHYMIST, an account of publishing that treatise, i. 376 *a*.

SCEPTICK, the character of a true *Sceptick*, i. 374 *b*.

SCHELDT, the effect of a fire-ship upon that river, iv. 273 *b*.

SCHLICHTINGIUS, his sense of the freeness of God's grace, i. 178 *a*.

SCHOLAR, account of the murther of a *Scholar* of *Baliol* college, by a taylor, v. 588 *b*.
SCHOOL-PHILOSOPHY, the unsatisfactorinesſ of it, ii. 459 *a*. Doctrines not contained in Scripture maintained by *School*-divines, iii. 522 *b*. *School*-men perplex the doctrines of religion, ii. 101 *a*. Their arguments in defence of the doctrine of ſubſtantial forms, ii. 478 *b*. Their diſtinction concerning effluviums, iii. 328 *a*. *School-Philoſophy* founded upon abſtracted reaſon, v. 41 *a*.
SCHOTTUS, his account of water not being turned into air, i. 33 *a*. His trial of the proportion of weight between air and water, iii. 61 *b*.
SCHROTTER, Dr. his character, v. 247 *b*.
SCIATICA, cured by a fright, v. 89 *b*.
SCIENCE, the imperfection and diſquiet of human *Science*, i. 460 *a*.
SCINTILLATION of a luminous liquor, iv. 73 *b*.
SCIRRHUS of the ſpleen, a remedy for it, iv. 215 *b*.
SCOFFERS at religion tremble at the hour of death, ii. 127 *b*.
SCORBUTE, the cauſe of many diſeaſes, v. 443 *a*.
SCORNERS of religion, advice to them, ii. 128 *b*. They read the Scripture without benefit, ii. 135 *a*.
SCORPION, the uſes of the oil of *Scorpions*, i. 439 *a*. A cure for the bite of *Scorpions*, i. 542 *b*. The pernicious effect of their ſtings, iv. 305 *a*. A remedy for their ſting, iv. 305 *b*. The poiſon of a *Scorpion* in the iſle of *Java*, iv. 307 *a*. Their poiſon ſometimes proves potentially cold, iii. 573 *a*.
SCORZONERAS, an account of them, v. 363 *b*.
SCOTLAND, a character of the people of that country, v. 506 *b*. A frugal and ſober nation, v. 509 *b*.
SCRIPTURE, the method and ſtyle of it will be underſtood in heaven, i. 184 *b*. Obſervations on the ſtyle of the *Scriptures*, ii. 88 *a*. Subjects of *Scripture* worthy of the choiceſt poetical ornaments, ii. 89 *a*. The benefit of the *Scripture*, ii. 92 *a*. Faults found with the ſtyle of the *Scripture*, ii. 94 *b*. Diſtinguiſh what the *Scripture* ſays, and what is ſaid in the *Scripture*, ii. 96 *b*. Penmen of *Scripture* write by the laws of truth, ii. 97 *a*. The ſimple are taught, and ſcholars may learn from *Scripture*, ii. 98 *b*. *Scripture* ſuited to all capacities, ii. 99 *a*. The objection of the obſcurity of *Scripture* anſwered, ii. 99 *b*. Why the prophetic paſſages of *Scripture* ſeem dark, ii. 100 *b*. The *Scripture* the beſt expoſitor of itſelf, ii. 102 *a*. Affords more light than the brighteſt human authors, ii. 103 *a*. The nature of the hiſtorical parts of *Scripture*, ii. 104 *a*. Objections againſt the methodicalneſs of the *Scripture* anſwered, ii. 104 *b*. Againſt the coherency of *Scripture* anſwered, ii. 105 *a*. The nature of *Scripture*-arguments explained, ii. 106 *a*. The exquiſite ſymmetry of the *Scripture*, ii. 107 *a*. In what manner to be read, ii. 107 *b*. Impeached as impertinent and uſeleſs, ii. 108 *a*. All paſſages of *Scripture* uſeful in ſome ages, and ſome in all, ii. 108 *b*. The conſtituent books of *Scripture* neceſſary to the canon of it, ii. 109 *a*. Objection, that the *Scripture* contains many things trivial, anſwered, ii. 109 *b*. The nature and reaſon of repetitions in *Scripture*, ii. 110 *a*. The *Scripture* explained to bad purpoſes, ii. 111 *a*. The truth and authority of it immemorially believed, ii. 111 *b*. Is not a barren ſoil, but a paradiſe, ii. 112 *a*. The nature of future rewards and puniſhments owing to *Scripture*, ii. 113 *a*. A moſt inſtructive book in reference to a good life, ii. 113 *a*. Divines argue negatively as well as affirmatively, from *Scripture*, ii. 113 *b*. The *Scriptures* the only book needful to ſalvation, ii. 114 *a*. The reverence that ought to be obſerved to *Scripture*, ii. 115 *b*. It commands awe and obedience more than other writings, ii. 116 *b*. Is the light which ſhines upon the church, ii. 117 *b*. Ought to be read, though ſome texts not underſtood, ii. 118 *a*. Will recompenſe the ſevereſt ſtudy, ii. 118 *b*. The company of enemies to *Scripture* to be avoided, ii. 119 *b*. Objection againſt the flatneſs of *Scripture* anſwered, ii. 120 *a*. Remarks upon the plainneſs of its ſtyle, ii. 121 *a*. An apology for the eloquence of the *Scriptures*, ii. 122 *b*. The *Scripture* has enviers as well as admirers, ii. 124 *b*. Obſervations on burleſquing the *Scriptures*, ii. 125 *b*. The paltry writings of the undervaluers of *Scripture*, ii. 127 *a*. The prophaning of *Scripture* no ſmall ſin, ii. 127 *b*. The *Scripture* a proper theme for men of wit, ii. 129 *a*. Application to princes to ſtudy the *Scripture*, ii. 130 *b*. *Scripture* read by the *Meſſias* himſelf, ii. 131 *b*. The ſtudy of it no deſpicable employment, ii. 132 *a*. It has mighty influence upon intelligent readers, ii. 132 *b*. And upon perſons of the higheſt ſtation, ii. 133 *a*. The love of the *Scriptures* founded on the love of God, ii. 134 *b*. The *Scripture* uſeful to thoſe qualified to receive it, ii. 135 *a*. The engaging majeſty of the *Scriptures*, ii. 136 *a*. Preferable to all books of devotion, ii. 137 *a*. They do not diſcloſe to us the whole nature of God, iv. 340 *b*. The fecundity of the *Scriptures* not ſufficiently obſerved, v. 52 *a*. The *Scripture* begins with deſcribing the book of nature, i. 432 *b*. Is full of alluſions to the properties of creatures, i. 433 *a*. The book of *Scripture* more perfect than the book of nature, iii. 409 *a*. The rewards of good men diſcover'd in *Scripture*, iii. 409 *b*. Qualifications neceſſary for the expounding of *Scripture*, iii. 416 *a*. The advantages of ſtudying the *Scripture*, iii. 418 *a*. The authority of *Scripture* neceſſary to eſtabliſh our belief, iii. 524 *a*. The doctrine of *Scripture* concerning a good and a bad life conſidered, v. 729 *a*. The conſequences of a light and tranſient reading of the *Scriptures*, v. 729 *b*. Obligations to piety and virtue contained in *Scripture*, v. 731 *a*.
SCULL, the effect of the moſs of a dead man's *ſcull*, iv. 323 *a*. The influence of the moon upon a broken *Scull*, v. 96 *b*.
SCURVY, a proper remedy for it, v. 420 *b*. Cured by the juice of ſtewed oiſters, v. 457 *a*.
SCURVY-GRASS, the juice of the leaves change the colour of human blood, iv. 198 *a*.
SEA; water ſalt at the bottom of the *Sea*, iii. 379 *b*. Inſtances to prove the ſaltneſs of the *Sea* at the bottom, iii. 380 *a*. Proved by the weighing of *Sea-Water*, iii. 380 *b*. And by other experiments, iii. 381 *a*. The reaſons of the ſaltneſs of the *Sea*, iii. 381 *b*. Obſervations on the ſaltneſs of the *Sea*, iii. 378 *a*. Whether the *Sea* more ſalt at the top than at the bottom, iii. 378 *b*. Freſh water fetched from the bottom of the *Sea*, iii. 379 *a*. The *Sea* follows the courſe of the moon, ii. 157 *a*. An account of the luminouſneſs of the *Sea*, iii. 91 *a*. The *Sea* not ſo ſalt near the poles, iii. 286 *b*.
SEA-COMPASS, that inſtrument explained, iv. 408 *a*. The art of making *Sea-Compaſſes*, iii. 149 *a*.
SEAMAN, Mr. his character, v. 311 *a*.
SEA-SALT, the ſpirit of it prepared to melt pure gold, i. 225 *a*. Diſſolved in water hinders freezing, iv. 199 *b*. In a few ſpoonfuls of common water, an antidote againſt the plague, iv. 294 *b*. Experiment by diſtilling of *Sea-Salt*, i. 363 *a*. On *Sea-Salt* retaining its acid ſpirit, i. 382 *a*. The ſpirit of *Sea-Salt* is highly acid, i. 387 *b*. The diſſolution of *Sea-Salt* in ſpirit of nitre, i. 388 *a*. The uſe of *Sea-Salt* in artificial glaciations, iii. 198 *a*. *Sea-Salt* diſſolved begins its coagulation on the ſurface of the water, iii. 379 *a*. The difficulty of ſeparating the parts of *Sea-Salt*, ii. 494 *a*.
SEA-SICKNESS occaſions vomitings, i. 537 *b*. That diſorder more particularly conſidered, iv. 410 *b*.
SEA-WATER, the temperature of it in *New France*, iii. 106 *a*. The water cold in the bottom of the ſea, iii. 106 *a*. The depth of the coldneſs of the ſea, iii. 107 *b*. The temperature of the ſeveral regions of the ſea, iii. 108 *b*. The inequality of the bottom of the ſea, iii. 110 *a*. An account of the depth of the ſea, iii. 110 *b*. The calmneſs of the water at the bottom of the ſea, iii. 112 *a*. The ſtagnation of water in the depths of the ſea, iii. 113 *b*. An invention to make *Sea-water* ſweet, iv. 159 *a*. The way of ſweetening *Sea-water*, v. 199 *b*. Experiment on freezing of *Sea-water*, ii. 264 *a*. The ſaltneſs of *Sea-water* examined, ii. 286 *a*. The main ſea never freezes, ii. 311 *a*. The whole body of the ſea is cold, ii. 312 *a*. The difference of heats and colds on the ſeas, ii. 321 *b*. *Sea-water* more difficult to be congealed than freſh, ii. 343 *a*. A trial to make *Sea-water* freſh, iii. 382 *b*. Obſervations on diſtilled liquors drawn from *Sea-Water*, iii. 383 *a*. The taſte of *Sea-water* not ſo much ſaline as bitterriſh, iii. 383 *b*. The cauſe of it, iii. 384 *a*. The putrefaction of *Sea-water*, iii. 384 *b*. *Sea-water* increaſes in weight, the nearer you come to the line, iii. 385 *a*. *Sea-water* ſalter in ſome places than others, iii. 385 *b*. Account of the ſhining of the *Sea-water*, v. 650 *b*.
SEA-WEED, makes a laſting fuel, v. 489 *b*.
SEASON, the difference of *Seaſons* on mount *Teneriff*, v. 175 *a*.
SEASONING of lignum vitæ, i. 284 *b*.
SECRETS of nature often diſcovered by accidental hints, i. 461 *a*.
SECTS ſince the firſt ages of Chriſtianity, v. 675 *a*.

SECURITY in sin of dangerous consequence, v. 208 *a*.
SEED, the way to sow *Seeds* that shall instantly grow, v. 583 *b*. A liquor to impregnate the *Seed* of corn, v. 260 *a*. The effect of dipping Corn-*Seeds* in oil, iii. 143 *b*. A sort of Chinese *Seed* sown in water, iii. 144 *a*.
SEED-LACE, the effect of the spirit of human blood upon it, iv. 185 *b*.
SELDEN, account of his books and manuscripts, v. 406 *b*.
SELF-MOIVNG LIQUOR, an account of it, iv. 299 *a*.
SELF-SHINING SUBSTANCES, an account of them, iv. 30 *a*.
SEMEDO, his account of the state of physick in *China*, i. 528 *a*.
SEMEIOTICAL PART of physick, some remarks concerning it, i. 480 *a*.
SEMEN ANIMATUM, the contrivance of it, iv. 345 *a*.
SEMI-METALS, an account of them, v. 27 *b*.
SENECA, his opinion concerning the air, i. 57 *b*. His observation upon discoveries, i. 201 *a*. His remark upon the mode of writing, ii. 123 *a*. Upon the imperfections of style, ii. 123 *b*. His praise of the contemplation of nature, i. 425 *a*. His opinion of the several works of nature, i. 430 *b*. He styles the world a temple, i. 441 *b*.
SENNA, there are different sorts of it, i. 210 *a*. A project for the planting of it, v. 562 *b*.
SENNERTUS, his observation on a student that stabbed himself, i. 65 *b*. His opinion of qualities, iii. 74 *a*. His remarks on the *Plica Polonica*, iv. 217 *a*. His account of the effects of orpiment, iv. 292 *b*. Of precipitating medicines, iv. 314 *a*. His unintelligible description of mercury, i. 342 *a*. A champion for the doctrine of the three principles, i. 348 *a*. His arguments in defence of the chymical principles, i. 349 *a*. He attributes colours to sulphur, i. 352 *b*. His account of subordinate forms, ii. 526 *b*.
SENSATION, its nature particularly considered, iii. 360 *b*. Is an internal perception of the changes that happen in the sensories, iii. 362 *b*.
SENSES, the foundation of a good memory, v. 429 *b*. All bodies not the objects of our *Senses*, i. 326 *b*. The imperfection of our *Senses* considered, iii. 434 *a*. The subtilty of the *Senses* in examining of objects, v. 121 *a*. Common *Sense* supposed to be seated in the brain, v. 700 *b*. The organs of the particular *Senses* terminate in the brain, v. 701 *b*.
SENSITIVE PLANT, a description of it, i. 165 *b*.
SENSORIES not always right in judging the degrees of cold, ii. 240 *a*. The reason why they are not always to be trusted, ii. 252 *a*. The operation of objects upon the *Sensories*, ii. 466 *a*.
SEPTALIUS, an account of his burning glass, v. 336 *b*.
SEPTUAGINT, some account of that translation, ii. 96 *a*.
SERAPHICK LOVE, why so called, i. 159 *a*. It admits of no bounds, i. 162 *b*. Its difference from ordinary flames, i. 163 *b*.
SERAPHIM, their office and employment, iv. 350 *b*. A description of *Seraphim* by the Jews, i. 168 *a*. They cover their faces with their wings, i. 190 *a*.
SERMON, reflections upon eloquence in *Sermons*, ii. 179 *a*. Upon preaching and hearing of *Sermons*, ii. 179 *b*. Better to forget than to forsake them, ii. 193 *a*. The effect of hearing *Sermons*, ii. 193 *b*. They cleanse and purify the mind, ii. 194 *a*.
SERPENT, an account of strange *Serpents* in *Egypt*, iv. 264 *a*. *Serpents* in the *East Indies* affected by musick, iv. 273 *b*. Stones in the heads of *Serpents*, their effect, iv. 337 *b*. The virtue of the licking of *Serpents*, v. 405 *a*. A petrified *Serpent* continued in a pebble, iii. 241 *b*.
SERUM, the detaining of it for a few moments in the lungs is mortal, i. 68 *b*. Experiments on the *Serum* of healthy blood, iv. 172 *a*. The weight of the *Serum* of human blood, iv. 172 *b*. The *Serum* hydrostatically examined, iv. 172 *b*. *Serum* coagulated by acids, iv. 173 *a*. *Serum* mixed with infusion of galls, iv. 173 *b*. The effect of the distillation of *Serum* of blood, iv. 174 *a*. The effect of *Serum* put on quick-lime, iv. 174 *b*. Of the *Serum* in a bolt-head hermetically sealed, iv. 175 *a*. An account of the air afforded by *Serum*, iv. 175 *b*. The nature of the spirit it affords by distillation, iv. 176 *a*. Experiment with raisins, and the *Serum* of human blood, iv. 178 *a*. The weighing of the *Serum*, and the fibrous part of the blood, iv. 200 *b*. An account of the freezing of the *Serum* of blood, iv. 200 *b*.
SETH, an account of his astronomical pillars, i. 426 *a*.
SEX, the praises of the Fair *Sex*, v. 401 *b*. The nature of the parts that discriminate the *Sexes*, iv. 344 *b*.
SEXTUS EMPIRICUS, his opinion that the world was God, iv. 376 *b*.
SHADE, certain dilute *Shades* visibly tremble upon high walls, i. 249 *b*.
SHADOW, reflections on a *Shadow* cast upon the water, ii. 188 *b*. The world called the *Shadow* of God, ii. 189 *a*. Curious remarks upon a *Shadow*, ii. 189 *b*. The stature not to be computed by the *Shadow*, ii. 190 *b*. The *Shadow* of the pic of *Teneriff*, v. 172 *a*.
SHAFT, the nature of an *Air-shaft* in mines, iii. 103 *a*.
SHAME alters the motion of the blood, iv. 308 *a*.
SHARROCK, Dr. Letters from him to Mr. *Boyle*, v. 418 *b*. He assists Mr. *Boyle* in printing some of his works, v. 419 *a*. His reasons for publishing Mr. *Boyle*'s usefulness of experimental philosophy, i. 421 *b*.
SHEEP, the benefit arising from them, v. 447 *a*. The grass and hay fittest for them, v. 447 *b*. Some grounds infectious to *Sheep*, v. 448 *a*. Particulars concerning the management, colours, age, diseases, &c. of *Sheep*, v. 449 *a*. *b*. Rules of the old writers of *Italy*, compared with the customs of *England* concerning *Sheep*, v. 450 *a*. Remedies for diseases in *Sheep*, v. 451 *b*. The *Romans* used to clothe their *Sheep* to preserve their wooll, v. 452 *a*. To improve the fineness, and increase the wooll in *Sheep*, v. 453 *a*. The translation of the blood of a *Sheep* into a man, v. 372 *a*. Experiment upon *Sheep* that died of the rot, v. 521 *a*.
SHELL, the *Shells* of eggs are porous, iv. 208 *b*. An account of eggs salted in the *Shells*, iv. 210 *a*.
SHELL-FISH, their parts of a plain and slight contrivance, i. 238 *b*.
SHIN, the cure of a boy, whose *Shin*-bone was drawn out, v. 649 *a*.
SHINING, observations on a *shining* phosphorus, iv. 73 *a*. The inflammability of it, iv. 82 *b*. Experiments tried upon *shining* wood, v. 563 *a*.
SHIP, *Ships* of war preserved by noctiluca's, iv. 23 *a*. An engine for the sinking of *Ships*, iv. 255 *a*. *Ships* affected by thunder in hot regions, iv. 255 *b*. The preserving of *Ships* from being worm-eaten, v. 352 *b*. A model of a *Ship* of the natives of *New England*, v. 642 *b*. *Ships* draw less water in cold countries, ii. 251 *b*.
SHIP-MONEY, the aversion of the *English* to that tax, v. 329 *a*.
SHOEING of horses without a forge, iii. 174 *b*.
SHOP, the use of searching into tradesmen's *Shops*, iii. 167 *a*. There is more learnt there than by books, iii. 168 *b*. The *Shops* of craftsmen are of use to a naturalist, iii. 169 *b*.
SHORE, the nature of it affects the temperature of the water, iii. 105 *b*.
SHOT, experiment on the time of *Shot* falling into water, v. 307 *a*.
SHREW-MICE, experiment upon *Shrew-mice* and common air, iv. 122 *a*. Put in a receiver for compressing of the air, iv. 124 *b*.
SHRINKING of metals, examples of it, iv. 268 *a*.
SIBERIA, the thawing of the earth in that province, ii. 397 *b*.
SICKNESS, reflections upon a state of *Sickness*, ii. 168 *a*. The benefits arising from it, ii. 171 *b*. The circumstances of a dangerous *Sickness*, ii. 175 *a*.
SIGHT, a sense nearest to the understanding, v. 60 *a*. The knowledge of it improved by the mathematicians, iii. 159 *a*. Is a sense dear to all men, v. 247 *a*. The organs of *Sight* in animals, a proof of the divine wisdom, iv. 525 *b*. Uncommon observations about vitiated *Sight*, iv. 551 *a*. The effect of the head-ach upon the *Sight*, iv. 555 *b*. Curious works performed by exquisiteness of *Sight*, v. 700 *a*.
SIGNATURE, what the chymists mean by it, ii. 97 *b*.
SIGNS of diseases examined, v. 298 *a*.
SILENCE frequently discovers wisdom, ii. 204 *b*.
SILK, a cylindrically shaped grain of *Silk* one hundred and twenty yards long, iii. 311 *b*.
SILK-WORMS destroyed by thunder, v. 186 *a*. The time of their production, iv. 344 *b*. Their nature and way of working explained, i. 435 *a*. They work by instinct, not by imitation, i. 435 *b*. They are more serviceable to man than the largest creatures, i. 437 *b*. The great advantages arising from that caterpillar, v. 692 *a*.
SILVER extracted from lead, i. 207 *b*. The effects of preparations of *Silver*, i. 212 *a*. Turned into gold by aqua fortis, i. 214 *b*. And by the operation of common sulphur, i. 215 *a*. Preparation of refined *Silver* given with success, i. 239 *a*. *Silver* dissolved in aqua fortis, an experiment concerning it, i. 250 *b*. A solution of *Silver* will dye of a black colour, ii. 34 *b*. An experiment

ment of diſſolved *Silver* precipitated with ſpirit of ſalt, ii. 61 *a*. The effect of the ſolution of *Silver* diſſolved in aqua fortis, ii. 67 *b*. Of the alloy of *Silver*, ii. 73 *a*. The nature of a thin piece of hammered *Silver*, iii. 79 *b*. Experiment of a ſhining liquor in a veſſel of refined *Silver*, iv. 81 *b*. *Silver* penetrable by a body of ſulphur, iv. 225 *a*. The way of preparing *Silver* for ſtaining of glaſs, iv. 229 *a*. The great virtues of the preparation of *Silver*, iv. 332 *b*. *Silver* found in lead-ore, v. 28 *a*. Experiment with ſolution of *Silver* and ſpirit of ſalt, v. 86 *a*. The effect of the air upon *Silver* plate, v. 120 *a*. *Silver* found in the iſland of *Teneriff*, v. 171 *a*. A quantity of it found in lead, v. 302 *a*. The effect of expoſing impure *Silver* and lead to fire, i. 303 *a*. *Silver* not to be diſſipated into its principles, i. 304 *a*. Remark on the refining of *Silver*, i. 304 *b*. Account of the growth of *Silver*, i. 358 *b*. The ſulphur of *Silver* is a fixed ſulphur, i. 359 *b*. *Silver* turned into running mercury, i. 401 *a*. A purge made with a preparation of *Silver*, i. 497 *b*. An earth that diſſolves *Silver*, i. 501 *a*. Lunar cryſtals obtained from *Silver*, ii. 489 *a*. The qualities of *Silver* changed by the change of its texture, ii. 505 *b*. Experiments on ſolutions of *Silver*, ii. 507 *b*. Cryſtals produced from a ſolution of *Silver* in putrefied aqua fortis, iii. 226 *a*. A curious account of *Silver* wire, iii. 311 *a*. Obſervations about the growth of *Silver*, iii. 461 *a*. *Silver* may be diſpoſed to volatility, iii. 613 *a*.

SILVERING over of braſs and copper, the way of it, iii. 200 *a*.

SILVER SODER, the quality of it, iii. 172 *b*.

SIMILITUDE; apt *Similitudes* a great part of wit, ii. 143 *b*.

SIMON PAULI, his remark on the diſcharging of great guns, iv. 255 *b*.

SIMONIDES, his anſwer concerning God, i. 169 *b*.

SIMPLE medicines, their uſe, iv. 302 *b*. The particular conveniences of them, iv. 328 *a*. A *Simple* may contain diſſimilar parts, iv. 336 *a*. A *ſimple* remedy may cure the plague, iv. 337 *a*. All diſeaſes curable by *Simples*, i. 509 *b*. The efficacy of ſlightly prepared *Simples*, i. 517 *a*. The preparation of *Simples* improved by the naturaliſt, i. 517 *b*. Their operation aſſiſted by being well prepared, i. 526 *a*. The advantage of *ſimple* medicines, iv. 325 *a*. They are more ſafe than compounded, iv. 326 *a*. The particular benefits of them, iv. 327 *a*. *Simples* ſometimes hurtful in medicines, iv. 326 *b*. A particular account of writers concerning them, i. 427 *a*.

SIN, the folly and deceitfulneſs of it explained, ii. 194 *b*. The plea of committing ſmall *Sins* conſidered, v. 210 *b*. Of ſinning in a paſſion examined, v. 212 *b*. The forſaking of *Sin* is no ſhame, v. 214 *b*. The puniſhment of *Sin* conſidered, v. 218 *b*. The nature of little *Sins* explained, v. 207 *a*.

SINCLAIR, Mr. GEORGE, his exceptions to the way of weighing water in water examined, iii. 289 *a*.

SINNER, the dangers of an habitual *Sinner* upon a death-bed, ii. 175 *a*. The caſe of a returning *Sinner*, ii. 183 *a*. Excuſes uſed by the *Sinner*, v. 214 *b*.

SIPHON of glaſs for an experiment in the air-pump deſcribed, i. 51 *b*. The courſe of water through *Siphons* depends on the preſſure of the air, i. 52 *a*. A *Siphon* to try the ſubtilty of corpuſcles of air and water, i. 54 *b*. The paſſage of water through *Siphons* conſidered, i. 147 *a*. The deſcription of a ſucking *Siphon*, iii. 15 *b*. Remarkable particulars concerning it, iii. 16 *b*. A barometrical *Siphon* explained, iii. 28 *b*. The making of long and ſhort *Siphons*, iii. 37 *b*. The aſcenſion of water in *Siphons* explained, ii. 437 *a*.

SIZE, the ingredients of which it is compoſed, iii. 196 *b*.

SKELETON, remarks upon the bones of a *Skeleton*, iv. 216 *b*.

SKIN, the different kinds of it, iv. 207 *b*. Pores diſcernible in the *Skins* of animals, iv. 208 *a*. The *Skin* like worſted ſtockings, iv. 209 *b*. Human bodies affected by the air through the *Skin*, iv. 280 *b*. Effluvia pierce through the pores of the *Skin*, iv. 310 *b*. Specifics operate through the pores of the *Skin*, iv. 320 *b*.

SLACKING of quick-lime in an exhauſted receiver, iii. 57 *b*.

SLEEP, meditations on the want of *Sleep*, ii. 170 *b*. Benefits ariſing from the want of *Sleep*, ii. 171 *a*.

SLOWNESS of the motion of natural bodies explained, i. 283 *b*.

SLOW-WORM, the continuance of it alive in a vacuum, iii. 131 *a*.

SLUSIUS, an account of him, v. 392 *b*.

SMALL POX, the filthineſs of that diſtemper properly deſcribed, v. 565 *a*.

SMART, THOMAS, an account of his medicines, v. 268 *b*.

SMELL, by adding of common water to produce a ſtrong *Smell* in a body that had no ſuch *Smell* before, iii. 591 *a*. Various experiments on changing the *Smell* of bodies, iii. 592 *a*. With an inodorous body, and another not well ſcented to produce a muſky *Smell*, iii. 593 *a*. To heighten good *Smells* by compoſition, iii. 594 *b*. *Smell* emitted by iron, iii. 66 *b*. And by an icy noctiluca, iv. 81 *b*. And by ſerum of human blood, iv. 175 *b*. The *Smell* of ſpirit of blood offenſive, iv. 180 *b*.

SMELLING, inquiries into the *Smelling* of animals, v. 368 *b*.

SMETHWICK, Mr. his invention of glaſſes, v. 387 *b*.

SMITH, Mr. ANTHONY, his account of a ſtrange cancer in a woman's breaſt, v. 638 *a*.

SMITH, the ſmith's trade capable of being improved, iii. 148 *a*.

SMOKE, an experiment in the air-pump concerning it, i. 60 *a*. May be made to appear like a liquor, i. 241 *b*. The emiſſion of *Smoke* by a ſolid phoſphorus, iv. 81 *a*. Account of medicinal *Smokes*, i. 538 *b*.

SMOKING of waters in froſty weather examined, ii. 366 *a*.

SMOLENSKO in *Ruſſia*, the extreme cold of that place, ii. 319 *a*.

SMOOTH, reaſons for the adheſion of *ſmooth* bodies by contact, i. 256 *b*. Experiments on the preſſure of the air by *ſmooth* marbles, i. 258 *b*.

SMOOTHNESS, the nature of it in bodies, iii. 79 *b*.

SMUTTING of corn, ſome account of it, v. 303 *a*.

SMYRNA, the nature of the plague in that place, v. 189 *a*.

SNAIL, a Houſe-*Snail* not killed in an air-pump, i. 71 *a*. Of its continuance alive in a vacuum, iii. 131 *a*. Experiment on a *Snail* in artificial air, iv. 127 *b*.

SNAKE, experiment by a *Snake* in an exhauſted receiver, iii. 115 *b*.

SNAKE-WEED, ſome account of it, v. 310 *a*.

SNEEZING, in what manner produced, i. 537 *b*.

SNOW, an experiment in the air-pump concerning it, i. 61 *a*. Compreſſed becomes a hard body, i. 245 *a*. The whiteneſs of *Snow* prejudicial to the ſight, ii. 24 *b*. It has no light but what it receives, ii. 25 *a*. Of what it properly conſiſts, ii. 27 *a*. *Snow* will not lie long over veins of minerals, iii. 102 *a*. *Snow* ſoon thawed near a tract of lime-ſtone, iv. 278 *a*. *Snow*-water not void of ſaltneſs, v. 202 *a*. The cold of *Snow* reflected by glaſſes, v. 344 *b*. Water frozen by *Snow* only, ii. 258 *b*. Experiments of freezing by mixing *Snow* with other bodies, iii. 260 *a*. &c. Trials to freeze *Snow* mixed with warm bodies, ii. 261 *a*. Entire bodies preſerved long by *Snow*, ii. 273 *a*. The benefit of rubbing frozen limbs with *Snow*, ii. 275 *b*. The duration and diſſolution of *Snow* examined, ii. 304 *b*. Way to conſerve *Snow*, ii. 306 *b*. The duration of *Snow* on the *Alps*, ii. 307 *a*. Its uſe in fertilizing the earth, ii. 346 *a*. Frozen limbs reſtored by rubbing them with *Snow*, ii. 392 *a*. Why *Snow* dazzles the eyes, according to the ſchoolmen, ii. 459 *a*.

SOADER, its various uſe, iii. 168 *a*. An account of malleable *Soader*, iii. 174 *b*.

SOAP, the ingredients of it, iii. 195 *a*. The making and diſtilling of *Soap*, i. 303 *a*. The ingredients of *Soap* ſeparated by fire, i. 317 *a*. The diſtilled liquors of common *Soap*, i. 340 *a*. The uſe of *Venetian Soap* in medicine, iv. 329 *a*. A proper remedy againſt making bloody urine, iv. 329 *b*.

SOCIETY, ROYAL, ſome account of it, v. 308 *b*. Verſes in praiſe of it, v. 341 *a*. Their deſign for a natural hiſtory, v. 349 *a*. The employment of their members, v. 353 *b*. Paralipomena relating to the hiſtory of it, v. 367 *b*. Their proceedings upon the deſign of building a college, v. 381 *a*. Their ſecuring of philoſophical properties, v. 382 *a*. Their great character and eſteem abroad, v. 392 *a*.

SOCINIANS, the ſucceſs of the art they uſe in publiſhing their books, v. 484 *b*.

SOCINUS, his remark upon the Scriptures, v. 438 *a*. His character, and way of writing, v. 438 *b*. His opinion concerning the authority of Scripture, iii. 524 *a*.

SOCRATES preferred to all the *Grecians*, v. 67 *a*.

SOIL, the various temperament of *Soils*, iii. 99 *b*. Many ways of improving the *Soils* of *England*, iii. 143 *b*. Waters partake of the nature of the *Soils* they paſs through, v. 465 *b*. The air affected by the effluvia from the *Soil*, iv. 277 *a*.

SOLAND-GEESE, account of their production, v. 405 *a*.

SOLDIER, famous for digesting of stones, i. 486 *b*.
SOLID bodies, by proper alterations, may become parts of a fluid, i. 150 *b*. Account of a *solid* self-shining substance, iv. 74 *a*. Motion transmitted through *solid* bodies, iv. 259 *a*. The way of weighing *Solids* in water, v. 4 *a*. The proportion between sinking *Solids*, and the liquor they are weighed in, v. 12 *b*. The qualifications of *Solids* in the examen of liquors, v. 13 *b*. The weight of *Solids* in acid and fermented liquors, v. 14 *b*. The weighing of a *Solid* in a cube of brass, v. 20 *a*. The way of measuring *Solids* dissoluble in water, v. 21 *b*. Of hydrostatically examining floating *Solids*, v. 22 *a*. The resistance of *solid* bodies to be broken by weight, iii. 189 *b*. The differing pressure of heavy *Solids* and fluids, iii. 298 *a*.
SOLIDITY of glass particularly considered, i. 257 *a*.
SOLOMON improved the study of natural philosophy, i. 426 *b*. His natural history, i. 429 *a*. A proper remark upon the wisdom of his choice, iii. 447 *a*. Observations upon his writings, ii. 129 *b*.
SOLUTION, experiment upon metalline *Solutions*, ii. 51 *a*. Upon the *Solution* of sublimate and oil of tartar, ii. 64 *b*. An account of the *Solution* of allom, ii. 78 *b*. Of silver and gold, their taste, iv. 216 *a*. Experiment by galls on a *Solution* of refined gold, iv. 239 *a*. On a *Solution* of fixt salt, i. 385 *b*. A *Solution* of loadstone with aqua regia, v. 82 *a*.
SOLVENT, a proper *Solvent* for silver, iii. 172 *b*.
SON, Monsieur de, account of his water-engine, v. 601 *b*. Of a curious watch invented by him, v. 345 *a*. Remarks on his parabolar object-glasses, v. 349 *a*. He is cured of pains in his back by a friction, v. 352 *b*. Employed in making optick glasses, v. 350 *b*.
SOOT, salts obtained from distillation of *Soot*, i. 303 *b*. The separation of its parts by fire, i. 333 *b*. The volatile salts from distilled *Soot*, i. 379 *a*. The use of *Soot* in medicine, i. 507 *a*. The virtue of oil of *Soot*, i. 578 *a*. *Soot* of wood abounds with spirit of salt, v. 118 *a*. Experiment with spirit of *Soot* of wood, and the filings of copper, v. 120 *b*. Observations on a decoction of *Soot*, iv. 9 *a*. A preparation of spirit and oil of *Soot*, i. 558 *b*.
SOPHRONIA, her Character, ii. 139 *a*.
SORBIERE, his penitential letter, v. 313 *a*.
SORBONNE, doctors, their opinion of the pope's supremacy, *&c*. v. 416 *a*.
SOUL, some believe the *Soul* created and infused, i. 94 *a*. Set times allotted for feeding the *Soul*, ii. 131 *a*. The *Soul* to be kept from idleness, ii. 147 *a*. Reflections upon the state of the *Soul*, ii. 178 *a*. Upon a *Soul* stupified with sensual pleasure, ii. 182 *b*. How it moves the members of the body, iv. 46 *b*. The *Soul* contemplates her own nature and powers, iv. 48 *a*. Finds some objects disproportionate to her power, iv. 50 *b*. How the *Soul* is concerned in the motion of the body, iv. 59 *b*. How the immaterial *Soul* operates on the material body, iv. 61 *b*. The divine perfections impressed upon the *Soul* of man, iv. 347 *a*. The immortality of the *Soul* considered, v. 43 *b*. Reasons for the belief of it, v. 44 *a*. The nature of the *Soul* according to Cartesian principles, v. 45 *b*. The distinction between a great and a mean *Soul*, v. 66 *b*. Humility the mark of a great *Soul*, v. 73 *a*. *Souls* of the Saints are not in heaven till the day of judgment, v. 410 *a*. Are in a middle state till the day of judgment, v. 410 *b*. The happiness of blessed *Souls* in Hades, v. 412 *a*. The faculties of the *Soul* how to be employed, i. 426 *a*. How the *Souls* of living creatures are the true forms of their bodies, ii. 528 *b*. The nature and immortality of the *Soul* revealed by Scripture, iii. 412 *a*. The immortality of the *Soul* to be proved by natural philosophy, iii. 412 *b*. How far the nature of the *Soul* is discovered by reason, iii. 413 *a*. Union of *Soul* and body a riddle to philosophers, iv. 353 *a*. The dignity of the rational *Soul* examined, iv. 531 *b*. The rational *Soul* supposed to be seated in the brain, v. 701 *a*. The peculiar excellencies of the rational *Soul* considered, v. 707 *a*. The perfections, the inestimable value, the sublime nature, *&c*. of the *Soul* of man considered, v. 708 *b*.
SOUNDINGS at sea explained, v. 52 *b*. Unequal *Soundings* in the sea, iii. 111 *a*.
SOUNDS convey'd to the ear by the medium of the air, i. 40 *b*. Are very languid in the receiver, i. 41 *b*. Grow stronger by an unusual quantity of air shut up with them in the same vessel, i. 42 *a*. The *Sound* made by a blade of a knife, i. 71 *b*. By the motion of a bullet or a wand through the air, i. 233 *b*. Propagation of *Sounds* in an exhausted receiver, iii. 53 *a*. A trial of *Sounds* by a hand-bell, iii. 53 *b*. *Sound* proceeds from the undulating motion of the air, iii. 79 *b*. The strange effect of *Sounds* on wounded men, iv. 255 *b*. *Sounds* propagated through the air with the greatest celerity, iv. 256 *a*. Consist in the undulating motion of the air, iv. 259 *b*. The air put into motion by *Sounds* at a great distance, iv. 262 *b*. The effect of acute *Sounds*, iv. 263 *b*. Of peculiarly modified *Sounds* on disposed bodies, iv. 264 *a*. The effect of *Sounds* on inorganical bodies, iv. 266 *a*. Of determinate *Sounds* upon solid bodies, iv. 266 *b*. The ringing *Sound* of bells how produced, iv. 271 *b*. The motion of the air propagated by *Sounds* at a great distance, iv. 272 *b*. The great efficacy of *Sounds* at a distance, iv. 273 *a*. The velocity of *Sounds* transmitted through the air, v. 50 *b*. The air the medium of *Sounds*, v. 130 *a*. Remarks on the nature and effect of *Sounds*, v. 338 *a*. More exact observations concerning them, v. 388 *b*. In which chymical principle resides *Sound*, i. 350 *a*. The effect of musical *Sounds* considered, i. 541 *a*. The measuring the breadth of a river by *Sounds*, iii. 185 *a*. The equivelocity of *Sounds*, iii. 191 *a*. The efficacy of *Sounds* depends upon the different motions of the air, iii. 324 *b*. Remark on the distinguishing nature of *Sounds*, v. 702 *a*.
SOUTHWELL, Mr. ROBERT, his letters to Mr. *Boyle*, v. 403 *a*. His account of the virtuosi of *Florence*, v. 403 *b*. His concern for the persecuted *French* Protestants, v. 408 *b*.
SPA-WATER, account of its being diluted by rain-water, iv. 250 *b*. Distempers cured by *Spa-waters*, i. 551 *b*. They greatly promote monthly evacuations, i. 552 *a*.
SPACE, the nature of it according to *Gassendus*, iv. 63 *a*.
SPAGYRISTS, their opinion of the corpuscular philosophers, i. 229 *b*. A particular account of them, i. 293 *b*. Advice in their making up of medicines, iv. 331 *b*. A set of *Spagyrists* of a higher order, i. 373 *b*.
SPANIEL, reflections on a *Spaniel's* care not to lose his master, ii. 177 *b*. On a *Spaniel's* fetching a glove, ii. 180 *a*.
SPANISH SALT, its use to preserve sheep, iii. 146 *a*.
SPAR, dissolved by spirit of salt, iii. 231 *a*. The nature of it particularly explained, v. 30 *a*.
SPEARMINT, in a phial of water, an account of it, i. 313 *a*.
SPECIFIC medicines reconcileable to the corpuscular philosophy, iv. 301 *a*. Their way of operating, iv. 302 *b*. What is properly meant by a *Specific* medicine, iv. 303 *b*. Arguments against *Specific* medicines, iv. 305 *b*. The effect of *Specific* medicines outwardly applied, iv. 306 *a*. Their way of operating on human bodies, iv. 306 *b*. The peculiar virtues ascribed to *Specifics*, iv. 308 *a*. Their ways of acting on morbific matter, iv. 309 *a*. Why *Specific* medicines sometimes fail, iv. 309 *b*. *Specific* remedies are mortifiers of acids, iv. 310 *b*. How they operate upon the blood, iv. 313 *a*. And upon the heart, iv. 314 *b*. The different manner of their operation, iv. 316 *a*. The change of the blood effected by *Specifics*, iv. 316 *b*. They remedy the faulty consistence of the blood, iv. 317 *b*. The nature of *Specifics* outwardly applied, iv. 320 *a*. A particular account of external *Specifics*, iv. 321 *b*. *Specifics* afforded by minerals, iv. 323 *b*. The *Specific* properties of simples examined, i. 509 *b*. *Specifics* commonly found among ignorant persons, i. 528 *b*. Apology for the use of *Specifics*, i. 533 *b*. A caution not to believe them too far, i. 537 *a*. The manner of operation of *Specifics* considered, i. 547 *a*. How the operation of *Specifics* may proceed, i. 547 *b*.
SPECULATIVE Atheists, very few, v. 42 *a*.
SPEECH, constriction of the parts inservient to *Speech*, a cure for it, i. 581 *a*. Curious remarks upon *Speech*, v. 722 *a*.
SPEHRERIUS, his observation on the bite of a viper, iv. 294 *b*.
SPELTER, used in an experiment upon copper, i. 250 *b*.
SPHERE, the proportion between a *Sphere* and a cylinder, iii. 157 *b*. The use of the doctrine of the *Sphere* to natural philosophy, iii. 158 *b*. An account of a *Sphere* of glass illuminated, iv. 10 *b*. The nature of the *Sphere* a useful study, iv. 69 *b*. A *Sphere* consists of brass and roundness, ii. 469 *b*.
SPHINCTERS of the *intestinum rectum*, their use, v. 703 *b*.
SPIDER, inclosed in a piece of hard amber, i. 276 *b*. In *Ireland* not venomous, iv. 284 *b*. The poison of a liquor emitted by a *Spider*, iv. 304 *b*. A *Spider* brought up by vomit, v. 444 *b*. The business of a *Spider* in a magnificent palace, i. 426 *a*. The bite of a *Spider* cured by musick, i. 541 *a*. Those in *Ireland* innocent without poison, i. 226 *a*. *Spiders*, whose venom passes

through

through the soles of shoes, iii. 315 *b*. The steam of a black *Spider* burnt causes faintings, iii. 338 *a*. The curious weaving of *Spiders* considered, iv. 541 *b*. Account of *Spiders* gliding in the air without wings, v. 462 *a*. The strength and quickness of their poison, v. 455 *b*.

SPINOZA, Signior, some account of him, v. 339 *a*.

SPIRE, experiment made at the *Spire* of the cathedral at *Sarum*, v. 164 *b*.

SPIRIT, the common prevailing notion of *Spirits* examined, v. 707 *b*.

SPIRIT, the nature and production of *Spirits*, iv. 351 *b*. The influence of the planets upon our *Spirits*, v. 126 *a*. The nature and remedy of possessions by evil *Spirits*, v. 456 *a*. *Spirit* is an immaterial substance, a very imperfect definition, v. 663 *b*. The doctrine of *Spirits* according to *Aristotle* examined, v. 665 *a*. The notion of a *Spirit* diffused through the mass of matter considered, i. 261 *b*.

SPIRIT, a *Spirit* extracted from oil of anniseed, iv. 91 *a*. Inquiry into the *Spirit* of human blood, iv. 161 *a*. *Spirit* of blood rectified, iv. 169 *a*. *Spirit* extracted from dried blood, iv. 171 *b*. Experiment of serum and *Spirit* of blood, iv. 176 *a*. History of the *Spirit* of human blood, iv. 176 *b*. No ardent *Spirit* to be raised from human blood, iv. 178 *a*. Whether the *Spirit* of human blood be a mixture of volatile salt and phlegm, iv. 178 *b*. *Spirit* of human blood belongs to the class of alcalies, iv. 179 *b*. The odour of *Spirit* of blood offensive, iv. 180 *b*. The quantity of the *Spirit* in human blood, iv. 181 *a*. The degree of fluidity in the *Spirit* of blood, iv. 181 *b*. The subtilty of the parts in *Spirit* of blood, iv. 182 *a*. The odour, taste, colour and transparence of *Spirit* of blood, iv. 182 *b*. Experiment with filings of copper, and the *Spirit* of human blood, iv. 183 *a*. Experiment of *Spirit* of blood upon coagulated blood, iv. 183 *b*. *Spirit* of blood endowed with an embalming virtue, iv. 184 *a*. Tinctures drawn by *Spirit* of blood, iv. 184 *a*. The effect of *Spirit* of blood on the filings of steel, iv. 184 *b*. The effect of *Spirit* of human blood on powdered amber, iv. 185 *b*. The precipitating power of the *Spirit* of human blood, iv. 186 *a*. The affinity between *Spirits* of blood and chymical oils, iv. 186 *b*. The ways to aromatise *Spirit* of blood, iv. 187 *b*. Relation between the air and the *Spirit* of human blood, iv. 188 *a*. Hostility of the *Spirit* of human blood to acids, iv. 189 *a*. Experiment with *Spirit* of blood and *Spirit* of nitre, iv. 169 *b*. The medicinal virtues of *Spirit* of human blood outwardly applied, iv. 190 *a*. The way of applying *Spirit* of human blood to the nostrils, iv. 191 *a*. The smell of *Spirit* of blood useful to the female sex, iv. 191 *b*. The external uses of the *Spirit* of blood, iv. 192 *b*. The internal uses of the *Spirit* of human blood, iv. 193 *a*. The *Spirit* of human blood both active and medicinal, iv. 193 *b*. Effectual in curing a cough, iv. 194 *a*. The effects of *Spirit* of blood skilfully compounded, iv. 194 *b*. The simple way of altering the *Spirit* of human blood, iv. 195 *a*. The qualities of the alcalizate *Spirit* of blood, iv. 201 *b*. The calcinatum of nitre and tartar mixed with dried blood, iv. 202 *a*. A solution of gold precipitated with *Spirit* of human blood, iv. 202 *b*. *Spirit* of blood made to freeze, iv. 203 *b*. *Spirit* of salt will eat into glass, iv. 226 *b*. *Spirits* will not ordinarily pierce through glass, iv. 227 *b*. To make an inflammable *Spirit* of roses, v. 100 *b*. *Spirit* of salt a remedy for the stone, v. 287 *a*. Corrosive *Spirits* abound in water, i. 316 *a*. The quality of *Spirit* of box, i. 328 *b*. What the chymists mean by distilled *Spirits*, i. 342 *b*. The coagulating *Spirit* of salt with *Spirit* of urine, i. 363 *a*. What chymists mean by the word *Spirit*, i. 386 *a*. The nature of urinous *Spirits* examined, i. 387 *a*. The nature and quality of adiaphorous *Spirits*, i. 390 *b*. The virtue of rectified *Spirit* of box distilled, i. 391 *b*. The producing of colours by an adiaphorous *Spirit*, i. 392 *b*. An oil extracted from *Spirit* of wine and oil of vitriol, i. 394 *a*. The production of inflammable *Spirits*, i. 395 *a*. The nature of the animal *Spirits* anatomically considered, v. 706 *b*.

SPIRIT, *Spirit* of wine will not turn into air, i. 33 *a*. An experiment upon *Spirit* of vinegar, i. 37 *b*. Its use in an experiment upon polished marble, i. 45 *a*. The nature and effect of its heat, i. 70 *a*. *Spirit* of salt, and *Spirit* of nitre, the effects of both, i. 206 *b*. An experiment to try the poorness of *Spirit* of wine, i. 213 *a*. The value of pure *Spirit* of wine, i. 213 *b*. The smoke and exhalation of *Spirit* of nitre considered, i. 235 *b*. The particles of *Spirit* of wine in violent agitation, i. 250 *b*. The heat of *Spirit* of wine, iv. 31 *b*. Experiment of the noctiluca and *Spirit* of wine, iv. 78 *b*. *Spirit* of wine hinders the production of air, iv. 108 *a*. Hinders fermentation, iv. 111 *b*. Experiment on paste with and without *Spirit* of wine, iv. 112 *b*. Hinders the production of air in pease, iv. 113 *b*. *Spirit* of wine not condensed by the compression of the air, iv. 140 *a*. Serum coagulated by *Spirit* of wine, iv. 173 *a*. Experiment on *Spirit* of wine and oil made *per deliquium*, iv. 141 *b*. *Spirit* of wine *in vacuo* accelerates ebullition, iv. 142 *a*. *Spirit* of blood will unite with *Spirit* of wine, iv. 187 *a*. The effect of amber dissolved in *Spirit* of wine, iv. 192 *a*. Flame of *Spirit* of wine will act on the hardest metals, iv. 257 *b*. The effect of *Spirit* of wine mixed with *Spirit* of urine, iv. 319 *a*. The way used by chymists to try their *Spirits*, v. 15 *a*. *Spirit* of wine consumed in sealed thermometers, v. 331 *b*. Is materially water, under a sulphurous disguise, ii. 316 *a*. Its power in dissolving of mixed bodies, i. 341 *a*. Is more fluid than water, and will flame all away, i. 350 *b*. The mixture of dephlegmed *Spirits* of wine and urine, i. 380 *a*. Experiment to make an acid *Spirit* of wine, i. 389 *b*. Highly rectified *Spirit* of wine used in weather-glasses, ii. 249 *b*. Will freeze mixed with snow, ii. 260 *a*. Experiment by freezing *Spirit* of wine, ii. 265 *b*. *Spirit* of wine coagulated by *Spirit* of urine, iii. 192 *b*. The duration of the flame of *Spirit* of wine impregnated with a metal in the exhausted receiver, iii. 256 *a*. *Spirit* of wine dephlegmed without distillation, iii. 367 *b*.

SPIRITUS CORNU CERVI, the use of it, v. 444 *b*.

SPITTLE, the freezing of *Spittle* within the mouth, ii. 326 *b*.

SPLEEN, experiment of taking out the *Spleen* of dogs, i. 465 *b*.

SPONGE, the use of *Sponges* to supply the want of respiration, i. 72 *a*. An hygroscope made of a *Sponge*, iii. 394 *b*. The moisture and dryness of the air known by the weight of the *Sponge*, iii. 397 *a*. The alteration of its weight by winds, frosty, snowy, and other weathers, iii. 397 *b*. Discovers the temper of the air in different rooms in the same house, 398 *b*. The virtue of *Sponges* dipped in lime-water, i. 525 *a*.

SPOT, the *Spots* in a turquois stone particularly considered, i. 285 *b*. *Spots* generated and dissipated near the surface of the sun, v. 51 *a*. *Spots* in linen when best to be washed out, iii. 91 *b*.

SPOUT, the effect of a *Spout* at sea, v. 282 *a*.

SPRAT, Mr. his history of the Royal Society, v. 325 *b*.

SPRING, the depth of the *Spring* discovered by the coldness of the water, iv. 242 *a*. The way to examine the saltness of mineral *Springs*, iv. 245 *a*. *Springs* imbued with mineral corpuscles, iv. 283 *a*. Remarks on an incrusted *Spring*, v. 158 *a*. The freezing of *Springs* examined, ii. 365 *a*. *Springs* in *Denmark* and *Norway* never frozen, ii. 365 *b*. Hot springs in the bottom of rivers, ii. 367 *b*. An inquiry into the origin of *Springs*, v. 463 *a*. Account of *Springs* in *Mendip* hills, *Wiltshire*, &c. v. 463 *a*. The nature of particular *Springs* explained, v. 464 *a*. They often run in veins near the surface of the earth, v. 466 *a*. Account of a *Spring* of an ill smell in *Oxfordshire*, v. 643 *a*. The smoking of *Springs* in frosty weather considered, iii. 97 *b*. The nature of *Spring*-water examined, i. 313 *b*. Account of a healing *Spring*, v. 440 *a*.

SPRING, a letter concerning the *Spring* of the air, i. 1 *a*. What he means by the *Spring* of the air, i. 8 *a*. Two ways of explaining the *Spring* of the air, i. 8 *b*. Objections against it, i. 9 *a*. The *Spring* of the air more particularly accounted for, i. 9 *b*. An experiment concerning the *Spring* of water, i. 29 *b*. The doctrine of the *Spring* of the air defended, i. 76 *a*. Is not yet sufficiently apprehended, i. 77 *b*. The *Spring* of the air of more force than the weight of it, i. 85 *b*. The measure of the *Spring* of the air compressed and dilated, i. 100 *a*. The *Spring* of the air able to resist a hundred inches of quicksilver, i. 102 *a*. Experiments concerning the *Spring* of the air particularly defended, 104 *a*. *b*. &c. Two experiments to prove the *Spring* of the air against Mr. *Hobbes*, i. 128 *a*. The sticking of bodies owing to a sort of *Spring* in the air, i. 256 *a*. Experiments on the *Spring* of the air, and its effects, iii. 6 *a*. The raising of quicksilver by the *Spring* of the air, iii. 7 *a*. The strength of the *Spring* of the air, iii. 8 *b*. How it raises quicksilver in unequal tubes, iii. 9 *b*. The *Spring* of the air improved by heat, iii. 10 *a*. A fountain made by the

the *Spring* of uncompressed air, iii. 10 *a*. The breaking of blown bladders by the *Spring* of the air, iii. 12 *b*. Bubbles of glass broke by the *Spring* of the air, iii. 13 *b*. Its force upon solid bodies, iii. 14 *a*. The *Spring* of the air weakened by expansion, iii. 14 *b*. The effect of it in the use of cupping-glasses, iii. 45 *a*. Trial of the *Spring* of the air in unequally broad-mouthed vessels, iii. 58 *a*. The great *Spring* of a small quantity of air, iii. 60 *a*. The *Spring* of the air increased by heat, ii. 225 *a*. The duration of the *Spring* of expanded air, iii. 206 *a*. Proved by experiments, iii. 207 *b*. The pressure of the air's *Spring* on bodies under water, iii. 296 *a*. The *Spring* of the air able to expand the compressed glass it was imprisoned in, iii. 482 *b*. The *Spring* of the air increased by heat, iii. 488 *b*. Experiments about the weakened *Spring* of the air, iii. 553 *a*. Whether in some metalline solutions the *Spring* of the neighbouring air will not be weakened, iii. 555 *a*. An enquiry into the elastic *Spring* of bodies, i. 124 *a*.

SPRING-TIDES, an account of them, iii. 91 *b*.

SPRINGY PARTICLES of the air, an account of them, v. 109 *a*.

SPUNK, an ineffectual attempt to make flame kindle *Spunk* in an exhausted receiver, iii. 258 *b*.

SPURRY-SEED, an account of it, v. 261 *b*. *Spurry* butter preferred to *May* butter, v. 262 *a*.

SQUARE, the diameter of it incommensurable to the side, v. 62 *a*. The side and diagonal of it examined, iv. 41 *a*.

STAGGERS in horses, a cure for that disease, i. 533 *a*.

STAHL, Mr. account of his course of chymistry, v. 419 *b*.

STAINS, taken out of linen, v. 421 *a*. The time of their going out of linen considered, v. 182 *b*.

STAR, the discovery of new *Stars*, ii. 115 *a*. The reason of falling *Stars*, iv. 35 *a*. The distances of the fixed *Stars* not to be measured, iv. 45 *b*. An account of *Stars* attending upon the sun, iv. 66 *b*. The magnitude of the fixed *Stars* explained, iv. 341 *a*. The velocity of the fixed *Stars*, iv. 342 *a*. A discovery of new *Stars*, v. 178 *a*. The distance of the fixed *Stars*, i. 434 *a*. Opinions concerning the distance and bulk of the fixed *Stars*, iii. 438 *b*. The periodical revolution of a *Star* observed by astronomers, iii. 529 *a*. The use of the fixed *Stars* to mankind, iv. 533 *b*. Many fixed *Stars* of which the earth can have no advantage, iv. 535 *a*. The appearance and disappearance of *Stars* explained, iii. 93 *b*. The magnitude of the fixed *Stars*, iii. 159 *a*. Remark on their shining at so vast a distance, iv. 261 *b*. Account of new discoveries in the number of the fixed *Stars*, v. 687 *a*. *Stars* may be made beneficial to several purposes, v. 691 *b*.

STAR-SHOOT, remark upon it, i. 244 *b*. The nature of *Star*-shoots particularly explained, v. 331 *b*.

STATE, the consequences of believing a future *State*, v. 43 *b*. Affairs of *State* in what manner to be judged of, ii. 196 *a*. The Heathens speak doubtfully of a future *State*, v. 68 *b*.

STATESMAN, the study of the *Scriptures* useful to a *Statesman*, ii. 132 *a*.

STATICAL BAROSCOPE, particular account of it, v. 132 *a*. The use and convenience of a *statical Baroscope* above the mercurial, ii. 545 *b*.

STATIONERS, their losses by the fire of *London*, v. 361 *a*.

STATUTES of Mr. *Evelyn*'s philosophical college, v. 399 *a*.

STEAMS of air considerably alter the pressure of the atmosphere, i. 28 *b*. The motion of *Steams* in an ambient body, i. 43 *b*. Colours observable in the *Steams* of bodies, ii. 62 *a*. The emanation of *Steams* from solid bodies, iii. 66 *a*. Emitted from grinding of iron, iii. 68 *a*. Moving in the air from between the north pole and the south, iii. 88 *b*. The strange discovery of pestilential *Steams*, iii. 89 *a*. *Steams* at the mouth of grooves feel warm, iii. 99 *a*. *Steams* to be found in deep mines, iii. 101 *b*. The use of the air to elevate the *Steams* of bodies, iii. 130 *a*. The shining *Steams* of a liquid phosphorus, iv. 73 *a*. The discolouring of money by sulphureous *Steams*, iv. 213 *a*. Subterraneous *Steams* affect the salubrity of the air, iv. 251 *b*. Fœtid *Steams* emitted by glass, iv. 271 *a*. Subterraneous *Steams* contribute to the quality of the air, iv. 276 *a*. Odorous *Steams* over the veins of minerals, iv. 279 *a*. Endemical diseases depend on subterraneal *Steams*, iv. 279 *b*. Are sometimes prevented by them, iv. 284 *a*. Subterraneal *Steams* the cause of the plague, iv. 290 *a*. Hurtful to human bodies, iv. 296 *b*. Terrestrial *Steams* in the air, v. 116 *a*. The effect of subterraneal *Steams* upon minerals, v. 122 *a*. Sulphureous *Steams* kindled in the air, v. 122 *b*. The changes of the air effected by subterraneal *Steams*, v. 185 *b*. Account of a *Steam* in the mines of *Hungary*, i. 358 *b*. The power of *Steams* upon human bodies, i. 536 *a*. *Steams* in the air of a chilling nature, ii. 241 *a*. Warm *Steams* arise from the lower parts of the earth, ii. 366 *b*. Hot *Steams* rising from the earth covered with water, ii. 367 *b*. Sulphurous *Steams* from a ditch in the north of *England*, ii. 368 *a*. Sudden thaws owing to subterraneal *Steams*, ii. 368 *b*. These *Steams* confined in winter in the bowels of the earth, ii. 368 *b*. Subterraneal bodies may be impregnated by subterraneal *Steams*, iii. 244 *a*. The piercing nature of animal *Steams*, iii. 322 *b*. The *Steams* of bodies have their distinct determinate natures, iii. 329 *a*. Instances of the coalition and resulting change of *Steams* in the air, iii. 333 *b*. A proof of the distinctness and subsequent commixture of *Steams* in the air, iii. 334 *a*. The resultancy of pestilential *Steams*, iii. 334 *b*. Pestilential *Steams* corrected by the coalition of antidotal particles, iii. 335 *b*.

STEEL; two *Steels* by collision will not strike fire in a receiver, i. 21 *a*. The different ways of tempering of *Steel*, i. 219 *a*. Made brittle by plunging it red-hot into fair water, i. 275 *a*. A spring of *Steel* bent, the nature of it, i. 284 *a*. Changes of colour to be observed in the tempering of *Steel*, ii. 6 *a*. Ways to try the temper of *Steel*, ii. 6 *b*. The colour of tempered *Steel* only superficial, ii. 9 *b*. The particular effects of a preparation of *Steel*, ii. 71 *a*. An account of the tempering of *Steel*, iii. 148 *a*. The effect of spirit of blood on the filings of *Steel*, iv. 184 *b*. Experiment upon pure *Steel* with tincture of galls, iv. 234 *b*. Remarks on the turning of *Steel*, iv. 253 *a*. In what manner the loadstone acts upon *Steel*, iv. 258 *a*. The producing of heat in bars of *Steel*, iv. 270 *a*. *Steel* given to cure the acidities of the blood, iv. 313 *b*. The chymists way of preparing *Steel*, v. 93 *a*. Experiment with filings of *Steel* and spirit of sea-salt, v. 93 *b*. The water used in the tempering of *Steel*, v. 201 *a*. The softning and hardning of *Steel* without fire, v. 306 *a*. The effect of cold in the tempering of *Steel*, i. 328 *a*. *Steel* in the flame of a candle will be of divers colours, i. 352 *b*. A piece of *Steel* will have its determinate poles, like a loadstone, iii. 643 *b*.

STEEPLE, experiments from *Paul's Steeple*, v. 305 *b*.

STENO, Monsieur, his experiment of binding the artery descending from the head, v. 385 *b*.

STEPHANUS, the contriver of chapters and verses in the Old Testament, ii. 104 *b*.

STEPKINS, Mr. his surprizing cure of a maid born blind, i. 424 *a*.

STEREOMETRY, hydrostatical, applied to the *materia medica*, v. 19 *a*.

STEVINUS, account of his hydrostatical elements, ii. 412 *b*. Of the weight of a ship in water, ii. 426 *b*. His demonstration of a hydrostatical paradox, ii. 430 *a*. A censure upon his experiments, ii. 432 *b*. His account of the pressure of water examined, ii. 446 *a*. His remarks on the floating of bodies, iii. 164 *a*.

STIFELIUS, his account of weights, iii. 158 *a*.

STILIARDS, the manner of weighing in them, iii. 160 *a*.

STIRIÆ, stony *Stiriæ* found in caves, experiments upon them, iii. 225 *b*.

STIRK, Dr. some account of him, v. 258 *b*.

STOICKS, believed the world to be made for man, i. 432 *a*. An argument against the *Stoicks*, ii. 191 *b*.

STOMACH, how the *Stomach* acts upon medicines, i. 505 *b*. The heat of men's *Stomachs* in winter examined, ii. 360 *b*. The constitution of the *Stomach* with regard to medicines examined, iv. 397 *a*.

STONE, the manner of its being generated, i. 211 *b*. An account of the growth of pebble *Stones*, i. 277 *a*. Whether *Stones* proceed from fluid bodies, i. 277 *b*. A mineral taken out of the body of a *Stone*, i. 278 *a*. The colour of the philosophers *Stone*, ii. 58 *b*. A strange account of a shining *Stone* in *America*, ii. 83 *a*. *Stones* emit a sensible smell, iii. 67 *a*. Taken out of bladders, smell like urine, iii. 67 *b*. *Stones* made to float, iii. 163 *b*. To measure depths by the descent of a *Stone*, iii. 179 *b*. The reflection of light in a *Stone*, iv. 7 *b*. The porousness of natural *Stones*, iv. 222 *a*. An account of the growing of *Stones*, iv. 268 *b*.

Obser-

Observations on the polishing of precious *Stones*, iv. 275 *a*. The virtue of a *Stone* against bleeding, iv. 305 *b*. A *Stone* taken out of a lady's tongue, iv. 313 *b*. A simple *Stone* of use in hysteric fits, iv. 337 *b*. The virtue of a stone like an agat outwardly applied, iv. 338 *a*. The weighing of *Stone* in air and water, v. 4 *a*. The specific gravity of *Stones* in the bladder, v. 7 *b*. The weighing of animal *Stones*, v. 8 *a*. To discover genuine *Stones* from false ones, v. 8 *b*. The five medicinal precious *Stones*, v. 11 *b*. Of *Stones* that change their colour, v. 184 *a*. Of *Stones* actually hot, v. 197 *b*. A *Stone* like a petrified bone, v. 250 *a*. A cure for the *Stone* in *Barclay*'s Euphormio, v. 265 *a*. A *Stone* yielding four different substances, v. 357 *a*. A *Stone* taken out of a horse, v. 394 *a*. *Stones* found in children and beasts, i. 357 *a*. *Stones* are generated at this time, i. 357 *b*. The reduction of *Stones* into a mere salt, i. 362 *b*. The transmutation of *Stones* into actual *Salt*, i. 378 *a*. The efficacy of one grain of the philosopher's *Stone*, i. 406 *a*. How a *Stone* is said to descend, i. 446 *b*. The causes of the *Stone* in the bladder and kidneys, i. 472 *a*. The shape and contexture of such *Stones*, i. 474 *b*. *Stones* produced in sucking children, i. 475 *a*. *Stones* found in the bodies of beasts, i. 477 *a*. *Stone* dissolved by the seed of a Peruvian plant, i. 484 *a*. The *Stone* cured by millepedes, i. 485 *a*. Whether the stone is curable by inward medicines, i. 485 *a*. A liquor may be made to dissolve the *Stone*, i. 486 *a*. The strange effect of a *Stone* dipped in oil, i. 488 *b*. The physical virtues of the *Stone* in the bladder, i. 506 *b*. An insipid liquor distilled from hard *Stones*, ii. 332 *b*. Hard *Stones* affected by the frost, ii. 340 *a*. The effect of using it at a proper time, iii. 188 *b*. The virtues of precious *Stones* considered, iii. 217 *a*. A liquor to be found in precious *Stones*, iii. 223 *b*. The opacity of precious *Stones*, iii. 230 *a*. The fragments of precious *Stones* taken inwardly, iii. 234 *b*. The specific gravity of opacous *Stones*, iii. 237 *a*. Cavities in the solid substances of *Stones*, iii. 238 *a*. Aggregates of figured *Stones* growing up from a root, iii. 241 *a*. The quality of the solutions of various *Stones*, iii. 242 *b*. The gravity of medicinal *Stones* explained, iii. 243 *a*. The matter of medical *Stones* imbued with virtues from subterraneous exhalations, iii. 243 *b*. Opacous *Stones* were mineral bodies before they became *Stones*, iii. 244 *b*. The virtues of medical *Stones* particularly considered, iii. 245 *a*. The manner and design of the formation of *Stones*, iv. 523 *a*. *Stones* expressing the shape of serpents, beasts, birds, &c. v. 467 *b*. Account of the growth of *Stones*, v. 530 *a*. *Stones* found in several parts of the human body, v. 530 *b*. Blueish *Stones* cast out of a blueish marl-pit, v. 497 *b*. A wooden *Stone* that swims on the surface of the water, v. 631 *b*.

STONE-CUTTERS, a particular account of their art, iii. 147 *b*. Their way of making an impalpable powder, iii. 170 *b*.

STONE-BOWS, brittle in frosty weather, ii. 274 *b*.

STOP-COCK to a receiver in an engine, described, i. 6 *a*.

STOPPLE, remarks on the *Stopple* of a strong phial, iv. 275 *b*. Glass-*Stopples* fittest for corrosive liquors, i. 513 *b*. Used for stopping of bottles, v. 278 *a*.

STORGE, an account of it in divers animals, v. 692 *b*.

STORM, meditations suggested by a *Storm*, ii. 155 *a*. The effect of *Storms* under water considered, iii. 112 *b*. A *Storm* foretold by a baroscope, v. 158 *b*.

STRABO, an account of the exquisiteness of his sight, v. 700 *a*.

STRADA, his account of a strange fireship, iv. 273 *b*.

STRASBURGH, an account of the clock at *Strasburgh*, i. 446 *a*.

STRATON-WATER, the weight of it, iv. 243 *a*.

STRAW, pestilential contagion preserved in *Straw*, iii. 320 *b*.

STRINGS of instruments will break in wet weather, iii. 322 *a*. The cause of it particularly explained, iii. 402 *a*. Remarks upon their tremulous motion, iv. 263 *b*. The impulse of the air on musical *Strings* considered, iv. 265 *b*. *Strings* of instruments broken by moist vapours, iv. 281 *a*.

STUDY of divine things, the excellency of it, iii. 422 *b*. The many advantages arising from it, iii. 425 *b*. It procures a welcome approbation from the conscience, iii. 436 *a*. The inconveniencies of hard study, v. 297 *b*.

STYLE, proper for experimental essays, i. 195 *b*. Observation on the *Style* of the Scriptures, ii. 88 *a*. A particular account of that treatise, ii. 91 *a*. Reasons for publishing it, ii. 91 *b*. What the author means by the *Style* of Scripture, ii. 94 *a*. The *Style* of Scripture judged of by the translations made of it, ii. 95 *a*. Not to be blamed for the obscurity of Scripture, ii. 101 *b*. The *Style* as unexceptionable as any other, ii. 119 *a*. Profane remarks upon the *Style* of Scripture, ii. 120 *a*. The *Style* of the Holy Ghost peculiarly awful, ii. 135 *b*. The *Style* of Scripture of more influence than that of other books, ii. 136 *b*. An account of the *Style* of the meditations, ii. 142 *b*. The suppleness of *Style* considered, ii. 153 *b*.

SUAQUENA, the infernal heat of that island, v. 166 *b*.

SUBJECT, the rules of judging of privileged *Subjects*, iv. 55 *b*. The marks of privileged *Subjects* iv. 57 *a*.

SUBJECT, the duty of *Subjects* to their prince, ii. 197 *a*.

SUBLIMATE, sophisticated with arsenic, i. 205 *b*. An experiment by a solution of common *Sublimate*, ii. 31 *a*. The solution of *Sublimate* made by salts explained, ii. 67 *b*. The way of taming a corrosive *Sublimate*, iv. 319 *b*. The weighing of *Sublimate* examined, v. 13 *a*. It may be oftner sublimed without a separation of its parts, i. 306 *b*. Experiment by dissolving Venetian *Sublimate*, and the salt of wood-ashes, i. 339 *b*. An experiment on the solution of *Sublimate* and oil of tartar, ii. 65 *a*. The qualities of a *Sublimate* from oil of anniseeds, iv. 91 *a*. Experiment with a sulphureous tincture and a good *Sublimate*, iv. 248 *a*. The operation of *Sublimate* upon copper and silver, ii. 506 *b*. The effect of new kinds of *Sublimate*, ii. 506 *b*. The piercing steams of dissolved *Sublimate*, iii. 339 *b*.

SUBLIMATIONS useful to the fine comminutions of divers bodies, iii. 616 *b*. *Sublimations*, the pestles of the chymists, i. 302 *b*.

SUBLIME, a character of it, ii. 142 *b*.

SUBMARINE REGIONS, their temper, iii. 105 *a*. An account of the *submarine* ground of the sea, iii. 110 *b*.

SUBORDINATE FORMS particularly explained, ii. 526 *a*. Attributed to inanimate bodies, ii. 527 *a*. To rhubarb, olives, kindled sulphur, &c. ii 527 *b*. *Subordinate Forms* as real as the specific, ii. 532 *a*.

SUBSIDENCE of mercury in the Torricellian experiment, iii. 26 *a*.

SUBSTANCE, the shining of an artificial *Substance*, iv. 10 *a*. A factitious self-shining *Substance*, iv. 19 *a*. The usefulness and virtue of them, iv. 23 *b*. A *Substance* is endowed with accidents, iv. 64 *a*. The operation of the air on animal *Substances*, v. 178 *b*. On the odours and tastes of *Substances*, v. 181 *b*. The nature of a corporeal *Substance* examined, iii. 433 *a*. The union of a corporeal with an incorporeal *Substance* hard to comprehend, iii. 433 *b*. What is to be meant by an immaterial *Substance*, v. 665 *b*.

SUBSTANTIAL FORMS, the origin and doctrine of them explained, ii. 476 *a*. The arguments for *Substantial Forms* confuted, ii. 480 *a*.

SUBTERRANEAL, the quality of the air owing to *subterraneal* expirations, iv. 177 *b*. The propagating power of *subterraneal* bodies, iv. 282 *a*. The effects of *subterraneal* effluvia upon human bodies, iv. 287 *a*.

SUBTILTY of parts in the glacial noctiluca, iv. 79 *a*.

SUCCEDANEUM to a menstruum will change the colours of medicines, ii. 74 *b*.

SUCKER, the *Sucker* of an air-pump described, i. 6 *b*. In what manner drawn to the bottom of the cylinder, i. 11 *b*. An experiment of a great weight hung at the *Sucker*, i. 134 *b*. *Hobbes*'s notion of the air's passing between the *Sucker* and the cylinder considered, i. 135 *a*. The description of the *Sucker* in the air-engine, iii. 5 *a*. The drawing up the *Sucker* of a syringe, iii. 41 *a*.

SUCKING-PUMP described, i. 6 *b*. The height that water can be raised by *Sucking-Pumps*, iii. 19 *a*.

SUCTION in the air-pump particularly explained, i. 47 *b*. Water and quicksilver ascend by *Suction*, i. 90 *a*. The ascension of liquors by *Suction* considered, i. 146 *b*. *Suction* depends upon the weight of the atmosphere, iii. 15 *b*. The elevation of liquors by *Suction* explained, iii. 16 *b*. The reason of *Suction* assigned, i. 445 *a*. Air extracted by *Suction* out of a glass, iii. 490 *a*. The interest of the weight of the atmospherical air in *Suction* experimentally tried, iii. 490 *b*. The cause of attraction by *Suction*, iii. 493 *a*. The ascension of liquors upon *Suction* examined, iii. 495 *a*. The Peripatetic opinion about the cause of *Suction*, iii. 496 *a*. Modern philosophers ascribe it to the action of the sucker's thorax, iii. 416 *b*. The raising of water in a pipe by *Suction* particularly explained, iii. 497 *a*. The ascension of liquors by *Suction* not owing to the impulse

impulse of the air, iii. 498 *b*. Occasioned by the expansion the air is brought to by *Suction*, iii. 499 *a*. The weight of the atmospherical air sufficient to raise up liquors in *Suction*, iii. 500 *a*. The ascension of liquors by *Suction* depends on the pressure of the air, iii. 501 *b*.

SUFFICIENCY of God particularly described, i. 173 *a*.

SUGAR of *Saturn* explained, i. 239 *a*. *Sugar* of lead sweeter than common *Sugar*, i. 362 *a*. A trial of freezing on a solution of *Sugar* and lead, ii. 263 *b*. *Sugar* will not preserve fruit like fermented liquors, iv. 155 *a*. *Sugar* cast into water easily dissolved, i. 246 *b*. No acid must mix in the formation of *Sugar*, i. 274 *b*. Experiment upon hard loaf-*Sugar*, iii. 55 *b*. Account of the trades belonging to *Sugar*, iii. 149 *b*. The planting of *Sugar*-Canes, iii. 150 *a*. The reason of *Sugar's* dissolving in water, iv. 257 *a*. Ways to increase the weight of *Sugar*, v. 348 *b*. The making of *Sugar*-wines, i. 491 *a*. Of preserving bodies by *Sugar*, i. 494 *a*. Several ways of making *Sugar*, i. 495 *a*. The great advantages of it, v. 692 *a*. *Sugar*-loaf of the Pic of *Teneriff*, how far seen at sea, v. 174 *b*. A description of it, v. 175 *a*.

SUISSET, JOHN, his behaviour on reading his own works, v. 482 *b*.

SULPHUR, adult, not the cause of blackness, ii. 39 *b*. An account of *Sulphur vegetabile*, ii. 40 *a*. Oil of *Sulphur* will heighten the tincture of red roses, ii. 54 *b*. Experiment with the noctiluca and flowers of *Sulphur*, iv. 85 *a*. Experiment on *Sulphur vivum* in an exhausted receiver, iv. 131 *b*. Experiment on the weight of flower of *Sulphur*, iv. 149 *b*. Gold and copper penetrable by *Sulphur*, iv. 225 *a*. A limpid liquor impregnated with mineral *Sulphur*, iv. 240 *b*. The effect of rubbing *Sulphur* upon the clothes, iv. 270 *b*. The effect of spirit of *Sulphur* upon marcasites, iv. 286 *a*. No native *Sulphur* found in mines, iv. 290 *b*. The virtue of terebinthinate balsam of *Sulphur*, iv. 331 *a*. Of *Sulphur* of *Venus*, iv. 333 *a*. A way to obtain *Sulphur* of *Mars*, v. 93 *b*. An account of *Sulphur* in the air, v. 122 *a*. *Sulphur* of *Stella martis*, some account of it, v. 242 *a*. The effect of common *Sulphur* sublimed, i. 305 *a*. *Sulphur* sublimed out of antimony, i. 305 *b*. Many ways of producing it, i. 306 *b*. The separation of *Sulphur* of wine, i. 307 *a*. *Sulphur* not to be separated from gold, i. 325 *b*. Distilled from oil of vitriol and oil of turpentine, i. 333 *a*. Observations on the *Sulphurs* of bodies, i. 340 *b*. Mineral *Sulphurs* differ from one another, i. 343 *a*. Common *Sulphur* abounds with oil and salt, i. 380 *a*. The produciblenes of *Sulphurs*, i. 393 *a*. The nature and difference of *Sulphurs*, i. 393 *b*. The production of consistent *Sulphur*, i. 395 *a*. *Sulphur* produced from oil of vitriol and common sea-salt, i. 395 *b*. The *Sulphur* of minerals and metals, i. 396 *a*. A *Sulphur* obtained from cinnabar, i. 396 *b*. The medical virtue of mineral *Sulphurs*, i. 397 *a*. *Sulphur metallorum Theophrasti*, i. 397 *b*. Store of *Sulphur* in common glass, i. 416 *a*. The way of making ruby of *Sulphur*, i. 571 *b*. The colours of fumes arising from a volatile tincture of *Sulphur*, iii. 330 *b*. The fusibility of *Sulphur* explained, iii. 598 *b*. Smoke of *Sulphur* cure for consumptions, i. 546 *a*. An ineffectual way of kindling *Sulphur in vacuo Boyliano*, iii. 250 *b*. The duration of flame of *Sulphur in vacuo Boyliano*, iii. 254 *b*. A way of making the powder of common *Sulphur* become dissoluble, iii. 633 *a*.

SUMATRA, the weather of that island, v. 166 *a*.

SUN, the inequalities that appear upon the setting-*Sun* described, i. 44 *b*. A derivative *Sun* described, i. 168 *b*. The discovery of spots in the *Sun*, i. 223 *a*. An effect of viewing the *Sun* through a telescope, ii. 9 *a*. A particular account of the sun's appearing white, ii. 24 *a*. The blackness of Negroes not occasioned by the heat of the *Sun*, ii. 35 *a*. Atmospheres given to bodies by the *Sun*, iii. 68 *b*. An account of the spots of the *Sun*, iii. 92 *b*. How the moon is enlightened by the *Sun*, iv. 66 *b*. The variety of weather not accounted for by the influence of the *Sun*, iv. 285 *b*. The *Sun* above a hundred and threescore times bigger than the earth, iv. 341 *a*. The *Sun*, according to the Cartesians, extremely fluid, iv. 342 *a*. The influence of the *Sun* upon the planets, v. 126 *a*. The appearance of three *Suns*, v. 176 *b*. The *Sun* the great servant of the universe, i. 431 *b*. The Ptolemean system concerning the *Sun*, i. 433 *b*. Two parhelions accompanying the *Sun*, ii. 399 *a*. Dark bodies discovered in the *Sun*, iii. 187 *a*. Observation of a spot in the *Sun*, iii. 213 *a*. The bigness of the *Sun*, the moon and the earth, as computed by astronomers, iii. 523 *b*. Various opinions concerning the *Sun*, iv. 377 *b*. Whether the *Sun* was made for the service of men, iv. 528 *a*. The rotation of the earth and planetary globes influenced by the *Sun*, v. 493 *a*. Remarks on the eclipses of the *Sun*, v. 667 *b*. How much it exceeds the bigness of the terrestrial globe, v. 687 *a*.

SUN-BEAMS consist of fiery particles, and can pass through glass, i. 141 *b*. An experiment upon the *Sun-Beams* in a darkned room, ii. 29 *b*. Their effect beneath the surface of the earth, iii. 97 *b*. The nature and force of the *Sun Beams*, iv. 254 *a*. The effect of the *Sun-Beams* upon the eyes, iv. 264 *b*. The air affected by the action of the *Sun-Beams*, iii. 464 *b*.

SUPERNATURAL EFFECTS inquired into, v. 54 *a*.

SUPPLEMENT to the essay on local motion, iv. 272 *a*.

SUPRA-LAPSARIANS, the reason of their name, iii. 416 *b*.

SURA, a drink in the *East-Indies*, i. 494 *b*.

SURFACE of water in vessels is concave, i. 57 *a*. The reason of the adhesion of bodies with smooth *Surfaces*, i. 256 *a*. The *Surfaces* of bodies are not properly smooth, ii. 10 *a*. An inquiry into the *Surface* of contiguous liquors, iv. 1 *b*. An experiment upon the *Surface* of quicksilver, iv. 2 *b*. An account of the *Surface* of regulus, iv. 9 *b*.

SURFEIT, cured by a particular vomit, v. 90 *b*.

SURVEY of the city of *London* for the rebuilding of it, v. 361 *b*.

SUSPICIONS, a tract on cosmical *Suspicions*, iii. 88 *a*.

SWALLOWS, spungy places of the earth, their nature, v. 463 *b*.

SWALLOWS, inclosed in ice, an account of them, v. 103 *b*. They hide themselves under water in winter, ii. 339 *a*.

SWEARER, the familiarity of *Swearers* to be avoided, v. 219 *b*. The vanity and foolishness of *Swearers*, v. 220 *b*.

SWEARING, a discourse against customary *Swearing*, v. 204 *a*. One of the most provoking sins, v. 206 *a*. Excuses in defence of customary *Swearing*, v. 206 *b*. It is expressly forbidden in the ten commandments, v. 207 *a*. The commonness of it a weak excuse, v. 207 *b*. *Swearing* in defence of truth not always justified, v. 208 *b*. The nature of *Swearing* by the creatures, v. 209 *b*. *Swearing* by fictitious terms considered, v. 210 *a*. *Swearing* some peculiar oath, v. 210 *b*. Frequent *Swearing* gains no belief, v. 210 *b*. The plea of *Swearing* in anger considered, v. 211 *b*. *Swearing* occasioned by drunkenness and choler, v. 212 *b*. Of *Swearing* at the second-hand, v. 213 *a*. *Swearing* called the sin of a gentleman, v. 213 *b*. Custom in *Swearing* no excuse, v. 217 *a*. *Swearing* the most inexcusable of all sins, v. 217 *b*. Followed by terrible punishments, v. 218 *b*. Prayer, a remedy against *Swearing*, v. 219 *b*. and forfeitures for oaths, v. 220 *a*. The folly of *Swearing*, v. 220 *b*. *Swearing* admits of no apology, v. 221 *a*. No temptation to it, pleasure in it, nor advantage from it, v. 221 *b*.

SWEAT, discharged at the pores of the skin, iv. 208 *a*. Of a fragrant smell, iii. 594 *a*. Linen stained blue by *Sweat*, v. 528 *a*.

SWEETENING of salt water examined, v. 202 *b*.

SWELLINGS in the throat by drinking of waters, v. 203 *a*.

SWIMMING, an account of the *swimming* and sinking of bodies, iii. 163 *b*.

SWINGING, remarks on the *swinging* of bodies, iii. 189 *a*.

SWITZERLAND, a peculiar wine in that country, i. 210 *a*.

SWOON, the motion of the spirits of persons in a *Swoon*, iv. 413 *b*.

SWORD, of the spirit, always to be worn by Christians, ii. 118 *b*.

SYDENHAM, his ascent to the Pic of *Teneriff*, v. 174 *b*. His particular description of it, iii. 32 *b*. His account of the small-pox, and his method in treating it, v. 639 *a*. Some account of him, v. 378 *a*.

SYLLOGISMS, founded on the doctrine of proportion, iv. 45 *a*.

SYMMETRY, of the several parts in animals, iv. 344 *a*.

SYMPATHETICK POWDER, some account of it, i. 222 *b*. Cures ulcers in the bladder, i. 530 *a*. Marasmus cured by a *sympathetick medicine*, i. 531 *a*.

SYMPATHY, remarks on a valetudinarian *Sympathy*, v. 474 *a*. *Sympathies* and antipathies inquired into, iii. 470 *a*.

SYMPTOM, the various *Symptoms* of diseases, iv. 335 *a*. The same simple may cure different *Symptoms*, iv. 336 *b*.
SYRINGE, of glass, its use in an experiment of the air, i. 84 *b*. Remarks on the drawing up the sucker of a *Syringe*, iii. 40 *b*. The cause of the ascension of liquor in a *Syringe*, iii. 42 *b*. The effect of it above the atmosphere, iii. 44 *a*. An experiment by a *Syringe* to try the qualities of the æther, iii. 49 *a*. The force of the spring of the air tried by a *Syringe*, iii. 58 *a*. The drawing up of water into the barrel of a *Syringe* examined, iii. 495 *a*. Experiments of the injecting of liquors into the veins by *Syringe*, v. 518 *a*.
SYRUP, meditation on *Syrups* taken in sickness, ii. 170 *a*.
SYSTEMS of philosophy, the inconveniences of them, i. 193 *a*. The usefulness of *Systems* of physiology, i. 193 *b*. The making experiments useful to the writing of *Systems*, i. 194 *b*. *Systems* of morality proper to persuade, but not command, ii. 116 *a*. The present *System* of the universe may be improved, iii. 90 *a*. Whether there are other mundane *Systems*, iv. 345 *b*. Methodical *Systems* of philosophy extracted from larger works, remarks on them, iii. 441 *a*. The advantages of the Copernican *System* over all the rest, v. 688 *b*.

T.

TABLE, a *Table* of the condensation of the air, i. 101 *a*. Of the rarefaction of the air, i. 102 *b*. Of the specific gravity of drugs and minerals, v. 36 *a*.
TABLE-BOOKS, a method of making them, iii. 151 *b*. The use and abuse of them, v. 427 *b*.
TADPOLE, pneumatical experiments by *Tadpoles*, iii. 126 *b*. Able to bear the compression of water and air, ii. 447 *b*.
TAFFATY, the appearances of colour in a changeable *Taffaty*, ii. 12 *b*.
TALC, an account of calcinated *Talc*, i. 209 *b*. Of Venetian *Talc* heated in a glass-furnace, i. 365 *a*.
TALMUD, the nature of the paraphrase, ii. 214 *b*.
TAMANDUA, a creature living upon ants, described, iv. 545 *b*.
TANCHUM, Rabbi, some account of him, v. 422 *a*.
TANGIER, the effect of the air of that place, v. 187 *b*.
TANKARD, a way to make water freeze through a *Tankard*, ii. 326 *b*.
TAPER, an experiment in an air-pump upon *Tapers* of wax, i. 18 *b*.
TARANTULA, inquiry into the bite of it, iv. 264 *b*. The venomous quality of that creature, iv. 274 *a*. The cure of it by musick, i. 540 *b*. Will dance at the sound of musick, i. 541 *a*.
TARTAR, a tincture drawn from salt of *Tartar*, i. 211 *b*. Calcined, used to obtain a pure spirit of wine, i. 213 *b*. Salt of *Tartar* dissolved into clear liquor, i. 249 *b*. Made to incorporate with spirit of wine, i. 252 *a*. An account of *Tartar per deliquium*, iii. 87 *a*. Salt of *Tartar* used in dephlegming brandy, iii. 180 *a*. Experiment by salt of *Tartar* and human blood, iv. 200 *a*. By oil of *Tartar* and solution of arsenic, iv. 241 *a*. The burning of salt of *Tartar* with common sulphur, iv. 246 *b*. A ready way to calcine *Tartar*, iv. 258 *a*. *Tartar* will afford a volatile salt, iv. 335 *b*. A fugitive salt obtained from distilled *Tartar*, i. 306 *b*. A volatile salt obtained from crude *Tartar*, i. 368 *a*. The power of salt of *Tartar* volatilized, i. 521 *a*. The best way of volatilizing it, i. 521 *b*. Experiment on the incalescence of salt of *Tartar*, iii. 577 *b*. The volatilizing of salt of *Tartar* explained, iii. 615 *a*. To make a fixed alkali of *Tartar* become volatile, iii. 615 *b*.
TARTARUM VITRIOLATUM given inwardly, i. 239 *a*. The nature and qualities of it particularly explained, iv. 312 *b*.
TARTARS, a people of a quick sight, v. 700 *a*.
TASTE, bodies that affect the organ of *Taste*, i. 377 *b*. The subtilty of the *Taste* different among men, i. 413 *a*. Experiments about the mechanical production of *Tastes*, iii. 586 *a*. To produce variety of *Tastes* in one insipid body, by associating it with divers menstruums, iii. 588 *a*. To produce variety of *Tastes* with one menstruum, by associating it with insipid bodies, iii. 588 *b*. Of two liquors, the one corrosive, the other pungent, to compose a body of a pleasant and aromatic *Taste*, iii. 588 *b*. To imitate by art the peculiar *Tastes* of natural bodies, iii. 589 *a*. Changes made of *Tastes* by maturation, iii. 590 *a*. To discover acids and alkalies by the *Taste* examined, iii. 605 *b*. The operation of the air on the *Taste* of substances, v. 181 *b*. Experiments concerning the production of *Tastes*, ii. 518 *a*.
TAVERNIER, his account of the water of *Africa*, v. 203 *b*.
TAUROMENIUM, shaken by the breaking out of Mount *Ætna*, iv. 273 *a*.
TAURUS, the uncertainty of the weather on mount *Taurus*, ii. 323 *a*.
TELESCOPE, the effect of looking upon the sun through a *Telescope*, ii. 8 *a*. Invented or improved by *Galileo*, iii. 139 *a*. Made of green glass, iii. 173 *b*. To find the distances of objects upon the earth, v. 341 *b*. Remarks upon its use, and discoveries made by it, iii. 536 *a*. The use of *Telescopes* in accounting for the phænomena of the planets and fixed stars, v. 688 *b*.
TEMPERATURE, of subterraneal and submarine regions, iii. 72 *a*. Of the air in the middle region of the earth, iii. 99 *a*. The *Temperature* of subterraneal air, iii. 100 *a*. Of the more central parts of the earth, iii. 104 *b*. Of the lower region of the sea, iii. 106 *a*. Relations on the *Temperature* of the sea, iii. 107 *b*.
TEMPERING of steel, the manner of it, ii. 6 *a*.
TEMPTATION, the success of it depends upon the mind, ii. 186 *b*.
TENERIFF, an account of the height of that mountain, iii. 32 *b*. The effect of the air on *Pic de Teneriff*, iii. 125 *b*. The island refreshed with breezes from the sea, v. 129 *a*. Particular remarks on the nature and quality of the island, v. 170 *b*.
TENSION, remarks on the *Tension* of bodies, iv. 267 *a*.
TERNATE, the quality of the air there, v. 187 *b*.
TERRA LEMNIA SIGILLATA SILESIACA, &c. examined, i. 500 *b*. The virtue of *Terra Silesiaca*, i. 501 *a*.
TERRÆ FILIUS, account of his speech at a publick act in *Oxford*, v. 515 *a*.
TESTAMENT, the Hebrew of the Old *Testament* difficult to be translated, ii. 95 *b*. The accents, chapters and verses of the Old *Testament*, ii. 104 *b*. The use and excellency of it, ii. 117 *a*. Necessary to the understanding of the New *Testament*, ii. 117 *b*. The writers of the New *Testament* conform in style to the translators of the Old, ii. 121 *b*. *Testament* New and Old in the Turkish language, v. 319 *b*.
TESTIMONY human and divine explained, v. 51 *b*.
TETRAGRAMMATON, the four-lettered name of God, iv. 340 *b*.
TETTER, the effect and cure of it, v. 440 *a*.
TEXTS of Scripture made dark by commentators, ii. 101 *a*. Are obscure, to exercise our industry, ii. 102 *a*. Are explained by the context, ii. 105 *a*. In what manner used by divines, ii. 106 *b*. Every *Text* in the Bible useful, ii. 108 *a*. The benefit of ænigmatical *Texts*, ii. 118 *a*. *Texts* of Scripture explained by the knowledge of nature, i. 433 *a*. Against unnecessary oaths, v. 206 *a*.
TEXTURE, the stability of bodies owing to the *Texture* of the parts, i. 263 *a*. How much depends upon the *Texture* of bodies, iii. 76 *a*. A proper definition of *Texture*, iii. 77 *a*. Changes in the *Texture* of liquid bodies, iii. 87 *b*. The *Texture* of things one of the principles of the universe, i. 361 *b*. The effect of the changes of *Texture* in bodies, i. 367 *a*. Strange alterations in the *Texture* of bodies, i. 535 *a*. Whence arises the *Texture* of bodies, ii. 466 *b*. The effect of the change of *Texture* in bodies upon our senses, ii. 468 *a*. The inconceivable *Texture* of the minute parts of bodies, ii. 474 *a*. Bodies specifically changed by a change of *Texture*, ii. 491 *b*. What is supposed performed by the soul, done by the *Texture* of the body, ii. 534 *b*. The interest of *Texture* in the production of heat and cold, iii. 580 *b*.
THALES, his opinion of the principle of all things, i. 448 *b*. His prediction of the plenty of olives, i. 463 *a*. He taught that all things were made and produced from water, i. 314 *b*.
THAMES, the praise of that river, ii. 191 *b*. The qualities of the *Thames*-water for long voyages, iii. 188 *a*. The difference in weight between *Thames*-water and salt-water, v. 649 *a*.
THAW, very sudden *Thaws* in *China*, ii. 368 *b*. Various trials to *thaw* ice, ii. 387 *b*.
THAWING of eggs and apples inquired into, ii. 271 *b*. The safe way of *thawing* bodies that are frozen, ii. 271 *b*.
THE or TEA, virtues and qualities ascribed to the decoction of that herb, i. 492 *b*. A violent head-ach cured by drinking of it, i. 539 *b*.

THEATRE,

THEATRE, the form of the dedication of the new *Theatre* in *Oxford*, v. 514 *b*.
THEMISON, a physician, an account of him by *Pliny*, i. 427 *a*.
THEMISTIUS, his opinion of the chymist's way of writing, i. 330 *a*.
THEOCRACY, the extent of the divine *Theocracy*, iv. 348 *a*.
THEODORA, the martyrdom of *Theodora* and *Didymus*, iv. 425 *a*. Her character, and the reason of her distress, iv. 429 *b*. She attempts her escape in disguise, iv. 436 *b*. Surrenders herself, iv. 447 *b*. Pleads at the tribunal in behalf of *Didymus*, iv. 448 *a*. She is condemned to death, iv. 450 *b*. Comforts *Didymus* against the fear of death, iv. 460 *a*. Her speech at execution, and death, iv. 462 *b*.
THEOLOGY, the excellency of it compared with natural philosophy, iii. 404 *a*. The imperfections of natural *Theology*, iii. 408 *b*. Divine *Theology* relates divers historical accounts of God's thoughts and actions, iii. 409 *a*. Pronounces God creator of the world, iii. 411 *a*. The advantages of it exceed those of trade, riches, or physick, iii. 431 *a*. Admits us into the knowledge of God and the divine mysteries, iii. 435 *b*. The study of it affords credit and reputation, iii. 446 *b*. *Theology* deserves all the ornaments of learning and eloquence, ii. 128 *b*. Revealed religion illustrated by natural *Theology*, v. 47 *a*. The use of operative and practical *Theology*, v. 437 *b*.
THEORY, the difficulty of establishing a *Theory* not liable to be changed, iii. 444 *a*.
THERAPEUTICAL part of physick considered, i. 496 *b*.
THERMÆ, waters so called, iv. 233 *b*.
THERMOMETER, a new way of it described, v. 319 *a*. Is not always to be relied on, ii. 242 *b*. Considerations on the new hermetical *Thermometers*, ii. 246 *a*. How *Thermometers* declare the degrees of cold, ii. 265 *b*. The use of a *Thermometer*, where a drop of liquor is pendulous, ii. 268 *a*. Open *Thermometers* not safely to be relied on, iii. 445 *a*. The use of sealed *Thermometers*, v. 472 *b*. A scheme for the improvement of the *Thermometer*, v. 492 *b*. An experiment upon the *Thermometer* with warm blood, iv. 166 *b*. The use and benefit of large and exact *Thermometers*, v. 127 *a*.
THERMOMETRICAL experiments, ii. 240 *a*.
THERMOSCOPE, an experiment by it to prove the spring of the air, i. 129 *b*. The effect of it when used in a mine, iii. 100 *b*. Of a *Thermoscope* furnished with water, iii. 109 *a*. An experiment with it and warm blood, iv. 167 *a*. Sealed *Thermoscopes* variously affected by the air, ii. 251 *a*.
THEVENOT, Monsieur, some account of him, v. 330 *b*.
THICKNESS of a man's skin tanned, iv. 208 *a*.
THIEF, meditation on a *Thief* in a candle, ii. 172 *b*.
THIGH, swellings in the *Thighs* from the badness of water, v. 203 *b*.
THINKING, charms against *Thinking*, ii. 171 *a*.
THIRST, the love of God expressed by a metaphor of *Thirst*, i. 161 *b*.
THOMSON, Mr. account of his opening a body that died of the plague, v. 370 *b*.
THORAX, the case of a perforation in the *Thorax*, iv. 214 *a*. An abscess in the cavity of the *Thorax*, v. 388 *a*. Whether suction depends upon the action of the sucker's *Thorax*, iii. 496 *b*. The *Thorax* necessary to the motion of the lungs, i. 64 *b*. Is dilated by the muscles of respiration, i. 84 *b*.
THOUGHTS, a security against evil *Thoughts*, ii. 147 *b*. How they are conducted in meditation, ii. 150 *b*.
THROAT, swellings in the *Throat* occasioned by drinking of waters, v. 203 *a*.
THUANUS, his account of the poison of enraged creatures, v. 299 *b*.
THUNDER, the sound of it propagated by the air, iv. 255 *b*. The shakings occasioned by claps of *Thunder*, iv. 261 *a*. The smell of brimstone produced from *Thunder*, v. 123 *a*. The noise of *Thunder* in the air, v. 130 *a*.
THUNDER-STONES, the stink emitted from them, iii. 67 *a*. The effect of thunder upon a house, iii. 325 *a*. Whether corpuscles in the air in time of thunder pierce through glass, iii. 325 *b*.
TICKLING, the effect of *tickling* a man's foot, iv. 260 *b*.
TIDES, their effect near the bottom of the sea, iii. 113 *b*. Remark upon spring *Tides*, iii. 472 *a*.
TILE, an experiment concerning whiteness and blackness by a *Tile*, ii. 30 *a*. The effect of rubbing a diamond upon a *Tile*, ii. 87 *a*.
TILLOTSON, Dr. account of his writings against atheism, and scoffing at religion, v. 507 *b*.
TIMBER, frozen by severe cold, ii. 339 *b*.
TIME, the proper way of spending it, ii. 147 *a*. The smallest portions of it to be improved, ii. 148 *a*. and rescued by devotion, ii. 148 *b*. Difficult to understand what *Time* is, v. 61 *b*. And to form a proper idea of it, iii. 525 *a*. Axioms concerning *Time* examined, iv. 401 *b*. The peculiar properties of *Time* and place, v. 663 *a*.
TIN, a way to change the colour of *Tin*-glass, ii. 34 *a*. An experiment upon *Tin* corroded in aqua fortis, ii. 72 *b*. Scarlet dyed in vessels lined with *Tin*, ii. 80 *b*. Mercury amalgamed with *Tin*, its height in barometers, iii. 27 *b*. A mineral water in the bottom of a *Tin*-mine, iv. 234 *b*. Experiment by a sulphureous liquor and solution of *Tin*, iv. 239 *b*. The working in *Tin*-mines very healthy, iv. 277 *b*. Cornish *Tin* distilled with Venetian sublimate, iv. 298 *a*. Gold found in *Tin*-mines, v. 30 *b*. Observations about the growth of *Tin*, iii. 459 *a*. The growth of *Tin* in the ore exposed to the air, iii. 459 *b*. *Tin* retains its metalline nature in the form of flowers, iii. 330 *a*.
TIN-GLASS broken, discovers smooth and bright planes, iii. 227 *a*.
TINCTURE, observations on the *Tincture* of the nephritic wood, ii. 47 *a*. An account of a volatile *Tincture* of sulphur, ii. 59 *b*. *Tincture* of roses changed by salts, ii. 64 *a*. Of *Tinctures* drawn with the spirit of human blood, iv. 184 *a*. The use of the *Tincture* of human blood, iv. 184 *b*. The effect of spirit of blood on *Tincture* of galls, iv. 185 *a*. The effect of the *Tincture* of amber with spirit of wine, iv. 192 *a*. Experiment with *Tincture* of galls and pure steel, iv. 234 *b*. To make the *Tincture* of galls, iv. 237 *b*. Upon *Roman* vitriol by *Tincture* of galls, iv. 238 *b*. The *Tincture* of oil of turpentine, an account of it, iv. 329 *a*. The surprising effects of *Tincture* of gold, iv. 332 *a*. The virtues ascribed to various *Tinctures*, i. 340 *b*. The *Tincture* of the glass of antimony, i. 427 *b*. The way of drawing *Tinctures* with saline spirits, i. 562 *b*.
TIROL, the air of a mine in that country, v. 170 *a*.
TITLES for writing a natural history, iv. 163 *a*. A particular survey of them, iv. 163 *b*. *Titles* of the first order for that history, iv. 164 *a*. *Titles* for the history of urine, iv. 165 *b*. Secondary *Titles* concerning the spirit of human blood, iv. 177 *a*. *Titles* for the natural history of mineral waters, iv. 235 *a*. Considered as a medicine, iv. 248 *b*. Particular inquiries concerning them, iv. 249 *a*. *Titles* for a general history of the air, v. 107 *b*.
TITUS, the *Roman* emperor, his character, ii. 198 *a*.
TOAD, the trochischs of *Toads* a cure for plaguy ulcers, iv. 218 *b*. The effect of the powder of a burnt *Toad*, i. 527 *a*. An account of a weather-wise *Toad*, v. 274 *b*. The effect of handling a *Toad*, v. 439 *b*.
TOBACCO, experiment on a plant of *Tobacco*, i. 313 *a*. The fixt salts of *Tobacco*-stalks, i. 338 *b*. The juice of *Tobacco* used by the *Indians*, i. 498 *b*. The effect of a decoction of *Tobacco*, i. 525 *b*. A pipe of *Tobacco* a cure for suppression of urine, v. 528 *a*. Chewing *Tobacco* a cure for the stone in the kidneys, v. 530 *b*. The juice of *Tobacco* used in the dressing of wounds, iv. 210 *b*. The great advantages of that weed, v. 692 *a*.
TOBACCO-PIPE CLAY, whether it be elementary earth, i. 417 *b*. *Tobacco-pipe* may be melted by fire, i. 418 *a*.
TOCKAY, the colour of the kernels of the grapes there, iv. 284 *a*.
TONGS, experiment with a pair of tobacco *Tongs*, iii. 51 *b*.
TONGUE, a stone taken out of a lady's *Tongue*, iv. 313 *b*. Its several parts and uses anatomically treated, v. 704 *b*.
TOOL, an edged *Tool* changed in its texture by being rubbed, iv. 269 *b*. The well-tempered *Tools* of artificers endowed with a magnetic virtue, iii. 644 *b*.
TOOPE, Dr. his account of the production of *Spanish* flies, in a letter to Mr. *Boyle*, v. 645 *b*.
TOOTH, quick-silver found in the hollow of a *Tooth*, iv. 217 *b*. The setting the teeth on edge, the reasons of it, iv. 263 *b*. The bite of the teeth of a man enraged, v. 299 *b*. The teeth of vipers and rattle-snakes hollow, v. 319 *a*. A cure for the *Tooth*-ach, v. 441 *a*. The weight of elephant's teeth, i. 436 *a*. Teeth set on edge by harsh noises, i. 537 *b*. Curious remarks upon the use, contrivance, &c. of the teeth, iv. 543 *b*. The shape, strength, &c. of the teeth considered, iv. 544 *a*.
TOPAZ, remark on polishing an oriental *Topaz*, iv. 275 *b*.

TOPICAL

TOPICAL medicines, their effect, iv. 321 *b*.
TORPEDO, its stupefying and benumbing quality, iii. 315 *b*.
TORRICELLIAN experiment particularly tried, i. 10 *a*. Whether it infers a vacuum, i. 24 *b*. Some necessary advertisements concerning it, i. 25 *b*. An account of the quicksilver in that experiment, i. 85 *a*. The trial of this experiment on the tops and feet of hills, i. 97 *a*. The *Torricellian* experiment to prove the spring of the air, i. 128 *a*. In this experiment, the quicksilver falls lower at the top of a mountain than at the foot, i. 129 *b*. The suspension of the quicksilver in the *Torricellian* experiment examined, iii. 7 *b*. Notes upon the *Torricellian* experiment, iii. 26 *a*.
TORRICELLIUS, his experiment on the descent of quicksilver, i. 257 *a*.
TORTOISE, the vivacity of *Tortoises* with their heads off, i. 467 *b*.
TOUCH, the *Touch* affected by impressions from effluvia, iii. 331 *b*. The discovery of colours by the *Touch*, ii. 14 *a*.
TOWN, account of a strange appearance of a *Town*, v. 177 *b*.
TOWNLEY, Mr. his trial of the Torricellian experiment, i. 98 *a*. His register of the air, v. 135 *b*.
TRADE, experimental philosophy useful to *Trade*, iii. 141 *a*. Differs from an experiment, iii. 149 *a*. Lost *Trades* may be recovered, iii. 150 *b*. *Trades* are the history of nature, iii. 167 *a*. *Trades* revived by the natural philosopher, iii. 170 *a*. The use of inquiring into the mysteries of *Trades*, iii. 171 *b*. The particular *Trades* to be improved by the naturalist, iii. 174 *a*. *Trade* of great concern to the publick, iii. 175 *b*. The valuation of the *Trade* of diamonds, v. 82 *b*. The advantages from the improvement of *Trade* examined, iii. 431 *a*.
TRADESMEN, an account of their observations, iii. 137 *b*. The mysteries of their art, iii. 138 *a*. Their practice and qualifications, iii. 138 *b*. The nature of disclosing their experiments, iii. 139 *a*. Their small improvements of nature, iii. 153 *b*. The benefit of conversing with *Tradesmen*, iii. 168 *a*. Their many observations, iii. 168 *b*. Their knowledge gained by experience, iii. 169 *a*.
TRAFFICK, the nature of philosophical *Traffick*, v. 232 *a*.
TRAJECTION, a trial of the composition of colours by *Trajection*, ii. 48 *b*.
TRANSACTIONS philosophical, the difficulties of getting them printed, v. 366 *b*. Begun to be published at *Rome*, v. 390 *b*.
TRANSCRIBER, remark on the faults of *Transcribers*, i. 201 *b*.
TRANSFIGURATION, some remarks upon Christ's *Transfiguration*, ii. 132 *a*. That miracle particularly described, v. 70 *a*.
TRANSFUSION upon a madman, some account of it, v. 253 *b*. Experiments on *Transfusion* of blood, v. 364 *b*. The success of a *Transfusion* at *Paris*, v. 369 *a*. Of *Transfusion* upon a madman, v. 377 *a*. A way of regulating that operation, v. 379 *a*. *Transfusion* of blood from one animal to another, ii. 550 *a*.
TRANSLATION, the Scripture disadvantaged by being judged of by *Translations*, ii. 95 *a*. An account of the imperfections of the *English Translation* of the bible, ii. 96 *a*. *Translations* of the Bible a disadvantage to it, ii. 121 *a*. General remarks upon *Translations*, ii. 122 *b*. Some account of the *Translation* of the Bible into *Irish*, v. 619 *a*.
TRANSMUTATION of metals, an account of it, iv. 15 *a*. More particularly explained, ii. 517 *a*. The *Transmutation* of bodies, its use, ii. 519 *a*.
TRANSPARENCY of bodies particularly considered, ii. 19 *a*.
TRANSPIRATION, how much is carried off from bodies by *Transpiration*, iv. 208 *b*. *Transpiration* through the membranes of the inward parts of bodies, iv. 209 *b*. *Transpiration* assisted by the air, v. 354 *a*. The great discharge of bodies by insensible *Transpiration*, iii. 540 *b*. The nature of *Transpiration* examined, i. 595 *b*.
TRANSPLANTATION, medicines working by *Transplantation*, i. 530 *a*. A pain in the arm cured by *Transplantation*, i. 530 *b*.
TRANSUBSTANTIATION, the opinion of the *Greeks* in that point, v. 379 *a*. That doctrine refuted by a Roman catholick, v. 417 *a*.
TRAP-DOORS, the use of them in experiments, iii. 165 *b*.
TREACLE, a famous antidote, iii. 245 *a*.
TREADLES of the egg, their use, v. 693 *a*.
TREE, contemplations on the pruning of a *Tree*, ii. 158 *b*. On the leaves and blossoms, ii. 160 *a*. Branches of *Trees* slit by lightening, v. 123 *b*. An account of sensitive *Trees*, v. 310 *b*. Of *Trees* taken out of the moors near *Bridgewater*, v. 363 *a*. Frozen *Trees* thawed before they can be cut, ii. 274 *b*. The inoculation of fruit-*Trees* considered, ii. 499 *b*. *Trees* growing at the bottom of the sea, iii. 388 *a*.
TRE-FOIL, proper grass for sheep, v. 448 *a*.
TRENCH for conveying of sounds, an account of it, v. 368 *b*.
TRIA PRIMA, the opinion of the chymists on that subject, i. 330 *b*. The *Tria Prima* made up of the four elements, i. 336 *a*. Not necessary to divers qualities in mixed bodies, iii. 596 *b*.
TRIAL, the way of making hydrostatical *Trials*, v. 5 *b*.
TRIANGLE, rectangular, an account of it, iv. 56 *b*.
TRIBE, the several *Tribes* of chymical salts, ii. 66 *b*.
TRINITY, the mystery of it difficult to be conceived, iv. 59 *b*.
TRIPOLI, an account of the winds of that country, v. 166 *b*.
TRIPOLI, whether it be elementary earth, i. 418 *a*.
TROCHISCHS of toads useful in the plague, iv. 212 *a*.
TRUSION, when the movent goes along with the moved body whilst the progress lasts, iii. 494 *b*.
TRUTH, all divine *Truths* contained in the Scripture, ii. 112 *b*. The extensive effect of physical *Truth*, iii. 155 *a*. Some *Truths* unnecessary for us to know, iv. 42 *b*. Will not admit of mathematical demonstration, iv. 56 *a*. The harmony of all *Truths* difficult to be discerned, iv. 67 *b*. The evidence required to establish a *Truth*, iv. 68 *b*. The proper method in inquiring after *Truth*, v. 38 *a*. The nature of abstracted *Truths*, v. 47 *a*. The benefit of seeking *Truth* by laborious experiments, v. 48 *a*. *Truths* in religion not to be discoverd by reason, v. 60 *b*. *Truths* taught by natural religion, v. 64 *a*. The use and value of *Truth*, i. 375 *a*. Obligations to the study of divine *Truths*, iii. 421 *b*. The many advantages of it, iii. 423 *b*. Benefits arising from the knowledge of divine *Truths*, iii. 426 *a*. The difficulty of apprehending the proof of theological *Truths*, no argument against them, iii. 526 *a*. The reason of men's aversion to believe theological *Truth*, v. 662 *b*. *Truth* distinguished into two sorts, v. 667 *b*. Reasons why theological *Truths* are held repugnant to philosophy, v. 676 *b*. Distinctions concerning the nature of *Truth*, v. 679 *b*. No *Truth* can really contradict another *Truth*, v. 683 *b*.
TUBE, the glass *Tube* how prepared for the Torricellian experiment, i. 26 *a*. The raising of mercury in unequal *Tubes* by the spring of the air, iii. 9 *b*. An engine with a double *Tube*, iv. 100 *a*. Experiment on a glass *Tube* immerged in water *in vacuo*, iv. 141 *a*. Experiment with a mercurial *Tube* from the top of *St. Paul's*, v. 535 *a*.
TULIP, experiment on *Tulips* in common and new air, iv. 120 *b*. On a *Tulip* in an empty receiver, iv. 133 *a*.
TUMOUR, a forerunner of the plague, iii. 89 *a*.
TUNBRIDGE-WATERS, a particular quality of them, iv. 238 *b*. Manifestly lighter than common water, iv. 242 *b*. The weight of *Tunbridge-water*, iv. 243 *b*. The reason of the sulphureous scent of those waters, iv. 244 *a*. The caput mortuum afforded by *Tunbridge-waters*, iv. 247 *a*. They are purely vitriolate, v. 380 *a*. Obstinate diseases cured by them, i. 552 *b*. The drinking of them causes a sensible coldness, ii. 297 *b*.
TUNE, a person weeps on the playing of a certain *Tune*, iv. 264 *b*.
TUNICLES of the eye anatomically explained, v. 697 *a*.
TURBERVILLE, Dr. his character, v. 248 *a*.
TURBITH MINERAL, a particular account of it, ii. 68 *b*. The fixing of *Turbith* made of oil of vitriol, iii. 623 *a*.
TURF, improvement of land by burning the *Turf*, v. 72 *a*.
TURKEY-COCKS offended at the sight of red, iii. 193 *b*.
TURKISH BIBLE, some account of it, v. 308 *a*.
TURMERICK, an experiment on a solution of pot-ashes, ii. 77 *b*. The effect of spirit of blood upon *Turmerick*, iv. 184 *b*.
TURNER, JOHN, his discourse concerning the *Messias*, v. 415 *b*.
TURNING brass or steel, the effects of it, iv. 253 *a*.
TURNING EVIL, a distemper in cattle, a remedy for it, i. 532 *b*.
TURNIP, land improved by sowing *Turnips*, iii. 143 *a*.
TURNSOL, a pigment, an account of it, ii. 60 *b*.

TURPENTINE,

TURPENTINE, the oil dropt into spirits of wine, the effect of it, i. 251 *a*. An experiment upon Venetian *Turpentine*, i. 265 *b*. The coagulation of oil of *Turpentine*, i. 270 *b*. An experiment of that oil mixed with water, ii. 26 *b*. The oil of it digested upon white sugar of lead, ii. 59 *b*. Experiments with oil of *Turpentine* invironed with fluids, iv. 4 *b*. Of the noctiluca in oil of *Turpentine*, iv. 77 *a*. The effect of frequent distillations of oil of *Turpentine*, iv. 94 *a*. Experiment with spirit of wine and oil of *Turpentine*, iv. 140 *a*. The effect of *Turpentine* upon the urine, iv. 320 *a*. The use of oil of *Turpentine* in wounds, iv. 328 *b*. Its particular qualities described, iv. 331 *a*. The nature of spirit of *Turpentine*, v. 12 *b*. The weight of a cubic inch of oil of *Turpentine*, v. 22 *a*. Experiment to produce air in oil of *Turpentine*, v. 113 *a*. The refraction suffered by oil of *Turpentine*, v. 319 *a*. *Turpentine* distilled *in balneo*, a cure for the scurvey, v. 420 *b*. Common sulphur dissoluble in oil of *Turpentine*, i. 340 *b*. Experiment of freezing by oil of *Turpentine*, ii. 266 *a*. Oil of *Turpentine* pneumatically tried, ii. 417 *a*.

TURQUOIS-STONE, the variation of spots in that stone, i. 285 *b*. An account of the changes of its colour, ii. 84 *a*. How to regain its colour, ii. 85 *a*.

TUSSER, his old rhymes on sheep and cattle, v. 447 *b*. His making butter of sheep's milk, v. 448 *b*.

TUTENAG, an *Indian* metal, its weight increased by fire, iii. 344 *a*.

TYCHO, his remark upon instruments used in observations, i. 223 *b*. His opinion of the distance between us and the firmament, iv. 342 *a*.

TYRREL, Sir JAMES, his letters to Mr. *Boyle*, v. 620 *a*. His account of a vitriolick water, v. 620 *b*.

U.

VACUISTS have experiments to favour their hypothesis, i. 123 *a*. Their principles and arguments examined, iii. 486 *a*. Their objections against the doctrine of Mr. *Hobbes*, iii. 489 *a*.

VACUUM, an account of the experiment *de vacuo*, i. 41 *b*. The axiom, that nature abhors a *Vacuum* explained, i. 48 *a*. The reason that bodies forget their own nature to shun a *Vacuum*, i. 49 *b*. Some philosophers deny the possibility of it, i. 65 *b*. Many eminent persons afraid to grant a *Vacuum*, i. 77 *a*. The reason why nature abhors a *Vacuum*, i. 113 *b*. Mr. *Hobbes*'s opinion concerning it, i. 122 *a*. What is meant by *Vacuum Boylianum*, iii. 123 *b*. The hatching of seeds of animals in a *Vacuum*, iii. 126 *b*. An instrument to distil *in vacuo*, iv. 105 *b*. Whether bread can produce air *in vacuo*, iv. 106 *b*. Experiment on pears included *in vacuo*, iv. 119 *a*. Experiment on gilly-flowers *in vacuo*, iv. 117 *a*. On animals *in vacuo*, iv. 128 *a*. Animals will die *in vacuo*, iv. 129 *a*. Experiment on harts-horn burnt *in vacuo*, iv. 131 *a*. The production of air *in vacuo*, iv. 131 *b*. Experiment on pears and apricocks *in vacuo*, iv. 132 *a*. On milk *in vacuo*, iv. 134 *a*. On horse-beans *in vacuo*, iv. 137 *b*. A glass-tube immerged in water *in vacuo*, iv. 141 *a*. Air easier produced *in vacuo*, than in common air, iv. 145 *b*. Experiment on boiled flesh *in vacuo*, iv. 157 *b*. On elixation and distillation *in vacuo*, iv. 156 *a*. Experiment to prove the possibility of a *Vacuum*, v. 257 *a*. An attempt in defence of a *Vacuum*, v. 324 *a*. Actraction not performed to avoid a *Vacuum*, i. 445 *b*. The avoiding of a *Vacuum* in sealed weather-glasses considered, ii. 253 *a*. Nature's abhorrence of a *Vacuum* considered, iii. 444 *b*. The various opinions of philosophers concerning it, iii. 495 *b*. The preservation of bodies *in vacuo Boyliano*, iii. 504 *a*. Phænomena, that occur about a *Vacuum* considered, iv. 382 *b*. The chief acceptations in which the term *Vacuum* is understood, iv. 405 *b*. Reason why philosophers believe nature abhors a *Vacuum*, iv. 406 *a*. The abhorrency of a *Vacuum* consistent neither with the Cartesian nor Atomical hypothesis, iv. 406 *b*.

VALESIUS, his account of a mass of silver found in the earth, i. 358 *b*.

VALENTINUS BASILIUS, his opinion of antimony, i. 208 *b*.

VALVE of an air-pump described, i. 6 *b*. An experiment on the pressure of the air by a brass *Valve*, i. 260 *a*. *Valves* of the heart, their nature and use, v. 703 *b*.

VAN HELMONT, an account of his *Alphabetum naturæ*, v. 378 *b*.

VAN TRUMP, some account of him, v. 305 *a*.

VANITY, the Scripture disregarded more from *Vanity*, than from incredulity, ii. 125 *b*.

VAPOUR, a particle of quicksilver turned into a *Vapour*, i. 91 *b*. Grounds made unwholesome by moist *Vapours*, iv. 277 *a*. *Vapours* of the air frozen by a mixture of snow and salt, ii. 297 *a*. *Vapours* of spirit of wine hinder fermentation, iv. 112 *a*. Hypochondriacal *Vapours* in the nose, v. 443 *a*.

VARENIUS, his account of the *Thermæ piperinæ* in *Germany*, iii. 472 *b*.

VARIATION of the needle, some particular accounts of it, i. 222 *a*. The difference observed in magnetical *Variations*, i. 226 *a*.

VARIETY in the analogous parts of animals explained, iv. 547 *a*.

VARNISH, account of the making of it, iii. 150 *a*. The several kinds of it, iii. 176 *b*.

VATTEVILLE, Monsieur de, is cured of blindness by a mercurial powder, i. 550 *b*.

VAU, the *Hebrew* conjunction explained, iii. 105 *a*.

VAULT, the seeming coldness of subterraneal *Vaults* in summer examined, ii. 362 *a*. Remarks on the steams of fermenting liquors in *Vaults*, iii. 98 *a*.

VAUX-HALL intended as a college of artisans, v. 264 *b*.

UBALDINI, Signior, some account of him, v. 332 *a*.

UBIQUITY of God explained, i. 176 *a*.

VEAL, the shining of a neck of *Veal* in the dark, without sensible putrefaction, iii. 304 *a*. Pneumatically treated, iii. 305 *b*. Particular observations concerning it, iii. 306 *a*.

VEGETABLES, difference in those of the same denomination, i. 210 *a*. Difference of colours in the leaves of *Vegetables*, ii. 5 *b*. The effect of salts upon the soluble parts of *Vegetables*, ii. 55 *b*. Lacca of *Vegetables*, an account of it, ii. 77 *a*. *Vegetables* nourished by salts in the earth, iii. 142 *b*. The *capita mortua* of *vegetable* bodies, iv. 95 *b*. Spirit of blood will mix with oils of aromatic *Vegetables*, iv. 187 *a*. The parts of a *Vegetable* brought to an actual ignition, iv. 253 *b*. *Vegetables* depraved by subterraneal effluvia, iv. 283 *b*. In what manner affected by particles of minerals, iv. 283 *b*. Six thousand different kinds of *Vegetables*, iv. 343 *b*. Volatile salts proceed from the putrefaction of *Vegetables*, v. 118 *a*. The operation of the air on *vegetable* substances, v. 179 *b*. Changes made by the air in *vegetable* substances, v. 184 *b*. The effect of analyzing *Vegetables* by fire, i. 303 *a*. *Vegetables* are simple water disguised, i. 314 *a*. The difference between *vegetable* fixed salts, and animal volatile ones, i. 338 *b*. The nature of oils distilled from *Vegetables*, i. 340 *a*. Different *Vegetables* produced out of water, i. 367 *b*. The production of volatile salt from *Vegetables*, i. 379 *a*. The number of *Vegetables* laid down by *Botanists*, i. 427 *a*. The figure of *Vegetables* preserved in books, i. 469 *a*. Wine made from the weeping of wounded *Vegetables*, i. 491 *b*. Of the nitro-tartareous salt in *Vegetables*, i. 499 *a*. The effect of sulphureous salts upon the juices of *Vegetables*, i. 500 *a*. Spirits cheaply drawn from *vegetable* substances, i. 514 *a*. The freezing of oil of *Vegetables*, ii. 363 *b*. A volatile spirit obtained from *Vegetables* by distillation, iii. 188 *b*. A plastic power remaining in *Vegetables* destroy'd by fire, iii. 540 *a*. To imitate by art the peculiar tastes of *Vegetables*, iii. 589 *a*.

VEGETATION hindered by the rarefaction of air, iv. 146 *b*.

VEIN, the surprising effects of injections into *Veins*, v. 375 *a*. The discovery of the milky *Veins* in a dog, i. 218 *b*. The ways to follow the *Vein* in mines, v. 194 *b*. The nature of *Veins* of ore examined, v. 195 *b*. The injection of saline liquors into the *Veins*, v. 252 *a*. *Veins* of the heart transposed, v. 315 *b*.

VEINS of hot water at the bottom of the sea, and of rivers, iii. 379 *b*.

VELOCITY, experiment to find the *Velocity* of a bullet, v. 307 *a*.

VELVET, an experiment upon the colour of black *Velvet*, ii. 29 *a*.

VENA CAVA, experiment by tying up that vein, v. 371 *a*. Trials on the nature and use of the *Venæ lacteæ*, v. 521 *b*.

VENEREAL, the effect of mercury in *venereal* cases, iv. 335 *a*. Remedy for *venereal* ulcers, i. 526 *b*. Many ways of treating *venereal* patients, i. 580 *b*.

VENICE GLASS often cracks of it self, i. 287 *b*.

VENICE TREACLE good in the plague, v. 441 *b*. Some account of that medicine, v. 269 *a*.

VENICE TURPENTINE, an experiment with it in a glass-tube, iv. 143 *a*.

VENOM of poisonous creatures, a remedy for it, i. 546 *b*.
VENTILATION of the blood made by respiration, i. 67 *a*.
VENT-PIT in mines, account of the nature of it, iii. 103 *a*.
VENUS, the emetic qualities of *Venus*, i. 212 *b*. The virtue of the sulphureous parts of *Venus*, iv. 333 *a*. The discus of *Venus* explained, v. 57 *a*. A particular account of that planet, iv. 66 *b*.
VERDEGREASE, green ice from the solution of green *Verdegrease*, i. 217 *a*. Experiment of a solution of *Verdegrease* with oil of tartar, ii. 54 *b*. Of *French Verdegrease*, and spirit of salt, ii. 68 *a*. Of spirit of *Verdegrease* with spirit of human blood, iv. 182 *b*. Impregnated *Verdegrease* mingled with tripoly, iv. 298 *a*. Spirit of *French Verdegrease* abstracted from salt of tartar, v. 100 *b*. The *caput mortuum* of *Verdegrease* reduced to copper, i. 364 *b*. The effect of the distillation of *Verdegrease*, i. 369 *a*. The effect from *Verdegrease* distilled per se, i. 379 *b*. The power of *Verdegrease* distilled, i. 516 *a*. Crystals obtained from spirit of *Verdegrease*, iii. 231 *b*.
VERDITER, the way of making it, i. 217 *b*.
VERMAASEN, JOHN, a man that discovered colours by the touch, ii. 13 *b*.
VERMINATION of the air the cause of the plague, v. 355 *b*.
VERSES upon the royal society, v. 341 *a*. A copy of Latin verses to Mr. *Boyle*, v. 424 *b*.
VERULAM, Lord, his opinion of the proportion of gravity between water and quicksilver, i. 57 *a*. His experiment of a rose-bush, i. 215 *b*. His use of salt-petre, i. 233 *a*. His distinction concerning experiments, iii. 154 *b*. What he means by *idola tribus*, iv. 48 *b*. His opinion of the weighing of bodies, v. 2 *b*. His use of comparisons, v. 39 *b*. His *Verulamian Sylva*, v. 77 *a*. His *Sylva sylvarum*, v. 77 *b*. His judgment of approved receipts, i. 581 *b*. His saying of heat and cold, ii. 232 *a*. Observation on prejudices founded in human nature itself, iii. 519 *a*.
VESPASIAN, his law concerning ill-language, i. 120 *b*.
VESSEL, the weight of air in *Vessels* hermetically sealed, iv. 149 *a*. Elixation in *Vessels* stopt with screws, iv. 158 *a*. Earthen *Vessels* porous and penetrable by salts, iv. 221 *b*. *Vessels* of mineral waters must be well stopped, iv. 244 *b*. The improvement of *Vessels* for chymical uses, i. 513 *b*. *Vessels* of earth impaired by the frost, ii. 340 *a*. In a full *Vessel*, the lower parts are pressed by the upper, ii. 435 *a*. Experiment on the bottom of a *Vessel* parallel to the horizon, &c. ii. 445 *a*.
VESUVIUS, the exhalations emitted from that mountain, v. 118 *b*. The height of the flame issuing from mount *Vesuvius*, v. 122 *b*.
VIALS containing aerial noctiluca's, iv. 24 *a*. Light emitted from liquor contained in *Vials*, iv. 27 *b*.
VIBRATIONS of quicksilver descending explained, i. 89 *a*. An account of the *Vibrations* of pendulums, iii. 161 *a*. Of hard bodies sounding, v. 306 *a*.
VIBURG, the quality of the hole of *Viburg*, iv. 261 *a*.
VILLAGERS, the happiness of their state of life, ii. 185 *b*. They are possessed with envy, ii. 187 *a*.
VINCENT LE BLANCK, his account of an African fruit, ii. 500 *b*.
VINCENT, an account of St. *Vincent*'s water, v. 380 *a*.
VINCENTIO VINCENTI, his invention of glass-fountains, i. 145 *a*.
VINE, observations upon a *Vine* near *Paris*, iv. 283 *b*. The water flowing from the wound of a *Vine*, i. 367 *b*.
VINEGAR distilled used in an experiment, i. 73 *b*. Living creatures to be found in *Vinegar*, i. 205 *b*. Fishes or worms discovered in it, i. 225 *a*. The qualities of spirit of *Vinegar*, iii. 74 *b*. Experiment on *Vinegar*-worms *in vacuo*, iv. 129 *a*. The effect of spirit of *Vinegar* mixed with stale urine, iv. 180 *a*. Put upon a florid superficies of human blood, iv. 197 *b*. Experiment upon an egg in distilled *Vinegar*, iv. 210 *a*. By dissolving minium in spirit of *Vinegar*, i. 321 *a*. The nature of spirit of *Vinegar* distilled, i. 335 *a*. Swimming animals discovered in *Vinegar*, i. 368 *a*. Effect of pouring spirit of *Vinegar* on calcined lead, i. 369 *a*. Of pouring *Vinegar* on Egyptian nitre, i. 381 *b*. Worms discovered in *Vinegar*, i. 436 *b*. *Lapides cancrorum* dissolved by *Vinegar*, i. 485 *a*. The way of changing wine into *Vinegar*, i. 534 *a*. *Vinegar* will operate upon the shell, not upon the egg, i. 548 *b*. Living creatures discovered in *Vinegar*, iii. 186 *b*. The effect of *Vinegar* upon the dissolving of crude lead, iii. 192 *b*. The effect of spirit of *Vinegar* put upon minium, iii. 556 *a*. The nature and operation of *Vinegar*, iii. 625 *b*. The disagreement between *Vinegar* and nitre inquired into, v. 587 *a*.
VINOUS SPIRITS, the production of them, i. 386 *a*. The nature of *vinous Spirits* obtained from bodies, i. 386 *b*. The modus whereby *vinous Spirits* are produced, i. 387 *a*.
VIOL, the effect of a note upon a base *Viol*, iv. 266 *a*. Of the weather upon the string of a *Viol*, v. 130 *a*.
VIOLET, experiment of syrup of *Violets*, dropt upon white paper, ii. 52 *a*. The syrup changed into a green colour, ii. 53 *a*. Experiment of the noctiluca dropt on syrup of *Violets*, iv. 85 *b*. With arsenical liquor and syrup of *Violets*, iv. 241 *b*. With syrup of *Violets* and spirit of salt, v. 85 *a*.
VIPER, a particular account of the poison, teeth, &c. of *Vipers*, v. 540 *a*. Of the lungs of a *Viper* upon dissection, v. 542 *a*. Phænomena by *Vipers* in the exhausted receiver, iii. 115 *a*. Experiment by drowning a *Viper*, iii. 122 *b*. By its living in rarefied air, iii. 124 *b*. The effect of the bite of a *Viper*, iv. 307 *a*. *Goa* stones against the bite of a *Viper*, iv. 337 *b*. Fowl fed by the flesh of *Vipers*, v. 300 *a*. Their way of poisoning, v. 319 *a*. The poison lodged in two vesicles about the *Viper's* teeth, v. 347 *a*. The vivacity of dissected *Vipers*, i. 467 *b*. A way to preserve the taste of *Vipers*, i. 469 *b*. In what their poison consists, i. 477 *b*. A certain cure for their biting, i. 478 *a*. A *Viper* strangled with purple thread an amulet, i. 535 *a*. The virtue of oil of *Vipers*, i. 562 *b*.
VIRGA AUREA, some account of it, v. 263 *b*.
VIRGIL, his way of writing in the Georgicks, ii. 143 *a*.
VIRGIN, the whole world made happy by a *Virgin*, v. 55 *b*. The question, whether a *Virgin* continuing such may have a child, examined, iii. 517 *b*.
VIRGINALS out of tune in wet weather, iii. 402 *b*.
VIRGINITY, the tokens of it doubtful and disputed, i. 221 *a*.
VIRGULA DIVINATORIA, the nature of it, i. 203 *b*. The way of making and using it, i. 220 *a*.
VIRTUE on a throne has as much influence as vice, ii. 131 *a*. Not safe to travel on the confines of *Virtue*, ii. 191 *a*. Christianity promotes extraordinary degrees of *Virtue*, v. 67 *b*. Rewards proposed to *Virtue* by religion, v. 68 *a*. The medical *Virtues* of mixed bodies, i. 371 *b*.
VIRTUOSI rely upon experimental philosophy, v. 41 *a*. An account of two Florentine *Virtuosi*, v. 383 *b*. The chief subject of their experiments, v. 384 *b*. They present the Florentine experiments to the royal society, v. 388 *b*. Their notion of the ætherial part of the world, v. 686 *b*.
VIRTUOSO, the Christian *Virtuoso*, the first part, v. 37 *a*. The business of a *Virtuoso* to improve the mind, v. 39 *a*. The advantage of a Christian *Virtuoso* over a school philosopher, v. 44 *a*. In contemplating the fabrick of the world, v. 44 *b*. An experimental *Virtuoso* reasons on mathematical principles, v. 47 *b*. His design in reading the Scriptures, v. 52 *a*. His way of examining supernatural evidence, v. 57 *b*. Appendix to the first part of the Christian *Virtuoso*, v. 655 *a*. The Christian *Virtuoso*, the second part, v. 685 *a*. The use the Christian *Virtuoso* may make by studying the macrocosm, v. 686 *b*. Upon what he is to ground his veneration of the divine wisdom, v. 688 *a*. By studying the works of nature, he establishes the foundation of all religion, v. 711 *a*. The advantages he gains by searching into the parts of the cosmical system, v. 712 *b*. Particular reasons for his celebrating the divine praises, v. 715 *a*. Inducements to oblige him to the love of God, v. 719 *a*.
VISION is a continued action from the object into the eye, i. 138 *b*. The definition of it by Mr. *Boyle*, i. 139 *a*. The happiness of the beatific *Vision*, i. 185 *b*. Particulars necessary to a theory of *Vision*, ii. 23 *a*.
VISIVE, the imbecility of the *visive* faculty, iv. 65 *b*.
VITAL, a *vital* substance diffused through the air, iii. 467 *a*.
VITRIFICATION, some account of it, i. 415 *b*. It is the ultimate action of fire, iv. 253 *b*.
VITRIOL, different sorts of it, i. 209 *b*. A caution in making it, i. 217 *b*. Oil of *Vitriol* made to incorporate with quicksilver, i. 252 *a*. An experiment by pouring oil of *Vitriol* upon crystals of salt-petre, i. 269 *a*. The *Vitriol* of metals heavier than the metalline part alone, ii. 18 *a*. An experiment upon the burning of blue *Vitriol*, ii. 32 *b*. Upon rectified oil of *Vitriol* mixed with essential oil of worm-wood, ii.

33 *b*. Upon a diſſolution of blue *Vitriol* in fair water, ii. 54 *a*. Oil of *Vitriol* heightens the colour of red-roſe leaves, ii. 63 *a*. An experiment upon common *Vitriol* beaten to powder, ii. 69 *a*. On the ſolution of *Vitriol* and ſea-ſalt, iii. 38 *a*. An account of *Vitriol* in gold mines, iii. 103 *a*. The making of blue venereal *Vitriol*, iii. 152 *b*. Obſervation on oil of *Vitriol* frozen, iv. 9 *b*. On the weight of oil of *Vitriol*, iv. 76 *b*. On ſal-armoniac and oil of *Vitriol in vacuo*, iv. 144 *b*. On the fixed ſalt of human blood and oil of *Vitriol*, iv. 171 *a*. Serum coagulated by oil of *Vitriol*, iv. 173 *a*. The alcalizate ſpirit of blood mingled with oil of *Vitriol*, iv. 202 *a*. Oil of *Vitriol* mingled with powdered human blood, iv. 202 *b*. Its power in corroding glaſs, iv. 227 *a*. Experiment by tincture of galls upon Roman *Vitriol*, iv. 238 *b*. With oil of *Vitriol* and ſolution of arſenic, iv. 241 *a*. With a ſolution of *Dantzick Vitriol* and liquor of arſenic, iv. 241 *b*. To diſcover the predominancy of *Vitriol* in a mineral water, iv. 246 *a*. *Vitriol* made of vitriolate ſtones, iv. 279 *b*. Experiment of oil of *Vitriol* upon powdered marcaſites, iv. 286 *a*. Engliſh *Vitriol* and ſea-ſalt diſtilled, iv. 297 *b*. The uſe of ſulphur of *Vitriol* to procure ſleep, iv. 333 *a*. *Vitriol* made from marcaſites, v. 32 *b*. The different kinds of *Vitriol*, v. 94 *b*. Air produced in oil of *Vitriol*, v. 111 *b*. The ſeparating the metalline from the ſaline part of *Vitriol*, i. 305 *b*. A ſulphur obtained from antimony and oil of *Vitriol*, i. 306 *a*. *Vitriol* will by heat be made fluid like water, i. 316 *b*. Experiment by diſtilling oil of *Vitriol* and oil of turpentine, i. 333 *a*. Obſervations on ſtones rich in *Vitriol*, i. 340 *b*. The generation of *Vitriol*, i. 359 *a*. Salt ſeparated from oil of *Vitriol*, i. 363 *a*. The diſſolution of pure *Vitriol* in common water, i. 366 *b*. *Vitriol* not deſtitute of mineral ſulphur, i. 395 *b*. The *caput mortuum* of *Vitriol* examined, i. 417 *b*. The whitiſh ſalt of *Vitriol* uſed as a vomit, i. 564 *a*. Experiment on the congealing of oil of *Vitriol*, ii. 236 *a*. On freezing the ſolutions of all ſorts of *Vitriols*, ii. 382 *a*. The quality of factitious *Vitriol*, ii. 486 *b*. Common *Vitriol* will run *per deliquium*, ii. 487 *a*. The quality of *Vitriol* made with ſpirit of ſalt, ii. 487 *b*. Phænomena from the diſtillation of oil of *Vitriol* and ſpirit of wine, ii. 524 *b*. Remark on the *caput mortuum* of oil of *Vitriol*, iii. 188 *b*. An efflorescence of *Vitriol* growing upon ſtones, iii. 465 *b*. The operation of the air upon *Vitriol*, iii. 471 *b*. Inſtances of the production of heat by the operation of oil of *Vitriol*, iii. 581 *b*. Oil of *Vitriol* mingled with water or ſpirit of wine will grow hot, iii. 582 *a*. The ſame experiment mingled with colcothar, iii. 582 *b*. Its effect mingled with oil of turpentine, petreolum, minerals, &c. iii. 583 *a*. With vegetables, minced fleſh, ſea-ſalt, &c. iii. 583 *b*. The efficacy of oil of *Vitriol* in fixing ſome parts of volatile bodies with ſome parts of itſelf, iii. 623 *b*. The difficulty of ſeparating the parts of *Vitriol*, ii. 494 *a*.

VITRIOLUM MARTIS, an account of it, ii. 73 *a*.

VITRUM SATURNI, of what compounded, iii. 194 *b*.

UKRAIN, an account of the cold of that province, ii. 329 *a*. Scarce ſupportable by horſes and tame beaſts, ii. 329 *b*.

ULCER, a remedy againſt venereal *Ulcers*, iv. 333 *a*. A cure for an *Ulcer*, v. 279 *b*. The cauſe of an *Ulcer* in the hand, v. 442 *a*. The cure of *Ulcers* in the noſe, v. 444 *b*. *Ulcers* cured by a chymical liquor, i. 483 *a*.

UNBELIEF, the cauſe of many ſins, ii. 135 *a*.

UNDERSTANDING, wonderfully enlarged in heaven, i. 181 *a*. The darkneſs of it will be cleared in the other world, i. 185 *a*. The quickneſs of its ſenſation, iv. 53 *b*. How it acts upon the will, iv. 59 *a*. In what manner the *Underſtanding* is the eye of the mind, iv. 63 *b*. The benefit it receives by the internal light of the mind, iv. 64 *a*. Its way of acting in ſupernatural revelation, v. 58 *b*. An inquiry into things that ſurpaſs the *Underſtanding*, v. 61 *a*. *Underſtanding* the higheſt faculty in man, i. 424 *a*. To be exerciſed upon divine ſubjects, iii. 422 *b*. The weakneſs of our *Underſtanding* in corporeal things, v. 662 *a*.

UNGUENT, the caſe of odoriferous *Unguents* among the Jews, i. 158 *b*.

UNION of heterogeneous bodies by cold, i. 310 *b*. The *Union* of the ſoul and body particularly conſidered, v. 709 *a*.

UNISON, the impulſe of the air on the *Uniſon* ſtrings of inſtruments, iv. 265 *a*. More particularly explained, v. 515 *b*. *Uniſon* ſtrings of the ſame inſtruments, a trial upon them, iii. 55 *a*.

UNIVERSE, its ſtructure liable to deviations, iii. 92 *a*. Not capable of local motion, iv. 63 *a*. The vaſtneſs of the *Univerſe* ſhews the power of God, iv. 341 *a*. The vaſt magnitude of the fluid part of the *Univerſe*, iv. 341 *b*. The fluid part of the *Univerſe* exceeds the ſolid, iv. 342 *b*. The phænomena of the *Univerſe* prove a Deity, v. 42 *b*. The *Univerſe* maintained and preſerved by the great Maker of it, v. 45 *a*. The principles of the *Univerſe* explained, i. 361 *a*. The magnificent fabric of the *Univerſe* conſidered, i. 423 *b*. Not made by a fortuitous concourſe of atoms, i. 452 *b*. The workmanſhip of the *Univerſe* to be admired and praiſed, i. 461 *b*. The *Univerſe* to be conſidered as a great engine, ii. 467 *a*. God the only efficient of the *Univerſe*, iv. 373 *a*. The preſent ſyſtem of the *Univerſe* not equally uſeful to the whole earth, iv. 535 *b*.

UNSOCIABLE things, their nature explained, iv. 51 *b*.

UNTZERUS, his account of the *lapis nephriticus*, iv. 324 *a*.

VOICE, remark on the different *Voices* of perſons, v. 702 *a*.

VOID, the opinion of naturaliſts concerning it, i. 25 *a*.

VOLATILE SALT, of human blood, iv. 168 *b*. A diſtillation of it in diſtilled water, iv. 179 *a*. *Sal volatile oleoſum* of ſpirit of blood, iv. 192 *b*. How much *volatile Salt* of human blood is diſſoluble in water, iv. 198 *b*. Hinders water from freezing, iv. 199 *a*. Diſſolved in water promotes freezing, iv. 199 *b*. An account of *volatile* gold, v. 34 *a*. An experiment to diſſolve *volatile Salt* in water, v. 100 *a*. *Volatile Salts* proceed from putrefaction, v. 118 *a*. The amicableneſs of *volatile* ſpirits to the blood, v. 251 *b*. The *volatile Salts* of ſoot, i. 303 *b*. The diverſity of *volatile Salts*, i. 338 *b*. They are the ſame in their medicinal properties, i. 339 *a*. The making a *volatile Salt* from crude-tartar, i. 368 *b*. The production of *volatile Salts*, i. 379 *a*. The nature of thoſe obtained from vegetables, i. 379 *a*. How *volatile Salt* unites with ſulphur, i. 380 *a*. *Volatile Salt* produced from human urine, i. 384 *b*. The qualifications by which a portion of matter is found to be *volatile*, iii. 610 *a*.

VOLATILITY, the mechanical origin and production of it, iii. 609 *a*. Effected by the comminution and alteration of the ſhape of the corpuſcles of bodies, iii. 612 *b*. Depends upon the texture and other mechanical affections of a body, iii. 613 *b*. *Volatility* belongs to the three principles of the chymiſts, i. 350 *a*.

VOLATILIZING OPERATIONS of the open air, i. 237 *a*. The five ſeveral ways of *volatilizing* of bodies, iii. 612 *a*. The *volatilizing* of colcothar and ſteel, iii. 614 *b*. Of ſalt of tartar, iii. 615 *a*. The air is ſometimes an inſtrument in the *volatilizing* of bodies, iii. 617 *a*. The *volatilizing* of bodies by the operation of fire, iii. 618 *a*.

VOLCANO'S, the productions of fire in them examined, ii. 486 *a*.

VOLOGDA, in *Ruſſia*, account of the cold of that country, ii. 400 *a*.

VOMIT, a proper *Vomit* given in the plague, ii. 8 *a*. A *Vomit* by applying decocted tobacco to the wriſts, iv. 210 *b*. The nature of *Vomits* examined, v. 90 *a*. The uſe of them, v. 442 *a*. Corroſive liquor brought up by *Vomit*, i. 475 *a*.

VORTEX, our *Vortex* compared to the univerſe, iv. 345 *a*.

UPSAL, archbiſhop of, his account of the mountains of *Poland*, ii. 364 *b*.

URBAN, the eighth, employed in the ſtudy of the Scripture, ii. 133 *b*.

URINAL, remarks on the breaking of *Urinals*, iv. 274 *b*.

URINATORS, their office and employment, v. 506 *a*.

URINE, experiment in the air-pump by ſpirit of *Urine*, i. 38 *a*. A great difference in *Urines*, i. 210 *b*. An account of the diſtillation of *Urine*, i. 211 *a*. An experiment by ſpirit of *Urine* mixed with ſpirit of wine, i. 263 *b*. Spirit of *Urine* will at different ſeaſons be fluid and ſolid, i. 274 *a*. Will heighten the colour of cochineal, ii. 55 *a*. An experiment by a diſtillation of putrefied *Urine*, iii. 81 *a*. The uſe of writing with *Urine*, iii. 151 *b*. Spirit of *Urine* impregnated with copper, iv. 25 *b*. Human *Urine* uſed in making a noctiluca, iv 37 *a*. Experiment on *Urine in vacuo*, iv. 134 *a*. Titles for the natural hiſtory of human

Urine, iv. 165 *b*. *Urine* a subject worthy to be inquired into, iv. 165 *b*. Experiment of fresh *Urine* poured upon quick-lime, iv. 174 *a*. Of fresh *Urine* and salt of pot-ashes, iv. 174 *b*. Human *Urine* will make invisible ink, iv. 200 *b*. Incontinence of *Urine* cured by a specific, iv. 322 *b*. A remedy for the sharpness of *Urine*, iv. 327 *b*. Against making bloody *Urine*, iv. 329 *b*. Spirit of *Urine* used in examining of sand-gold, v. 32 *a*. Experiment with rectified spirit of *Urine* and filings of steel, v. 93 *a*. *Urine* by putrefaction affords volatile salts, v. 118 *a*. The phosphorus made from a preparation of human *Urine*, v. 198 *a*. The effect of placing a vessel of *Urine* in a dunghill, i. 307 *a*. Human *Urine* separated by cold, i. 10 *b*. Remarks on the fixed salt of *Urine*, i. 338 *b*. A volatile salt produced from human *Urine*, i. 384 *b*. Experiment on the solution of salt of *Urine*, i. 385 *a*. Common salt afforded by the *Urine* of horses, i. 385 *b*. Sediments observed in spirit of *Urine*, i. 472 *b*. The use of examining the *Urine* of patients, i. 481 *b*. The mixture of spirit of salt with digested *Urine*, i. 500 *a*. The benefit of drinking one's own *Urine*, i. 507 *b*. Ways of distilling spirit of *Urine*, i. 515 *b*. The uses of the preparations of *Urine*, i. 559 *a*. Remark on the distilling of fresh *Urine*, iii. 188 *a*. The effect of spirit of *Urine* upon musk, iii. 192 *b*.

URINOUS SALT, the various qualities of it, iii. 81 *b*. It is an enemy to acids, i. 380 *a*. The production of *urinous* spirits, i. 387 *a*. They consist of a crystalline volatile *Salt*, i. 387 *b*.

USE, the *Uses* of the parts of animals, according to *Epicurus*, examined, iv. 539 *a*. *Uses* of the parts often discovered by the structure of them, iv. 539 *a*.

USEFULNESS of experimental natural philosophy, i. 420 *a*.

UVEA, of the eye, its wonderful and curious contexture, iv. 538 *a*. Its nature and use anatomically explained, v. 698 *b*.

VULCAN, a quick mediator of amities, v. 231 *b*.

W.

WALES, remarkable stones of a mountain in *Wales*, v. 184 *a*.

WALKER, Mr. his conversion to popery, v. 417 *a*. His letter to bishop *Barlow*, v. 118 *a*.

WALL, the *Walls* in buildings how long in hardening, i. 285 *a*. Of houses infected with the plague, v. 103 *b*.

WALLÆUS, his observation on the lungs, i. 65 *b*.

WALLER, Mr. the poet, some account of him, v. 556 *b*. Remarks upon his memory, v. 427 *b*.

WALLIS, Dr. his account of the coagulative spirit of lead, i. 269 *b*. His demonstrations of *Euclid*, iii. 3 *a*. His notion of conic sections, iv. 66 *a*. His hypothesis about the flux and reflux of the sea, v. 356 *b*. His letters to Mr. *Boyle*, v. 511 *a*. His account of teaching a person deaf and dumb to speak, v. 511 *b*. His recommendation of a wife to Mr. *Boyle*, v. 515 *b*.

WALNUT, the oil of *Walnuts*, its use in the stone and gravel, iv. 329 *a*. The use of a liquor drawn from the wounded roots of *Walnut*-trees, i. 491 *b*. The shade of them noxious to the head, iii. 338 *a*.

WALSH, Father, his character and way of writing, v. 411 *a*.

WAND, particular observations on the divining *Wand*, i. 220 *a*.

WAR proclaimed by *France* against *England*, v. 349 *b*. *Wars* less destructive since the invention of gun-powder, v. 503 *b*.

WARD, Dr. his refutation of Mr. *Hobbes*'s explication of the Torricellian experiment, i. 133 *b*.

WARMTH, the reason of it in the lower region of the earth, iii. 101 *a*. The reason of the *Warmth* of subterraneal exhalations, iii. 101 *b*.

WARNERUS, some account of his translation of the Bible, v. 249 *b*. A particular character of him, v. 293 *a*. His skill in the Arabic and Turkish languages, v. 295 *b*. His design to translate the New Testament, v. 327 *b*.

WARSAW, the appearing of three suns near that place, v. 176 *b*.

WART, a charm to cure *Warts*, v. 317 *b*. A magnetical cure by Sir *Francis Bacon*, i. 531 *b*. The *Warts* of horses legs, their virtue, v. 567 *b*. *Warts* cured by a dead man's hand, v. 441 *a*.

WARWICK, Mr. *Boyle*'s letter to the Countess of *Warwick*, i. 155 *a*. Some account of the Earl of *Warwick*, v. 236 *b*.

WASE, Mr. his character, v. 581 *b*.

WASH, an innocent *Wash* for the face, i. 364 *a*.

WATCH, an experiment upon a *Watch*, in the air-pump, i. 40 *b*. The motion and sound of its pulse described, i. 41 *a*. A trial of the sound of a *Watch* in an exhausted receiver, iii. 54 *a*. An account of the invention of them, iii. 149 *b*. The case of a *Watch* richly perfumed, iv. 225 *b*. Experiment of a *Watch* in a pneumatic engine, iv. 261 *a*. The invention of a *Watch* without a pendulum, v. 345 *a*. An easy method to make glass covers for *Watches*, iii. 181 *b*. A *Watch* taken by the *Chinese* to be a living creature, iv. 550 *a*.

WATCH-CASE, an account of a *Watch-case* perfumed, iv. 282 *b*.

WATER, an experiment relating to its subsiding in glass-tubes, i. 28 *b*. Its motion in the receiver, i. 29 *a*. The elastic power of *Water* tried, i. 29 *b*. Has a power to expand itself after compression, i. 30 *a*. Will not turn into air, i. 33 *a*. When a body will swim in the *Water*, i. 39 *b*. *Water* fourteen times lighter than quicksilver of the same bulk, i. 44 *b*. Will ascend in a glass-pipe held upright, i. 52 *a*. The particles of it will pass through a lamb's bladder, i. 54 *a*. Near a thousand times heavier than air, i. 56 *a*. An experiment of *Water* frozen in the receiver, i. 61 *b*. Why frozen *Water* breaks through the solid bodies that inclose it, i. 61 *b*. Is swelled by freezing, i. 61 *b*. An experiment by boiled *Water*, i. 74 *a*. *Water* has very little elastic force, i. 81 *b*. An experiment by *Water* to try the weight of the atmosphere, i. 98 *b*. The spring of the *Water* owing to particles of air harboured in it, i. 109 *b*. How long a man may continue under *Water*, i. 112 *a*. The reason of its suspension or descent in a watering-pot considered, i. 122 *b*. The ascent of *Water* in a streight tube examined, i. 136 *b*. *Water* coagulated by a sort of salt, i. 268 *b*. Coagulates into stone, i. 278 *a*. The corpuscles of *Water* always in motion, i. 282 *b*. *Water* agitated into froth exhibits a white colour, ii. 20 *b*. An account of the different appearances in the colour of its surface, ii. 26 *b*. The weighing bodies in water, iii. 2 *b*. The raising of water by the spring of the air, iii. 9 *b*. The effect of the air upon *Water* in an air-pump, iii. 11 *b*. The ascension of *Water* in sucking-pumps, explained, iii. 15 *b*. The raising of mercury and *Water*, by the spring of the air, iii. 18 *b*. An account of the raising of *Water* by attraction, iii. 20 *a*. The height of *Water* in sucking-pumps, iii. 21 *b*. The ascension of water in slender pipes of glass, iii. 36 *a*. The surface of the *Water* higher, next the surface of the glass, iii. 38 *a*. Its gravity tried by a sealed bubble, iii. 61 *a*. The weighing of *Water* in *Water*, iii. 71 *a*. The raising of *Water* in the experiment by *Hero's* egg, iii. 84 *b*. *Water* to sense is cold, iii. 106 *a*. The *Water* cold in the bottom of the sea, iii. 106 *b*. The analogy between *Water* and air, iii. 108 *a*. *Water* will press on mercury immersed therein, iii. 108 *b*. Is not the *summum frigidum*, iii. 109 *b*. The pressure of the *Water* at the bottom of the sea, iii. 111 *b*. The tranquillity of the water in the bottom of the sea, iii. 112 *a*. The motion of the upper part of the *Water* above the lower, iii. 113 *b*. Air concealed in the pores of *Water*, iii. 117 *b*. The benefit of overflowing lands by *Water*, iii. 145 *a*. The surface of *Water* encompassed with other fluids, iv. 8 *a*. particularly with oil of cloves, iv. 8 *b*. Experiment with oil of anniseeds and common *Water*, iv. 8 *b*. A noctiluca kept in *Water*, iv. 75 *a*. Experiments upon it, iv. 75 *b*. &c. The *Water* turned like melted rosin, iv. 76 *a*. Attended with shining explosions, iv. 76 *b*. An experiment to produce light in common *Water*, iv. 78 *b*. Of *Water* impregnated with luminous matter, iv. 80 *b*. Inquiry into the effects of a phosphorus immersed in *Water*, iv. 87. *a*. The filtration of air through *Water*, iv. 104 *a*. Experiment on *Water* with dissolved salt *in vacuo*, iv. 139 *b*. *Water* useful to the preservation of flesh, iv. 153 *a*. An account of fresh *Water* made out of salt, iv. 159 *a*. The wholesomeness of such *Water*, iv. 160 *a*. The uses and weight of it, iv. 160 *a*. The difference of weight between *Water* and human blood, iv. 167 *b*. The weight of *Water* compared with spirit of blood, iv. 182 *b*. The operation of the salt of human blood, on distilled *Water*, iv. 204 *a*. *Water* not void of pores, iv. 219 *b*. Memoirs for the history of mineral *Waters*, iv. 231 *a*. *Water* impregnated by various minerals, iv. 233 *a*. The trial of mineral *Waters* by galls, iv. 233 *b*.

The

The manner of inquiring into the nature of mineral *Waters*, iv. 234 *a*. Medicinal *Waters* found in mines, iv. 234 *b*. Proper considerations for the history of a mineral *Water*, iv. 235 *a*. Experimental remarks on the examining of mineral *Waters*, iv. 237 *b*. The exploring of mineral *Waters* by colours, iv. 239 *b*. Mineral *Waters* discovered by vegetable pigments, iv. 240 *a*. Various salts contained in mineral *Waters*, iv. 240 *b*. The specific gravity of a mineral *Water*, iv. 242 *b*. The spontaneous residence of *Water*, iv. 243 *b*. Excrements blacken'd by martial *Water*, iv. 238 *b*. The examining of a mineral *Water* suspected to contain arsenic, iv. 241 *b*. The way to estimate the degree of coldness in *Water*, iv. 242 *a*. The weight of common *Water*, iv. 243 *a*. The reason of odours in mineral *Waters*, iv. 244 *a*. They have a particular quickness at the spring-head, iv. 244 *b*. Ferruginous *Waters* impregnated with common salt, iv. 245 *a*. The predominancy of an alkali in mineral *Waters* discovered, iv. 246 *a*. The ways to discover vitriol in mineral *Waters*, iv. 246 *b*. The nature of the salts in English purgative *Waters*, iv. 246 *b*. The caput mortuum afforded by mineral *Waters*, iv. 247 *a*. No vitriol in the mineral *Waters* about *London*, iv. 246 *b*. The quality and virtue of vitriolate *Water*, iv. 248 *a*. Mineral *Water* considered as a medicine, iv. 248 *b*. The phænomena of mineral *Waters* uncertain, iv. 250 *a*. Mineral *Waters* affected by rain, iv. 250 *b*. The dissolving quality of *Water* on precipitate, iv. 257 *a*. Common *Water* made hurtful to human bodies, iv. 283 *a*. The action of common *Water* upon marcasites, iv. 286 *a*. *Water* sweetened by a medicinal liquor, iv. 314 *a*. The way of weighing sinking bodies in *Water*, v. 4 *a*. The weighing of liquors in *Water*, v. 10 *a*. Powder of sinking bodies weighed in *Water*, v. 11 *b*. Hydrostatical weighing of bodies that dissolve in *Water*, v. 12 *a*. The specific gravity of different *Waters* examined, v. 18 *b*. The weight of a cubical inch of *Water*, v. 19 *b*. Air produced in mines by running *Water*, v. 113 *a*. The weight of a cubic inch of *Water*, v. 133 *b*. Ice used at sea instead of fresh *Water*, v. 165 *b*. The qualities of the *Water* proper for natural history, v. 191 *b*. To examine the freshness and saltness of *Water*, v. 199 *a*. Fresh water fittest for œconomical uses, v. 200 *a*. To know how much one *Water* is fresher than another, v. 200 *b*. The examining mineral *Waters* by salt, v. 201 *a*. Rain-*Water* tried by spirit of salt, v. 201 *b*. Whence proceeds the unwholesomeness of *Waters*, v. 202 *b*. Distilled *Water* best to drink, v. 203 *a*. An account of a *Water* hour-glass, v. 271 *a*. A *Water* against the stone, v. 295 *b*. The refraction of common *Water*, v. 307 *a*. Particular account of the freezing of *Water*, v. 355 *a*. The height of *Water* by pumping, v. 384 *b*. The use of *Water* in analyzing of bodies, i. 308 *a*. Plants consist chiefly of transmuted *Water*, i. 314 *a*. *Water* the material cause of fixed bodies, i. 314 *b*. The chaos from which all things were made was *Water*, i. 314 *b*. *Water* the material cause of the universe, i. 315 *a*. but not simple elementary *Water*, i. 316 *b*. Quicksilver reduced into *Water*, i. 317 *b*. Oil, salt and earth produced from *Water*, i. 322 *b*. The operation of *Water* upon steel, i. 328 *b*. *Water* may be transmuted into all other elements, i. 357 *a*. Differently varied, produces clouds, hail, snow, &c. i. 362 *b*. The qualities of *Water* examined, i. 363 *a*. *Water* is not an universal ingredient of mixed bodies, i. 363 *b*. The growth of plants by assimulated *Water*, i. 393 *b*. *Water* produced in bodies by the action of fire, i. 413 *b*. An account of a mercurial *Water*, i. 414 *a*. Of water reduced into earth, i. 414 *b*. The production of earth in *Water* by particles of fire, i. 416 *b*. An instrument to try the weight of *Water*, i. 495 *b*. The effect of drinking cold *Water*, i. 538 *a*. *Water* is thicker and heavier in winter than in summer, ii. 251 *b*. *Water* sealed in glass-vessels turned into ice, ii. 254 *a*. Several ways of freezing of *Water*, ii. 258 *b*. Experiment on the freezing of *Water* by weighing it, ii. 267 *a*. The way to make *Water* freeze first at the bottom, ii. 269 *b*. Experiments of the expansion of water by being frozen, ii. 276 *b*. *Water* fluid and frozen of the same weight, ii. 280 *b*. The expansive force of freezing *Water*, ii. 288 *a*. The way of reducing *Water* into air, ii. 296 *b*. Experiments on the fluidness of *Water*, ii. 298 *a*. Whether the *Water* be *primum frigidum*, ii. 310 *b*. The *Water* not indifferent as to heat and cold, ii. 311 *b*. To measure the condensation of the air by the ascent of *Water*, ii. 317 *b*. The weight of frozen *Water* examined, ii. 333 *b*. Whether hot *Water* would sooner freeze than cold, ii. 341 *a*. Experiment to free salt *Water* from the phlegm by cold, ii. 347 *b*. Whether *Water* be capable of compression, an experiment upon it, ii. 353 *b*. The smoking of *Waters* in frosty weather examined, ii. 366 *b*. Experiments on freezing common *Water*, ii. 382 *a*. In *Water* the lower parts are pressed by the upper, ii. 417 *a*. The resistance made by *Water* to bodies that sink in it, ii. 423 *b*. The pressure of *Water* against the lower part of the body immersed in it, ii. 424 *b*. Experiment on the ascension of *Water* in pumps, ii. 426 *b*. The pressure upon a body placed under *Water* examined, ii. 430 *a*. *Water* may be made as well to depress a body lighter than itself, as to buoy it up, 436 *a*. The ascension of *Water* in siphons explained, ii. 437 *a*. The sinking of ponderous bodies in *Water*, ii. 439 *a*. Objections against the pressure of the upper parts of *Water* on the lower answered, ii. 441 *b*. Bodies immersed under *Water* are not compressed by it, ii. 447 *b*. Of plants nourished by simple *Water*, ii. 498 *a*. The transmutation of *Water* into earth, ii. 519 *a*. Remark on the running of *Water* out of a hole at the bottom of a vessel, iii. 189 *b*. The parts of *Water* most pressed will thrust away those that are less pressed, iii. 277 *a*. In stagnant *Water* the upper parts do actually press the lower, proved by experiment, iii. 279 *a*. The gravitation of *Water* particularly considered, iii. 290 *b*. *Water* presses the subjacent *Water*, but does not prægravitate, iii 292 *a*. The heat and coldness of *Water* in regard to sense, iii. 368 *b*. The reason of heated *Water's* returning to its natural coldness, iii. 391 *a*. The agitation of the parts in hot *Water*, iii. 576 *a*. Heat produced by a mixture of oil of vitriol with common *Water*, iii. 581 *b*. What degree of coldness is natural to *Water*, iv. 391 *b*. The effects of different *Waters* upon different soils, v. 465 *b*. A way to walk on the *Water*, v. 583 *b*.

WATER, receipt of a *Water* for a fistula, ulcers, &c. i. 558 *a*.

WATER-DRINKERS, the tricks of quacks called *Water-Drinkers*, ii. 70 *b*.

WATER-FOWL, their feathers made not to admit the water, i. 248 *b*.

WATERING-POT, of a conical figure, how used, i. 48 *b*. The reason of the suspension of the water in a gardener's *Watering-Pot*, i. 146 *a*. An experiment by a *Watering-Pot* concerning a vacuum, i. 122 *a*.

WAX, an experiment upon oil of *Wax*, i. 271 *a*. A way to make white *Wax*, ii. 33 *b*. Of representing fruit in *Wax*, iii. 182 *b*. Experiment of drawing asunder the opposite parts of a piece of *Wax*, iii. 480 *b*.

WEAPON-SALVE, testimonies of authors concerning it, i. 530 *b*.

WEATHER, the unaccountable variety of the *Weather* in *England*, iv. 285 *a*. To know the *Weather* by a weight upon a rope, v. 114 *a*. A diary of the *Weather* useful, v. 127 *a*. Change of *Weather* foretold at the bottom of mines, v. 130 *a*. Mr. *Locke*'s register of the change of the *Weather*, v. 136 *a*. Houses set on fire by hot *Weather*, v. 168 *b*. Dry *Weather* not favourable to the production of insects, v. 184 *b*. Pains felt by persons against change of *Weather*, i. 538 *a*. Presages of change of *Weather* by animals, by pains, aches, &c. considered, iii. 331 *b*. To know the differing variation of *Weather* in the same month, day and hour, iii. 396 *a*. Reflections upon wet *Weather*, ii. 178 *a*.

WEATHER-GLASS, an experiment by it to try the weight of the atmosphere, i. 98 *a*. A sealed *Weather-Glass* to be used in mines, iii. 100 *a*. To discover the temperature of the submarine regions, iii. 108 *b*. *Weather-Glass* furnished with mercury instead of water, iii. 108 *b*. put into a porringer of warm blood, iv. 166 *b*. Spirit of blood and spirit of verdegrease put in a *Weather-Glass*, iv. 203 *a*. A natural *Weather-Glass* of a toad, v. 275 *a*. Description of an improvement in *Weather-Glasses*, v. 275 *b*. A *Weather-Glass* to find the pressure of the air at sea, v. 379 *b*. To discover the *Weather* at sea, v. 389 *b*. The effect of air blown by bellows on a *Weather-Glass*, ii. 236 *a*. *Weather-Glasses* not always true in judging of cold, ii. 240 *a*. Their reports not to be depended on, ii. 243 *a*. The effect of the air on *Weather-Glasses* in deep mines, ii. 243 *b*. Of the different gravity of the atmosphere, ii. 244 *a*. The difference between two

Weather-Glasses explained, ii. 245 *a. b.* Observations about the deficiencies of *Weather-Glasses*, ii. 246 *a.* A way of settling a standard for *Weather-Glasses*, ii. 246 *a.* What liquors to be used in *Weather-Glasses* to be considered, ii. 248 *a.* The reason of sealing *Weather-Glasses*, ii. 249 *b.* The defects of sealed *Weather-Glasses*, ii 252 *a.* The ascent of water by cold in *Weather-Glasses*, ii. 252 *b.* The air is expanded by cold in sealed *Weather-Glasses*, ii. 253 *a.* The reason of the depression of the water in *Weather-Glasses*, ii. 254 *b.* The ascent of water tried by experiments, ii. 255 *b.* The use of sending sealed *Weather-Glasses* from one country to another, ii. 267 *b.* Experiment by sealed *Weather-Glasses* to try the heat of subterraneal places, ii. 371 *a.* The effect of freezing upon *Weather-Glasses*, ii. 389 *a.* Experiments by a sealed *Weather-Glass* in severe frosts, ii. 398 *b.*

WEIGHING of air, an experiment concerning it, i. 50 *a.* The *weighing* of it in a bubble of glass, i. 53 *a.* The *weighing* of water in water, iii. 71 *a.* Of *weighing* by double progression, iii. 158 *a.* An account of the *weighing* of mineral waters, iv. 243 *a.* The *weighing* of quicksilver in water, v. 10 *b.* The method of *weighing* solids in water, v. 5 *a.* Hydrostatical *weighing* of bodies that dissolve in water, v. 12 *a.* The *weighing* of fluids in oleous liquors, v. 12 *b.* A method of *weighing* liquors in water, v. 16 *b.* The *weighing* of solids in water, particularly stated, v. 20 *a.* The *weighing* of brass particularly stated, v. 27 *b.* Of air, winds and clouds, v. 348 *a.* The use of *weighing* the body after eating, i. 495 *b.* The *weighing* of ice, snow, *&c.* ii. 402 *b.* The *weighing* of air, ii. 415 *a.*

WEIGHT, an experiment concerning the *Weight* of the atmosphere, i. 98 *a.* Objection of Mr. *Hobbes* against the *Weight* of the air, i. 127 *a.* The adhesion of smooth glasses owing to the *Weight* of the air, i. 257 *b.* Experiments on the *Weight* of the air and its effects, iii. 6 *a.* Of lifting a *Weight* by the spring of the air in a bladder, iii. 13 *a.* The difference of *Weight* between quicksilver and water, iii. 20 *b.* The *Weight* of a mercurial cylinder, iii. 40 *a.* Solid *Weight* ascends by the pressure of the air, iii. 42 *a.* *Weight* lifted up by a cupping glass, iii. 45 *b.* The raising of *Weight* by air, iii. 58 *b.* The proportion of *Weight* betwixt air and water, iii. 61 *b.* Change of *Weight* made by the sun in vessels hermetically sealed, iv. 149 *a.* The *Weight* of salt water made sweet, iv. 160 *a.* Experiment on the *Weight* of human blood, iv. 167 *b.* The *Weight* of the serum of human blood, iv. 172 *b.* To discover the genuineness of bodies by their *Weight* in water, v. 1 *a.* The *Weight* of rock-crystal in water, v. 3 *b.* The proportion of *Weight* between water and solid bodies, v. 6 *a.* The *Weight* of liquid bodies in water examined, v. 11 *a.* The specific *Weight* of several different liquors examined, v. 16 *a.* The manner of ascertaining the *Weight* of bodies, v. 20 *b.* The difficulty of finding an uniformity in *Weights*, v. 23 *b.* The *Weight* of gold in water, v. 30 *b.* Of diamonds examined, v. 83 *b.* The *Weight* and density of the air examined, v. 133 *a.* The *Weight* of a cubic inch of water and quicksilver, v. 133 *b.* The *Weight* of a pillar of the atmosphere, v. 144 *b.* The *Weight* of calcined bodies examined, v. 233 *b.* The difference of the *Weight* of bodies above and below, v. 309 *a.* The *Weight* of a cylinder of air, v. 354 *a.* The *Weight* of bodies frozen and unfrozen examined, ii. 330 *b.* The addition of *Weight* made in bodies by freezing, ii. 386 *b.* The *Weight* of bodies in glasses hermetically sealed, considered, iii. 348 *a.*

WELL, experiment of gravity, of lighted candles, *&c.* in a deep *Well*, v. 544 *b.* The quality of the air, the descent of leaden bullets, *&c.* v. 545 *a. b.* The danger of going into close *Wells*, iii. 98 *a.* A *Well* in *Herefordshire* that yields bones, v. 275 *a.* The *Wells* of *Moscow* not frozen in winter, ii. 356 *b.*

WEN, cured by a dead man's hand, v. 441 *a.*

WENCEL, Friar, transmuted base metals into gold, v. 244 *b.*

WENCH, the saying of a witty *Wench* about lovers, i. 160 *a.*

WHALE, the bulk and vastness of *Whales* considered, i. 436 *b.*

WHALE-BONE; of a man that forced his meat and drink down his throat with a *Whale-Bone*, v. 523 *b.* An experiment on the spring of the air with a *Whale-Bone*, iii. 23 *a.*

WHALE-FISHING, some account of it, v. 312 *a.*

WHEAT, a curious account of prolific *Wheat*, iii. 143 *b.* Experiment on *Wheat*-flower drenched in water, v. 112 *a.* The nature and quality of the oil of *Wheat*, v. 440 *a.*

WHEEL-BAROMETER, the description and use of it, v. 343 *a.*

WHISTLE, to be heard five miles off, v. 174 *a.*

WHITE, how *white* bodies are affected by the rays of light, ii. 24 *a.* What is meant by a *white* heat by smiths, ii. 24 *b.* The superficial particles of *white* bodies are convex and smooth, ii. 27 *a.* Experiments of *white* bodies deprived of their whiteness, ii. 27 *b.* Most precipitated bodies are *white*, ii. 38 *a.* The various nature of *white* bodies, iii. 79 *a.* The *white* of an egg examined, ii. 496 *b.* *White* objects best discerned by a vitiated sight, iv. 552 *a.*

WHITENESS, the phænomenon of *Whiteness* in the receiver explained, i. 60 *a. &c.* The reason of its appearance, i. 111 *b.* An account of the *Whiteness* of the froth of water, ii. 20 *b.* The nature of *Whiteness* and blackness, ii. 23 *a.* A general definition of *Whiteness*, ii. 24 *a.* It depends upon the surface of bodies, ii. 26 *a.* How bodies are deprived of their *Whiteness*, ii. 27 *b.* *Whiteness* produced by chymical precipitation, ii. 37 *b.* Whether *Whiteness* will receive all colours, ii. 39 *a.* *Whiteness* occasioned by a copious reflection of light, iii. 80 *a.* The *Whiteness* of animals occasioned by cold, ii. 330 *a.*

WHITE-THORN, pears will grow upon a *White-Thorn* stock, i. 216 *a.*

WHITING, experiment on a small *Whiting in vacuo*, iv. 144 *a.* On two *Whitings* in two receivers, iv. 154 *a.*

WHITLOW-GRASS, its effect upon a tumour in the throat, iv. 328 *a.*

WHORE, what makes a *Whore* in the popish canon law, v. 413 *a.*

WICKED, they contribute to God's glory, i. 174 *a.*

WIDOW, the *Widow's* mite explained, v. 67 *a.*

WIFE, the love of a *Wife* explained, i. 159 *b.*

WIGHT, marchasites found in the isle of *Wight*, v. 32 *b.*

WILKINS, Dr. some account of him, v. 282 *b.* His letter to Mr. *Boyle*, v. 629 *b.*

WILKINSON, Dr. an account of his school, v. 397 *a.*

WILL, our *Will* should be subservient to the *Will* of God, i. 163 *a.*

WILLIS, Dr. his notion of chymical principles, iv. 94 *a.*

WILLOW-TREE, an experiment upon it, i. 313 *b.*

WINCHELSEA, Earl of, his letters to Mr. *Boyle*, v. 601 *b.*

WIND, men killed by *Winds* preserved from putrefaction, i. 470 *a.* *Wind* not made cold by being blown with bellows, ii. 241 *a.* *Winds* from frozen lands blow cold, ii. 293 *b.* The effect of *Winds* upon the temperature of the air, ii. 318 *a.* Heat and cold depend on the circumstances of the *Winds*, ii. 323 *a.* The effect of southerly and northerly *Winds*, ii. 323 *b.* The nature and qualities of *Winds* considered, ii. 324 *a.* An experiment to try the coldness of *Wind*, ii. 324 *b.* *Winds* become cold by driving the cold air before them ii. 325 *a.* Cold *Winds* receive their qualities from the regions over which they blow, ii. 325 *a.* The quality of infrigidating *Winds* examined, ii. 352 *b.* Whether the refrigeration of the air is caused by *Wind*, ii. 375 *b.* The effect of the heat of some *Winds*, ii. 376 *b.* Of *Wind* blown upon weather-glasses, ii. 377 *a.* Of *Winds* blowing from great tracts of ice, ii. 396 *b.* The *Wind* deadened by great tracts of ice, ii. 397 *b.* The temperature of air changed by *Winds*, iii. 397 *b.* The nature of some *Winds* in *America*, i. 60 *b.* The effect of *Winds* at the bottom of the sea, iii. 112 *b.* The force of *Winds* on solid bodies, iv. 254 *b.* The effect of the *Wind* on trees in autumn, iv. 257 *a.* Noxious effluvia carried by the *Wind*, iv. 286 *b.* The effect of a blasting *Wind* upon trees, iv. 287 *a.* The rapid motion of boisterous *Winds*, iv. 342 *b.* Of the motion of the air and *Winds*, v. 128 *b.* Strong *Winds* on the tops of mountains, v. 129 *a.* The quality of the *Winds* at *Archangel*, v. 166 *a.* In *New Hampshire*, v. 167 *b.* The effect of a red *Wind* upon the air, v. 177 *b.* The effect of *Wind* upon the health of animals, v. 186 *a.* A way to sail with all *Winds*, v. 286 *b.* An account of a *Wind*-frost, v. 346 *b.* The *Wind* partakes of the nature of the region over which it blows to us, iii. 397 *b.*

WIND-FOUNTAIN, the compressing of air in it, ii. 291 *a.*

WIND-GUNS, the dilatation of the air in them, i. 9 *a.* In *Wind-Guns* the air is crouded into a little space, i. 10 *a.* It is compressed into half its usual room, i. 49 *a.* They make little noise, iii. 166 *a.* The description of a *Wind-*

Wind-Gun, iv. 104 *b*. The motion of the bullet from a *Wind-Gun*, iv. 254 *a*.

WINDMILL, reflections on a *Windmill* ſtanding ſtill, ii. 164 *b*. On a *Windmill* for the raiſing of water, iii. 365 *b*.

WINDOW, the colouring of glaſs for *Windows*, iv. 229 *a*. Glaſs *Windows* broken by the diſcharge of ordnance, iv. 254 *b*. The glaſs of *Windows* corroded by fretting ſalts, v. 119 *a*. Account of the hoar froſt upon glaſs *Windows*, ii. 261 *a*.

WIND-PIPE is the great chimney of the body, iv. 209 *a*.

WINE, an experiment concerning the preſſure of the air by red *Wine*, i. 37 *b*. The manner of its mixing with water, i. 44 *a*. The ſpirituous parts of it remain unfrozen, i. 243 *a*. *Wine* preſerved cool in the African ſea, iii. 107 *a*. Diſcovery of aerial particles in *Wine*, iii. 118 *b*. An experiment with ſpirit of *Wine* mixed with oil, iv. 4 *a*. *Wine* turned into vinegar, iv. 14 *b*. Dephlegmed ſpirit of *Wine* preſerves human blood, iv. 198 *b*. *Wine* made of a powder thrown into water, v. 291 *b*. Account of the thawing of *French Wines*, v. 311 *a*. The mixing of *Wine* with water, an account of it, i. 318 *b*. The various changes produced in *Wine*, i. 368 *a*. Sweet *Wines* degenerate into vinegar, i. 378 *a*. Ways of making artificial *Wines*, i. 389 *a*. The quality of an acid ſpirit of *Wine*, i. 389 *b*. Bodies preſerved in ſpirits of *Wine*, i. 470 *b*. The *Wine* drank in *China*, i. 490 *b*. *Wine* made from the weeping of wounded vegetables, i. 491 *b*. An inſtrument to try whether *Wine* be adulterated, i. 495 *b*. The virtues of a medicated *Wine*, i. 519 *a*. *Wine* ſoured by thunder and lightening, i. 524 *a*. *Wine* frozen loſes its virtue, ii. 274 *a*. The way to keep *Wine* in the muſt, ii. 347 *a*. Of uſing frozen *Wine* in *Moſcow*, ii. 393 *a*. Changes wrought upon highly rectified ſpirit of *Wine*, ii. 523 *b*. *Wine* becomes pleaſant and briſk by fermentation, iii. 590 *b*.

WINIFRED, a ſtory of a lady at *St. Winifred*'s well, ii. 37 *a*.

WINTER, the cold of it not felt in the lower region of the earth, iii. 101 *a*.

WINTERTON, Dr. a phyſician at *Cambridge*, v. 425 *b*.

WINTHROP, Mr. his letter to Mr. *Boyle*, v. 596 *a*.

WIRE-STRING of an inſtrument, an experiment in the air-pump concerning it, i. 41 *b*. Muſical notes yielded by *Wire-ſtrings*, iii. 189 *b*. A grain of ſilver drawn into twenty ſeven foot of *Wire*, iii. 311 *a*.

WISDOM of God not diſcovered without revelation, ii. 190 *b*. What we owe to God for his *Wiſdom* and power, iv. 339 *a*. An inquiry into the *Wiſdom* of God, iv. 341 *a*. The proper objects of the divine *Wiſdom*, iv. 343 *a*. It is ſhewn in the uſefulneſs of one creature to another, iv. 344 *a*. In governing other ſyſtems of the world beſides ours, iv. 345 *b*. His *Wiſdom* reaches the whole extent of the univerſe, iv. 347 *a*. The manifeſtation of the divine *Wiſdom* at the day of judgment, iv. 348 *a*. In guiding and over-ruling all the actions of Men, iv. 348 *b*. In the work of man's redemption, iv. 349 *a*. In the creation and the order of providence, iv. 349 *b*. In creating and governing the multitudes of ſpirits, iv. 352 *a*. The *Wiſdom* of God conſpicuous in all his works, v. 43 *b*. In the animal and vegetable creation, v. 46 *a*. The *Wiſdom* of God conſpicuous in his creatures, i. 434 *a*. Apparent in the leſſer creatures, i. 435 *a*.

WIT, an application to the *Wits* who diſregard the Scripture, ii. 92 *b*. Their way of uſing the Scripture, ii. 125 *a*. Curious remarks upon their prophaneneſs, ii. 125 *b*. Their ignorance and folly, ii. 126 *a*. Their writings in verſe and proſe, ii. 126 *b*. Ought to expiate the injuries they have done religion, ii. 129 *a*. Are capable of writing excellently on divine ſubjects, ii. 129 *b*. Some men of *Wit* entertain a high veneration for the Scripture, ii. 132 *b*. *Wit* improved by the Meleteticks, ii. 153 *a*. Atheiſtical *Wits* reſembled to dark clouds, ii. 154 *b*. A ſuperficial *Wit* compared to a ſwimmer, v. 48 *a*.

WITCH, ſtories of *Witches* of diſſervice to religion, v. 244 *b*.

WITCHCRAFT, effects aſcribed to *Witchcraft*, cured by *Appenſa*, i. 527 *a*. The effect and puniſhment of *Witchcraft* among the *Ruſſians*, v. 633 *b*. The ſtories of *Witchcraft* juſtly ſuſpected, v. 244 *a*.

WOAD uſed in dying, an account of it, i. 217 *a*. It ſupplies the place of *Indigo*, iii. 173 *b*.

WOLF, the great ſagacity of *Wolf-dogs*, iii. 319 *a*.

WOMAN, the love of married *Women*, v. 400 *b*. The welfare of *Women* not ſo happily provided for by nature, as that of men, iv. 548 *b*. Teeming *Women* ſaved by phlebotomy, i. 464 *a*.

WONDER, never more ſeaſonable than when God is the object, i. 169 *b*.

WOOD, harder in ſome places near the bark, than at the heart, i. 226 *b*. A piece of *Wood* found in the body of a ſtone, i. 277 *b*. Trial to raiſe heat in pieces of *Wood* by attrition, iii. 57 *b*. An account of evaporation made from *Wood*, iii. 65 *b*. Of its floating above water, iii. 163 *a*. Why it ſhould rather ſwim than ſink, iii. 163 *b*. Ways of ſeaſoning *Wood*, iii. 173 *a*. *Wood* emboſſed made in molds, iii. 175 *a*. Quickſilver will pierce through the pores of *Wood*, iv. 220 *b*. Effect of the turning of *Wood*, iv. 253 *a*. Of a log of *Wood* on the ſurface of the water, iv. 262 *a*. Soot of *Wood* abounds with ſpirit of ſalt, v. 118 *a*. Earth under old ſtacks of *Wood* proper for flowers, v. 248 *a*. Experiments on the deſcent of *Wood* in water, v. 309 *a*. Experiments about ſhining *Wood*, v. 376 *a*. Four elements proved from the burning of green *Wood*, i. 297 *b*. Objections to that argument, i. 298 *b*. The operation of fire in the burning of *Wood*, i. 309 *b*. Remarks on the diſtillation of *Woods*, i. 328 *a*. On the burning of *Wood* in a chimney, i. 333 *a*. Splinters of reſinous *Wood* uſed inſtead of candles, i. 341 *a*. The reſolution of green *Wood* by fire into the four elements examined, i. 351 *b*. Ways of working on *Wood* by tools, i. 365 *a*. Diſtilled *Woods* afford acid ſpirits, i. 378 *a*. Obſervations on adiaphorous ſpirits of *Woods*, i. 390 *b*. Aſhes of *Wood* turned to glaſs by fire, i. 415 *b*. *Wood* eaſieſt to be cleft in froſty weather, ii. 274 *b*. The effect of freezing in *Wood* conſidered, ii. 239 *b*. *Wood* turned into ſtone in ſandy earth, ii. 408 *a*. *Wood* falling into water impelled up again, ii. 425 *b*. The relation between light and air in ſhining *Wood*, ii. 555 *a*. Shining *Wood* pneumatically tried, ii. 555 *b*. The effect of the expanſion and compreſſion of the air upon ſhining *Wood*, ii. 556 *b*. Experiment on ſhining *Wood* hermetically ſealed in a pipe of glaſs, ii. 557 *a*. What degree of rarefaction of the air deprives the *Wood* of its ſplendor, ii. 558 *a*. The ſhining of *Wood* pneumatically tried depends upon the air, ii. 560 *a*. Account of petrified *Wood*, iii. 236 *b*. Experiment of weighing a piece of *Wood* in water, iii. 291 *a*. Inquiry into the poſitive levity of *Wood* under water, iii. 293 *a*. *Wood* will ſwell by means of aqueous effluviums, iii. 322 *a*. *Wood* diſtended by aqueous particles getting into its pores, iii. 401 *a*. Reſemblances and differences between a burning coal and ſhining *Wood*, ii. 562 *a*. They agree in five reſemblances, ii. 502 *b*. The differences between them, ii. 564 *a*.

WOOD, Mr. an account of his hiſtory of the univerſity of *Oxford*, v. 572 *b*.

WOODWARD, Mr. his account of a maid's caſe that vomited a ſtone, v. 654 *b*.

WOOLL, its power of ſelf-dilatation explained, i. 8 *b*. The air compared to *Wooll*, i. 145 *b*. Obſervations for the improvement of *Wooll*, and its manufacture, v. 459 *b*. The fineneſs and price of *Wooll* in *Hereford-ſhire*, v. 452 *b*.

WORD of God compared to ſeed, ii. 118 *a*.

WORK, the *Works* of God worthy of their author, v. 42 *b*. Diſcover the perfections of their Creator, i. 440 *a*. God's approbation of his ſix days *Works*, i. 453 *a*. Contemplation of the *Works* of God, a motive to piety and devotion, v. 711 *a*. The *Works* of God diſtinguiſhed into three worlds, v. 711 *b*.

WORLD, the creation of the *World* an effect of divine goodneſs, i. 172 *b*. The *World* a great *Conclave Mnemonicum*, ii. 145 *b*. The great book of the God of nature, ii. 155 *a*. A library and oratory to the devout, ii. 161 *b*. Made by God without pains, ii. 189 *a*. The eccho of God's productive *fiat*, ii. 189 *b*. The *World* not made by chance, ii. 190 *a*. Like a great animal, iii. 93 *a*. The ſyſtem of the *World* variouſly explained, iii. 158 *b*. Difficulties concerning the making of the *World*, iv. 46 *b*. The *World* may move without changing its place, iv. 62 *b*. The ſmallneſs of the viſible *World* compared with the univerſe, iv. 341 *b*. Whether the *World* be infinite, iv. 345 *a*. The ſyſtem of other *Worlds* conſidered, iv. 345 *b*. The wiſdom of God in governing the diabolical *Worlds*, iv. 348 *a*. The ætherial part of the *World* not void of inhabitants, iv. 351 *b*. The *World* cannot be the effect of chance, v. 45 *a*. The agreement of the parts of the *World* with the whole, v. 341 *b*. The beauty of the *World* owing to the wiſe author of nature, i. 361 *a*. Much of the viſible *World* made for the uſe of man, i.

431 *a*. The *World* to be destroyed by fire, i. 431 *b*. Properly compared to a ship, i. 432 *b*. The discoveries of the new *World*, i. 438 *a*. The *World* is God's epistle to mankind, i. 439 *b*. Considered by philosophers under the notion of a temple, i. 441 *a*. The Epicurean system of the *World's* original, i. 447 *b*. The *World* made out of water according to *Thales*, i. 449 *a*. Not possible to be made by a concourse of atoms, i. 452 *b*. The contemplation of the *World* leads men to the knowledge of God, i. 456 *b*. The *World* we live in is a self-moving engine, ii. 474 *a*. The *World* not made according to the doctrine of the Epicureans or Cartesians, ii. 483 *b*. The different opinions concerning the creation, eternity, duration of the *World*, iii. 411 *b*. The soul of man more valuable than the whole corporeal *World*, iii. 417 *a*. The account of the creation of the *World* delivered in Scripture, iv. 372 *b*. The opinion of Jews, Heathens, and Christians, concerning an intelligent *World*, iv. 375 *b*. The opinion of philosophers concerning the soul of the *World*, iv. 376 *b*. Whether the *World*, and the creatures that compose it, are as perfect as they could be made, iv. 384 *a*. Reasons of God's creating the *World*, iv. 386 *a*. The wisdom and design of the wonderful operations of the *World* considered, iv. 388 *a*. The Aristotelian doctrine of the eternity of the *World*, iv. 522 *a*. The fabrick of the celestial parts of the *World* proves the wisdom of a divine agent, iv. 522 *b*. Men are not yet sufficiently acquainted with the true system of the *World*, iv. 523 *a*. The material *World* useful to man as a rational creature, iv. 532 *a*. The physical use of the *World* to man as he is an animal, iv. 532 *b*. The opinions of the sects of philosophers concerning the *World*, v. 674 *a*. The curious contrivance of the fabrick of the *World*, v. 686 *a*. The *World* distinguished into spiritual, visible, and dioptrical, v. 721 *b*.

WORM, a mercurial remedy for *Worms*, iv. 307 *b*. Of *Worms* breeding in men's legs, v. 186 *b*. The preserving of ships from *Worms*, v. 352 *b*. *Worms* discovered in vinegar, i. 436 *b*. A remedy much used for the *Worms*, iii. 235 *b*. Perfect *Worms* in a human body, iv. 414 *a*. Account of strange *Worms* in human bodies, with a cure for them, v. 467 *a*. Of monstrous *Worms* voided without legs, v. 515 *b*.

WORMWOOD, of prejudice to the head, iv. 326 *b*. The mouth affected with a bitter taste from the exhalations of *Wormwood*, iii. 331 *a*. The virtue and use of that herb, v. 268 *a*. The effect of *Wormwood* beer, iv. 457 *a*.

WORSELEY, Mr. a letter to him from Mr. *Boyle*, v. 232 *b*.

WORSHIP, a philosophical *Worship* of God recommended, i. 462 *a*.

WORT, the bubbles of it express all the colours of the rainbow, v. 477 *a*.

WOTTON, Sir H. his remark on the school philosophy, v. 447 *a*.

WOUND, the use of oil of turpentine in *Wounds*, iv. 328 *b*. Fresh *Wounds* cured by a drink, i. 497 *b*.

WREN, Mr. his experiment concerning the pressure of the air, i. 27 *a*. His reception at *Paris*, v. 333 *a*. His model for a new city, v. 358 *b*.

WRITE, a method to *write* without ink, iii. 151 *a*. To *write* with great secrecy, iii. 151 *b*.

WRITER, observations of *Writers* to be read with candour, i. 225 *b*.

WRITING, an account of the art of double *Writing*, v. 264 *b*. A receipt for secret *Writing*, v. 300 *b*. Remark on the great variety and distinguishableness of persons hand-*writing*, v. 704 *b*.

X.

XENOPHON, his opinion of the soul of the world, iv. 376 *a*.

XILOTEPEC, a strange fountain in that province of *Mexico*, iii. 472 *b*.

Y.

YARROW, worn on the stomach, a cure for the ague, i. 526 *a*.

YEAR, to know how much one year or season is dryer or moister than another, iii. 396 *b*.

YEAST, the working of it explained, v. 477 *a*.

YELLOW, experiment upon *yellow* flowers, and alcalizate liquors, ii. 56 *b*. Glass painted *yellow* with a preparation of the calx of silver, ii. 74 *b*. The reason of a *yellow* colour afforded by silver, iv. 229 *b*.

YORK, Duke of, the christning of his son *Edgar*, v. 366 *a*.

YOUTH, the vain reflections of *Youth*, ii. 173 *b*. The bones of a *Youth* corrupted, v. 385 *a*.

YTZTICPATLI, a Mexican fruit, its nature and quality, v. 589 *a*.

YUCCA, an *Indian* root, the qualities of it, i. 490 *a*.

Z.
