Vorwort.

Im Sommer 1875 wurden fast alle Stationen inspicirt. Bei dieser Gelegenheit erhielten die Stationen Domsten, Brønø, Ranen, Bodø, Røst, Fagernes, Lødingen, Tromsø, Alten, Fruholm, Vardø und Syd-Varanger neue (Kew-)Barometer. Die auf einigen dieser Stationen früher stehenden Fortinschen Barometer wurden, nach der nöthigen Reinigung, auf den Stationen Flesje, Sogndal, Leirdal, Ullensvang und Sandøsund aufgestellt Die Station Oxø hatte schon in Februar 1874 ein Kew-Barometer bekommen[1]). Sämmtliche Stationen erhielten Aneroidbarometer, theils als Reserve für die Quecksilberbarometer, theils, an den Stationen, die kein Quecksilberbarometer haben, als Variations-Instrumente. Bei der erstgenannten Classe von Stationen werden die Aneroid-Barometer jeden Tag um 8 Uhr Morgens beobachtet, bei der letzgenannten an allen drei täglichen Beobachtungsstunden.

Sämmtliche Stationen erhielten neue Thermometer-Beschirmungen. Auf den Stationen, die Psychrometer haben, stehen die Thermometer in einem Häuschen, 59 Centimeter hoch, 25 Centimeter breit und 19 Centimeter tief. Da, wo das Häuschen vor einem Fenster steht, ist die innere Seite offen. Steht das Häuschen vor einer Wand, hat es eine nach aussen wendende Thür. Die Häuschen sind unten offen, haben oben ein Dach, und die breite Wand und die Thür sind jalousieartig durchbrochen Auf den anderen Stationen, den Leuchtthurmstationen z. B. steht das Thermometer in einem runden, mit Dach und auf der einen Seite mit einer Spalte verschenen, unten offenen Gehäuse, das vor einem Fenster oder einer Wand aufgestellt ist.

Sämmtliche Stationen erhielten Minimumthermometer. Diese stehen auf den Psychrometer-Stationen im Häuschen unter dem Psychrometer. An den anderen Stationen stehen sie in einem besonderen, doppelwändigen Häuschen, das nach dem Fenster zu und nach unten offen ist, und auf einer starken horizontalen Axe sitzt, mittelst welcher es sich sammt dem Thermometer von innen drehen lässt. Das Minimumsthermometer wird jeden Tag bei der Morgenbeobachtung mit dem trocknen Thermometer verglichen.

Die Beschirmungen bestehen alle aus starkem Eisenbliech und sind licht gelb angestrichen. Für Schatten ist immer gesorgt. Der Abstand der Thermometer vom Fenster oder von der Wand ist 31 Centimeter. Die Höhe über dem Boden ist in der unten stehenden Tabelle angeführt.

Die neuen Beschirmungen sind von den früheren dadurch verschieden, dass sie in der Regel grösser sind und dadurch mehr Schutz gegen Ausstrahlung und Hydrometeore geben. Da sie aus Metall verfertigt sind, werden sie den Temperaturvariationen leichter folgen, als die älteren, hölzernen. Eine längere Vergleichsreihe zwischen beiden Arten von Beschirmung, am Institute ausgeführt, hat indessen keinen merklichen Unterschied in den abgelesenen Temperaturen gegeben. Da auch die früheren Aufstellungsorte an den Stationen beibehallten worden sind, wo sie die Bedingungen für Schatten und freie Luftcirculation erfüllten, können die mit den neuen Beschirmungen gemachten Temperaturbeobachtungen ohne Bedenken direct mit den älteren verknüpft werden. Nur auf einigen Leuchtthurmstationen ist die Einführung der neuen Beschirmungen von einer wesentlich besseren Aufstellung der Thermometer begleitet gewesen.

Mehrere Stationen erhielten Haarhygrometer, aber diese bewährten sich, des feuchten

---

[1]) Im Jahrbuche für 1874 ist Oxø fehlerhaft mit dem älteren Barometer aufgeführt, dessen Correction + 1.^{mm}6 war.

Klima wegen, nicht. Die Feuchtigkeit ist daher, wie früher, aus den Psychrometerbeobachtungen berechnet worden.

Eine Reihe von Stationen erhielt Windfahnen mit Geschwindigkeits-Platte (System Wild). Es scheint jedoch, in einem Gebirgslande, wie Norwegen, fast unmöglich zu sein, die Windgeschwindigkeitsmesser so aufzustellen, dass sie bessere Auskunft über die wahre Geschwindigkeit der Luftströme geben, als die einfache Schätzung. In diesem Jahrbuche ist daher die frühere Bezeichnung der Windstärke beibehalten worden.

An den Regenmessern ist keine Aenderung eingeführt.

Die See-Temperatur ist am 8 Uhr morgens gemessen worden.

In Vardø ist die Feuchtigkeit der Luft in den Monaten Januar, Februar und März nicht beobachtet worden.

In Sandøsund ist die (am Abend gemessene) Regenhöhe für denselben Tag angeführt worden.

Die folgende Tabelle giebt eine Uebersicht über die Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Beobachtungszeiten und die Reduction auf die Mitteltemperatur des Monats. In Bezug auf die Beobachtungsstunden muss bemerkt werden, dass diese aus Rücksicht auf die verschiedenen Berufsbeschäftigungen der Beobachter nicht überall und zu allen Zeiten dieselben sein können. Da es bei Anordnung der Beobachtungs- und Uebersichtstabellen nicht möglich gewesen ist, in diesen die genauen Beobachtungsstunden für die verschiedenen Monate auf den verschiedenen Stationen mit aufzunehmen, so sind diese abgesondert in untenstehender Tabelle gegeben. Dem hier berührten, minder glücklichen Umstande ist in der Folge abgeholfen worden.

Die Beobachtungsstunden der Stationen (C. Christiania Zeit, L. locale Zeit).

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Von dem Zeitpunkt an, da die Minimumthermometer in Gebrauch genommen wurden, ist auch die Minimumtemperatnr in der Nacht gegeben. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, iuclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann. Die Methode ist jedoch erst seit Anfang 1876 eingeführt worden.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Der Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100 %

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

Die Windstärke nach Schätzung, Scala 0 = Still bis 6 = Orkan[2]).

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem sie gemessen wurde.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

● Regen.	^{n} Nacht	Als Exponent
* Schnee.	^{a} Vormittag	
△ Graupeln.	^{p} Nachmittag	
≡ Nebel.	^{o} Schwach	
⌴ Reif.	^{2} Stark	
∝ Höhenrauch.	^{1} Erste Beobachtungsstunde.	
⁄ Starker Wind.	^{2} Zweite —	
⊼ Gewitter.	^{3} Dritte —	
< Blitz ohne Donner.		
⊔ Nordlicht.		
⊕ Sonnenring.*		
⦶ Sonnenhof.*		
⦷ Mondring.*		
⦸ Mondhof.*		

Interpolirte Werthe sind mit Cursiv gedruckt.

---

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1874.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874.

*) Die Zeichen für "Hof" und "Ring" sind in den gedruckten Tabellen für 1874 und 1875 leider verwechselt worden. ⦶ bedeutet also in den Tabellen "Sonnenring."

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und absoluten Stand, aber nicht auf die Meeresfläche reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind als Mittel der Morgen- und Abendbeobachtung mit Beifügung einer Correction (der obenstehenden Tabelle gemäss) bestimmt. Diese Correctionen sind für die einzelnen Stationen nach ihrer Lage im Verhältniss zu den Stationen Christiania, Bergen, Throndhjem und Vardø, an welchen Orten stündliche Beobachtungen ausgeführt sind, berechnet. Für Christiania sind die Monatsmittel der mittelst Minimumthermometer beobachteten Minimumtemperatur gegeben. Bei einigen anderen Stationen ist dasselbe für einzelne Monate geschehen. Für Christiania sind gleichfalls die mittelst Minimum- und Maximumthermometer beobachteten absolut niedrigsten und höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima und Minima, welche aufgeführt wurden.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunden 8 Uhr Morgens.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *Th. Fearnley*, *K. Hesselberg*, *C. Krafft* und *H. Chr. Løcken* ausgeführt. Die drei erstgenannten Herren sind mit der Correctur beschäftigt gewesen.

Christiania, October 1877.

H. Mohn.
