Inhalt.

Vorwort.

Meteorologische Litteratur, im Jahre 1896 in Norwegen erschienen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Christiania 1896.

II. Meteorologische Beobachtungen an zwölf Stationen in Norwegen 1896.

III. Monats- und Jahres-Resumé für das Jahr 1896.

IV. Anhang. Beobachtungen der Bewegung der Cirruswolken 1896.

Druckfehler und Verbesserungen

Vorwort.

Das Jahrbuch für 1896 ist in einigen Stücken von den früheren Jahrbüchern verschieden.

Es enthält die stündlichen Luftdruck- und Temperatur-Registrierungen in Christiania, die vollständigen Terminbeobachtungen für dieselben 12 Stationen wie die vorhergehenden Jahrgänge, die Uebersichtstabellen für 57 Stationen und einen Anhang mit Cirrusbeobachtungen. Von den 57 Stationen haben 40 Quecksilberbarometer, 42 Psychrometer, 15 nur trocknes Thermometer, unter welchen 6 Leuchtfeuerstationen sind. Die in den vorigen Jahrgängen mitgenommenen Regenmesserstationen sind im Jahrbuch für 1896 nicht eingenommen, da seit Juli 1895 eine erweiterte Niederschlagsmessung in Norwegen eingeführt worden ist, mit 350 Stationen ausserhalb der in diesem Jahrbuch enthaltenen, und deren Beobachtungen hoffentlich bald in einer besonderen Publikation mitgetheilt werden können.

Im Sommer 1896 machte ich eine Inspektionsreise nach Stationen im südlichen Norwegen und in Finmarken. Als Reise-Kontroll-Barometer benutzte ich Wild-Fuess No. 270. Die Korrektion dieses Barometers hielt sich den ganzen Sommer hindurch vollkommen konstant, wie die folgende Tabelle zeigt. Ich beobachtete mit der unteren Hülfsskala auf Null gestellt. In der Tabelle bedeutet Korr. a das einfache Mittel der für Fuess 270 durch Vergleichungen mit dem Normalbarometer (Fuess No. 214 +0.12 mm.) gefundenen Korrektionen, Korr. b. das Mittel der für jeden Tag gefundenen Mittelkorrektionen und M. F. die mittlere Abweichung einer einzelnen Korrektionsbestimmung vom resp. Mittel derselben. Die Beobachtungen auf den Stationen sind mit einer Korrektion für Fuess No. 270 gleich Null berechnet worden.

Tab. 1.

1896 Tage.	Anzahl d. Beob.	Korr. a. mm.	M. F. mm.	Korr. b. mm.	M. F.
Mai 12—27.	23	+0.010	±0.034	+0.013	±0.038
Mai 30—Juni 1.	8	0.000	.028	+0.010	.013
Juni 5—9.	22	+0.001	.020	+0.003	.013
Juli 17, 18; 27—29.	15	—0.014	.022	—0.014	.008
Aug. 27—31.	9	+0.003	.030	+0.006	.025
Mittel		0.000		+0.004	

Das Resultat der Barometervergleichungen auf der Inspektionsreise ist aus der Tabelle 2 zu ersehen. Korr. 1896 zeigt die für die Stationsbarometer gefundene Korrektion auf die wahre Barometerhöhe. Frühere Korr. zeigt den Werth der Korrektion, mit welcher früher gerechnet worden war, und △ den Unterschied zwischen der neuen und der früheren Korrektion. Die Bemerkungen, zu welchen dieser letzte Anleitung giebt, finden sich unten mitgetheilt. Wenn der genannte Unterschied nicht 0.05 mm übersteigt, wird die Korrektion des Barometers als unverändert angesehen.

An sämmtlichen Stationen, die ich besuchte, wurden die Quecksilberthermometer mit einem Normalthermometer verglichen, dessen Korrektion auf das Luftthermometer bekannt war.

An einer Mehrzahl der besuchten Stationen machte ich Vergleichungen zwischen Assmann's Aspirationspsychrometer und den Stationspsychrometern. Die Ergebnisse sind aus der folgenden Tabelle 3 zu ersehen. t ist das trockne Thermometer, korrigiert, e der Druck der Wasserdämpfe und r die relative Feuchtigkeit. Für das Aspirationspsychrometer ist Sprung's Formel, für die Stationspsychrometer Jelineks Tafeln benutzt worden.

Während dieser Vergleichungen waren die Umstände in den meisten Fällen ungünstig für die Stationspsychrometer. Starker Sonnenschein, hohe Temperatur, trockne Luft und keine oder fast keine Luftbewegung waren der natürlichen Ventilation der Psychrometer hinderlich. Indessen haben unsere Psychrometer nach den Umständen sowohl die Temperatur als die Feuchtigkeit recht wohl gemessen.

In Bezug auf die einzelnen Stationen verweise ich auf die früheren Jahrgänge und folgende Bemerkungen.

Aabogen. Die Barometerbeobachtungen sind mit der alten Korrektion —0.14 mm berechnet, mit Ausnahme von November und December, für welche die neue Korrektion —0.03 mm benutzt worden ist.

Aalesund. Durch Neuberechnung der Vergleichungen in 1890 erhalte ich als die wahrscheinlichste Korrektion des Stationsbarometers: +0.05 mm, also keine merkliche Aenderung bis 1896. In diesem Jahrbuch ist die Korrektion +0.04 mm benutzt worden.

Andenes. Die gemessenen Seetemperaturen sind wegen der Seichte der See wenig zuverlässig, weshalb sie in diesem Jahrbuch nicht mitgenommen sind.

Florø. Die Barometerbeobachtungen sind für Januar bis Oktober mit der früheren Korrektion, +0.11 mm, für November und December mit der neuen Korrektion, +0.18 mm, berechnet worden.

Granheim. Die Beobachtungen im Juli, August und September fehlen wegen der Abwesenheit des Beobachters.

Hamar. Durch Vergleichung mit den Nachbarstationen ist es wahrscheinlich gemacht worden, dass die Korrektion des Stationsbarometers seit 1890 dieselbe gewesen ist wie die in 1896 gefundene. Mit dieser ist in diesem Jahrbuch gerechnet worden.

Lillehammer. Durch Neuberechnung der Barometervergleichungen in 1891 finde ich den wahrscheinlichsten Werth der Korrektion des Stationsbarometers gleich +0.12 mm. In 1896 fand ich +0.14 mm. Mit dieser ist für 1896 gerechnet worden.

Listad. Für 1896 ist mit der Korrektion des Stationsbarometers —0.06 mm gerechnet worden.

Mandal. Vergleichungen zwischen den Barometerbeobachtungen in Mandal und zu Oxö machen es wahrscheinlich, dass mit der in 1896 gefundenen Korrektion für das Stationsbarometer in Mandal vom Juli 1890 aus gerechnet werden darf. Im Jahrbuch für 1896 ist mit der neuen Korrektion gerechnet.

Sydvaranger. Für 1896 ist mit der Korrektion des Stationsbarometers +0.68 mm gerechnet worden.

Voss. Die Beobachtungen im Juli sind verunglückt.

Neue Stationen III Ordnung sind Soggendal und Kongens Grube (bei Røros).

Die folgende Tabelle giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die konstante Korrektion der Barometer, die Schwerekorrektion, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphen-, Eisenbahn- und Leuchtfeuer-Stationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —

Am 1. Januar 1895 wurde die mitteleuropäische Zeit, eine Stunde früher als Greenwich, durch Gesetz in Norwegen eingeführt. An den meisten meteorologischen Stationen wurden die früheren Beobachtungstermine beibehalten, indem die respektiven Uhrzeiten nach Normalzeit den Beobachtern mitgetheilt wurden. Nur an einigen Telegraphenstationen, musste die Aenderung gemacht werden, dass die Beobachtungen auf 8 a, 2 p und 8 p Normalzeit verlegt wurden. Als aber eben diese Stationen früher nach Christiania Zeit beobachteten, und diese Zeit nur 17 Minuten später ist als die Normalzeit, hat die Aenderung nur wenig Bedeutung.

Wegen der Kontrolle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die erste Abtheilung, welche neu ist, enthält die stündlichen Beobachtungen für Christiania, die mit Richards Barograph und Thermograph registriert worden sind.

Der Barograph ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf den Stand des auf 0^0, auf das Normalbarometer und die Normalschwere reducierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe ist 24.9 Meter.

Der Thermograph steht in der Wild'sche Hütte im Park des astronomischen Observatoriums. Seine Bügel steht im Kupferhäuschen, wo das Psychrometer aufgestellt ist und ganz nahe an der Kugel des trocknen Thermometers. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf die auf das Luftthermometer reducierten Ablesungen des Normal-(Luft) Thermometers [1]).

Die Tabellen der zweiten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0^0 C, auf das Normalbarometer und auf **die Normalschwere** reduciert [2]). Die Reduktion auf die Normalschwere nach der Formel

$$\text{Schwerekorrektion} = b\,(-0.00259 \cos 2\varphi - 0.000000196\, H)$$

wo b die auf 0^0 und das Normalbarometer reducierte Barometerhöhe, φ die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerekorrektion angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerekorrektion stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerekorrektion, im Sinne unreducierte minus redu-

---

[1]) Am Institut haben wir die folgenden mit Barograph und Thermograph registrierten Beobachtungen berechnet und eingeführt in Manuskript-Tabellen wie die in diesem Jahrbuch für Christiania gedruckten.

	Luftdruck	Lufttemperatur.
Christiania.	Barogr. Richard von Juli 1892 bis jetzt.	Thermogr. Rung von Juli 1883 bis Januar 1896. Thermogr. Richard von Juni 1893 bis jetzt.
Bergen.	Barogr. Hottinger von Januar 1891 bis Oktober 1894. Barogr. Richard von August 1896 bis jetzt.	Thermogr. Richard von Sept. 1895 bis jetzt.
Trondhjem.	Barogr. Richard von Januar 1896 bis jetzt.	Thermogr. Richard von Januar 1896 bis jetzt.
Dovre.	Barogr. Richard von Januar 1896 bis jetzt.	
Aasnes.		Thermogr. Richard von Januar 1896 bis jetzt.

[2]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252 sammt Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math.-naturv. Klasse, 1896 No. 1. Side 1—15.

cierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Korrektionen der Thermometer auf das Luftthermometer reduciert worden[1]). Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m., mit dem trocknen Thermometer, korrigiert worden. Vom 1sten Januar 1894 an wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Psychrometerbeobachtungen sind seit 1895 nach Jelineks Tafeln berechnet worden, mit der Aenderung, dass, nach Ekholms Anweisung, wenn das feuchte Thermometer-Kältegrade zeigt, eine Korrektion an die (für Theilungsfehler berichtigten) Ablesungen dieses Thermometers angebracht worden ist, wie diese Tabelle zeigt

Von	$-0^0.1$	bis	$-1^0.1$	Korr. =	$-0^0.1$
„	$-1\ .3$	„	$-2\ .2$	„	$-0\ .2$
„	$-2\ .4$	„	$-3\ .3$	„	$-0\ .3$
„	$-3\ .5$	„	$-4\ .4$	„	$-0\ .4$
über	$-4\ .4$			„	$-0\ .5$.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 6 = Orkan[2]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Ueberzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden, sind nach der Bewölkungszahl angeführt worden. ● Regen; ∗ Schnee; ⁑ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. (Normalzeit).

Die Bezeichnungen sind:

●	Regen.	n	in der (vorhergehenden) Nacht
∗	Schnee.	a	vormittags
△	Graupeln.	p	nachmittags

[1]) Dies ist durch den glücklichen Umstand erreicht, dass die Korrektionen des Normalthermometers auf das Luftthermometer weniger als $0^0.05$ betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot. welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

≡ Nebel.	mg.	morgens

	fl.	Flocken.	
	körn.	körnig.	

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Angaben der Tagestunden beziehen sich auf mitteleuropäiche Zeit. Die Zeitangabe „früh" bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr Morgens, „spätabd" zwischen 8 Uhr Abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. „abd" ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. „mtg" umfasst die Stunden 12 bis 2.

Interpolierte Werthe sind mit Kursiv gedruckt.

Die Uebersichtstabellen der dritten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobactungen plus eine Korretkion. Diese Korrektionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christiansand, Bergen und Bossekop abgeleitet worden.[1]) Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Korrektionsgrössen, welche für 1896 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel[2])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt.[3])

Für Christiania, Aas, Aasnes, Eg[4]) und Trondhjem sind die mittelst Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometers gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.
[2]) Siehe Met. Zeitschr. 1891, S. 253 ffg.
[3]) Siehe Jahrbuch für 1894. S. IX.
[4]) Seit 1886.

der drei Terminbeobachtungen plus eine Korrektion. Die Werthe dieser Korrektionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Jerkin, Dovre und Tonsaasen ist Korrektion wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\ q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Faktors c. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den zweiten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *N. J. Nielsen*, *Aa. Grårud*, *K. Irgens*, *C. Krafft*, *H. Chr. Löcken* und *N. A. J. Larsen* ausgeführt.

Christiania, Juni 1897.
