INHALT

Vorwort . . . . . S. V

Zeichen- und Symbolerklärungen . . . . . S. IX

Verzeichnis der Stationen . . . . . S. X

Registrierungen in Ås von Luftdruck, Lufttemperatur, relativer Feuchte, Wind, Niederschlag und luftelektrischem Potentialgefälle 1937 . . . . . S. 1

Tägliche Beobachtungen (Extense-Tabellen) 1937 in Oslo, Bergen, Trondheim und Tromsø . . . . S. 18

Monats- und Jahresübersichten 1937 für 130 Stationen . . . . . S. 42

Tägliche Beobachtungen (Extense-Tabellen) 1936 an Isfjord Radio, Bjørnøya, Jan Mayen, Myggbukta und Torgilsbu . . . . . S. 94

Monats- und Jahresübersicht 1936 für Isfjord Radio, Bjørnøya, Jan Mayen, Myggbukta und Torgilsbu S. 124

Flugzeugaufstiege Kjeller 1937:

Ergebnisse der Aufstiege für die markanten Punkte und für die Hauptisobarenflächen . . . . S. 126

Luftdruck, Lufttemperatur und relative Feuchte in bestimmten Geopotentialen . . . . . S. 130

Registrierballonaufstiege (Ås und Nesbyen):

Verzeichnis der Aufstiege . . . . . S. 131

Ergebnisse der Aufstiege . . . . . S. 132

Abweichungen der Monatsmittel vom Mittelwert 1901–1930 für Luftdruck und Lufttemperatur an ausgewählten Stationen 1937 . . . . . S. 135

See-Temperatur für 13 Küstenstationen 1937 . . . . . S. 138

Berichtigung zum Jahrbuch für 1933 . . . . . S. 139

Druckfehler und Verbesserungen.

Im Jahrbuch für:		Steht	Lies
1914–1936. Kongsberg. Die geografische Breite wird überall verbessert		59°40′	59°39′
1923–1936. Bjornoya. Die Schwerekorrektion ist überall zu berichtigen. Die wirklich verwendete Schwerekorrektion ist Cg = 2,25 mb bei 985 mb, welche auch richtig ist.			
1929–1937. Kistrand. Die Stationshöhe wird überall verbessert	*H*	11	12
1933. S. 92. Offersøy (Ytterstad). Lufttemperatur, Mittel, Juli		15,7	13,3
" " " Jahr		4,9	4,7
S. 144. As. Registrierballonaufstiege, 12. April, 19h 02 MEZ. Durch Verwechselung infolge gemeinsamer Apparatnummer sind die Ergebnisse eines anderen Aufstieges (As 1932, 10. Nov., 14h 02 MEZ) angegeben. Die richtigen Ergebnisse sind in diesem Jahrbuch (1937), S. 136, zu finden.			
1934–1936. Rognan (früher *Saltdal* und *Rognan i Saltdal*). Die geographischen Koordinaten und die Stationshöhe werden überall verbessert	*q*	67°6′	67°5′
	λ	15°24	15°22′
	H	15	ca. 28
Fagerlidal i Mäsely (1934: *Malsele*). Die Stationshöhe wird überall verbessert	*H*	30	72
1936. S. 28. As. Tägl. Gang d. luftelektr. Potentialgefälle nach Abw. vom Monatsmittel, Februar, 24 Uhr		8,0	−8,0
Jahr, 2 Uhr		−3,2	−3,3
S. 138. Myggbukta, Jahr, Beobachtetes Max.		11,0	15,1

VORWORT

Im Jahrbuch für 1937 sind die Tabellen nach den neuen Beschlüssen der internationalen meteorologischen Organisation (Warschau 1935, Salzburg 1937) aufgestellt; die Tabellen für 1936 (arktische Stationen) dagegen sind nach dem alten Schema in den früheren Jahrbüchern aufgestellt.

Übersicht über den Inhalt.

Das Jahrbuch für 1937 enthält zweistündliche Werte (Registrierungen) für Luftdruck, Lufttemperatur, relative Feuchte, Wind, Niederschlag und für das luftelektrische Potentialgefälle in As. Ferner enthält es die täglichen Beobachtungen (Extenso-Tabellen) für Oslo, Bergen, Trondheim und Tromsø, und die klimatologischen Daten (Monats- und Jahresübersichten) von 130 Stationen.

In einer Spezialtabelle sind die Abweichungen der Monatsmittel des Luftdrucks und der Lufttemperatur vom Mittelwert 1901—1930 für einige Stationen und die Monatsmittel der See-Temperatur für einige Küstenstationen angegeben.

Das Jahrbuch enthält weiter die Ergebnisse der aerologischen Flugzeugaufstiege vom Militärflugplatz Kjeller aus und die Ergebnisse der Registrierballonaufstiege in As im Jahre 1937, nebst Nachträgen früherer Jahre (As und Nesbyen).

Von den arktischen Stationen enthält das Jahrbuch die Beobachtungen für das Jahr 1936, und zwar werden die täglichen Beobachtungen (Extenso-Tabellen) und die klimatologischen Daten (Monats- und Jahresübersichten) für Isfjord Radio, Bjørnøya, Jan Mayen, Myggbukta und Torgilsbu angegeben.

Von den 135 Stationen führen 66 Messungen des Luftdrucks (Quecksilberbarometer) aus, 75 Messungen der Feuchte. Sämtliche Stationen messen die Lufttemperatur und die Minimumstemperatur, während nur 28 die Maximumstemperatur messen. Die Thermometer sind bei 107 Stationen in speziellen Hütten angebracht, während sie bei 28 Stationen in kleinen Gehäusen am Fenster aufgestellt sind.

Die Quecksilberbarometer sind alle Gefässbarometer mit reduzierter Skala. Von den Barometern haben 60 Millibareinteilung während 6 mit Millimetereinteilung versehen sind. Diese letzteren sollen allmählich eingezogen werden. Die Thermometer sind Küchler-Thermometer mit Papierskala und $^1/_{10}$ C. Einteilung, für Minimumthermometer $^1/_1$ C. Die Feuchteinstrumente sind im Stationenverzeichnis für die betreffenden Stationen angegeben. Die Haarhygrometer sind hauptsächlich die Russeltvedt'schen Torsionshygrometer[1]). Von den Stationen haben 74 Richtungsanzeiger für den Wind, während die übrigen die Richtung schätzen. Die Windstärke wird an den meisten Stationen nach der Beaufortskala geschätzt, während Messungen nur an den 25 Stationen ausgeführt werden, die mit Anemograph versehen sind. Erläuterungen betreffend die Niederschlagsmessung sind im Vorwort zum *»Nedbørjakttagelser i Norge«* angegeben.

An 58 Stationen befindet sich ein Barograph, an 31 ein Thermograph, an 14 ein Hygrograph, an 7 ein Thermo-Hygrograph, an 7 ein Pluviograph und an 25 ein Anemograph. Ausser den gedruckten (Registrierungen von Luftdruck, Lufttemperatur, relativer Feuchte, Wind und Niederschlag in As) werden auch stündliche oder zweistündliche Werte von den folgenden Registrierungen dieser Instrumente ausgewertet: die Hygrogramme in Trondheim, die Thermo-, Hygro-, Anemo- und Pluvio-gramme in Bergen.

[1]) Met. Zeitschrift 1908, S. 396—400.

Erläuterungen hinsichtlich der Stationen.

In diesem Jahrbuch befinden sich alle dieselben Stationen wie im vorhergehenden. Neue Stationen sind Elvesæter, Vinstra, Brekke Sluse, Sola, Brandsøy i Kinn, Molde, Ørland, Meraker, Ytteroy und Gibostad.

In Bezug auf die einzelnen Stationen ist folgendes zu erwähnen:

Elvesæter: Seit Juni 1936 in Betrieb.

Vinstra: Seit Juni 1936 in Betrieb.

Oslo: Die alte Station am Astronomischen Observatorium musste leider von Juni 1937 ab aufhören. Die neue Station Oslo (Blindern) am zukünftlichen Meteorologischen Institut ist seit März 1937 in Betrieb und liegt ungefähr 3 Km nördlich von der alten Station.

Kongsberg: Die Station wurde vom Dezember 1937 ab ungefähr 2 km gegen N verlegt. (Alte Breite 59°39' N. früher fehlerhaft als 59°40' angegeben, neue Breite 59°40' N.)

Brekke Sluse: Seit dem 25. Mai 1936 in Betrieb.

Sola: Seit dem 21. Mai 1935 in Betrieb.

Brandsøy i Kinn: Seit dem Jahre 1933 in Betrieb.

Molde: Seit dem 24. Mai 1935 in Betrieb.

Ørland: Seit dem 25. Februar 1936 in Betrieb.

Meraker: Seit dem 16. Juni 1935 in Betrieb.

Ytteroy: Seit dem 19. Februar 1936 in Betrieb.

Mo i Rana: Die Beobachtungen haben seit Oktober 1937 aufgehört. (Die Beobachtungen sind mit neuem Beobachter ab März 1938 wieder fortgesetzt.)

Gibostad: Seit dem 16. Mai 1936 in Betrieb.

Verzeichnis der Stationen.

Die Seiten X—XI enthalten die wichtigsten Erläuterungen über die Stationen in Tabellenform. In der vorletzten Kolonne sind die Beobachtungsstunden angegeben, aus denen ersichtlich ist, dass die gewöhnlichen Beobachtungstermine 8, 14, 19 Uhr M. E. Z. sind.

Die Registrierungen in Ås.

Die Seiten 1—17 enthalten die zweistündlichen Werte des Luftdrucks, der Lufttemperatur, der relativen Feuchte, des Windes (Richtung und Geschwindigkeit), des Niederschlags und der luftelektrischen Potentialgefälle nebst Monatsmittel der luftelektrischen Leitfähigkeit.

Ein Quecksilberbarograph wird seit dem Jahre 1915 benutzt.

Der Thermograph und die zwei Hygrographen stehen in der Hütte des Meteorologischen Observatoriums.

Die Windregistrierungen sind für jede zweite Stunde als Mittelwert der vorgehenden Stunde angegeben. (Windgeschwindigkeit in m/sek).

Der Niederschlag wird mit einem registrierenden Schneemesser, System Hellmann-Fuess, gemessen.

Die Potentialregistrierungen sind durch die im Oktober 1918 aufgestellte Potential-Registrieranordnung ermittelt. Für die Mittelberechnung sind nur Normaltage verwendet für welche die Zahlen fett gedruckt sind. Neben den zweistündlichen Werten der luftelektrischen Potentialgefälle und dem zugehörigen Monatsmittel ist auch das Monatsmittel der luftelektrischen Leitfähigkeit in den Tabellen aufgeführt. Die Ladevorrichtung der Messanordnung für die Registrierung der Leitfähigkeit[1]) wird seit Mitte Mai 1937 von einem elektrischen Motor betrieben.

Die Extenso-Tabellen.

Die Seiten 18—41 enthalten die täglichen Beobachtungen an den 4 Stationen Oslo mit Oslo (Blindern), Bergen, Trondheim und Tromsø. Die Tabellen enthalten folgende Daten:

1. Den Monatstag.

2. Den Luftdruck (in Millibar) an der Station. Die beobachteten Maxima und Minima sind fett gedruckt.

[1]) Siehe Beiheft zum Jahrbuch des Norw. Met. Inst. für 1925.

3. Die Lufttemperatur (in Celsiusgraden). Das Ablesen des Indexes des Minimumthermometers und des Maximumthermometers ist durch tägliches Vergleichen mit dem gewöhnlichen (trockenen) Thermometer korrigiert worden. Vom 1. Januar 1894 ab bis Ende 1937 wurde das Minimumthermometer um 8 Uhr eingestellt. Das Maximumthermometer ist um 19 Uhr eingestellt worden. Die absoluten Maxima und Minima sind mit fetten Typen gedruckt.

4. Die relative Feuchte (in Prozenten). An Stationen mit Psychrometerbeobachtungen ist die relative Feuchte nach Jelincks und für Kältegrade nach Birkelands Tabellen berechnet worden. Auch für die Kältegrade wird die relative Feuchte im Verhältnis zur Sättigung über dem Wasser berechnet[1]). Die beobachteten Minima sind mit fetten Typen gedruckt.

5. Die Windrichtung, ausgedrückt in der Skala 01—32.

Die Windstärke (in Beaufort Skala), an den meisten Stationen nach Schätzung, an 25 Stationen nach Anemograph[2]).

6. Die Sicht. Skala 0 ($\leqq$ 50 m) bis 10 ($>$ 150 km).

7. Die Bewölkung nach einer Skala 0 bis 10. Die Zahlen geben an, wie viele Zehntel des Himmels mit Wolken bedeckt waren.

Das Wetter am Beobachtungstermin unter Verwendung von der Symbole die auf Seite IX angegeben sind.

8. Die Höhe des Niederschlags in Millimetern um 8 Uhr gemessen, angeführt für den Tag an den sie gemessen ist. (Viele Stationen messen auch den Niederschlag bei der Abendbeobachtung; diese Menge wird zu der am folgenden Morgen gemessenen addiert.)

9. Die Schneehöhe in Zentimetern, um 8 Uhr gemessen.

10. Den Witterungsverlauf unter Verwendung der auf Seite IX angeführten Symbole und Abkürzungen. Die Zeitangaben sind auf 10 Minuten abgerundet.

Die Monats- und Jahresübersichten.

Die Seiten 42—93 enthalten die klimatologischen Daten (Monatsmittel und Monatssummen) von 130 norwegischen Stationen. Die Tabellen enthalten:

1. Den Monat (I = Januar, ... XII = Dezember).

2. Den Luftdruck (in Millibar) an der Station und den Luftdruck auf das nächste Standard-Geopotentialniveau reduziert. (Jedoch für Røros, Dombas, Tryvasshøgda und Rundemannen auf das Meeresniveau reduziert). Die Zahlen sind Mittel der drei täglichen Beobachtungen.

3. Die Lufttemperatur. Die Monatsmittel (t Diest) sind berechnet nach der Formel[3])

$$m = n - k(n - \text{Min})$$

wobei n das einfache Mittel aus den drei festen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und den Monat wechselt[4]). Die beobachteten Maxima und Minima sind mit Angabe des Datums aufgeführt.

4. Die Windverteilung. Für die 8 Hauptrichtungen (32 = N, 04 = NE, 08 = E, ... 28 = NW) sind für jede Richtung die Anzahl der Fälle mit der dazugehörigen mittleren Windstärke (Skala Beaufort) angegeben. Alle Beobachtungen mit ungerader Richtungszahl (01, 03, 05 . . . . 31) sind so gezählt als ob sie zu der benachbarten Hauptrichtung gehörten (31 und 01 als 32, 03 und 05 als 04 . . . . . 29 und 30 als 28). Die Richtungen 02, 06, 10, 14, 18, 22, 26 und 30 sind mit einer Hälfte der Anzahl auf die beiden benachbarten Hauptrichtungen verteilt. (Deshalb kommt $^1/_2$ in der Anzahl der Fälle vor). Die zugehörigen Zahlen der Windstärke werden entsprechend verteilt. Die Summe aller Windstärken für eine Hauptrichtung wird durch die entsprechende Anzahl der Beobachtungen dividiert, um die mittlere Windstärke der Richtung zu erhalten. Die Jahresmittel der Windstärke sind entsprechend ermittelt worden.

5. Die relative Feuchte. Die Monatsmittel der relativen Feuchte. Diese sind nach der Köppenschen Formel:

$$m = q + c(2p - q), \text{ wo } q = \tfrac{1}{2} \text{ (Morgenbeob. + Abendbeob.)}$$

berechnet worden[5]).

[1]) B. J. Birkeland: Neue Feuchtigkeitstafeln für das Psychrometer unter dem Gefrierpunkt, Christiania 1907, Vorwort.

[2]) G. C. Simpson: The Velocity Equivalents of the Beaufort Scale, Professional Notes, No. 44, London 1926.

[3]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg., und «Klimatabeller for Norge» I. Luftens Temperatur, S. 6—7

[4]) Siehe Jahrbuch für 1920, S. IX.

[5]) Die Werte des Faktors c sind im Jahrbuch für 1920, S. XI, angegeben.

6. Die Bewölkung. Die Zahlen geben an wie viele Zehntel des Himmels im Mittel mit Wolken bedeckt waren.

7. Den Niederschlag. Monatssumme, nebst maximalem Niederschlag mit Datum sind angegeben.

8. Zahl der Tage. Die 10 ersten Kolonnen brauchen keine Erklärung wenn man sich nur daran erinnert, dass R in Millimetern und F in Beaufort gemessen werden.

Als Regentage, Schneetage und Tage mit Regenschnee (Regen mit Schnee) sind diejenigen Tagen gerechnet, an denen der Niederschlag ≧0.1 war. Tage mit Regenschnee sind nicht nur als Regenschneetage, sondern auch als Regentage und als Schneetage gerechnet. Als Tage mit Nieseln, Reifgraupeln, Frostgraupeln, Hagel, Gewitter, Nebel (Sichtweite < 1 km), Sonnenschein und Nordlicht sind diejenigen gerechnet, an denen die betreffende Erscheinung überhaupt beobachtet ist (Tage mit Nieseln sind auch als Regentage gerechnet, wenn der Niederschlag ≧0.1 gewesen ist). Heitere Tage sind solche, an denen die Summe der Bewölkung für alle drei Beobachtungsstunden 5 oder weniger beträgt. Bewölkte Tage sind solche, an denen diese Summe 25 oder mehr beträgt.

Die Extenso-Tabellen und die Monats- und Jahresübersichten für die arktischen Stationen.

Die Seiten 94—125 enthalten die täglichen Beobachtungen und die klimatologischen Daten (Monatsmittel und Monatssummen) für Isfjord Radio, Bjornoya, Jan Mayen, Myggbukta und Torgilsbu für 1936. Diese Tabellen sind nach dem alten Schema aufgestellt. Es wird auf das Vorwort in früheren Jahrbüchern verwiesen. Auf Jan Mayen sind um 2 Uhr Beobachtungen ausgeführt worden, die aber nicht gedruckt sind. Die Monatsmittel in den Übersichtstabellen sind Mittel aus den 4 Terminmitteln.

Flugzeug- und Registrierballonaufstiege.

Die Seiten 126—134 enthalten die Ergebnisse der aerologischen Flugzeugaufstiege vom Militärflugplatz Kjeller aus im Jahre 1937 und die Ergebnisse der Registrierballonaufstiege in Ås im Jahre 1937 nebst Nachträgen (Ås 1935, Nesbyen 1935 und Ås 1936). Gemäss Beschluss der Direktorenkonferenz in Warschau 1935 ist die Temperatur in Celsiusgraden angegeben. Auf Seite 130 in der Übersichtstabelle für die Kjeller-Aufstiege sind Luftdruck, Lufttemperatur und relative Feuchte für die Standard-Geopotentiale angegeben.

Luftdruck- und Lufttemperaturabweichungen. See-Temperatur.

Seite 135 enthält die Abweichungen der Monatsmittel des Luftdrucks und der Lufttemperatur vom Mittelwert 1901—1930 für 16 bzw. 41 Stationen. Weiter enthält sie die Monats- und Jahresmittel der Temperatur des Oberflächenwassers für 13 Küstenstationen. Diese See-Temperatur wird um 14 Uhr gemessen.

Auf Seite 136 steht eine Berichtigung zum Jahrbuch für 1933.

In allen Tabellen sind interpolierte Werte mit einem gehobenen x versehen.

Oslo, im Dezember 1938.

NAMENÄNDERUNG

Die Station Saltdal (früher Rognan i Saltdal) hat die Name Rognan bekommen.

ZEICHEN- UND SYMBOLERKLÄRUNGEN

Zeichen und Symbole die in den Rubriken «Bewölkung und Wetter» und «Witterungsverlauf» der Extenso-Tabellen verwendet werden.

- Reine Luft (Sichtweite > 150 km).
- Höhenrauch.
- Dunst.
- Nebel (Sichtweite < 1 km).
- Nieseln.
- Regen.
- Schnee.
- Regen mit Schnee.
- Griesel.
- Eiskörnchen.
- Eisnadeln.
- Regenschauer.
- Schneeschauer.
- Schauer mit Regen und Schnee.
- Reifgraupeln.
- Frostgraupeln.
- Hagel.
- Wetterleuchten.
- Gewitter.
- Schneetreiben.
- Tau.
- Reif.
- Glatteis.
- Rauhreif.
- Sturm.
- Sonnenschein.
- Sonnen- oder Mondhalo.
- Sonnen- oder Mondkranz.
- Regenbogen.
- Nordlicht.

n nachts.

a vormittags.

p nachmittags.

na Zeit nach Mitternacht (frühmorgens).

np Zeit vor Mitternacht (spät abends).

i intermittierend.

( ) Klammer wird verwendet für Erscheinungen in der Umgebung der Station. Indices 0 und 2 werden verwendet für Intensitätsangaben. 0 schwach oder leicht, 2 stark oder dicht.

Übrige Symbole.

P Luftdruck.

T Lufttemperatur.

T Seetemperatur.

U Relative Feuchte.

D Windrichtung.

v Windgeschwindigkeit.

F Windstärke.

C Windstille.

V Sichtweite.

R Niederschlag.

N Wolkenmenge.

w Wetter.

W Witterungsverlauf.

φ Geographische Breite.

λ Geographische Länge.

g Schwerebeschleunigung.

Δ G Unterschied zwischen der benutzten Zeit und Greenwich Zeit[1]).

H_s Höhe der Station über dem Meeresspiegel (nach den Richtlinien des Beschlusses von 1874 $H_s = H_T - h_T$).

H_b Höhe des Quecksilbergefässes des Barometers über dem Meeresspiegel.

h_t Höhe der Kugel des Thermometers über dem Erdboden.

h_a Höhe des Anemometers über dem Erdboden.

h_d Höhe des Windrichtungsanzeigers über dem Erdboden.

h_r Höhe der Auffangfläche des Regenmessers über dem Erdboden.

Φ Geopotential.

Index m Mittel eines Elements.

Δ Differenz.

Σ Summe.

n Zahl der Beobachtungen.

An Jahreswert.

M Monatswert.

Dat Datum.

Dies Tag.

Registrierungen der luftelektrischen Potentialgefälle (in 10 Volt/Meter)
Monatsmittel der luftelektrischen Leitfähigkeit (in $10^4 \lambda_-$)

Perturbierte Stunden sind mit p bezeichnet. Normstage sind fett gedruckt.

1937

Ås

$\varphi = 59^\circ\ 40'\ N$ $\lambda = 10^\circ\ 46'\ E$ $\Delta G = +1^\circ$ $H_1 = 95$ Höhe des Kollektors $h_k = 4.5$
