Vorwort.

Das Jahrbuch für 1887 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 79 Stationen: von letzteren sind 34 Stationen solche, die mit Qvecksilberbarometer versehen sind, 7 Leuchtfeuerstationen, und 32 Regenmesserstationen.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen:

Im Sommer 1888 unternahm ich eine Inspectionsreise nach den Stationen II Ordnung Tönset, Röros, Trondhjem, Stenkjær, Gjesvær, Vardö, Alten, Tromsö und Bodö. Als Controlbarometer wurden 2 Barometer mitgeführt: Sécrétan No. 349 (Fortin) und Adie No. 674 (Kew-Station-Barometer). Die Vergleichungen dieser Barometer mit dem Normalbarometer vor der Reise fanden unter wenig glücklichen Umständen statt, indem die Temperatur der Barometer sich bis an 29° erhob, und schon auf der ersten Station (Tönset) zeigte das Barometer Adie No. 674 eine andere Correction gegen Sécrétan No. 349 als in Christiania. Auf der Reise zeigte später Adie sich nicht constant gegen Sécrétan, und nach der Reise fand ich für Adie eine andere Correction als vor der Reise. Die Vergleichungen der Stationsbarometer mit dem Barometer Adie wurden deshalb ausgeschlossen. Die Vergleichungen des Reisebarometers Sécrétan mit dem Normalbarometer Fuess ergaben die folgenden Correctionen für das erstere:

Vor der Reise	1888 Juni	21. bis 27.	13 Vergl.	$+ 0.^{mm}86$,	M. F. =	$\pm 0.^{mm}057$
Nach „ —	„ August	21. „ 25.	11 „	$+ 0.^{mm}91$,	—	$\pm 0.^{mm}063$
	Mittel			$+ 0.^{mm}885$.		

Das Mittel weicht nur am ± 0.025 ab von den beiden Werthen und ist für die Berechnung der Vergleichungen an den Stationen benützt worden.

Auf der Inspectionsreise wurden die Thermometer der Stationen mit einem mitgebrachten Normalthermometer verglichen. Die gefundenen Correctionen konnten in diesem Jahrbuche nicht berücksichtigt werden.

Alten. Bei der Inspection am 24. Juli bis 4. August 1888 fand ich aus 20 Vergleichungen die Correction des Stationsbarometers Adie No. 1485 $= + 0.^{mm}32$: M. F. $= \pm 0.061$. In 1883 fand ich $+ 0.12$. Die Beobachtungen sind mit $+ 0.09$ corrigirt worden. Angenommen, die Correction habe sich stetig geändert, sind an die gedruckten Barometerhöhen folgende Correctionen anzubringen:

1883 August bis 1883 December	$+ 0.^{mm}4$	(Jahrb. f. 1884, S. VI).
1884 Januar	$0.^{mm}0$.	
1884 Februar bis 1886 April	$+ 0.^{mm}1$.	
1886 Mai „ 1887 December	$+ 0.^{mm}2$.	

Die Thermometer standen um $0^{0}.1$ zu hoch. Der Beobachter hat Nordlicht nicht notirt.

Andenes. Die Beobachtungen vom November fehlen.

Bodö. Am 7. August fand ich folgende Correction für die Thermometer:

Gegen SW Trocknes Corr. = —0°.2. Feuchtes Corr. = —0°.2.
NE — „ —0°.1. — „ 0°.0.

Christiansund. Am 1. September 1887 wurde die Station nach ein neues Local überführt. Die neue Seehöhe des Barometers ist 16.3 Meter, die Höhe der Thermometer $3^m.4$. Die Barometerhöhen in den Uebersichtstabellen von Anfang September bis Ende December sind auf die frühere Seehöhe von 15.4 reducirt worden.

Fagernes. Die Beobachtungen des Minimumthermometers von Januar bis Juli sind unbrauchbar. S. Jahrb. f. 1886 S. VI. Die Mitteltemperatur für diese Monate ist durch Vergleichung mit Tromsö und Bodö berechnet worden. Im ersten Halbjahr fehlen Nordlichtbeobachtungen.

Flesje (richtiger Balestrand). Wegen häufiger Abwesenheit des Beobachters sind viele Lücken in den Beobachtungen entstanden.

Gjesvær. Bei der Inspection am 13. bis 15. Juli 1888 fand ich aus 14 Vergleichungen die Correction des Stationsbarometers Adie No. 1487 = + $0.^{mm}07$; M. F. = ± 0.066. Im Juli 1881 fand Hrr. Steen + 0.06.

Für die Thermometer fand ich

Gegen NW Corr. = —0°.3.
„ SE „ —0°.2.

Am Mitternacht 15.—16. Juli bestimmte ich die Richtung des Meridians durch die Sonne.

Vom 1. August 1887 ab ist die Höhe der Regenmesser $1^m.5$.

Kistrand. Die Niederschlagsmessungen sind im Winter unmöglich wegen Schneetreibens.

Röldal. Die Beobachtungen für Mai und November fehlen wegen der Abwesenheit des Beobachters.

Röros. Am 30. Juni und 1. Juli 1888 fand ich aus 13 Vergleichungen die Correction des Stationsbarometers Adie No. 1561 = + $0^{mm}.41$; M. F. = ± 0.071. Im August 1887 fand Hrr. Schroeter + 0.32, und im Mai 1885 fand ich + 0.36. Die bisher benützte Correction, + $0^{mm}.36$, ist beibehalten worden. Die Vergleichungen von 1888 litten etwas durch starken Sonnenschein. Ich fand ferner

Beide Thermometer gegen Nord Corr. = —0°.2.
„ — „ Süd „ 0°.0.

Röst. Die Monate Januar bis Mai haben keine brauchbare Beobachtungen von Nebel. Die Minimumthermometer-Beobachtungen sind nicht zu brauchen. Beob. Min. ist aus den Terminsbeobachtungen entnommen. Die Monatsmittel der Temperatur durch Vergleichung mit Bodö berechnet.

Sogndal. Die Lücken rühren von der Abwesenheit des Beobachters her.

Stenkjær. Bei der Inspection am 3 Juli 1888 fand ich aus 4 Vergleichungen die Correction des Stationsbarometers Adie No. 1565 = + $0^{mm}.11$; M. F. = ± 0.018. Im Mai 1885 fand ich + 0.10.

Für die Thermometer fand ich:

Gegen Nord Trocknes Corr. = —0°.3. Feuchtes Corr. = —0°.2.
„ Süd — „ —0°.2. — „ —0°.2.

Svolvær. Im März und April ist die Niederschlagshöhe zu klein ausgefallen, wegen eines Loches im Schneemesser. Die Beobachtungsstunden sind in 1886 und 1887: 9^h, 4^h und 7^h.

Südvaranger. Die Beobachtungen für Februar sind zu lückenhaft um Mittelzahlen zu bilden. Die Niederschlagshöhen für November und December sind wahrscheinlich zu klein.

Trondhjem. Bei der Inspection am 2. Juli 1888 fand ich durch 4 Vergleichungen die Correction des Stationsbarometers Adie No. 1568 = + 0^{mm}.25, mit einem M. F. von ± 0.013. Die Beobachtungen waren wegen Sonnenscheins unter etwas ungünstigen Bedingungen genommen. Im Juli 1887 fand Hrr. Schroeter + 0.18, welche für die Reduction der Beobachtungen adoptirt worden ist. Das Barometer ist auf der Norwegischen Polarstation in Bossekop gewesen. Die früheren Correction schwancken zwischen + 0.14 und + 0.21.

Sämmtliche Thermometer zeigten um 0°.2 zu hoch.

Die Aufstellung der Instrumente am dieser Station ist eine sehr gute, und die Beobachtungen sind in allen Richtungen lobenswürdig ausgeführt.

Tonsaasen. Sanatorium, zwischen den Thälern von Land und Valders gelegen.

Am 19. und 20. Juli 1886 fand ich die Correction des Stationsbarometers Adie No. 1506 aus 6 Vergleichungen mit Sécrétan = + 0^{mm}.215; (M. F. = ± 0.033) bei 705^{mm}. Die Seehöhe wurde barometrisch aus 4 guten Bestimmungen gleich 620.9 Meter gefunden. Die Thermometer standen auf der Aussenseite eines Verandas in einer Höhe von 1.9 Meter.

Am 15. August 1887 wurde das Barometer in der Seehöhe 624.1 Meter aufgestellt. Für die ersten 7 Monate sind die auf die neue Seehöhe reducirten Monatsmittel der Barometerhöhe:

Januar	703.2.
Februar	07.5.
März	03.1.
April	01.8.
Mai	04.2.
Juni	06.0.
Juli	03.2.
Jahr	702.0.

Die in der Uebersichtstabelle Seite 76 gegebenen Werthe der Feuchtigkeit sind ohne Luftdruckscorrection berechnet worden. Die corrigirten Werthe stehen in der folgenden Tabelle:

Monat	Absol. Feuchtigk.				Relat. Feuchtigk.			
	1	2	3	Mittel	1	2	3	Mittel
Januar	2.9	3.1	3.0	3.0	97	96	96	96
Februar	2.9	3.7	2.8	2.9	97	89	95	96
März	3.0	3.6	3.1	3.1	91	72	90	90
April	3.7	4.4	3.7	3.7	82	77	83	82
Mai	5.7	6.6	5.7	5.7	79	75	83	81
Juni	8.1	8.3	7.9	8.0	71	62	72	72
Juli	8.9	8.9	8.6	8.8	81	73	82	82
August	7.2	7.6	7.3	7.3	77	70	80	78
September	6.4	7.2	6.3	6.4	87	80	88	88
October	3.7	4.3	3.8	3.8	87	76	97	87
November	2.8	3.2	2.8	2.8	95	94	95	95
December	2.3	2.5	2.2	2.3	98	96	97	97
Jahr	4.8	5.3	4.8	4.8	86	80	87	87

Die Thermometer wurden am 1. October 1887 auf die neue Höhe von $2^m.8$ gebracht.

Die Station liegt in einem Thale. Die Windbeobachtungen sind deshalb nicht immer zuverlässig.

Am 14. September wurde der Regenmesser durch den Wind herumgeworfen. Die Regenhöhe ist für diesen Fall auf 30^{mm}. geschätzt worden.

Tönset. Bei der Inspection am 29. Juni 1888 fand ich aus 8 Vergleichungen die Correction des Stationsbarometers Adie No. 1475 $= + 0^{mm}.95$; M. F. $= \pm 0.019$. Im August 1886 fand ich $+ 0.99$.

Alle Thermometer zeigten um $0^0.2$ zu hoch.

Die Niederschlagssumme für November ist etwas unsicher. Der Schneemesser war einmal von fremden Händen mit Schnee gefüllt worden.

Tromsö. Am 6. August 1888 fand ich die Correction der Thermometer $= - 0^0.2$.

Udsire. März bis September fehlen wegen Aenderung des Beamtenpersonales.

Vardö. Bei der Inspection am 18. Juli 1888 fand ich die Correction des Stationsbarometers Adie No. 1488 aus 7 Vergleichungen $= + 0^{mm}.31$; M. F. $= \pm 0.05$. In 1878 fand ich -0.09, und in 1883 $+ 0.13$. Die Correction scheint also zu steigen. Nach brieflicher Mittheilung des Herrn Professor Sundell's aus Helsingfors fand der finnische Physiker Petrelius im Sommer 1887 durch ein Sundellsches Vergleichsbarometer die Correction des Vardö-Barometers $= + 0.27$, was mit dem von mir gefundenen ganz übereinstimmt. Da die Beobachtungen mit $+ 0.13$ reducirt worden sind, sind die im Jahrbuche gedruckten Barometerhöhen zu corrigiren

von 1884 Mai bis 1887 April mit $+ 0^{mm}.1$.
„ 1887 Mai „ 1887 Decbr. „ $+ 0^{mm}.2$.

Die Correctionen der Thermometer waren im Juli 1888

Gen SE Trocknes Correction $= -0^0.1$, Feuchtes Corr. $= -0^0.2$.
„ NNW — — $-0^0.2$, — „ $-0^0.1$.

In Bezug auf die Schwerecorrection ist auf das Jahrbuch für 1882, Vorwort, Seite III und IV zu verweisen.

Die Tabelle auf Seite IX giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchtthürmen werden die Beobachtungen vom betreffenden Leuchtfeuerverwalter ausgeführt.

In der ersten Rubrik „Ordnung“ bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —
R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens, kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, inclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[2]).

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

● Regen.	*n* Nacht	Als Exponent
✱ Schnee.	*a* Vormittag	Als Exponent
△ Graupeln	*p* Nachmittag	Als Exponent
≡ Nebel.	*o* Schwach	Als Exponent
⊔ Reif.	*2* Stark	Als Exponent
∝ Höhenrauch.	1 Erste Beobachtungsstunde.	
⸗ Starker Wind.	2 Zweite —	
⊼ Gewitter.	3 Dritte —	
< Blitz ohne Donner.		
Nordlicht.		
⊕ Sonnenring.		
⦶ Sonnenhof.		
Mondring.		
Mondhof.		

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ●1, Regen 8ʰ Morgens; ✱3, Schnee 8ʰ Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort. Seite II.

beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolirte Werthe sind mit Cursiv gedruckt.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und das Normalbarometer (wahre Barometerhöhe), aber nicht auf die Meeresfläche und nicht auf die Normalschwere reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind für alle Stationen des südlichen Norwegens bis an die Breite von Trondhjem ($63^1/_2$ Grad) als Mittel der drei täglichen festen Beobachtungen und der Minimumtemperatur bestimmt. Für die Stationen, welche eine nördlichere Lage haben, ist die im Jahrbuch für 1884, Vorwort S. XII—XIII angegebene Berechnungsweise angewendet worden.

Für Christiania, Aas und Trondhjem sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt wurden.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet. Für Dovre, Röros und Tönset ist Correction wegen des Luftdrucks an den Mitteln angebracht worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *J. Schroeter*, *C. Krafft*, *N. Nielsen* und *H. Chr. Löcken* ausgeführt.

Christiania, Januar 1889.

H. Mohn.
