Inhalt.

Vorwort.

Meteorologische Litteratur, im Jahre 1903 in Norwegen erschienen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Christiania 1903.

II. Termin-Beobachtungen an zwölf Stationen in Norwegen 1903.

III. Monats und Jahres-Resumé für das Jahr 1903.

IV. Anhang. Beobachtungen der Bewegung der Cirruswolken 1903.

Druckfehler und Verbesserungen.

In sämmtlichen Jahrbüchern von 1895 bis 1902 Vorwort sind die Ekholm'sche Korrektionen für Jelinek's Psychrometertafeln übereinstimmend mit den Werthen dieses Jahrbuchs für 1903 zu berichtigen.

	Lies:
Im Jahrbuch für 1901 u. 1902:	
S. 53—58. Florø. Morgentermin 8	$7\frac{1}{2}$

Vorwort.

Das Jahrbuch für 1903 enthält die stündlichen Luftdruck- und Temperatur-Registrierungen in Christiania, die vollständigen Terminbeobachtungen für dieselben 12 Stationen wie die vorhergehenden Jahrgänge, die Uebersichtstabellen für 59 Stationen und einen Anhang mit Cirrusbeobachtungen. Von den 59 Stationen haben 39 Quecksilberbarometer, 40 Psychrometer, 19 nur trocknes Thermometer, unter welchen 6 Leuchtfeuerstationen sind.

In Bezug auf die einzelnen Stationen verweise ich auf die früheren Jahrgänge und folgende Bemerkungen.

Andenes. See-Temperatur unbrauchbar.

Florø. Neues Lokal 15. Oktober 1903. Neue Seehöhe des Barometers 6.9 Meter. Luftdruck für das ganze Jahr auf die frühere Seehöhe, 8.0 Meter, bezogen.

Kautokeino aufgehört.

Tonsaasen. Vom November 1903 aufgehört.

Trondhjem. Neues Lokal, Bispehaugens Skole, Baklandet, $2^1/_4$ Kilometer østlich vom früheren, vom 18. Juli 1903. Neue Seehöhe 40.5 Meter. Luftdruck auf das frühere Niveau, 21.3 Meter, für das ganze Jahr bezogen.

Tønset. Neues Lokal Mitte Oktober. Seehöhe nicht sehr verschieden von der früheren.

Utsire. See-Temperatur unbrauchbar.

Die Schwerekorrektionen für die Barometerhöhen, welche in diesem Jahrbuch für 1903 benutzt worden sind, habe ich aus den bekannten Werthen für die wahre Schwere an den Stationen berechnet. Ich verweise auf meine Abhandlung: „Das Hypsometer als Luftdruckmesser und seine Anwendung zur Bestimmung der Schwerekorrektion“ (Videnskabsselskabets Skrifter 1899) und: „Einige Bemerkungen über die Schwerekorrektionen der Barometerhöhen“ (Meteorologische Zeitschrift 1901 S. 50—53), sammt Jahrbuch für 1902 S. VI. Für die Normalschwere habe ich Helmerts neuesten Werth 9.80632 m. (Der normale Theil der Schwerkraft im Meeresniveau von F. R. Helmert. Sitzungsberichte der K. Preussischen Akademie der Wissenschaften zu Berlin 1901 XIV [328]) eingeführt. In der folgenden Tabelle II habe ich zusammengestellt die Schwerekorrektionen für unsere Barometerstationen bei 760 mm. nach Broch (Br.) und nach den wahren Werthen der Schwere (W) berechnet, sowie den Unterschied ($\triangle$) zwischen beiden. Die Pendelstationen sind durch ein *p* bezeichnet, die Stationen, für welche

die Schwerekorrektion durch Hypsometer bestimmt worden sind, durch ein *h*. Für die übrigen Stationen sind die Schwerekorrektion aus einer Karte mittelst den obigen Werthen der wahren Schwerekorrektionen durch graphische Interpolation entnommen worden. Aus der Kolonne △ wird man ersehen, wie nothwendig es ist mit der wahren Schwere zu rechnen, wenn der Fehler in den Schwerekorrektionen ± 0.05 mm. nicht übersteigen soll.

Tab. I Verzeichniss der Stationen.

Am 1. Januar 1895 wurde die mitteleuropäische Zeit, eine Stunde früher als Greenwich, durch Gesetz in Norwegen eingeführt. An den meisten meteorologischen Stationen wurden die früheren Beobachtungstermine beibehalten, indem die respektiven Uhrzeiten nach Normalzeit den Beobachtern mitgetheilt wurden. Nur an einigen Telegraphenstationen musste die Aenderung gemacht werden, dass die Beobachtungen auf 8 a, 2 p und 8 p Normalzeit verlegt wurden. Als aber eben diese Stationen früher nach Christiania Zeit beobachteten, und diese Zeit nur 17 Minuten später ist als die Normalzeit, hat die Aenderung nur wenig Bedeutung.

Wegen der Kontrolle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die erste Abtheilung enthält die stündlichen Beobachtungen für Christiania, die mit Richards Barograph und Thermograph registriert worden sind.

Der Barograph ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reducierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph steht in der Wild'sche Hütte im Park des astronomischen Observatoriums. Seine Bügel steht im Kupferhäuschen, wo das Psychrometer aufgestellt ist, und ganz nahe an der Kugel des trocknen Thermometers. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf die auf das Luftthermometer reducierten Ablesungen des Normal-(Luft) Thermometers [1]).

[1]) Am Institut haben wir die folgenden mit Barograph und Thermograph registrierten Beobachtungen berechnet und eingeführt in Manuskript-Tabellen wie die in diesem Jahrbuch für Christiania gedruckten.

	Luftdruck	Lufttemperatur.
Christiania.	Barogr. Richard von Juli 1892 bis jetzt.	Thermogr. Rung von Juli 1883 bis Januar 1896. Thermogr. Richard von Juni 1893 bis jetzt.
Bergen.	Barogr. Hottinger von Januar 1891 bis Oktober 1894. Barogr. Richard von August 1896 bis jetzt.	Thermogr. Richard von Sept. 1895 bis jetzt.
Trondhjem.	Barogr. Richard von Januar 1896 bis jetzt.	Thermogr. Richard von Januar 1896 bis jetzt.
Dovre.	Barogr. Richard von Januar 1896 bis jetzt.	
Aasnes.		Thermogr. Richard von Januar 1896 bis jetzt.

Die Tabellen der zweiten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0^0 C, auf das Normalbarometer und auf **die Normalschwere** reduciert [1]). Die Reduktion auf die Normalschwere nach der Formel

$$C_b = \frac{g - g_{45}}{g} b \text{ (für Pendelstationen) oder } C_b = \frac{C_0}{b_0} b,$$

wo g die Acceleration der Schwere an der Station, g_{45} die Normalschwere (9.80632 m.), b die Barometerhöhe, reducirt auf 0^0 und das Normalbarometer, C_b die Schwerekorrektion bei b, C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite ist der Betrag der Schwerekorrektion angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerekorrektion stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerekorrektion, im Sinne reducierte minus unreducierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt [2]). Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Korrektionen der Thermometer auf das **Luft**thermometer reduciert worden [3]). Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m., mit dem trocknen Thermometer, korrigiert worden. Vom 1. Januar 1894 an wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Psychrometerbeobachtungen sind seit 1895 nach Jelineks Tafeln berechnet worden, mit der Aenderung, dass, nach Ekholms Anweisung, wenn das feuchte Thermometer Kältegrade zeigt, eine Korrektion an die (für Theilungsfehler berichtigten) Ablesungen dieses Thermometers angebracht worden ist, wie diese Tabelle zeigt

Von	$-0^0.1$	bis	$-1^0.0$	Korr. =	$-0^0.1$
„	-1.1	„	-2.0	„	-0.2
„	-2.1	„	-3.0	„	-0.3
„	-3.1	„	-4.0	„	-0.4
unter	-4.0			„	-0.5

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 6 = Orkan [4]).

---

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252 sammt Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math.-naturv. Klasse, 1896 No. 1. S. 1—15.

[2]) $B_5 = \frac{g}{g - g_{45}} C_5$ oder $= \frac{B_0}{C_0} C_5$

[3]) Dies ist durch den glücklichen Umstand erreicht, dass die Korrektionen des Normalthermometers auf das Luftthermometer weniger als $0^0.05$ betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[4]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Ueberzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden, sind nach der Bewölkungszahl angeführt worden. • Regen; * Schnee; ⚹ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit (Normalzeit).

Die Bezeichnungen sind:

◉ Regen.	n	in der (vorhergehenden) Nacht	
* Schnee.	a	vormittags	
△ Graupeln.	p	nachmittags	
≡ Nebel.	mg.	morgens	
⌓ Thau.	mtg.	mittags	
⌣ Reif.	abd.	abends	
∞ Höhenrauch.	o	Schwach	Als Exponent
⁄ Starker Wind.	2	Stark	Als Exponent
⊼ Gewitter.	I	Erste Beobachtungsstunde.	
< Blitz ohne Donner.	II	Zweite —	
♕ Nordlicht.	III	Dritte —	
⊕ Sonnenring.	u.	und.	
⦶ Sonnenhof.	st.	stark.	
⦶ Mondring.	sp.	später.	
⦶ Mondhof.	zeitw.	zeitweise.	
	sch.	Schauer.	
	tr.	Tropfen.	
	fl.	Flocken	
	körn.	körnig.	

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Angaben der Tagestunden beziehen sich auf mitteleuropäische Zeit. Die Zeitangabe „früh" bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr Morgens, „spätabd." zwischen 8 Uhr Abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. „abd." ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. „mtg." umfasst die Stunden 12 bis 2.

Interpolierte Werthe sind mit Kursiv gedruckt.

Die Uebersichtstabellen der dritten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen plus eine Korrektion. Diese Korrektionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christiansand, Bergen und Bossekop abgeleitet worden.[1]) Die

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.

Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Korrektionsgrössen, welche für 1902 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel[1])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt.[2])

Für Christiania, Aas, Aasnes, Eg und Trondhjem sind die mittelst Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometers gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion. Die Werthe dieser Korrektionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Hjerkinn, Dovre und Tonsaasen ist Korrektion wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Faktors c. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den zweiten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren *A. Steen, N. J. Føyn, Aa. Graarud, K. Irgens, J. Birkeland, H. Chr. Löcken, N. Russeltvedt* und *H. J. Lundh* ausgeführt.

Christiania, April 1904.

H. Mohn.
