Inhalt.

Vorwort.

Verzeichnis der Stationen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Kristiania, die des Niederschlags und des luftelektrischen Potentialgefälles in Aas 1922.

II. Termin-Beobachtungen an zwölf Stationen in Norwegen 1922.

III. Monats- und Jahres-Resumé für das Jahr 1922.

IV. Anhang I. Abweichungen der Monatsmittel 1922 vom Normalwert.

V. Anhang II. See-Temperatur 1922.

VI. Anhang III. Beobachtungen auf Spitzbergen in Green Harbour, Eisfjord, Juli 1921—Juni 1922.

Monats- und Jahres-Resumé 1921.

Beobachtungen auf Jan Mayen September 1921—Juni 1922.

Monats und Jahres-Resumé 1921.

VII. Anhang IV. Beobachtungen auf Haldde 1922.

Druckfehler und Verbesserungen.

Vorwort.

Das Jahrbuch für 1922 enthält stündliche Werte des Luftdrucks und der Temperatur in Kristiania, diejenigen des Niederschlags und des luftelektrischen Potentialgefälles in Aas, die Terminbeobachtungen für 12 Stationen, die Uebersichtstabellen für 130 Stationen und vier Anhänge. Im ersten von den Anhängen finden sich die Abweichungen des Luftdrucks und der Temperatur von den normalen Werten für einige älteren Stationen, im zweiten die Monatsmittel der Seetemperatur für einige Küstenstationen, im dritten stündliche Werte und Terminbeobachtungen mit Uebersichtstabellen für Green Harbour in Spitzbergen und Jan Mayen, im vierten stündliche Werte und Terminbeobachtungen für Haldde.

Von den 132 Stationen haben 61 Quecksilberbarometer, 95 Psykrometer oder Haarhygrometer und 37 nur trockenes Thermometer. Sämtliche Stationen haben Minimumthermometer, während nur Kristiania, Bergen, Trondhjem und Haldde mit Maximumthermometer versehen sind. Die Thermometer sind in kleinen Gehäusen am Fenster aufgestellt. Hütten sind nur an Stationen mit Thermographen im Gebrauch.

Die Quecksilberbarometer sind Stationsbarometer hauptsächlich englischen Fabrikates. Ungefähr die Hälfte der Stationen hat neue Barometer mit Millibarteilung erhalten. Die Thermometer sind Küchlerthermometer mit Papierskala und 1/5° C Einteilung, für Minimumthermometer 1/1° C. Bei den Psykrometerbeobachtungen wird Aspirator nicht verwendet. Die Haarhygrometer, die bei uns verwendet werden, sind hauptsächlich die Russeltvedt'schen Torsionshygrometer [1]). Die meisten Stationen im nördlichen Teile des Landes haben doch Devik'sche Hygrometre [2]).

An den Stationen Kristiania, Aas, Bergen, Rundemanden, Trondhjem, Dovre, Spitzbergen, Jan Mayen und Haldde sind Barographen, in Kristiania, Aas, Bergen, Rundemanden, Trondhjem, Lærdal, Rena, Spitzbergen, Jan Mayen und Haldde Thermographen und in Aas, Bergen und Lærdal Hygrographen aufgestellt. Die Registrierungen dieser Instrumente sind alle ausgewertet und in Manuskripttabellen eingeführt wie die in diesem Jahrbuch gedruckten.

In diesem Jahrbuch befinden sich dieselben Stationen wie im vorhergehenden mit Ausnahme von Asker und Florø, die herausgegangen sind. Dazu sind nun 64 neue Stationen gekommen.

In bezug auf die herausgegangenen Stationen sind zu erwähnen:

Asker. Die Station wurde anfangs Januar von der Versuchsanstalt in dem Hofe

[1]) Met. Zeitschrift 1908 S. 396—400.

[2]) Das Prinzip des Instrumentes beruht darauf, dass die Länge des Haares durch eine Mikrometerschraube gemessen wird. Keine Beschreibung veröffentlicht.

Berg nach der »Smaabrukerlærerskole« im Hofe Sem überführt. Die Beobachtungen wurden hier nicht befriedigend gemacht. Besonders kamen grössere Löcher in der Beobachtungsmateriale vor und für mehrere Monate könnte kein Mittel berechnet werden.

Florø. Die Station wurde in Januar 1922 durch Feuersbrunst vernichtet und ist nicht wieder errichtet, da die Beobachtungen in den letzeren Jahren von den Telegraphenbeamten weniger gut ausgeführt worden waren.

Von den vielen neuen Stationen sind folgende mit einigen Worten zu besprechen:

Lillehavn unweit der im Jahre 1876 aufgehörten Station an dem Leuchtfeuer Lindesnes.

Lister an dem Leuchtfeuer Lister, wo eine Station, die im Jahre 1877 aufhörte, in Wirksamkeit gewesen war.

Obrestad Leuchtfeuerstation auf Jären sehr frei gelegen.

Rundemanden an der Telegraphenstation »Bergen Radio« auf dem Berge Rundemanden gelegen, 513 m. höher als Bergen (Meteorologisches Observatorium), während die horizontale Entfernung nur $3^1/_2$ km. beträgt. Die Station ist seit dem Jahre 1912 in Wirksamkeit.

Aalesund. In der Stadt Aalesund ist früher eine alte Station gewesen. Sie wurde im Jahre 1904 bei der Feuersbrunst der Stadt vernichtet. Die Beobachtungen, die damals von Telegraphenbeamten ausgeführt wurden, sind jetzt von den Hafenbeamten übernommen und die Instrumente sind im Hafengebäude unterbracht.

Nordli unweit der älteren Station Lierne, die vom Jahre 1881 bis 1887 in Wirksamkeit war.

Tromsø II (Geofysiske Institut) liegt auf dem höchsten Teile der Insel Tromsøy ein wenig ausserhalb der Stadt. Sehr freie Lage.

Kistrand auf demselben Ort wie die frühere Station dieses Namens, die im Jahre 1898 aufhörte.

Kautokeino ganz in der Nähe des Ortes, wo die ältere Station, die im Jahre 1903 aufhörte, gelegen war.

In bezug auf die älteren Stationen ist zu bemerken:

Mandal. Die Höe des Barometers wurde am 8. Juli 1922 um 0.1 m. erniedrigt.

Skudenes. Die Höe des Barometers wurde am 21. Juli 1922 um 0.1 m. erniedrigt.

Brønnø. Neues Lokal vom 1. Dezember 1922, wodurch die Meereshöhe 16.4 m statt früher 6.3 m. geworden ist. Die Luftdruchswerte sind bis Ende des Jahres auf die alte Höhe reduziert.

Mehavn. Die Station hatte am 8. November 1921 ein neues Lokal erhalten. Die Meereshöhe wurde dadurch 4.6 m. Die Luftdruckswerte waren in dem übriggebliebenen Teil des Jahres 1921 auf die alte Höhe 6.4 m. reduziert.

Vardø. Die Station hatte am 28. Oktobr 1921 ein neues Lokal erhalten. Die Meereshöhe wurde dadurch 6.8 m. Die Luftdruckswerte waren in dem übriggebliebenen Teil des Jahres 1921 auf die alte Höhe 10.0 reduziert.

Auf Seite XII sind die wichtigsten Erläuterungen über die Stationen tabellarisch gegeben. In der letzten Kolonne sind die Beobachtungsstunden angegeben, aus welchen zu sehen ist, dass die gewöhnlichen Beobachtungstermine 8 a, 2 p und 7 p nach Mitteleuropäischer Zeit sind Nur an ganz wenigen Stationen ist der Mittagstermin aus verschiedenen Gründen auf 1 p statt 2 p verlegt.

In diesem Jahrbuch ist das Luftdruck vom Anfang des Jahres 1922 in Millibar angegeben, während für die Dampfspannung Millimeter beibehalten ist.

Das Jahrbuch ist in drei Abteilungen geteilt.

Die erste Abteilung enthält die stündlichen Werte des Luftdrucks und der Temperatur in Kristiania, diejenigen des Niederschlags und des luftelektrischen Potentialgefälles in Aas.

Der Barograph in Kristiania ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde sind reduziert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reduzierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph in Kristiania steht in der Wild'schen Hütte im Park des astronomischen Observatoriums. Seine Angaben sind reduziert auf die auf das Luftthermometer reduzierten Ablesungen des Normalthermometers.

Der Niederschlag in Aas wird mit einem registrierenden Schneemesser, Süstem Hellmann, gemessen.

Die in diesem Jahrbuch angeführten Potentialregistrierungen sind durch die im Oktober 1918 aufgestellte neue Potential-Registrieranordnung erhalten.

Ausser den Stundenwerten des Luftelektrischen Potentials sind angegeben sowohl »Monatsmittel des luftelektrischen Potentialgefälles für jede Stunde« und »Täglicher Gang des luftelektrischen Potentialgefälles nach Abweichungen vom Monatsmittel« als »Monatsmittel der luftelektrischen Leitfähigkeit (für positive Elektricität) für jede Stunde» und »Täglicher Gang der luftelektrischen Leitfähigkeit nach Abweichungen vom Monatsmittel», während die Kurven der früheren Jahrgänge weggelassen sind.

Für die Mittelberechnung sind (es gilt die beiden elektrischen Elemente) nur Normaltage verwendet, für welche die Zahlen fett gedruckt sind.

Die zweite Abteilung enthält die vollständigen Terminbeobachtungen an den 12 Stationen Dovre, Kristiania, Færder, Mandal, Skudenes, Bergen, Aalesund, Trondhjem, Brønnø, Bodø, Alten und Vardø. Interpolierte Werte sind mit Kursiv gedruckt. Die Tabellen haben folgende Daten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf die Normalschwere, aber nicht auf das Meeresniveau, reduziert[1]). Die Reduktion auf die Normalschwere geschiet nach der Formel.

$$C = \frac{g - g_{45}}{g_{45}}\, b = \frac{C_0}{b_0}\, b,$$

wo g die Schwerebeschleunigung an der Station, g_{45} die Normalschwere (9.80616 m.), b die Barometerhöhe, reduziert auf 0° und das Normalbarometer, C die Schwerekorrektion bei b, C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite sind zwei zusammengehörige Werte von C und b angegeben. C wird dort C_g genannt um anzugeben, dass es sich um die Schwerekorrektion handelt. Die angegebene Barometerhöhe ist so gewählt, das die Schwerekorrektion für diese Höhe eben von einem Zehntel bis nächsten überspringt. Man sieht dann unmittelbar mit welcher Schwere-

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252 sowie Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math. naturv. Klasse, 1896 No. 1. S. 1—15.

korrektion man zu rechnen hat und es ist auch ganz leicht die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumsthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m. mit dem trocknen Thermometer korrigiert worden. Vom 1. Januar 1894 an wird das Minimumsthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psykrometerbeobachtungen nach Jelineks und für Kältegrade nach Birkelands Tabellen berechnet. Für die Haarhygrometer Stationen Dovre, Alten und Spitzbergen aus der relativen Feuchtigkeit und der Luft-Temperatur. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet oder direkt nach den korrigierten Haarhygrometerbeobachtungen genommen. 00 = 100 %.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 12 = Orkan[1]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Überzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden sind, sind nach der Bewölkungszahl angeführt worden. • Regen; * Schnee; ⚹ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern am 8 Uhr mg. gemessen, angeführt für den Tag, an welchem er gemessen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tagezeit M. E. Z.

Die Bezeichnungen sind:

● Regen.	sch.	Schauer.		n	in der (vorhergehenden) Nacht
* Schnee.	tr.	Tropfen,		a	vormittags.
△ Graupeln.	fl.	Flocken.		p	nachmittags.
≡ Nebel.	körn.	körnig.		mg.	morgens.
⌒ Tau.	o	Schwach	Als Exponent	mtg.	mittags.
⌣ Reif.	2	Stark.		abd.	abends.
⚡ Starker Vind.				I	Erste Beobachtungsstunde.
⚡ Gewitter.				II	Zweite —
< Blitz ohne Donner.				III	Dritte —
Nordlicht.				u.	und.
⊕ Sonnenring.				st.	stark.
◐ Sonnenhof.				sp.	später.
Mondring.				zeitw.	zeitweise.
Mondhof.					

[1]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. - Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Zeitangabe »früh« bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr morgens, »spätabd«. zwischen 8 Uhr abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. »abd.« ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. »mtg.« umfasst die Stunden 12 bis 2.

Die dritte Abteilung enthält die Übersichtstabellen des Monats- und Jahresresumé in Mitteln und Summen. Die Tabellen haben dieselben Daten wie die der 2. Abteilung.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, aber nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen.

Lufttemperatur. Von den Minimumstemperaturen gilt dasselbe wie oben von denen in der zweiten Abteilung gesagt. Die Monatsmittel sind berechnet nach der Formel [1])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt [2]).

Für Kristiania, Bergen (Met. Obs.), Trondhjem und Haldde sind die mittels Maximumsthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, welche angegeben worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion [3]). Diese die aus den stündlichen Beobachtungen in Kristiania, Bergen und Bossekop (Alten) berechnet worden sind, können mit dem Abendtermin um 7 p ungeändert gebraucht werden.

Die Terminmittel für Haarhygrometerstationen sind aus den Mitteln der relativen Feuchtigkeit und der Lufttemperatur berechnet mit einer empirisch bestimmten Korrektion, die nur von der Temperatur abhängt:

Temp.	Korr.
> 20°	— 0.2
15-20	— 0.1
10-15	0.0
0-10	+ 0.1
— 6-0	+ 0.2
— 10- —6	+ 0.3
< — 10	+ 0.4

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden [4]).

---

[1]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg.
[2]) Siehe Jahrbuch für 1920. S. IX.
[3]) Die Werte dieser Korrektion sind angegeben im Jahrbuch für 1891, S. XV.
[4]) Die Werte des Faktors c sind angegeben im Jahrbuch für 1920, S. XI.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tage mit merkbarem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und über oder gleich 1.0 mm. Als Schneetage sind in diesem Jahrbuche nur diejenigen gerechnet, an welchen eine messbare Menge gefallen ist. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Als Tage mit Nebel sind auch diejenigen gerechnet, wo schwache Nebel vorhanden war, aber Tage mit Bodennebel sind nicht mitgezählt. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Als Gewittertage sind diejenigen gerechnet, an welchen Donner gehört wurde. Übrigens sind die Angaben der Gewitter bei den meisten Stationen ganz unvollständig. Sturmtage sind solche, an welchen die Windstärke über 8 notiert ist. Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergibt. Die Angaben von Trondhjem sind doch ziemlich vollständig.

Die Windverteilung ist direkt aus den notierten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Sonst gelten für die Übersichtstabellen dieselben Bemerkungen wie für den zweiten Teil.

Anhang I enthält die Abweichungen der Monatsmittel des Luftdrucks und der Temperatur vom Normalwert für beziehungsweise 10 und 18 Stationen. Die verwendeten Normalperioden sind für Luftdruck (1866—95) und für Temperatur (1841—90).

Anhang II gibt die Monats- und Jahresmittel der Temperatur des Ueberflächewassers für 10 Küstenstationen. Die Temperatur wird um 8 Uhr morgens gemessen.

Anhang III enthält die Beobachtungen an den norwegischen Radiostationen in Green Harbour, Spitsbergen, vom Juli 1921 bis Juni 1922, und auf Jan Mayen vom September 1921 bis Juni 1922 nebst Monats- und Jahresresuméen für das Jahr 1921.

Die stündlichen, aus den Registrierungen der Richard-Barographen herausgenommenen Luftdruckswerte sind auf die Angaben des Stationsbarometers reduziert. Die Thermographen stehen in norwegischen Hütten, und die stündlichen Temperaturwerte sind auf die Angaben eines dortigen Quecksilberthermometers reduziert.

Auf Jan Mayen sind Luftdruck- Temperatur- und Windbeobachtungen seit November 1921 auch um 2 Uhr nachts ausgeführt und hier unter den gewöhnlichen Terminbeobachtungen mitgenommen. Die Art des Niederschlags ist von dieser Station nur bei den gemessenen Höhen angeführt, und keine sonstigen Notierungen genacht. Darum ist die Bemerkungrubrik in den Terminbeobachtungen herausgenommen.

Anhang IV enthält die stündlichen Werte des Luftdrucks, der Temperatur und der Windstärke auf Haldde, nebst den Terminbeobachtungen im Laufe des Jahres 1922. Die Registrierung der Windrichtung ist misslungen.

Das Monats- und Jahresresumé findet sich, wie in den vorhergehenden Jahrbüchern, in der dritten Abteilung.

Kristiania, December 1923.
