INLEIDING

De 1966-editie van de statistiek van de meteorologische waarnemingen in de Nederlandse Antillen is de veertiende in de serie, die in 1953 begonnen is. De inhoud van deze publikatie werd in de loop van de jaren geleidelijk uitgebreid. Over 1966 zijn nu ook van de Beatrix Luchthaven, Aruba, de uurgemiddelden van de bewolking en de luchtdruk gegeven.

Wegens stopzetting van de radiosonde opstijgingen van 00.00 G.M.T. op het Juliana Vliegveld, St. Maarten, konden alleen de resultaten van 12.00 G.M.T. opgenomen worden. Wegens technische gebreken konden de resultaten van de minimum temperatuurwaarnemingen te Oranjestad, St. Eustatius, niet verwerkt worden. Tevens is gebleken dat deze gegevens over 1965 onbetrouwbaar zijn.

Voor het eerst zijn van de Dr. A. Plesman Luchthaven, Curacao, gegevens opgenomen betreffende de kunstmatige radioactiviteit van de lucht in pc/m3 (tabel VII-B). Het maximum van 4.00 pc/m3 werd gevonden op 10-11 oktober 1966 en was het gevolg van een Franse kern-explosie die in september 1966 in de Stille Oceaan werd gehouden.

Sinds het begin van de metingen, per 1 maart 1958 werd tot nu toe de hoogste piek gevonden op 26-27 februari 1960. De activiteit liep toen op tot 47,9 pc/m3 ten gevolge van proefnemingen met een Franse atoombom in Noord-Afrika. De metingen worden verricht in samenwerking met het K.N.M.I. te De Bilt.

REGENVAL

Uit tabel III blijkt, dat de neerslag op de Benedenwindse Eilanden boven normaal was, terwijl deze voor de Bovenwindse Eilanden beneden het gemiddelde bleef. Op Curacao, Aruba en Bonaire werd voor 1966 een eilandgemiddelde van de neerslag van resp. 161, 151 en 123% van de 1931-1960 gemiddelden gevonden. Voor St. Maarten, St. Eustatius en Saba bedroegen deze cijfers resp. 77, 83 en 73%.

De eilandgemiddelden zijn daarbij berekend uit de maandcijfers, waarin de maandtotalen van alle regenstations -- voor zover beschikbaar -- zijn verwerkt, ongeacht de plaatselijke dichtheid van het netwerk van regenstations. Alleen voor Curacao is voor de bepaling van het maandgemiddelde gebruik gemaakt van een geselecteerd aantal representatieve stations.

De frequentie van de neerslag (tabel VI) op de Dr. A. Plesman Luchthaven, Curacao, is uitsluitend gebaseerd op de uurlijkse waarnemingen zonder te letten op de vorm van de neerslag of de intensiteit ervan.

OPMERKINGEN

1. Evenals in de 1965-editie zal de inhoud van de tabellen van deze publicatie niet afzonderlijk worden besproken. Verwezen wordt naar de uitvoerige inhoudsopgave.

2. Alle druk-indicaties hebben betrekking op de luchtdruk gereduceerd tot zee-niveau. Voor St. Eu - [illegible] is de QFF gegeven: voor alle overige stations is de QNH vermeld. De verschillen tussen de QNH en de corresponderende QFF waarden zijn door de geringe hoogtes van de barometer boven zee verwaarloosbaar klein.

ORKAANSEIZOEN.

Het orkaanseizoen begon op 4 juni 1966 met de orkaan Alma en eindigde 13 november toen de orkaan Lois ten westen van Portugal verdween. Met vier tropische stormen en zeven orkanen was de activiteit voor 1966 iets boven normaal.

De tropische stormen Celia, Ella en Greta trokken resp. op 13 juli, 26 juli en 5 september ten noorden van St. Maarten langs. Alleen de storm Ella bracht op de Bovenwindse Eilanden regen van betekenis. De orkaan Faith passeerde op 26 augustus ten noorden van St. Maarten op een afstand van ongeveer 65 km. Behalve enkele plaatselijk zware buien was de neerslag gering.

De orkaan Inez trok ten zuiden van St. Eustatius langs op een afstand van ongeveer 135 km. Ook deze orkaan bracht op de Bovenwindse Eilanden minder regen dan men zou mogen verwachten. De laatste storing in de Caribische Zee was de zwakke tropische storm Judith, die op 30 september overging in een z.g. "easterly wave".
Voor de banen van de verschillende storingen in de omgeving van de Nederlandse Antillen wordt verwezen naar het kaartje op bladzijde 77 van deze publicatie.

CURACAO, Dr A. Plesman Luchthaven

De luchthaven is gelegen aan de noordkust van Curacao op een plateau dat 8 m boven zee-niveau ligt. De positie is 12°11' NB en 68°58' WL. De thermometerhut bevindt zich op 400 m van de kust en op 120 m van het midden van de startbaan. De windmeter is opgesteld op 10 m boven de grond en op een afstand van 170 m van de startbaan, die de richting 104° - 284° heeft. Van de aanwijzingen van de windmeter, de droge-bol thermometer en de natte-bol thermometer vindt een continue registratie plaats in de observatie-kamer van de meteorologische dienst in het stationsgebouw op het vliegveld. De barometer is opgehangen op 9 m boven de grond en 17,4 m boven zee-niveau. De Campbell-Stokes

zonneschijnmeter bevindt zich op het dak van het stationsgebouw, waar tevens de metingen van de kunstmatige radioactiviteit van de lucht worden verricht.

ARUBA. Beatrix Luchthaven

De luchthaven ligt aan de zuidkust van Aruba op 12° 30' NB en 70° 01' WL. De thermometerhut is opgesteld nabij het stationsgebouw op het op 300 m afstand van de kust en op 200 m afstand van de startbaan. De barometer hangt in de verkeerstoren op 2 m boven de officiële vliegveld hoogte en 20,3 m boven zee-niveau.
De windmeter staat op het dak van de verkeerstoren, 24 m boven de grond. De in de publicatie opgenomen windsnelheden werden niet voor deze hoogte gecorrigeerd. De registratie van de wind, de droge-bol temperatuur en de natte-bol temperatuur vindt plaats in de verkeerstoren.

BONAIRE. Kralendijk

De thermometerhut met geventileerde thermometers bevindt zich op 100 m van de westkust van Bonaire op normale hoogte boven de grond op 12° 09' NB en 68° 16' WL. De windvaan is in de nabijheid opgesteld op een hoogte van 10 m boven de grond, terwijl registratie van de wind plaats vindt in het kantoor van de Lands Radio- en Telegraafdienst ter plaatse. De barometer hangt 3.6 m boven zee-niveau.

ST. MAARTEN. Juliana Vliegveld.

Het vliegveld ligt op een smalle landtong aan de zuidwestzijde van St. Maarten op 18° 02' NB en 63° 07' WL. De thermometerhut staat op het dak van het stationsgebouw 7 m boven de grond. De barometer hangt 8.8 m boven zee-niveau, terwijl de windmeter staat opgesteld op de verkeerstoren 15 m boven de grond.

ST. EUSTATIUS. Oranjestad.

De thermometerhut is opgesteld nabij 17° 29' NB en 62° 59' WL op 200 m van de westkust van St. Eustatius, ongeveer 40 m boven zee-niveau. De windmeter, die zich aanvankelijk op een mast 8 m boven de grond bevond, werd in juli 1966 verplaatst naar het dak van het kantoor van de Lands Radio en Telegraafdienst en is nu 10 m boven de grond opgesteld.
De wind ter plaatse wordt in sterke mate beinvloed door de 600 m hoge, uitgedoofde vulkaan The Quill op 2.5 km afstand oostzuidoost van het station gelegen.

INTRODUCTION

The 1966-edition of the statistics of the meteorological observations in the Netherlands Antilles is the fourteenth in the series that started in 1953. The contents of this publication increased gradually in the course of years. Hourly means of cloudiness and pressure for the year of 1966 as observed at the Beatrix Airport, Aruba, have been included for the first time.

As the radiosonde ascents of 00.00 G.M.T. were discontinued at Juliana Airport, St. Maarten, only the results of the 12.00 G.M.T. observations are published. On account of a technical defect no minimum temperatures for Oranjestad, St. Eustatius are listed. At the same time it became evident that these data for 1965 are unreliable.

For the first time data concerning the artificial radioactivity of the air in pc/m3, as measured at Dr. A. Plesman Airport, Curacao, have been included. The maximum of 4,00 pc/m3 was found on 10-11 October, 1966, caused by a French nuclear explosion, which took place in the Pacific in September 1966.

Since the beginning of the measurements, as of 1 March 1958, the highest peak so far was observed on 26-27 February 1960. The activity increased to 47,9 pc/m3 in consequence of a test with a French atomic bomb in North-Africa.

The measurements are carried out in close cooperation with the Royal Netherlands Meteorological Institute at De Bilt.

RAINFALL

Table III shows that the precipitation in the Dutch Windward Islands was above normal, whereas the totals for the Dutch Leeward Islands were below normal during 1966.

At Curacao, Aruba and Bonaire an average rainfall per island of 161, 151 and 123% of the corresponding 1931-1960 means was found respectively. For St. Maarten, St. Eustatius and Saba these figures were 77, 83 and 73 % respectively.

The averages per island were derived from the monthly totals of all available rainstations, not taking into account the local density of the network.

For Curacao, however, a selection of representative stations was used. The frequency of the precipitation, given in table VI, is solely based on the hourly observations, disregarding the form of the precipitation and its intensity.

REMARKS

1. Like the 1965-edition the contents of the tables

in this publication will not be discussed one by one. Reference is made to the detailed table of contents.

2. All listed pressure values are reduced to sea-level. For St. Eustatius QFF is given; for all other stations QNH is indicated. The differences between QNH and the corresponding QFF values are negligible due to the low elevations of the barometers above sea-level.

HURRICANE SEASON

The hurricane season started on 4 June 1966 with hurricane Alma and ended 13 November when hurricane Lois vanished west of Portugal. With four tropical storms and seven hurricanes the activity for 1966 was slightly above normal.

Tropical storms Celia, Ella and Greta passed north of St. Maarten at 13 July, 26 July and 5 September respectively. Only tropical storm Ella produced some significant rainfall over the Dutch Leeward Islands.

Hurricane Faith travelled at a distance of about 65 K.M. north of St. Maarten on 26 August. Except for some local heavy showers, rainfall was small.

Hurricane Inez passed south of St. Eustatius at a distance of about 135 K.M. This hurricane too brought less precipitation over the Dutch Leeward Islands than expected.

The last disturbance in the Caribbean was the weak tropical storm Judith, which downgraded to easterly wave status on 30 September. The tracks of the mentioned disturbances in the vicinity of the Netherlands Antilles are shown in the chart as given on page 77 of this publication.

CURACAO. Dr A. Plesman Airport.

The airport is located at 12°11' N and 68°58' W on the northcoast of Curacao on a terrace 8 M. above sea-level. The thermometer screen is situated at 400 M. from the coast and 120 M. from the runway about halfway its length.

The windmeter is mounted 10 M. above ground-level at a distance of 170 M. from the centre line of the runway which is oriented 104° - 284°.

The wind, the dry-bulb temperature and the wet-bulb temperature are recorded in the meteorological offices in the terminal building of the airport. The barometer is suspended 9 M. above the official airport elevation and 17.4 M. above sea-level.

The Campbell-Stokes sunshine-recorder is located on the roof of the terminal building. The measurements of the artificial radioactivity of the air are taken on the roof as well.

ARUBA, Beatrix Airport.

The airport is situated on the southcoast of Aruba near 12°30' N and 70°01' W. The thermometer screen is located near the terminal building at a distance of 300 M. from the coast and 200 M. from the runway. The barometer is read at 2 M. above the official airport elevation and 20.3 M. above sea-level. The windmeter is mounted on top of the airport tower, 24 M above the ground. The published windspeeds are not corrected for this height. Temperatures and wind are recorded in the control tower.

Bonaire, Kralendijk.

The thermometer screen with ventilated thermometers is located near 12°09' N and 68°16' W at a distance of 100 M. from the westcoast of Bonaire. The windvane is mounted nearby at 10 M. above the ground and the wind is recorded in the office of the Radio Service. The barometer is read 3.6 M. above sea-level.

ST. MAARTEN, Juliana Airport.

The airport is situated on the southwestcoast of St. Maarten at 18°02' N and 63°07' W. The thermometer screen is placed on the roof of the terminal building, 7 M. above the ground. The barometer is read 8.8 M. above sea-level and the windmeter is placed on top of the control tower at 15 M. above the ground.

ST. EUSTATIUS, Oranjestad.

The thermometer screen is located near 17°29' N and 62°59' W at a distance of 200 M. from the westcoast of the island, roughly 40 M. above sea-level. The windmeter, at first mounted on top of a 8 M. high mast, was moved in July 1966 to the roof of the office of the Radio Service and is now at 10 M. above the ground.
The wind at the site of the station is materially affected by the vicinity of The Quill, a dead volcano, 600 M. high, 2.5 K.M. ESE of the station.

INTRODUCCION

La edición sobre 1966 de la estadística de las observaciones meteorológicas en las Antillas Holandesas es la décima cuarta en la serie, con la cual fué comenzada en 1953. El contenido de esta publicación ha sido extendido gradualmente en el curso de los años. Para el año 1966 han sido mencionados también los promedios horarios de la nubosidad y presión del Aeropuerto Beatrix en Aruba.

Por motivo de la suspensión de las ascenciones de radiosondeo de 00,00 H.M.G. en el Aeropuerto Juliana en St. Maarten, solamente los resultados de 12,00 H.M.G. pudieron ser insertados. Los resultados de las observaciones de la temperatura mínima en Oranjestad, St. Eustatius, no podían ser mencionados esta vez por causa de defectos técnicos. Ademas resultó que estos datos mencionados en la edición de 1965 no son de fiar.

Del Aeropuerto Dr. A. Plesman, Curazao, han sido insertados por primera vez datos tocante a la radio-actividad artificial del aire en pc/m3 (cuadro VII -B).

El máximo de 4,00 pc/m3 fué hallado el 10 a 11 de octubre de 1966 por causa de una explosión atómica francesa que tuvo lugar en el mes de septiembre de 1966 en el Océano Pacífico. Desde el comienzo de las mediciones, el primero de marzo de 1958, hasta ahora el pico más alto fué hallado el 26 a 27 de febrero de 1960. La radio-actividad aumentó entonces hasta 47,9 pc/m3 por causa de pruebas con una bomba atómica en el Africa del Norte.

Las mediciones son efectuadas en cooperación con el Instituto Meteorológico Real Holandes en De Bilt.

PRECIPITACION

Resulta del cuadro III que la precipitación en las Islas de Sotavento ha sido más de lo normal, mientras que en las Islas de Barlovento ésta quedó bajo del promedio. En Curazao, Aruba y Bonaire fué constatado para 1966 un promedio de la precipitación de respectivamente 161, 151 y 123% de los promedios del periodo 1931 - 1960. Para St. Maarten, St. Eustatius y Saba estas cifras eran respectivamente 77, 83 y 73%.

Los promedios de las islas han sido calculados en este caso de las cifras mensuales, en las cuales han sido contados los totales mensuales de todas las estaciones pluviométricas --por cuanto que éstas fueron disponibles -- sin tener en cuenta la densidad local de la red de estaciones pluviométricas.

Solamente para Curazao fueron selectadas algunas estaciones representativas para el cálculo del promedio mensual. La frecuencia de la precipitación (cuadro VI) en el Aeropuerto Dr. A. Plesman, Curazao, es basada solamente en las observaciones horarias sin tener en cuenta la forma o la intensidad de la precipitación.

NOTAS

1. Así como en la edición de 1965 el contenido de los cuadros en esta publicación no es discutido entre si. Para eso es referido al índice extenso.
2. Todas las indicaciones de la presión se refieren a la presión reducida a nivel del mar. Para St. Eustatius han sido mencionadas las cifras QFF; para las otras estaciones las cifras QNH. Las diferencias entre los valores QNH y los valores QFF correspondientes son mínimas por la poca elevación del barómetro sobre el nivel del mar.

TEMPORADA DE HURACAN

La temporada de huracán comenzó el 4 de junio de 1966 con el huracán Alma y acabó el 13 de noviembre cuando el huracán Lois desapareció al oeste de Portugal. Con cuatro tempestades trópicas y siete huracanes la actividad en 1966 era algo más de lo normal.

Las tempestades trópicas Celia, Ella y Greta pasaron respectivamente el 13 de julio, 26 de julio y 5 de septiembre al norte de St. Maarten. Solamente la tempestad Ella trajo sobre las Islas de Barlovento alguna lluvia de importancia. El huracán Faith pasó el 26 de agosto al norte de St. Maarten a una distancia de mas o menos 65 kilómetros. Con excepción de algunos aguaceros locales fuertes, la precipitación era poca. El huracán Inez pasó al sur de St. Eustatius a una distancia de mas o menos 135 kilómetros.
También este huracán trajo menos lluvia en las Islas de Barlovento que uno esperaría. La ultima interrupción en el Mar Caribe fué la tempestad trópica debil Judith, que se convirtió el 30 de septiembre en un "easterly wave". Para las rutas de los diferentes huracanes en el vecindario de las Antillas Holandesas se refiere al mapa en página 77 de esta publicación.

CURAZAO. Aeropuerto Dr. A. Plesman.

El Aeropuerto está situado en la costa norte de Curazao en una terraza que se halla a 8 metros sobre nivel del mar. La posición es 12°11' de latitud norte y 68°58' de longitud oeste. El abrigo meteorológico está montado a 400 metros de la

costa y a 120 metros del centro de la pista de despegue. El anemómetro está montado a 10 metros sobre la tierra y a una distancia de 170 metros de la pista de despegue, la cual tiene la dirección 104° a 284°. Una registración continua de las indicaciones del anemómetro, del termómetro seco y del termómetro mojado es hecha en el cuarto observador del servicio meteorológico en la estación del aeropuerto. El barómetro está montado a una altura de 9 metros y a 17,4 metros sobre el nivel del mar. El Campbell-Stokes autógrafo se halla en el techo de la estación, donde también se efectuan las mediciones de la radio-actividad del aire.

ARUBA, Aeropuerto Beatrix.

El aeropuerto está situado en la costa sur de Aruba a 12°30' de latitud norte y 70°01' de longitud oeste. El abrigo meteorológico está montado cerca del edificio de la estación a 300 metros de distancia de la costa y a 200 metros de la pista de despegue. El barómetro está colgado en la torre de control a 2 metros sobre la altura oficial del aeropuerto y 20,3 metros sobre nivel del mar. El anemómetro está en el techo de la torre de control, a 24 metros sobre la tierra. Las velocidades del viento mencionadas en la publicación no fueron corregidas para esta altura. La registración del viento, la temperatura del termómetro seco y la temperatura del termómetro mojado se efectua en la torre de control.

BONAIRE, Kralendijk.

El abrigo meteorológico con termómetros ventilados se halla a 12°09' de latitud norte y 68°16' de longitud oeste a 100 metros de la costa oeste de Bonaire a altura normal sobre la tierra. La veleta está montado allí cerca a una altura de 10 metros sobre la tierra, mientras que la registración del viento se efectua allí en la oficina del Servicio de Radiotelefonía y Radiotelegrafía del Gobierno. El barómetro está colgado a 3,6 metros sobre nivel del mar.

ST. MAARTEN Aeropuerto Juliana.

El aeropuerto está en una estrecha longuera en la parte sur oeste de St. Maarten a 18°02' de latitud norte y 63°07' de longitud oeste. El abrigo meteorológico está en el techo de la estación a 7 metros sobre la tierra. El barómetro se halla a 8,8 metros sobre el nivel del mar, mientras que el anemómetro está montado en la torre de control a 15 metros sobre la tierra.

ST. EUSTATIUS, Oranjestad.

El abrigo meteorológico está montado a 17°29' de latitud norte y 62°59' de longitud oeste a 200 metros de la costa oeste de St. Eustatius, mas o menos 40 metros sobre el nivel del mar. El anemómetro que se hallaba al principio en un mastil a 8 metros sobre la tierra, fué trasladado en el mes de julio de 1966 al techo de la oficina del Servicio de Radiotelefonía y Radiotelegrafía y está montado ahora a 10 metros sobre la tierra. El viento allí es influenciado en alto grado por la cercanía del volcán apagado, "The Quill", cual es 600 metros alto y a 2,5 kilometros ESE de la estación.

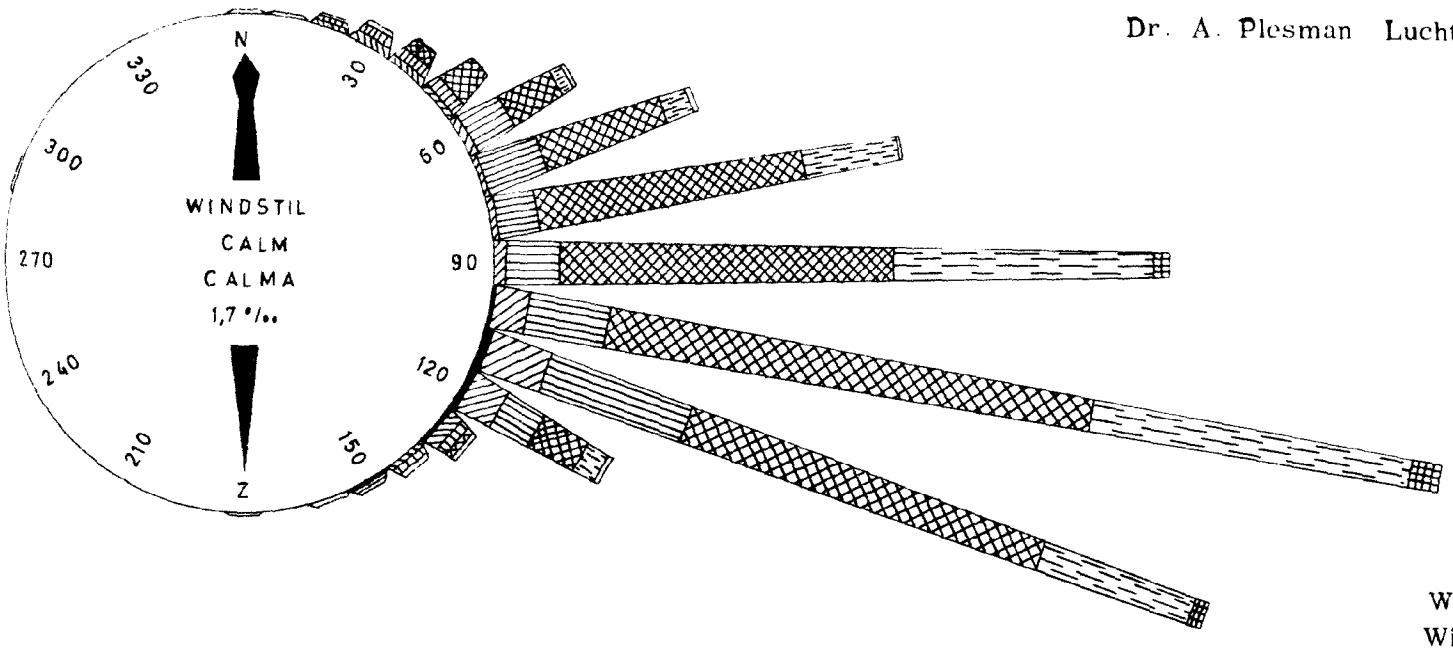
Dr. A. Plesman Luchthaven, Curacao



Windsnelheid
Wind velocity
Velocidad del viento

m/sec.	knopen/knots nudos
0.3 - 1.5	1 - 3
1.6 - 3.3	4 - 6
3.4 - 5.4	7 - 10
5.5 - 7.9	11-16
8.0 -10.7	17-21
10.8-13.8	22-27
13.9-17.1	28-33

Voor minder frequente windrichtingen
(170 ^{O} door West t/m 350 ^{O})
zijn de windsnelheden niet onderverdeeld
1 cm lengte komt overeen met 20 0/00

For the less frequent wind directions
(170^{O} West up to and incl. 350^{O})
the wind velocities have not been subdivided
1 cm. length corresponds to 20 0/00

Las velocidades del viento no son subdivididas
para las direcciones del viento menos frecuentes
(170 ^{O} por el Oeste hasta incl. 350^{O})
1 cm. longitud corresponde a 20 0/00

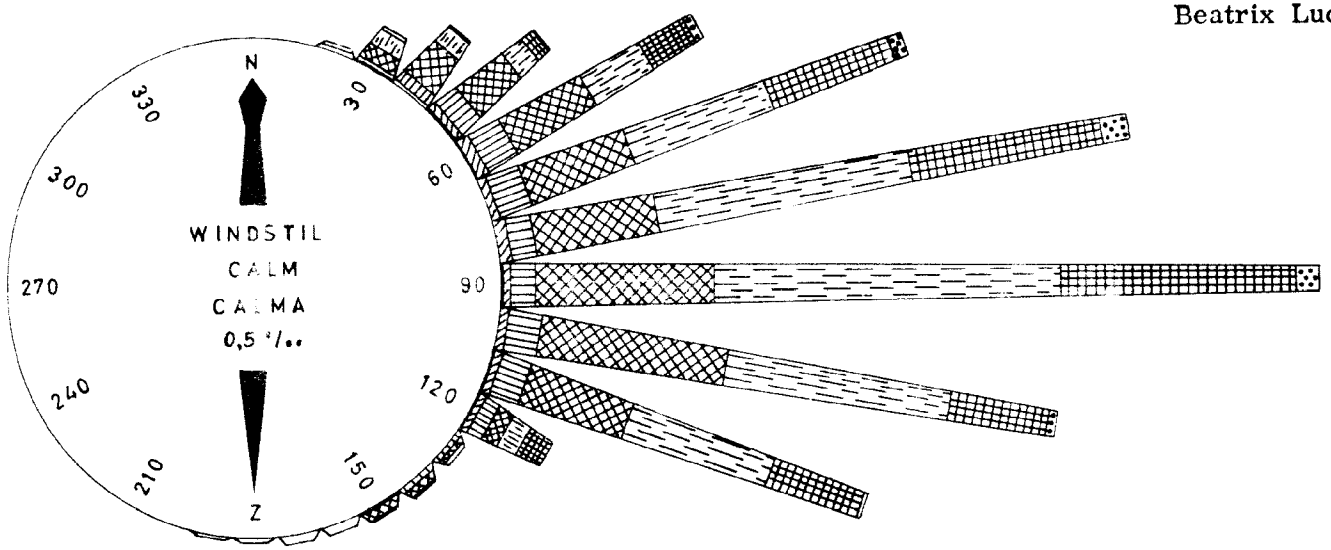
Beatrix Luchthaven, Aruba



Windsnelheid
Wind velocity
Velocidad del viento

m/sec.	knopen/knots nudos
0.3 - 1.5	1 - 3
1.6 - 3.3	4 - 6
3.4 - 5.4	7 - 10
5.5 - 7.9	11-16
8.0 -10.7	17-21
10.8-13.8	22-27
13.9-17.1	28-33
17.2-20.7	34-40

Voor minder frequente windrichtingen
(200°, door West t/m 10°)
zijn de windsnelheden niet onderverdeeld
1 cm lengte komt overeen met 20 0/00

For the less frequent wind directions
(200° through West up to and incl. 10°)
the wind velocities have not been subdivided
1 cm length corresponds to 20 0/00

Las velocidades del viento no son subdivididas
para las direcciones del viento menos frecuentes
(200° por el Oeste hasta incl. 10°)
1 cm longitud corresponde a 20 0/00

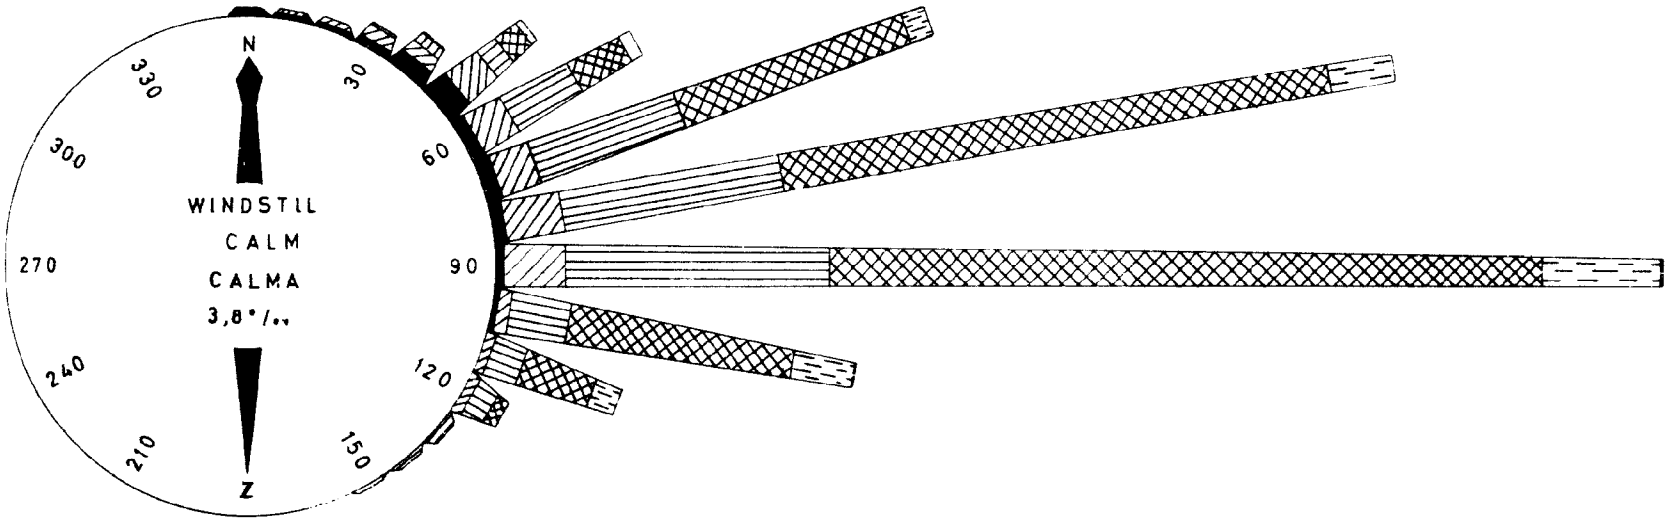
Kralendijk, Bonaire



Windsnelheid
Wind velocity
Velocidad del viento

m/sec.	knopen/knots nudos
0.3 - 1.5	1-3
1.6 - 3.3	4-6
3.4 - 5.4	7-10
5.5 - 7.9	11-16
8.0-10.7	17-21
10.8-13.8	22-27

Voor minder frequente windrichtingen
(160° door West t/m 350°)
zijn de windsnelheden niet onderverdeeld
1 cm lengte komt overeen met 20 0/00

For the less frequent wind directions
(160° West up to and incl. 350°)
the wind velocities have not been subdivided
1 cm length corresponds to 20 0/00

Las velocidades del viento no son subdivididas
para las direcciones del viento menos frecuentes
(160° por el Oeste hasta incl. 350°)
1 cm longitud corresponde a 20 0/00
