RECENT PAPERS BEARING ON METEOROLOGY

The following titles have been selected from the contents of the periodicals and serials recently received in the library of the Weather Bureau. The titles selected are of papers and other communications bearing on meteorology and cognate branches of science. This is not a complete index of all the journals from which it has been compiled. It shows only the articles that appear to the compiler likely to be of particular interest in connection with the work of the Weather Bureau.

SOLAR OBSERVATIONS

SOLAR AND SKY RADIATION MEASUREMENTS DURING MARCH, 1926

By HERBERT H. KIMBALL, Solar Radiation Investigations

For a description of instruments and exposures and an account of the method of obtaining and reducing the measurements, the reader is referred to the REVIEW for January, 1924, **52**: 42, January, 1925, **53**: 29, and July, 1925, **53**: 318.

From Table 1 it is seen that solar radiation intensities averaged above March normals at all three stations. At Washington, a noon reading of 1.53 gr. cal./min./cm,² on the 5th, is 3½ per cent higher than any intensity heretofore measured at that station in March, and 1⅓ per cent higher than the maximum that has been measured in any month.

Table 2 shows that the total solar and sky radiation received on a horizontal surface averaged above the March normal at all three stations, and decidedly above at Washington and Madison.

Skylight polarization measurements were not made at Madison on account of the presence of snow on the ground during nearly the entire month. At Washington, measurements made on six days give a mean of 61 per cent with a maximum of 66 per cent on the 5th. These are above the average March values for Washington.
