NOTE.—See General Remarks.

REVIEW.

INTERNATIONAL METEOROLOGY.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade.*]

With this REVIEW is issued chart iii., which exhibits the tracks of the more important atmospheric depressions that have appeared in the northern hemisphere during the month of June, 1881. This chart continues the series of international charts begun in November, 1877.

The following descriptions relate to chart ii. (formerly iv.), for the months of June and July, 1881, (which were issued with the SUMMARY for the respective months). This chart continues the series of international charts begun in January, 1877, and exhibits the mean pressure, mean temperature, and the prevailing direction of the wind in the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich mean time.

In the description of these charts much valuable information has been obtained from the "Monatliche Uebersicht der Witterung," published by Professor Dr. G. Neumayer, Director of the German Marine Observatory, Hamburg, Germany; and from the "Bulletin Mensuel," published by Mr. Marc Dechevrens, of Zi-Ka-Wei, China.

For the month of June, 1881, the mean atmospheric pressure was distributed as follows: The area of lowest mean pressures was indicated by the isobarometric line of 29.4 (746.7), and occupied a small territory in British India between the states of Cashmere and Rajputana, which included Lahore, where the mean pressure was 29.39 (746.5). In that part of India lying between N. 20° and 30° the mean pressure ranged from 29.43 (747.5) to 29.54 (750.3). South of the twentieth parallel it ranged from 29.7 (754.4) to 29.75 (755.6). Over Greenland and Iceland the mean pressure was 29.77 (756.1) in the former and 29.73 (755.1) in the latter. Over European Russia and at stations in Sweden, on the shores of the Gulf of Bothnia, the mean atmospheric pressure ranged from 29.7 (754.4) to 29.8 (756.9). In the Black sea region it was above 29.8 (756.9). In Canada, Ireland, Scotland, and in the eastern part of Europe, excluding Russia, the mean pressure ranged from 29.8 (756.9) to 29.9 (759.4). In the United States, east of the ninetieth meridian, in England, and in central Europe it ranged from 29.9 (759.4) to 30.0 (762.0); over the greater part of France and the Iberian peninsula it was above 30.0 (762.0). Over the Atlantic ocean south of the fiftieth parallel, and from W. 60° eastward to the European coasts, the mean atmospheric pressure was above 30.0 (762.0); the area of barometric maxima being situated over the Azores, in which region the pressure ranged from 30.15 (765.8) to 30.3 (769.6).

Compared with the preceding month (May, 1881,) there has been a general decrease of pressure throughout the United States, except in the Florida peninsula, where there has been a slight rise. In Canada the decrease of pressure has averaged .14 inch, and was greatest in the Maritime Provinces. Over the continent of Europe and the British Isles, there has been a decrease of pressure; the decrease was greatest in northern Europe and in Russia, and was least in the southern and western parts of the continent. In Asia, from the Urál mountains eastward to Japan, there has been a decrease of pressure ranging from .1 inch in Japan and British India to .2 inch in Siberia and China.

Compared with the corresponding month of previous years, the mean atmospheric pressure is below the normal in all parts of the United States, except in the northern sections of Wisconsin and Michigan. In Canada, the pressure was below the normal, the departure being greatest in the Maritime Provinces.

The following table shows the mean pressure and the mean temperature, with corresponding departures, for the month of June, 1881, in the several countries of the eastern hemisphere, compared with the means as determined from observations taken during the years 1877, 1878, 1879, and 1880:

Countries.	Mean pressure.			Mean temperature.		
	June, 1877, 1878, 1879, 1880.	June, 1881.	Departure.	June, 1877, 1878, 1879, 1880.	June, 1881.	Departure.

In the United States the mean temperature of the air was below the normal from Lake Superior eastward to the Atlantic coast, and southeastward to North Carolina. Elsewhere the mean temperature was above the normal, the greatest departures occurring in the Gulf states and in the eastern Rocky mountain slope. On the Pacific coast the temperature was from normal to 3° below the normal. In Europe the mean temperature of the air was slightly below the normal.

Referring to the temperature in China, Mr. Marc Dechevrens, in the "Bulletin Mensuel," for June, 1881, states:

> At Zi-Ka-Wei the maximum temperature of the 6th did not exceed 72°.5 Fahr. (22°.5 Cent.), yet, at Chang-Kia-Chuang (Tientsin, Pekin), the thermometer reached 110°.5 Fahr. (46°.3 Cent.) in the shade; but this high temperature was fortunately accompanied by an extreme dryness of the air (7 per cent. at 7 p. m.).

In British India the highest mean temperature reported was 100°.4 Fahr. (38°.0 Cent.) at Lahore, and the lowest was 76°.2 Fahr. (24°.6 Cent.) at Belgaum.

The following are some of the extreme mean temperatures reported at isolated stations for the month:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Freetown, Africa	85.8	29.9	Godthaab, Greenland	40.6	4.8
Bridgetown, Barbadoes	84.1	28.9	Fort Saint Michael, Alaska	41.0	5.0
Tashkend, Asia	83.5	28.6	Stykkisholm, Iceland	47.3	8.5
Manila, Philippine Islands	83.5	28.6	York Factory, B. A	50.0	10.0

In the United States the prevailing wind directions were as follows: Generally southwesterly in the country between the Atlantic and the ninetieth meridian and south of the fortieth parallel; northerly in the western, and easterly and northeasterly in the eastern part of the lake region; northerly in New England; southerly and southeasterly in Texas and the Rocky mountain region, and westerly and southwesterly on the Pacific coast. In Canada the prevailing winds were northerly and northwesterly in the western part of the Dominion; in the Maritime Provinces they were generally southerly and southwesterly. Over the Atlantic ocean the prevailing winds were mostly southwesterly from the coast of North America northeastward to the British Isles; over the region between W. 15° and 45° and N. 20° and 40° the winds were mostly northeasterly. In the British Isles the prevailing winds were southerly and southwesterly; in central Europe they were mostly northwesterly; in France and the Netherlands they were northerly, westerly, and southwesterly, the westerly predominating. In Russia the winds were mostly westerly and northwesterly, except in the Black sea region, where they were southerly. At Zi-Ka-Wei, China, the prevailing wind was southeasterly; in Japan it was southerly.

The rainfall during the month of June, 1881, in the United States was much below the average in the country east of the one hundred and fifth meridian and south of the thirty-ninth parallel; it was also below the average in Minnesota, Wisconsin, and Michigan. In the country north of N. 39° and east of W. 89°, except in the states named above, the precipitation was in excess of the average. In Canada it was above the average. In Europe it was generally below the average. At Zi-Ka-Wei, China, rain fell on fifteen days, the total precipitation for the month being 6.70 inches, or 170.3 millimetres.

In July the distribution of mean atmospheric pressure over the northern hemisphere was as follows: The mean pressure was lowest in the northern and northwestern provinces of British India, where it ranged from 29.43 (745.5) to 29.49 (749.0). In northeastern and central India the pressure ranged from 29.50 (749.3) to 29.56 (750.8), and over the country south of N. 20° it ranged from 29.7 (754.4) to 29.8 (756.9). In Greenland, Iceland, northern Scandinavia, and the eastern half of European Russia, from the Arctic ocean to the Caspian sea, the mean pressure was below 29.7 (754.4). In Siberia and the whole of the Chinese Empire the pressure ranged from 29.52 (749.8) to 29.7 (754.4). In the United States there were two areas of comparatively low pressure; the first of these was situated in southern California and Arizona, and was inclosed by the isobarometric line of 29.8 (756.9); the second area occupied the region near Hudson's bay, the mean pressure at York Factory being 29.78 (756.4). The isobar of 29.8 (756.9) extended over northern Scotland, the Scandinavian peninsula, except the extreme northern and southern parts, and over western Russia southward to the Black sea. The line of 29.9 (759.4) extended from eastern Canada northeastward over the Atlantic and through the northern parts of Ireland and England eastward to the Baltic, thence southward to Austro-Hungary. In the United States, south of the lake region and east of the hundredth meridian, the mean pressure ranged from 30.0 (762.0) to 30.07 (763.8). Over the whole of central and southern Europe it ranged from 30.0 (762.0) to 30.1 (764.5), except over a small area in Spain, where it was slightly below 30.0 (762.0).

The most marked area of barometric maxima was that of the Atlantic; it was indicated by the isobar of 30.1 (764.5), and covered the ocean from the northwestern coast of Africa westward to the fifty-second meridian, and from N. 18° northward to N. 45°. The centre of the high area was in the Azores, where the mean pressure was 30.35 (770.9). The second area of high pressures, inclosed by the isobar of 30.1 (764.5), occupied the Bay of Biscay and stretched southeastward over southwestern France to the Pyrenees.

The following table shows the mean pressure and the mean temperature, with corresponding departures, for the month of July, 1881, in the several countries of the eastern hemisphere, compared with the means as determined from observations taken during the years 1877, 1878, 1879, and 1880:

Countries.	Mean pressure.			Mean temperature.		
	July, 1877, 1878, 1879, 1880.	July, 1881.	Departure.	July, 1877, 1878, 1879, 1880.	July, 1881.	Departure.

Compared with the chart for the preceding month (June, 1881,) there has been an increase of pressure ranging from .01 to .1 inch over the United States, the region of greatest increase comprising the country between the eighty-ninth and ninety-fifth meridians. In Canada the mean pressure was slightly lower than for the preceding month. In Europe the changes were as follows, viz.: an increase over the southern part of the British Isles, and over the whole of central and southern Europe; over the Scandinavian and Danish peninsulas the pressure has decreased about .05 inch, and in European Russia it has remained unchanged. In Greenland it has decreased about .08 inch. In Asia there has been a slight in-

crease of pressure over British India, but in Siberia, China, and Japan there has been a decrease.

Compared with the corresponding month of previous years, the mean atmospheric pressure is slightly below the normal over that part of the United States east of the Mississippi river and south of the fortieth parallel; elsewhere the pressure is slightly above the normal.

In the United States the mean temperature of the air was from 1° to 4° below the normal over the country west of the the one hundred and seventh meridian; eastward of that meridian the temperature ranged from normal in the middle Atlantic states and in the upper Mississippi valley to 2° above the normal in the Ohio valley and Tennessee.

In Europe the mean temperature was above the normal, except in Denmark and in Scandinavia, where it was slightly (less than 1°) below the normal. In connection with this subject may be mentioned the remarkably high temperatures (in many cases unprecedented) which prevailed throughout Europe during this month. In England and Denmark the highest temperatures of the month occurred on the 15th; in central and western Europe the maxima were registered during the period from the 17th to the 20th, inclusive. In Spain and Portugal the highest temperatures were recorded on the 24th and 25th; in Italy on the 6th, and in Russia on the 27th and 28th.

The following notes and data referring to this subject are taken from "Symons' Monthly Meteorological Magazine," for August, 1881:

The exceptional temperatures, in England, were very local, and were confined to the southern part of England. July 5th was a hot summer day; temperatures slightly exceeding 90° were recorded at several stations, and over the greater part of England it was the hottest day of the month; but none of the temperatures observed on that day were unprecedented. The remarkable feature of the month was the temperature reached on July 15th, in a belt of country extending from Wiltshire, through the north of Hampshire, north Surrey, west Kent, Middlesex, Essex, Suffolk, and Norfolk.

The following data are taken from tables published by Mr. Symons, giving the highest maximum temperatures and dates at several of the principal cities of Europe:

6th: Rome, Italy, 94°.8 Fahr. (34°.9 Cent.). 12th: Christiania, Norway, 81°.0 Fahr. (27°.2 Cent.). 15th: Greenwich, England, 97°.1 Fahr. (36°.2 Cent.); Copenhagen, Denmark, 86°.5 Fahr. (30°.3 Cent.). 16th: Vienna, Austria, 92°.3 Fahr. (33°.5 Cent.). 17th: Avignon, France, 101°.1 Fahr. (38°.4 Cent.). 18th: Bordeaux, France, 102°.4 Fahr. (39°.1 Cent.). 19th: Paris, (Montsouris), France, 99°.0 Fahr. (37°.2 Cent.); Paris, (Parc St. Maur), 101°.1 Fahr. (38°.4 Cent.); Geneva, Switzerland, 96°.6 Fahr. (35°.9 Cent.). Brussels, Belgium, 95°.4 Fahr. (35°.2 Cent.). 20th: Berlin, Germany, 94°.5 Fahr. (34°.7 Cent.); Hamburg, Germany, 87°.3 Fahr. (30°.7 Cent.). 24th: Lisbon, Portugal, 93°.9 Fahr. (34°.4 Cent.). 25th: Madrid, Spain, 102°.6 Fahr. (39°.2 Cent.). 27th: Saint Petersburg, Russia, 82°.9 Fahr. (28°.3 Cent.). 28th: Moscow, Russia, 92°.5 Fahr, (33°.6 Cent.).

In the south of England the hottest day was on the 15th; on that day the temperature reached or exceeded 100° Fahr. (37°.8 Cent.) at the following French stations: Paris, 100° Fahr. (37°.8 Cent.); Nancy, 101°.1 Fahr. (38°.4 Cent.); Nantes, 101°.5 Fahr. (38°.6 Cent.); and Biarritz, 100°.4 Fahr. (38°.0 Cent.).

The following are additional data to those given above: 19th, France, Charleville, 100°.4 Fahr. (38°.0 Cent.); Le Mans, 101°.7 Fahr. (37°.7 Cent.); Belgium, Arlon, 96°.8 Fahr. (36°.0 Cent.); Maeseyck, 99°.1 Fahr. (37°.3 Cent.).

In British India the highest monthly mean temperature reported was 93°.5 Fahr. (34°.2 Cent.) at Lahore, and the lowest was 71°.1 Fahr. (21°.7 Cent.) at Belgaum. At Zi-Ka-Wei, China, the absolute maximum temperature of the month was 97° Fahr. (36°.1 Cent.), and occurred on the 25th; the minimum was 76°.1 Fahr. (19°.5 Cent.) on the 8th.

The following are some of the extreme monthly mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Tashkend, Asia	88.5	31.4	Godthaab, Greenland	43.0	6.1
Athens, Greece	86.4	30.2	Stykkisholm, Iceland	50.4	10.2
Beirut, Syria	86.2	30.1	Gjaesvaer, Finmark, Norway	52.0	11.1
Nassau, Bahamas	85.2	29.6	York Factory, B. A.	56.0	13.3

In the United States the prevailing directions of the wind were as follows: Between the eightieth and ninetieth meridians, from west to north; in the south Atlantic states, southwesterly; in the middle Atlantic and New England states southwest, west, and northwest. Over the country, from W. 90° to W. 110°, the prevailing winds were generally southerly and southeasterly. On the Pacific coast they were westerly and northwesterly. In Canada they were westerly and southwesterly. Over the Atlantic, from the coast of North America northeastward to the European coasts, the winds were mostly southwesterly. Over the Azores, and within the region of the barometric maxima, viz., from the northwestern coast of Africa westward to W. 50°, and between N. 20° and 45°, the winds were mostly northeasterly; south of N. 20° they were northeasterly.

In the British Isles the prevailing winds were westerly and southwesterly; throughout central Europe they were southwesterly, and from west to northwest. At Zi-Ka-Wei, China, it was southeasterly, and in Japan the prevailing directions were southerly and southwesterly.

The rainfall during the month was below the average in the United States east of the hundredth meridian, except in the upper Mississippi valley, the upper lake region, the south Atlantic states, and the Florida peninsula. The deficiency was greatest in the Ohio valley and in Tennessee. There was a slight excess in the north Pacific coast region. The rainfall was slightly below the normal in the northern, and about normal in the southern parts of central Europe.

Chart ii. (formerly v.) exhibits the tracks of barometric minima for the month of June, 1881, which have been traced from the daily international charts. On this chart is also shown the track of the second typhoon that occurred in the China sea during the season of 1881.

The data are charted for each day of the month on the maps accompanying each issue of the INTERNATIONAL BULLETIN, and from these charts and from additional reports are traced the movements of the centres of barometric minima.

Twenty-two depressions in the northern hemisphere have thus been traced for the month of June, 1881. Their general distribution was as follows:

Six appeared in the United States and Canada; all of these pursued an east-southeasterly course over the country north of the fortieth parallel. No storm has been traced over the region west of the Rocky mountains during the month. Number v. is the only depression traced over the ocean after leaving the North American continent; it moved north-northeastward to Iceland, and extended its influence over the northern part of Great Britain and over northern Scandinavia.

Nine depressions are shown over Europe; three of these moved from west to east over the country south of the forty-eighth parallel, while the remaining six prevailed north of the fiftieth parallel, their movement being mostly from southwest to northeast. Depression xii. was remarkable for the persistence with which it remained over central Europe, having continued for ten days between the meridians of 15° and 35° east longitude. Depression xiv. originated in Greenland, and moved southward to N. 51°, where it remained for several days, materially affecting the weather conditions over the British Isles. Seven depressions are traced in Asia; four of these appeared in the eastern part of the continent and three in Siberia; of the latter, two were continuations of storms that were first observed in Europe.

The following are brief descriptions of the depressions traced in the United States and Canada:

I.—On the 2d, an area of low pressures stretched from the Lake Superior region southeastward to the south Atlantic coast. In the lower lake region clear weather prevailed, while in the upper lake region and on the Atlantic coast, from North Carolina to New York, the weather was generally cloudy with frequent, and occasionally heavy, rains. On the 3d, the centre of least pressure was in northern Illinois; the areas of cloud and rain now included the lower lakes, while to the west-

ward fair weather obtained. During the 3d, the disturbance moved eastward along the fortieth parallel, and by the 4th, it was central off the New England coast, the pressure having decreased as the disturbance neared the ocean. On the 4th, heavy rains occurred along the Atlantic coast and in the Maritime Provinces, and continued until the 5th, on which date an improvement took place in the weather, and the disturbance moved northeastward to the Gulf of Saint Lawrence. On the 5th, the pressure began to increase, and by the following day the depression had filled up over the Gulf.

II.—During the 6th and 7th, the pressure remained uniformly low over the central part of the United States, but on the 8th, the disturbance became well-defined and was indicated by the isobar of 29.8 (756.9), which stretched from northern Texas to Indiana. On the 8th, rain became general over the country from Missouri eastward to the Atlantic coast, and thunder-storms were of frequent occurrence. On the 9th, the low area, having become contracted and circular in form, was central in West Virginia; during the day it moved off into the Atlantic, attended by moderate gales along the coast and at sea. On the 10th, it was central near N. 39°, W. 71°, and appears to have moved northeastward, causing rainy weather in the Maritime Provinces. By the 11th, the depression had filled up, and clearing weather set in.

III.—This was a small but well-defined depression which appeared in Dakota on the 11th, and was accompanied by heavy rains. It apparently moved northward, and united, on the 12th, with low area iv., which was then moving from British America toward Minnesota. On the 12th, severe hail-storms and tornadoes occurred in Kansas, Missouri, and Iowa, and caused great loss of life and destruction to property.

IV.—On the morning of the 12th, this disturbance occupied Manitoba and the Lake Superior region. On the 13th, it was central near the northern shore of Lake Superior, causing rain at stations in the eastern quadrants. During the 13th and 14th, the disturbance moved in an easterly direction along the Saint Lawrence, and by the 15th, it was central near the western part of the Gulf, attended by rainy weather and moderate breezes. On the 16th, the disturbance moved to Newfoundland, where it appears to have gradually filled up.

V.—This disturbance first appeared in Dakota on the 15th. It moved with decreasing pressure east-southeastward to Minnesota, where it was central on the 16th. During the day it continued its east-southeasterly course over the lake region, causing heavy rains and thunder-storms in the eastern quadrants; and on the morning of the 17th, it was central, with increased pressure, over Lake Erie. During the 18th and 19th, it remained over the Saint Lawrence valley and the Maritime Provinces, causing unsettled and showery weather in those districts. On the 21st, the storm-centre was apparently to the south of Nova Scotia; by the following day it had passed slowly along the coast of Nova Scotia, and was central to the eastward of Cape Breton island. During the 22d, it moved over the Atlantic, and on the 23d, was shown near N. 51°, W. 45°; on that day the s. s. "Nova Scotian," in N. 49° 02′, W. 47° 08′, reported barometer 29.26 (743.2), wind wnw., force 5, drizzling; and the s. s. "Circassian," in N. 54° 34′, W. 42° 00′, reported barometer 29.46 (748.3), wind ese., force 5, overcast. On the 24th, the storm-centre was probably to the southwest of Iceland, the barometer at Stykkisholm reading 29.30 (744.2), a fall of .47 inch in twenty-four hours; the temperature rose several degrees and the wind shifted to southeast and increased to a fresh gale with rain. On the 25th, the disturbance was central near the west coast of Iceland, the pressure having further decreased to 28.89 (733.8), the wind shifting to southwest and moderating to force 2. On the 26th, the depression maintained nearly the same position as on the preceding day, but the pressure had increased about .13 inch. During the 25th and 26th, there was a uniform decrease of pressure over the British Isles, and cloudy weather and rain prevailed, more particularly in the northwestern districts. On the 27th, the disturbance passed to the northeastward of Iceland, the wind having shifted to northwesterly over that island. During the 28th and 29th, the storm-centre apparently remained over the ocean between Iceland and the Scandinavian peninsula, but the depression was filling up, although unsettled and showery weather still prevailed in the extreme northern part of Scotland and in the Scandinavian peninsula.

Note.—In connection with the depression (v.), attention is called to the remarks under "Errata," page 14, of this BULLETIN.

VI.—This disturbance is not shown on the chart for the 22d, but its position has been indicated from the following vessel-report, which appears sufficiently reliable to justify a notice of the disturbance: The bark "Justin H. Ingersoll," in N. 34° 24′, W. 75° 00′, on the 22d, reported: "noon, wind se.; at 3 p. m. it hauled to ene., and then backed again to se.; weather threatening, with torrents of rain and heavy swell from all directions; barometer 29.8 (756.9), vessel under lower topsails. At 5 p. m. it became calm, then the wind suddenly struck out from the nw. with great violence, blowing away sails and throwing the vessel on her beam ends. At 7 p. m. the wind hauled to n. and increased in fury; obliged to cut away the mainmast to save the vessel; barometer 29.2 (741.7). The hurricane lasted until 9 p. m., when it moderated to a ne. gale. Other data are too meagre to admit of a tracing of the subsequent course of this storm.

VII.—This disturbance probably developed in the Saskatchewan valley on the 26th, and moved by a southeasterly course to eastern Minnesota, where it was central on the 27th. Rainy weather prevailed in the lake region and in eastern Canada on the 27th, and by the 28th, the low area extended from Lake Superior to the Saint Lawrence valley; in the latter region, numerous thunder-storms and heavy rains occurred. During the 28th, the disturbance moved, by a course slightly south of east, to the Maritime Provinces, where it was central on the 29th, the barometric pressure having decreased at the centre. On the 30th, the depression was central near the southern coast of Newfoundland. No unusual storm-energy was displayed during the progress of the disturbance. On the 30th, vessels east of the central depression reported moderate southerly gales.

The following descriptions refer to the storms that appeared in Europe:

VIII.—This disturbance appeared near the Ural mountains on the 1st, and was a continuation of the depression described as low area xvii. of the May chart. By the 2d, it had moved slowly east-northeastward, and on the 3d, was central northeast of Barnaul, Siberia, barometer 29.27 (743.4), wind south, force 4. After the 3d, the disturbance disappeared beyond the stations of observation.

IX.—On the 2d and 3d, a large depression existed off the coast of northern Scandinavia, causing higher temperatures and rainy or cloudy weather over that region. It apparently moved southeastward with decreasing pressure, and on the 4th, it was central south of Archangel, where the barometer read 29.09 (738.6). On the 5th, 6th, and 7th, it moved eastward into Siberia and beyond the stations of observation, having caused strong southwesterly winds and higher temperatures in northeastern Russia and in Siberia.

X.—This depression appeared central between the Färöe Islands and Norway on the 5th, the region of least pressure being inclosed by the isobar of 29.2 (741.7). Moderate to fresh northwesterly breezes prevailed over the northern part of Scotland, accompanied by showery weather; the winds were southerly and southwesterly in the southern, and easterly in the northern part of the Scandinavian peninsula, and remained moderate in force. By the 6th, the storm-centre had moved to the White sea, where it disappeared, while another depression developed off the Norwegian coast.

XI.—This depression developed off the Norwegian coast on the 6th, immediately after the passage of x., and was probably a secondary development of that depression. On the 7th,

the disturbance was central in southern Norway, while a small subsidiary area, which formed over the southern part of the North sea on the 6th, had moved northeastward and united with the central depression, where the pressure was now below 29.15 (740.4). Fresh to strong northwesterly winds and rainy weather prevailed over the British Isles and the western part of the continent, while over the Baltic and the Gulf of Bothnia, the winds were southerly and southeasterly. By the morning of the 8th, an increase of pressure had set in over the British Isles and the southern part of Scandinavia, and the depression moved northward, and finally disappeared off the extreme northern coast of Norway.

XII.—This depression was closely connected with low areas x. and xi., and was remarkable on account of the erratic course and exceedingly slow movement of the centre over the continent. Under the influence of low area xi., the pressure remained low over the whole of central Europe on the 7th. On the 8th, a recovery set in over the western part of the continent, and the area of low pressure was transferred to eastern Prussia and the Austrian Empire. On the 9th, the depression extended from the Baltic southeastward to the Black sea, the barometric readings being lowest over the former sea. Within the area of low pressures, and also over the country to the westward, very heavy rains occurred on the 8th and 9th, the winds shifted to north and northwest, and a considerable fall in temperature occurred over western Europe, while southeasterly winds and higher temperatures prevailed in western Russia. On the 10th, the centre of disturbance was between Wilna and Kieff, causing strong southwesterly winds on the northern shores of the Black sea. The pressure continued to increase in the region west of the centre, while it decreased at the centre of disturbance; in consequence, the barometric gradient became steeper and the northwesterly winds increased in force over eastern Germany and Denmark, but moderated in France. During the 11th, 12th, and 13th, the depression remained in western and central Russia, between Moscow and the Baltic Provinces, the winds in central Europe being controlled by the movements of the disturbance, and the weather remaining cloudy and rainy. On the 14th, the storm-centre was near Kasan, eastern Russia; it then appears to have recurved toward the west, as, on the 15th, the region of least pressure was again near Moscow. On the 16th and 17th, it remained in central Russia, near Moscow, causing moderate northeasterly winds in the Baltic Provinces of Russia; the pressure began to increase slowly, and on the last-mentioned date, the disturbance was indicated by the isobar of 29.8 (756.9), which presented an elongated appearance and stretched from E. 30° eastward beyond the Ural mountains. The depression hereafter described as low area xviii. was probably a continuation of this disturbance.

XIII.—This disturbance developed over the Gulf of Genoa on the 6th and 7th, on which days the whole of Europe was under the influence of low area xi. On the 7th, the centre of this disturbance was near Milan, whence it moved northeastward to Austria and became merged in low area xii. on the 8th.

XIV.—The barometer was low in Greenland for several days prior to the 11th, but on that day a further decrease of pressure occurred, and on the 12th, the disturbance was central to the westward of Iceland, where fresh to strong southerly gales prevailed, the wind having shifted to northwest in Greenland. During the 12th, the centre of depression appears to have moved nearly due southward, and on the 13th, it was near N. 54°, W. 25°. The s. s. "Hermann," in N. 49° 26′, W. 24° 49′, reported barometer 29.44 (747.8), wind ssw., force 8, overcast; and the s. s. "Britannic," to the west of the centre, in N. 48° 57′, W. 32° 36′, reported barometer 29.76 (755.9), wind nnw., force 6, rainy. On the 14th, the disturbance moved slowly eastward, causing a decrease of pressure with strong southeasterly winds in Ireland. On the 15th, the storm-centre was near N. 50°, W. 21°; the pressure had decreased slightly near the centre, and a corresponding decrease occurred over the British Isles. During the 16th and 17th, the depression remained persistently off the west coast of Ireland, causing unsettled and rainy weather in the British Isles and in France. On the 18th, the disturbance moved into Ireland and the rain-area extended to the eastern shores of the North sea. On the 19th, the storm-centre moved northeastward with increasing pressure, and on the following day, it was to the northward of Scotland, causing strong southerly and southwesterly breezes at stations in southern Scandinavia. On the 21st, the disturbance apparently dissipated in northern Scandinavia, but no decided increase of pressure occurred in the districts after the passage of the centre, owing to the advance of low area xv.

XV.—This disturbance appeared on the 20th over the ocean at some distance southwest of Ireland; on that date the s. s. "Braunschweig," in N. 49° 42′, W. 16° 38′, reported barometer 29.22 (742.2), wind sse., force 4, raining; and the s. s. "Köln," in N. 49° 15′, W. 19° 35′, barometer 29.33 (745.0), wind wnw., force 4-5, cloudy. During the day the disturbance moved, with decreasing pressure, north-northeastward along the Irish coast and caused heavy rains in Ireland, and showery, unsettled weather in Great Britain, accompanied by a general rise in temperature. On the 21st, the storm-centre was near the northern coast of Ireland, where the barometric readings ranged from 29.02 (737.1) to 29.16 (740.6). On the 22d, the depression was between the Shetlands and the Färöe Islands. It moved northeastward along the Norwegian coast, and on the 23d, it was central in northern Scandinavia, causing rainy weather and fresh southerly and southwesterly gales over the Gulf of Bothnia. On the 24th, the disturbance disappeared in the Arctic ocean north of Lapland.

XVI.—From the 23d to the 27th, an area of high pressure occupied the British Isles and central Europe, but on the 25th, it began to give way in the northern part of the British Isles, under the influence of low area v. On the 26th, there was also a slight decrease of pressure in Austro-Hungary; the disturbance, which was very slight, moved east-northeastward on the 27th and 28th, and dissipated near the Black sea on the last-mentioned date.

XVII.—This disturbance, which was also unimportant, developed over the Gulf of Genoa on the 26th. It passed in a southeasterly course through Italy and disappeared over the Adriatic on the 28th. On the 28th, an area of high pressure began to spread over western Europe, and at the close of the month, it occupied the central part of the continent.

XVIII.—This disturbance was probably a continuation of low area xii. On the 18th, the position of the storm-centre could not be definitely located, but on the 19th, it became well-defined near Kasan, where the barometer read 29.58 (751.4). The depression moved eastward, and on the 20th, it was central in the Ural region, barometer at Ekaterinburg 29.35 (745.5). During the 21st and 22d, it passed northeastward into northern Siberia and beyond the stations of observation.

The following descriptions are given of the storms traced in Asia:

XIX.—This disturbance moved from southwestern China on the 3d, and was central near Zi-Ka-Wei on the 4th. On the 5th, the depression was central over the Yellow sea; moving eastward over the island of Niphon, it disappeared in the Pacific on the 6th. Very heavy rains fell at Zi-Ka-Wei on the 4th and 5th, after the passage of the centre.

XX.—This depression moved northeastward from central China on the 9th, and was central over the Gulf of Pe-Chi-Li on the 10th. On the 11th, the centre was probably in the northern part of Corea, whence it moved northeastward to Tartary and disappeared on the 12th.

XXI.—This depression followed immediately in rear of xx., but pursued a more southerly course than its predecessor. It passed into the Yellow sea on the 13th, and moved over the southern part of the peninsula of Corea. On the 14th, it reached Niphon, and disappeared to the eastward over the Pacific.

XXII.—This disturbance probably originated in central China; it moved northeastward, and on the 18th and 19th, was

central in the Gulf of Pe-Chi-Li. On the 20th and 21st, it passed northeastward to Amoor and beyond the stations of observation.

The following notes, relating to the second typhoon of 1881 (June 26th—July 5th), are taken from Mr. Marc Dechevrens' "Typhoons of the Chinese Sea in 1881":

The typhoon moved from the region of Mindanao on the 25th and 26th, and passed along the eastern coasts of the islands to the latitude of Manila. On the 28th, it lay to the east of that town and turned aside from its original track to avoid the high mountains of Luzon. It is clear that the high mountain chain that runs along the eastern coast of Luzon repelled the typhoon, though its first direction would have led it to the same place on the eastern coast of China. The centre passed Manila on June 28th, when the barometric pressure was 29.5 (749.3). Before the passage of the centre, with the wind blowing from northeast and north-northwest, there was but little rain; after the passage, the wind blew from south-southwest and south, and there was a heavy rainfall (six inches during the night of 28–29). This is easily accounted for. The polar winds, on passing over the high mountains to the north of Manila, were almost entirely deprived of moisture, whilst, on the equatorial winds being forced up the sides of the same mountains, there must have been a considerable condensation, and consequently a diluvial rain on the southern side of the chain.

On July 1st, about midnight, the typhoon crossed the twentieth parallel, on the one hundred and seventeenth meridian (east), and, passing to the right of Hong-Kong, it entered the continent a few miles below Swatow on the morning of the 2d. During the passage of the disturbance from Manila to Swatow there was no casualty at sea worth noticing.

After reaching the continent the atmospheric depression seemed about to fill up. In front of it, at Hankow, no rain fell whatever, but to the right hand of the track, at Foo-Chow, Ning-po, at Zi-Ka-Wei, and at sea, there were heavy rains on July 3d and 4th. After remaining on the Chinese continent, during the 2d, 3d, 4th and 5th of July, it again took to the sea between Foo-Chow and Ning-po in about N. 28°. At sea the south and southwest winds blew rather hard, but along the Chinese coast the winds continued to blow feebly until the typhoon had left the continent. The disturbance appeared to have dissipated after reaching the ocean, as there were no indications of it in Japan.

The velocity of the typhoon in the first part of its track was about seven miles an hour, having left Luzon on the morning of June 29th and reached Swatow on July 2d (about 510 miles in 72 hours). It appears afterward to have traveled at about ten miles an hour. Manila was near the centre, and had probably to bear the greatest violence of the wind. The mean velocity of the wind on June 28th, between 7 and 9 p. m., was 81.4 miles an hour; it even reached 90.2 miles an hour during some of the squalls. At Swatow the typhoon did considerable damage to the houses near the river and destroyed several jetties; most of the buildings on the Swatow side were inundated to a depth of three feet. In Manila bay one vessel dragged her anchors and had to cut away masts to avoid collision.

GENERAL REMARKS.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are applied at this office. In the naval and marine series, corrections for temperature and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz.: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in metres per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometres per hour, to metres per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations. In the MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS the position of stations (latitude and longitude) are obtained from Keith Johnston's "Index Geographicus," except where more exact information is furnished. The elevations of stations are obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms, upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the originals, is carefully computed at this office. Generally all conversions are made at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

INTERNATIONAL CHARTS ACCOMPANYING THE DAILY BULLETIN AND MONTHLY SUMMARY.

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted. Broken lines indicate that the lines so broken are doubtful.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

Arrows show the direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
→	1, 2	0 to 9	0 to 4
→	3, 4	9.1 to 22.5	4.1 to 10.1
→	5, 6	22.6 to 40.5	10.1 to 18.1
→	7, 8	40.6 to 67.5	18.1 to 30.2
→	9, 10	67.6 up.	30.2 and over.

International chart iii. shows tracks of centres of low barometer. Storm-tracks in red. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date. Broken or dotted lines are doubtful.

The following remarks relate to the individual peculiarities in the *methods* of recording and the *times* of taking the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of General Maritz, Commandant Supérieur du Génie in Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of

Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemburg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind direction is given to 32 points and weather by the Beaufort notation.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Town the barometer is given on the original as corrected for temperature only. Upper and lower clouds are given on a scale of 0 to 10, and the kind occasionally indicated by abbreviating Poëy's classification.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation. At Hankow the originals give the barometer in inches, temperature in Fahrenheit, and force on a scale of 0 to 10.

DANISH SERIES (furnished by co-operation of Captain N. Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Mont Louis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Mont Louis and Perpignan. At Guéret the observations are taken at 12 m., instead of 12.16 p. m.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms. At Berlin observations are taken at 2 p. m., instead of 1.02 p. m.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchina, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by co-operation of I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (by authority of the Secretary of Public Works—furnished by co-operation of Señor Mariano Barcena, Director of the Central Meteorological Observatory in the City of Mexico, and respective observers).—All conversions (subject to correction at this office) are published as given in the originals. The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred.

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiana).—The originals give the barometer

in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimètres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At Astrakhan the barometer-cistern is below sea-level. The movement of the air is indicated by velocity in metres per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols.

SCOTTISH SERIES (furnished by co-operation of Alexander Buchan, M. A., F. R. S. E., Secretary of the Scottish Meteorological Society at Edinburg, and respective observers).—The originals give the barometer as read off and the movement of the air as indicated by force on a scale of 0 to 6. Distinction is made between upper and lower clouds as to degree, and the amount of cloudiness is given on a scale of 0 to 10. The direction of upper clouds is given separately. The rainfall, temperature, and humidity are not given at North Unst. The wind direction is given to 32 points.

SPANISH SERIES (furnished by co-operation of Antonio Aguilar, Director of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 4 p. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of Professor E. Plantamour, Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of Professor C. V. A. van Dyck, Superintendent of the Lee Observatory at Beirut.)—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in metres per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Office, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota and Navassa the barometer is corrected for temperature only; at Puerto Berrio is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea-disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

SWEDISH NAVAL SERIES (furnished by co-operation of E. Malmburg, Director of the Nautical Meteorological Bureau at Stockholm).—The originals give the barometer as read off. The movement of the air is indicated by force on a scale of 0 to 12, and the direction is corrected for magnetic variation at this office. The humidity is not given, but is computed from the hygrometrical observations. The rainfall is omitted. The height of the sea-swell is given on a scale of 0 to 9 and the weather by the Beaufort notation.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operation of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the number of days for which observations are at hand within the respective squares, and the total number of simultaneous observations reported on those days, (3) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather-maps.

ERRATA.

On the chart for June 24th, 1881, the area of lowest readings should appear in Iceland. The isobarometric line of 29.4 (746.7)

should cover the western part of Iceland, while the lines of 29.6 (751.8) and 29.8 (756.9) should run northeastward between Iceland and the Färöe Islands.

On the chart for June 25th, 1881, the area of least pressures should be in Iceland, and should be indicated by the isobarometric line of 29.0 (736.6). Southward and eastward of this region the pressure increases until the isobar of 29.6 (751.8) is reached; this line should run north-northeastward between the Färöe Islands and the Shetlands. The isobar of 29.8 (756.9) should include Scotland only, and not parts of Ireland and England, as indicated on the chart.

The line of 30.0 (762.0) remains unchanged.

Daily Bulletin, January 1st, 1881, page 5, Russian Series, Saint Petersburg, reduced barometer, 30.73 inches, should read 29.73 inches.

Daily Bulletin, May 1st, 1882, page 2, French, Mont-Louis, humidity, 84, should read 94.

2d, page 1, Austro-Hungarian, Kremsmunster, actual barometer, 729.0 mm., should read 728.0 mm.; page 5, United States, the direction of clouds at the following stations should be: Moorhead, upper; Morgantown and Mount Washington, lower; Nashville and New Haven, upper.

3d, page 1, Canadian, Halifax, velocity, 11 miles, should read 14 miles.

8th, page 3, Japanese, Tokei, temperature, 59°.3 Fahr., 15°.0 Cent., should read 59°.0 Fahr., 15°.3 Cent.

14th, page 4, United States, Cheyenne, velocity, 10.0 metres, should read 9.8 metres.

17th, page 3, Japanese, Nobiru, velocity, 0.3 miles, should read 10.3 miles; page 8, Miscellaneous, "Antonio Lopez," N. 30° 11′, should read N. 30° 01′.

18th, page 7, American Steamship Co., s. s. "Indiana," longitude, E., should read W.; Hamburg-American Packet Co., s. s. "Bohemia," latitude, N. 40° 39′, should read N. 49° 39′.

21st, page 1, Canadian sub-series, Saint John's Newfoundland, reduced barometer, 29.42 inches, should read 30.42 inches.

22d, page 8, Miscellaneous, s. "Ismir," latitude N. 64° —′, should read N. 6° 40′.

26th, page 3, Portuguese, Saint Paul de Loando, temperature, Fahr., 74°.3, should read 76°.3.

28th, page 4, United States, Champaign, temperature, Cent., 19°.6, should read 10°.6.

NOTE.—See General Remarks.

REVIEW.

INTERNATIONAL METEOROLOGY.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade.*]

With this REVIEW is issued chart iii., which exhibits the tracks of the more important atmospheric depressions that have appeared in the northern hemisphere during the month of July, 1881. This chart continues the series of international charts begun in November, 1877.

The following description relates to chart ii. (formerly iv.), for the month of August, 1881, (which chart was issued with the SUMMARY for that month). It continues the series of international charts begun in January, 1877, and exhibits the mean pressure, mean temperature, and the prevailing direction of the wind, in the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich mean time.

In the description of these charts, much valuable information has been obtained from the "Monatliche Uebersicht der Witterung," published by Professor, Dr. G. Neumayer, Director of the German Marine Observatory, Hamburg, Germany; and from the "Bulletin Mensuel," published by Mr. Marc Dechevrens, of Zi-Ka-Wei, China.

For the month of August, 1881, two areas of barometric minima are shown on the chart; these are both enclosed by the isobarometric line of 29.6 (751.8), and are situated, the one in the Scandinavian peninsula, where the mean pressure ranges from 29.57 (751.1) to 29.6 (751.8); the other in British India, where the pressure ranges from 29.49 (749.0) at Lahore, to 29.59 (751.6) at Nagpur. In southern Scandinavia, northern Russia, and northern Siberia the mean atmospheric pressure was below 29.7 (754.4). In North America the isobar of 29.8 (756.9) occupies the Hudson's Bay region, while that of 29.9 (759.4) is shown over the northwestern part of the United States and British America; elsewhere in the United States the pressure ranges from 29.9 (759.4) to 30.08 (764.0).

The most marked area of barometric maxima is that indicated by the isobar of 30.2 (767.1), which occupies the Azores. In Europe the region of greatest pressures occupies western and southwestern France and the eastern part of the Bay of Biscay; within that region the barometric means range from 30.0 (762.0) to 30.08 (764.0). In Algeria the mean pressure is above 30.0 (762.0).

The following table shows the mean pressure and the mean temperature, with corresponding departures, for the month of August, 1881, in the several countries of the eastern hemisphere, compared with the means as determined from observations taken during the years 1877, 1878, 1879, and 1880:

Countries.	Mean pressure.			Mean temperature.		
	Aug., 1877, 1878, 1879, 1880.	Aug., 1881.	Departure.	Aug., 1877, 1878, 1879, 1880.	Aug., 1881.	Departure.
Algeria	30.00	30.03	normal	89.4°	92.0°	+2.6°
Austria	29.89	29.89	normal	74.2	76.3	+2.1
British Isles	29.84	29.82	—0.02	63.4	61.4	—2.0
Denmark	29.84	29.71	—0.13	65.4	60.4	—5.0
France	29.94	29.98	+0.04	74.7	72.4	—2.3
Germany	29.92	29.87	—0.05	70.2	68.1	—2.1
India	29.62	29.59	—0.03	82.7	82.3	—0.4
Italy	29.94	29.93	—0.01	81.9	82.3	+0.4
Norway	29.83	29.57	—0.26	64.2	59.0	—5.2
Portugal	30.00	30.03	+0.03	80.1	85.4	+5.3
Russia	29.85	29.77	—0.08	71.4	71.4	normal
Spain*	29.94	29.98	+0.04	81.1	82.9	+1.8
Sweden	29.85	29.62	—0.23	65.1	59.2	—5.9

* Means for 3 years only.

Compared with the preceding month, (July, 1881,) there has been an increase of pressure in the United States east of the one-hundredth meridian, except in Florida and on the shores of the Gulf of Mexico; from the hundredth meridian westward to the Pacific coast there has been a slight decrease of pressure. In Europe the pressure has decreased throughout the continent, the decrease being most marked in the British Isles, Denmark, and the Scandinavian peninsula, and least in Russia. In Algeria there has been a slight decrease of pressure; in China, Japan, and in British India there has been a slight increase.

Compared with the corresponding month of previous years the mean atmospheric pressure is generally normal or slightly below over the entire country, except in the middle Pacific coast region and in the upper lake region, where it is slightly above the normal. In Canada it was generally above the normal.

The accompanying table shows the deviations in pressure and temperature at isolated stations during the month of August, 1881, as compared with the means of four years:

Stations.	Mean pressure.			Mean temperature.		
	Aug., 1877, '78, '79, '80.	Aug., 1881.	Departure.	Aug., 1877, '78, '79, '80.	Aug., 1881.	Departure.
Gibraltar	29.96	30.03	+ 0.07	79.4°	83.7°	+ 4.3°
Malta, Mediterranean Sea	29.94	.....	.....	84.2	84.6	+ 0.4

* Mean for three years only.

In the United States, the mean temperature of the air was from 0°.5 to 3°.0 above the normal in all districts east of the hundredth meridian, except in Florida, where it was normal. West of the above-mentioned meridian, the mean temperature was from 3°.1 to 5°.1 below the normal, except in the south Pacific coast region, where it remained normal. In Europe, the temperature was generally below the normal, except in the southern peninsulas and in Austria, where it was slightly above. In British India, the highest mean temperature reported was 88°.6 Fahr. (31°.4 Cent.) at Lahore, and the lowest was 71°.5 Fahr. (21°.9 Cent.) at Belgaum.

The following are some of the extreme mean temperatures reported at isolated stations for the month:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
Athens, Greece	90.1°	32.3°	Godthaab, Greenland	41.7°	5.4°
Beirut, Turkey in Asia	89.4	31.9	York Factory, B. A	47.3	8.5
Tiflis, Caucasia, Russia	87.6	30.7	Stykkisholm, Iceland	48.9	9.4
Bridgetown, Barbadoes	84.6	29.2	Thorshavn, Faroe Islands	52.5	11.4

In the United States, the prevailing winds were southerly and southeasterly over the country between W. 90° and 100°, and from the Gulf of Mexico northward to Manitoba. In the lake region, they were generally northerly; on the Atlantic coast and in Florida, they were northeasterly and easterly; elsewhere the winds were variable. In Canada, the prevailing winds were mostly westerly and southwesterly. Over the north Atlantic ocean, the winds were as follows: from the seventieth meridian eastward to W. 35°, southerly and southwesterly; near the Azores, northeasterly; north of the Azores, from W.

35°, eastward to the European coasts, it was generally westerly. At Zi-Ka-Wei, China, the wind was easterly, and in Japan it was southerly.

In the United States, the rainfall of the month was very much below the average, causing a severe drought in nearly all parts of the country, except in Florida, the east Gulf, and in Minnesota, where the rainfall was in excess of the average. In Europe, the rainfall was everywhere above the average.

Chart iii. (formerly v.) exhibits the tracks of barometric minima for the month of July, 1881, which have been traced from the daily international charts. This chart also exhibits the tracks of three typhoons that occurred in the China sea during the month.

The data are charted for each day of the month on the maps accompanying each issue of the INTERNATIONAL BULLETIN, and from these charts and from additional reports are traced the movements of the centres of barometric minima.

Twenty-eight depressions have been traced in the northern hemisphere for the month of July, 1881. They were distributed as follows: Seven appeared in the United States and Canada, four of these originated in the northwest and moved in an east-southeasterly direction across the country; the remaining depressions prevailed in the lake region and in eastern Canada. Two storms have been traced from the Maritime Provinces northeastward to northern Europe, and thence into Siberia, and six have moved from southwest to northeast over the British Isles. Two depressions moving northeastward are traced in northwestern Europe, while two have prevailed in the southern part of the continent. Two depressions, in addition to those mentioned above, originated off the Norwegian coast and moved northeastward over the peninsula. Of the depressions shown in Asia, three are continuations of storms which appeared first in Europe and moved into Siberia; three are traced in eastern Asia, and one in Japan.

The following are descriptions of the depressions shown on the chart:

I.—This was probably a continuation of low-area vii. of the June chart. At the close of June the disturbance was central near Newfoundland; by July 1st it had moved northeastward to about N. 53°, W. 50°, in which region the pressure was below 29.6 (751.8). On the 1st there was a destructive easterly gale in the Straits of Belle Isle; nearly all the small craft in the various harbors were destroyed, and several large vessels were driven ashore and totally wrecked. On the 2d the disturbance was central to the southeastward of Greenland; on the 3d it was between Iceland and the Faröe Islands. During the day it moved eastward, and on the 4th the centre was shown in Scandinavia. This disturbance is hereafter described as low-area ix.

II.—This depression appeared in the Saskatchewan valley on the 3d, and on the 4th, was central in Manitoba. Moving in an easterly track north of the lakes the centre of disturbance reached eastern Ontario on the 5th, where it was accompanied by higher temperatures, but with slight precipitation. On the 6th the disturbance passed off the coast into the Atlantic, and ceased to exist as a distinct area of low pressure. No high winds occurred during the passage of this depression.

III.—This depression developed over the Maritime Provinces, where, on the 4th, the pressure was below 29.8 (756.9). On the 5th, the centre of disturbance was off the southeast coast of Nova Scotia, having caused heavy rains in that province during the 4th. By the morning of the 6th, the storm-centre had moved to the northeastward of Newfoundland, and on the 7th, it was near N. 58°, W. 38°. During the day, the disturbance moved slowly northeastward, and, on the morning of the 8th, it was to the southwestward of Iceland. During the 9th, 10th, and 11th, the depression hovered near Iceland, and the winds increased somewhat in force in the southern and eastern quadrants; on the last-mentioned date, a decided decrease of pressure occurred, the barometer at the centre of disturbance, which was then in Iceland, reading 29.08 (738.6). On the 12th, the depression passed to the northward of Iceland, with constantly diminishing pressure at the centre, which was now indicated by the isobar of 29.0 (736.6); on the 13th, the disturbance moved slowly eastward with slightly increased pressure, and by the 14th, it was off the extreme northern coast of Norway, the lowest barometric readings being inclosed by the isobarometric line of 29.4 (746.7). During the progress of this disturbance over the ocean no violent winds were reported. This disturbance in its course over the land-areas, is hereafter described as xiii.

IV.—This depression appeared in British America, north of Dakota, on the 7th; it moved eastward and on the 8th was central northeast of Fort Garry, Manitoba, attended by brisk to high winds in the western quadrants. During the day, the depression disappeared and was immediately followed by an area of barometric maxima.

V.—During the 11th, the atmospheric pressure began to decrease in Manitoba, and in the northwestern part of the United States, and by the 12th, the isobar of 29.8 (756.9) included within its limits the Lake Superior region. On the 13th, the region of least pressure was in the Saint Lawrence valley, where it was attended by westerly and southwesterly winds and a decided rise in temperature. During the day, the depression moved eastward, followed by cooler weather and northerly winds, and on the 14th, it was central over the Gulf of Saint Lawrence; during the day, showery weather prevailed in the Maritime Provinces, while the wind reached the force of a moderate gale over the Gulf. On the 15th, the depression passed to the eastward of Newfoundland, causing moderate gales to the eastward. During the 16th and 17th, vessels between 50° and 30° west longitude reported moderate to strong southwest to northwest gales, but the data are not sufficient to warrant a further tracing of this disturbance.

VI.—On the 17th, the pressure fell below 29.6 (751.8) in the Maritime Provinces and eastern Quebec, and showery weather prevailed throughout those provinces. The disturbance remained nearly stationary until the 19th, and during this time, the area of disturbance extended southward to the New England states, and the rainy weather, accompanied by moderate winds, continued. On the 20th, the depression dissipated over the Gulf, but on the following day, the increase of pressure was checked by the advance of low-area vi *a*.

VI *a*.—This depression appeared in Ontario on the 20th, causing light rains there; it moved east-southeastward into Quebec, where it was central on the 21st. On the 22d and 23d, it remained central off the coast of Nova Scotia, and on the 24th, it disappeared to the northeastward of Newfoundland, having caused during its passage heavy rains in the Maritime Provinces, and moderate gales in the Gulf of Saint Lawrence.

VII.—This depression appeared in Dakota on the 19th, and moving southeastward, became central in the southeastern part of that state on the 20th, on which date, cloudy or rainy weather prevailed at stations east of the centre. On the 21st, the disturbance was central, with slightly increased pressure, in Iowa; on the 22d, it occupied the country north of N. 35° from Illinois eastward to the Atlantic, the lowest barometric readings being in southern Indiana, while the rain-area extended to the south Atlantic states.

VIII.—This depression appeared in the lower lake region on the morning of the 25th, causing showery weather and thunderstorms in western Canada. On the 26th, the depression was in Ontario; on the following day it remained over the Saint Lawrence valley, but the pressure had begun to increase, and during the day the depression filled up.

The following descriptions refer to the depressions that appeared in Europe:

IX.—This was a continuation of low-area i. described above; on the 3d the disturbance was central north of the British Isles, causing strong southerly winds in Scandinavia and rainy weather with westerly winds in Scotland. On the 4th the centre of disturbance passed over Scandinavia to the western shore of the Gulf of Bothnia; rain continued in Scandinavia, in northern Scotland, and at stations on the shores of the

Baltic, and the winds were fresh to strong in force. On this day a small depression, 29.6 (751.8), was shown near Iceland, but it filled up during the day without exhibiting any special energy. On the 5th the area of low pressures (ix.) extended from Finland eastward to the Ural mountains, the region of least pressure being between Saint Petersburg and Archangel; moderate to strong westerly and northwesterly winds and rainy weather with lower temperature prevailed at stations west of the centre. On the 6th the position of the storm-centre remained unchanged, but the pressure had decreased about .2 inch, and the northwesterly winds increased to strong gales over the Baltic and the Gulf of Bothnia, while rainy weather continued at stations in central and eastern Russia.

X.—This was an extensive depression which on the 6th occupied the whole of Scotland and England, except the southwestern part of the latter country. Strong northerly and northwesterly winds occurred at stations west of the centre and over the English Channel. During the day the disturbance moved slowly northeastward with decreasing pressure, and on the 7th it was central near the west coast of southern Norway. The pressure having increased rapidly over western Europe the barometric gradient became somewhat steep, and strong westerly winds, increasing to moderate gales, prevailed over the North Sea and at stations in Denmark and northern Germany. On the 8th the depression moved northward and disappeared off the Norwegian coast.

XI.—This was a slight disturbance that appeared in the Saint George's Channel on the 8th; it moved northeastward, causing showery weather, but was unaccompanied by high winds. On the 9th the disturbance was central over the Skager Rack, where it apparently dissipated during the day.

XII.—This disturbance appeared in west Russia on the 10th, and caused rainy weather in that region; during the 11th and 12th, it moved slowly northeastward, and on the latter date, the region of least pressure was in central Russia. Fresh northerly winds prevailed in the northwestern part of the country; in the southern quadrants of the depression, the winds were between west and south, and were moderate to fresh in force. On the 13th, the pressure began to increase, and by the 14th, the depression had disappeared.

XIII.—This was a continuation of low-area iii. before described. On the 14th, the disturbance was central in northern Scandinavia, the region of least pressure being enclosed by the isobar of 29.4 (746.7). Rain fell at stations in Scandinavia, and strong westerly breezes to fresh gales occurred at the northern stations. By the 15th, the depression having moved by a course slightly south of east, was central in the neighborhood of the White sea, and on the 16th, it was in eastern Russia, where it ceased to exist as a distinct low-area.

XIV.—This depression appeared over the ocean to the west of Norway on the 15th, on which date moderate to fresh westerly and southwesterly breezes prevailed in Scotland and in southern Scandinavia, and a slight but general rise occurred in temperature. During the 15th, the disturbance moved eastward, with decreasing pressure, over Scandinavia, and by the morning of the 16th, it was shown as a large depression extending from the White sea southeastward to the Caspian sea. Fresh to strong northerly and northwesterly gales occurred at Swedish stations, on the shores of the Gulf of Bothnia, and cooler northwest winds prevailed over the greater part of the British Isles. On the 17th, the depression was central over the White sea, the barometer at Archangel reading 29.16 (740.7), wind southwest, while the strong northwesterly winds continued over the Gulf of Bothnia and in Sweden. During the 18th and 19th, the disturbance remained in northern Russia, finally disappearing in the Arctic regions on the last mentioned date.

XV.—This disturbance appeared in the Bay of Biscay on the 19th; it advanced northeastward through France and Germany, causing unsettled and showery weather in the British Isles and northwestern Europe, but was not attended by high winds. On the 20th, the disturbance probably united, when over the North sea, with depression xvi. then advancing toward the Norwegian coast.

XVI.—This depression appeared between the Shetland and Faröe Islands on the 20th; it moved eastward and on the 21st, was shown in Scandinavia; the region of least pressure enclosed by the isobar of 29.4 (746.7). Rain fell at stations in southern Scandinavia, and moderate to fresh westerly and northwesterly breezes prevailed west of the centre of depression. On the 22d, the disturbance was in Lapland where it disappeared, being replaced on the following day by an area of relatively high pressures.

XVII.—This disturbance appeared in southern France on the 20th; moving eastward during the day, it passed into northern Italy where it was central on the 21st. It then moved to Austro-Hungary, and disappeared in the Black sea region on the 23d.

XVIII.—This disturbance developed apparently off the northwest coast of Scotland; it moved eastward and was central in the northern part of that country on the 22d, attended by moderate to fresh southerly and southwesterly winds and rainy weather. On the 23d, the disturbance having moved over the North sea, was central in southern Norway; on that date, the barometric pressure was high over the Gulf of Bothnia and Sweden, and during the day, the depression appears to have filled up in Norway.

XIX.—On the 24th, the circulation of the winds in the British Isles indicated the presence of a depression to the westward of Scotland and north of Ireland; during the day rain fell at stations in the British Isles, and on the eastern shores of the North sea, but the winds remained moderate. On the 25th, the disturbance, which had moved northeastward with decreased pressure, was central over the North sea, where it exhibited increased energy. Fresh to strong easterly and southeasterly gales prevailed in Denmark and in southern Scandinavia, while in Scotland, the wind blew strongly from west and northwest. The storm-centre moved northward along the Norwegian coast, with constantly decreasing pressure, the centre being enlosed by the isobar of 29.4 (746.7) on the 26th, and fresh to strong southerly winds and rainy weather prevailed at the Swedish stations and on the Baltic. On the 27th, the disturbance disappeared in northern Scandinavia, but the increase of pressure which occurred after the passage of the centre was checked by the immediate advance of low-area xx.

XX.—This depression advanced from the English Channel northeastward through France to Belgium, where it was central on the 26th. On this date, general rains occurred in France and Belgium, and at a few stations in England, and the winds remained light or moderate, except in the southern quadrants, where they blew with the force of a moderate gale. On the 27th, the storm-centre was in southern Sweden, where the barometric readings were below 29.25 (742.9). On the 28th, the depression was central in Sweden, attended by general rains and causing moderate westerly gales in the southern, and easterly gales in the northern quadrants. On the 29th, the disturbance passed off the northwestern coast of Norway into the Arctic ocean.

XXI.—This depression appeared over the western part of the Mediterranean on the 26th, and moved with slowly decreasing pressure to northern Italy, where it was central on the 27th. The course then changed to southeastward and the disturbance gradually dissipated over the Adriatic on the 28th.

XXII.—On the 28th, the wind in Ireland shifted to south and blew strongly, accompanied by rain, and the pressure began to diminish somewhat rapidly, indicating the advance of a depression from the westward. During the day, the disturbance moved northeastward along the Irish and Scottish coasts, and on the 29th, it was central near the Shetlands, where it probably combined with low-area xx., then off the Norwegian coast, the two forming an extensive area of low pressures over the ocean north of the sixtieth parallel of latitude.

XXIII.—On the 30th, there was a general decrease of press-

ure over the British Isles and western Europe. On the 31st, the decrease became more marked, the region of least pressure occupying Great Britain, the Irish sea, and the northwestern part of Ireland. Within this area, the lowest barometric readings were 29.22 (742.2) at Liverpool, and 29.27 (743.4) at Sheffield. Heavy rains occurred in the British Isles, except in the extreme northern part of Scotland, and strong southwesterly winds prevailed over the English Channel and at stations on the northwest coast of France.

XXIV.—On the 1st, a barometric depression occupied eastern Russia, and extended beyond the Ural mountains into Asia. Moving east-southeastward, the region of least pressure, 29.37 (746.0), was shown near Akmolinski, western Siberia, on the 2d. During the 3d and 4th, the disturbance moved slowly northeastward through Siberia, where the barometer remained low for several days.

The following descriptions refer to the depressions traced in Asia:

XXV.—This disturbance was apparently central near the Gulf of Pe-Chi-Li, on the 2d. It moved eastward over the sea of Japan and on the 3d, it was central in the island of Niphon; during the 4th and 5th, the pressure gradually increased and the disturbance disappeared in the sea of Japan. This depression was probably closely connected with the typhoon traced on chart iii. for June, 1881.

XXVI.—This disturbance moved from central China on the 10th; on the 11th, the centre of depression was south of Pekin, where the barometric pressure was 29.56 (750.8). Moving eastward, the storm-centre reached the Gulf of Pe-Chi-Li, on the 12th, causing a southerly gale at Cheefoo. On the 13th, the disturbance disappeared to the north of Corea. This disturbance occasioned very high temperatures in northern China during its passage.

XXVII.—This depression probably developed from the remains of the typhoon traced as ii. (July 10th-17th). On the 18th, the disturbance was central over the southern part of the sea of Japan; during the 19th and 20th, it hovered near the islands of Japan, attended by gradually increasing pressure, and without exhibiting any storm-energy. On the 21st, it disappeared, moving probably into the Pacific.

XXVIII.—This depression appeared to the north of Pekin on the 28th; it moved by a southeasterly course over the Gulf of Pe-Chi-Li, and on the 29th, it was central over the Yellow sea, and at the close of the month, it was apparently in the peninsula of Corea.

The following notes on the three typhoons that occurred in the China sea during July, 1881, are taken from Mr. Marc Dechevren's "Typhoons of the Chinese Sea, 1881:"

I.—(July 6th to 11th.) This typhoon appears to have formed to the west of Mindanao, Philippine Islands, on the 5th or 6th. On the 7th, it was near N. 12°, E. 120°. On the 8th, the s. s. "Plainmeller" encountered the typhoon in N. 15° 21′, E. 116° 33′, wind w. The bark "Fabius" reported calms on Macclesfield Bank for four days, followed by the typhoon in N. 18° 40′, E. 113° 28′, barometer 29.48 (748.8), wind blowing with hurricane force; the vessel was hove to until the morning of the 9th, when the wind veered to nnw. On the 10th, the s. s. "Consolation" encountered the typhoon at the entrance to the Gulf of Tonquin. The lowest barometric reading observed on board H. M. S. "Magpie," anchored in Manin Bay, Island of Hainan, was 29.41, at 1 p. m. of the 10th. The typhoon appears to have vanished before reaching the western shores of the Gulf of Tonquin, although the barometer remained low over Hainan and over the gulf.

II.—(July 10th to 17th.) This typhoon developed in the Philippine archipelago almost simultaneously with, and under the same conditions as, typhoon i. That disturbance originated to the westward of Mindanao between the 4th and 6th, while typhoon ii. sprang up to the eastward of Mindanao between the 6th and 9th. To the southeast and southwest of that island, from the 6th to 12th, the wind blew from west and southwest with varying force (5–9) and with heavy rain all the time, while to the north of the archipelago the wind was from east and southeast. At Manila, Luzon, the barometer gave no indication of the approach of the typhoon until the evening of the 11th. The centre moved northwestward at some distance from the eastern coast of Luzon, and, by the 14th, it was off the northeast point of the island. At Manila the general direction of the wind was from west to east, with little variation; it first blew from northwest to southeast when the centre was to the southeast, then from west to east, when it reached the latitude of Manila, and, lastly, from southwest to northeast, when it passed the straits that separate Luzon and Formosa. The centre passed much nearer to Tuguegarao than to Manila; the barometric minimum, 29.58 (751.3), occurred at Manila at about 4 p. m. of the 14th. At Tuguegarao the barometer reached its lowest point, 29.45 (748.0), at 6 a. m. of the 14th. An effect of the mountain chain that runs along the eastern coast of Luzon must be noticed; the strong northwest, west, or southwest winds that blew at Tuguegarao struck directly against the western slope of the mountains and rain fell abundantly on that side. During the 15th, the typhoon traversed the island of Formosa from south to north and caused some damage in that island. At Tai-wan-foo (N. 22° 58′, E. 120° 13′) the lowest barometric reading was 29.29 (744.0) at 4 a. m. of the 15th, wind blowing half a gale from nnw. At Tamsui, Formosa, (N. 25° 10′, E. 121° 25′,) the barometric minimum occurred at 7 a. m. of the 15th, wind n., 10–11 (Beaufort scale). At 7.40 a. m. it became quite calm, the sun being visible for ten minutes. At 9.30 the wind came with great violence and very suddenly from the west, gradually changing to southwest. At Keelung, twenty miles east of Tamsui, the calm lasted from 7 to 7.30 a. m., and the barometer fell to 28.6 (726.4); wind ne., force 8, at 5 a. m.; ene., force 9, at 7 a. m.; s., force 4, at 8 a. m., sw., force 9, at 9 a. m.; sw., force 10, at 10 a. m.; sw., force 11, at noon; sw.-force 8, at 2 p. m.; sw., force 6, at 4 p. m. At Twatutia, eight miles south, east of Tamsui, the calm lasted from 7 to 8 a. m. The barometric minimum seems to have occurred at 8 o'clock, after the period of calm. The wind went through the same variations as at Keelung—e. and ne. before the calm, and sw. after. After leaving Formosa, the typhoon moved northward to the coast of China, and on the 16th it was near Shanghai. The s. s. "Keelung," from Cheefoo for Swatow, first noted indications of the typhoon on the morning of the 15th in N. 27° 53′, E. 121° 42′, barometer 29.54 (750.3), wind se., force 5, dense showers of rain, heavy cross-sea from ne. and se. At 3 p. m. of the 15th, in N. 26° 58′, E. 121° 00′, the barometer reached its lowest point, 28.78 (731.0), wind nnw., force 10 (Beaufort scale). At 4 p. m., the wind gradually shifted to wsw., with furious squalls of hurricane force and very heavy rain. The heaviest gusts of wind were from sw. by w. The brig "Emily" appears to have passed near the centre of the typhoon on the 15th, in N. 27° 00′, E. 121° 30′, 3.45 p. m. barometer (aneroid) fell to 28.84 (732.5). At 4.30 p. m., after a period of calm, the wind veered from e. to se., s., and ssw. Another vessel, the brig "Peter," passed close to the same position at about 3 p. m. She reported the same brief calm, winds from e. to se. and sw., barometer 28.85 (732.8). Towards evening of the 15th, the rainfall became heavy and the wind increased at Shanghai. By 2 a. m. of the 16th, the rain had ceased, wind blowing in violent squalls between e. and se. At 2.30 a. m. the wind shifted to ne. and rain began to fall abundantly. At 3.30 the wind again went back to ese. Between 4 and 5 a. m. the barometric minimum, 29.13 (739.9), occurred, wind sse., 45 miles; the velocity of the squalls may have reached fifty-five or sixty miles an hour; several trees were uprooted at Zi-Ka-Wei. The wind veered from east to west, through south, consequently the typhoon passed to the westward of Zi-Ka-Wei. Much damage was done to junks and other vessels on the river, and some loss of life occurred. The typhoon continued its northerly course and crossed the Yang-tsi-Kiang river to the east of Ching-Kiang, one hundred and ten miles northwest of Shanghai, and forty-seven miles east of Nanking. The lowest barometric reading, 29.2 (741.7), was observed at 9 a. m. of the 16th, wind nne., force 9–12. The worst of the gale was between 9. a. m. and 3 p. m. from nne. and nnw. At 4 p. m. it began to abate. On the 17th, the typhoon reached Cheefoo. Its course then appears to have been influenced by the high promontory of Shan-Tung, as reports indicate that it did not cross the thirty-seventh parallel of latitude between Corea and China. After the 17th, the disturbance cannot be traced as a typhoon, but the depression shown in Japan as low-area xxvii. was evidently the remains of this typhoon, which had now lost the greater part of its storm-energy. During the passage of this typhoon two shipwrecks occurred in the China sea. The bark "Aberdonian" was wrecked on one of the islands of the Chusan archipelago on the night of the 16th, and the brigantine "Annie J. Hall" was lost on the same night. After encountering the typhoon the vessel was so damaged as to be unmanageable, and was abandoned off Fung-me island, one of the Taichow group.

III.—(July 26th to August 2d.) The first indications of this typhoon were noticed at Manila on the 24th, when the barometer began to fall. It attained its minimum, 29.72 (754.9) on the 26th, the centre of disturbance remaining apparently to the northeast of Luzon. On the island of Formosa, both at Tai-wan-foo, in the south, and at Tamsui, in the north, the barometer remained low during the 28th, 29th, and 30th, the absolute minimum, 29.55 (750.6), being observed on the evening of the 28th. The typhoon moved slowly northeastward at a great distance from the coasts of China, and by August 1st it was south of Japan. At Siwomisaki light-house (N. 32° 26′, E. 135° 45′) the wind attained hurricane force, being the only station at which violent winds occurred. The barometric reading was 29.05 (737.9) at 9 a. m. of the 1st. On that day five inches of rain fell, making a total of eight inches from July 30th. Severe local floods occurred in the southern provinces of Japan. The typhoon then moved in a northeasterly direction at some distance from the coast of Japan. The barometric minimum, 29.42 (747.3), occurred between 2 and 3 p. m. of the 2d at Omaisaki light-house (N. 34° 36′, E. 138° 13′). The typhoon passed at considerable distance from the capital of Japan, as no heavy weather was experienced there or in the the Gulf of Yedo. The lowest barometric reading at Tokei was observed at 1 a. m. of the 3d, when it was 29.55 (750.6), and the wind did not exceed ten miles an hour. The typhoon then passed east-northeastward into the Pacific.

GENERAL REMARKS.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are applied at this office. In the naval and marine series, corrections for temperature and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz.: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in metres per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometres per hour, to metres per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations. In the MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS the position of stations (latitude and longitude) are obtained from Keith Johnston's "Index Geographicus," except where more exact information is furnished. The elevations of stations are obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms, upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the originals, is carefully computed at this office. Generally all conversions are made at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

INTERNATIONAL CHARTS ACCOMPANYING THE DAILY BULLETIN AND MONTHLY SUMMARY.

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted. Broken lines indicate that the lines so broken are doubtful.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

International chart iii. shows tracks of centres of low barometer. Storm-tracks in red. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date. Broken or dotted lines are doubtful.

Arrows show the direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
→	1, 2	0 to 9	0 to 4
→	3, 4	9.1 to 22.5	4.1 to 10.1
→	5, 6	22.6 to 40.5	10.1 to 18.1
→	7, 8	40.6 to 67.5	18.1 to 30.2
→	9, 10	67.6 up.	30.2 and over.

The following remarks relate to the individual peculiarities in the *methods* of recording and the *times* of taking the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of General Maritz, Commandant Supérieur du Génie in Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemburg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind direction is given to 32 points and weather by the Beaufort notation.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Town the barometer is given on the original as corrected for temperature only. Upper and lower clouds are given on a scale of 0 to 10, and the kind occasionally indicated by abbreviating Poëy's classification.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of

simultaneous observation. At Hankow the originals give the barometer in inches, temperature in Fahrenheit, and force on a scale of 0 to 10.

DANISH SERIES (furnished by co-operation of Captain N. Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Mont Louis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Mont Louis and Perpignan. At Guéret the observations are taken at 12 m., instead of 12.16 p. m. The original at Besancon for June, 1882, states that observations for this month are taken at midday instead of 0.32 p. m.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms. At Berlin observations are taken at 2 p. m., instead of 1.02 p. m.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchina, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by co-operation of I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (by authority of the Secretary of Public Works—furnished by co-operation of Señor Mariano Barcena, Director of the Central Meteorological Observatory in the City of Mexico, and respective observers).—All conversions (subject to correction at this office) are published as given in the originals. The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred.

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiana).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At Astrakhan the barometer-cistern is below sea-level. The movement of the air is indicated by velocity in metres per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols.

SCOTTISH SERIES (furnished by co-operation of Alexander Buchan, M. A., F. R. S. E., Secretary of the Scottish Meteorological Society at Edinburg, and respective observers).—The originals give the barometer as read off and the movement of the air as indicated by force on a scale of 0 to 6. Distinction is made between upper and lower clouds as to degree, and the amount of cloudiness is given on a scale of 0 to 10. The direction of upper clouds is given separately. The rainfall, temperature, and humidity are not given at North Unst. The wind direction is given to 32 points.

SPANISH SERIES (furnished by co-operation of Antonio Aguilar, Director of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale

of 0 to 10. The rainfall at San Juan is measured at 4 p. m., local time, and at San Fernando at midnight. The weather is iven in gen eral (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of Professor E. Plantamour, Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of Professor C. V. A. van Dyck, Superintendent of the Lee Observatory at Beirut.)—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in metres per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Office, U. S. Army). On June 1st, 1882, elevation of barometer cistern at Sacramento, California, changes from 70 to 65 feet.

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota and Navassa the barometer is corrected for temperature only; at Puerto Berrio is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas. At Rivas the humidity is obtained by readings from Saussure's hygrometer. On June 1st, 1882, the elevation of barometer cistern at York Factory, B. A., changes from 51 to 55 feet, and on June 25th, at Puerto Berrio, U. S. C., from 454 to 542 feet.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea-disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

SWEDISH NAVAL SERIES (furnished by co-operation of E. Malmburg, Director of the Nautical Meteorological Bureau at Stockholm).—The originals give the barometer as read off. The movement of the air is indicated by force on a scale of 0 to 12, and the direction is corrected for magnetic variation at this office. The humidity is not given, but is computed from the hygrometrical observations. The rainfall is omitted. The height of the sea-swell is given on a scale of 0 to 9 and the weather by the Beaufort notation.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operation of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the number of days for which observations are at hand within the respective squares, and the total number of simultaneous observations reported on those days, (3) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather-maps.

ERRATA.

Monthly Summary, October, 1880, page 2, Cape Colony series, Cape Town, temperature 80°.2 Fahr., 26°.8 Cent., should read 73°.7 Fahr., 23°.2 cent.

Monthly Summary, May, 1882, page 5, United States sub-series, elevation of barometer cistern at Puerto Berrio, 542 feet, 165 meters, should read 454 feet, 138 meters.

Daily Bulletin, June 13th, 1882, page 4, United States, Buffalo, actual barometer 28.53 inches, should read 28.43 inches.

14th, page 7, North German Lloyd, s. s. Elbe, longitude E., should be W.

19th, page 6, British naval, H. M. S. Dido, longitude N. 50′ 10°, should read N. 10° 50′.

21st, page 7, Merchants S. S. Co., s. s. Glenfyne, longitude E., should be W.

24th, page 2, Indian, Deesa, actual barometer 30.08 inches, should read 29.08 inches.

25th, page 1, Austro-Hungarian, Agram, actual barometer 29.65 inches, should read 29.55 inches; page 7, North German Lloyd, s. s. Hohenzollern, longitude E., should read W.

29th, page 5, United States, Morgantown, actual barometer 29.95 inches, should read 28.95 inches.
