MONTHLY WEATHER REVIEW

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

SIMLA, JANUARY 1909.

INTRODUCTION.

THIS review of the weather in India during the month of January 1909, is based on observations taken daily at 8 hrs. at 238 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 35 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the Provincial Governments up to the date of the preparation of the review, have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

In the remaining monthly reviews of the present year the brief statements of the methods of recording and tabulating the data, for each of the elements of observation, given in the present number at the commencement of each section, will not be repeated.

Up to the end of the year 1906 there have been published in Tables I and II the data of the first, second and third class stations. From 1907 the tables have been called B and A respectively, and a Table C has been introduced containing the data of fourth class stations.

Summary of the chief features of the weather in India during the month of January, 1909.

2. January, like the preceding three months, was dry over the greater part of northern and central India. Although unsettled weather was experienced in northern India with almost the normal frequency, the resulting precipitation was light and restricted owing to an abnormal character of the disturbances.

On the other hand weather was unusually wet over the southern half of the peninsula in consequence of the passage through that region of a cyclonic storm on the first two days of the month. The aggregate measurements of the precipitation of the month were less than the corresponding normal values over the whole of the country with the exception of Madras, Mysore, Chota Nagpur, Hyderabad North, Central India East and Assam; the excess was small in the three last named areas, and exceptionally large in Madras which obtained six times its normal quantity. The defect in northern India averaged about half an inch over the tract extending from the Suleiman ranges eastwards to Bihar, and was greatest in the North-West Frontier Province where it slightly exceeded an inch in amount.

The air was dry over the greater part of northern India and damper than usual in most parts of the peninsula and of Burma. The proportion of cloud was equal to or exceeded the average in all parts of the country except locally in the North-West Frontier Province. Temperature did not depart materially from the normal except in the mountainous region to the west and north of upper India where the weather was decidedly cooler than usual, both by day and night.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar Observations.*—The first three days of the month were too cloudy for any solar work, the 6th was not favourable for prominence observations, and the prominence record was imperfect on three other days.

Sunspots.—There were only 19 new groups, but the daily average was 4·5 and the average life of a spot was 8·0 days. Groups 1586, 1595 and 1596 were returns of 1575, 1578 and 1580 respectively. There was a difference of several degrees in longitude between the old and new positions of 1586 and 1595 but in the previous rotation they were long

trains of spots only a few of which survived to return. A majority of the new groups came round the east limb as large spots. There was again a preponderance of southern spots, which extended over 13° of latitude, while the northern spots were confined to the region between 6° and 9°. The latitude distribution was as follows :—

	1°-10°	11°-20°	Extreme latitudes.	Mean latitude.
North	7	1	16, 6	9·4
South	4	7	17, 4	11·5

Though the total number of new groups was small the activity, as judged by the number of large spots, was large. Spots 1578 and 1580 which came round the east limb about the end of December were situated in about longitude 180° and when this region came round again towards the end of January it contained the five large groups 1593, 1594, 1595, 1596 and 1598. The first three of these were changing rapidly from day to day and were also spectroscopically active; C was frequently observed reversed and thus D_3 dark near them. On the 23rd D_3 was seen bright on the whole of the main spot in No. 1593. Another region, about longitude 310°, contained 2 large spots and the active group 1590. Altogether there were 10 large spot groups during the month.

Prominences.—Fifty-seven large and 4 metallic prominences were recorded during the month. The tallest and the most active of them was photographed on the 12th. At $8^h\ 3^m$ the main part of it was an arch 15° long and 160″ high. Subsequent photographs showed it as changing rapidly both in form and height. But at $14^h\ 27^m$ there was nothing left except a narrow slanting strip 10° long and far away from limb, it was 285″ high at the highest place. Four other eruptive prominences were observed during the month.

Magnetic disturbances.—There were "very great" magnetic disturbances on the 3rd, 4th and 31st, "great" ones on the 1st, 2nd and 30th, a "moderate" one on the 29th and "slight" disturbances on half a dozen other days. The large group No. 1578 crossed the central meridian on the 2nd and No. 1580 crossed on the 4th, and the "very great" disturbance on the 31st is probably a recurrence after one rotation of the "very great" disturbance of the 3rd and 4th.

C. MICHIE SMITH,
Director,
Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Note on the Alibag Magnetic Record.

4. During the month of January the traces showed 12 calm days, 10 days of small, 7 days of moderate and 2 days of great disturbance.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 7th, 11th, 17th, 20th and 22nd. The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms as also the ranges and the summed ranges of the horizontal force and declination for the month are as follow :—

	° ′ ″	
Easterly declination	1 1 17	
Horizontal force	·36842	C.G. S. unit.
Vertical force	·15970	,, ,,
Dip (calculated)	23° 26′·1	,, ,,
Dip (observed twice a week)	23° 25′·8	,, ,,
Horizontal force range	·00039	,, ,,
Horizontal force summed range	·00219	,, ,,
Declination range	1′·28	,, ,,
Declination summed range	7′·41	,, ,,

(NOTE.—Summed range means sum without regards to signs of 24 ordinate of diurnal inequality.)

The following table represents the magnetic character of each day during the month.

TABLE 1.

Day.	Character.	Day.	Character.	Day.	Character.
1	G	12	C	23	C
2	M	13	M	24	S
3	G	14	S	25	S
4	M	15	S	26	S
5	S	16	C	27	M
6	C	17	C	28	S
7	C	18	S	29	M
8	C	19	S	30	M
9	S	20	C	31	M
10	C	21	C	..	...
11	C	22	C	...	...

C = calm ; S = small ; M = moderate ; G = great ; V.G. = very great.

Seismic disturbances recorded at Bombay.

Two seismic disturbances were recorded during the month, on the 22nd and 23rd.

List of seismic disturbances.

A=E—W. component.

B=N—S. component.

Magnification of each instrument=15.

The following table contains a list of the earthquakes that have been reported :—

TABLE 5.

Place at which felt.	Date.	G. M. T. of earthquake	Intensity.	Duration.	Remarks.
		H. M.		Sec.	
Ispahan . . .	22nd ...	2—34	4?	?	
Gauhati . . .	26th ...	19—50	2	8	1 shock.
Dam Dim . . .	26th ...	20—35	3	20	1 ,,
Panighatta (Bengal) .	26th ...	20—58	4	4	1 ,,

NOTE —The scale of intensity is as follows :—

1. Strong enough to be felt by persons at rest.
2. Strong enough to make doors and windows rattle.
3. Strong enough to make hanging objects swing.
4. Strong enough to be move the observer's seat.
5. Strong enough to throw down loose objects.
6. Strong enough to crack the walls of buildings.
7. Strong enough to cause greater damage (to be specified).

Solar Radiation.—The following figures give the intensity of solar radiation, as measured at Simla by Angstrom's pyrheliometer. The values are corrected to local noon, and expressed in grammecalories per square centimetre per minute :—

Maximum	1·53
Minimum	1·39
Mean	1·47
Number of days of observation .	12

J. H. FIELD,

Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. Solar Observations.—Observations were taken on the 4th, 6th, 7th, 9th, 11th, 13th, 15th, 16th, 18th, 20th, 21st and 26th to 30th. Groups of sunspots were observed throughout. The sunspots were especially numerous from 26th to 30th and faculæ were seen on each day of observation.

Magnetic disturbances.

TABLE 6.

Date.	Time.	Disturbance.
2nd to 3rd	15h. to 6h.	Rapid fluctuations in H. F. (± 20) in decl. (± 9.)
4th to 5th	15h. to 6h.	Fluctuations in H. F. (± 10) in decl. small.
4th	16½h. to 18½h	Wave in H. F. (—30) steep at end.
4th	17½h. to 18¾h	Wave in decl (+20).
13th	12½h. to 13½h	Wave in H. F. (—18) steep at commencement and at end.
13th	13·4h. to 13·5h.	Decrease in H. F. (18): 16h. to 17½h. decrease in H. F. (71) followed by gradual increase (36) till 21h. with superposed wave 18½h. to 20½h (—10).
23rd to 24th	20h. to 5h.	Frequent small fluctuations in H. F.
25th	1h. to 8h.	Frequent small fluctuations in H. F.
25th to 26th	14h. to 6h.	Fluctuations in H. F. (±10) with waves 19½h. to 23h. (+15).
26th	3h. to 5½h.	(+21).
26th to 27th	21h. to 1h.	Irregular wave in H. F. (+20) 14h. to 14½h. sharp wave in H. F. (+15) steep at commencement and at end.
27th to 28th	23½h. to 2h.	Wave in H. F. (+25).

T. F. CLAXTON,

Director.

Weather in the Indian monsoon region.

8. Pressure ruled below the normal in the Indian Ocean, but not to the same extent as in India: it was low also in Persia and Arabia. The low pressure conditions over India were thus determined by general and not by local actions.

The air movement did not differ materially from the type usual in January. The distribution of rainfall on the other hand was very irregular, the aggregate measurement being about 46 per cent in excess at Zanzibar and 34 and 12 per cent in defect of the average at Mauritius and the Seychelles.

TABLE 7.

Depressions and cyclonic storms.

9. The cyclonic storm which was approaching the south Madras coast on the last day of December had by 8 hrs. of the 1st January crossed inland between Negapatam and Pamban. It was at this stage a well-defined disturbance and its effects on the winds and weather was as great at the level of Kodaikanal in the Palni Hills as in the plains. The storm advanced almost due west during that day and on the morning of the 2nd was shown over the Arabian Sea to the west of the Malabar coast. The greatest defect of pressure in the centre of the storm was throughout these two days a quarter of an inch, and it is to be noticed that there was no appreciable diminution of this depth in consequence of the obstructing action of the West Ghats. The further career of the storm is uncertain, there being but little marine information available at present for the southeast of the Arabian Sea. Winds recorded on the Malabar coast and at Minicoy appear however to show that the disturbance was broken up during the next two or three days while moving slowly westwards.

The storm was of an exceptional character in the following respects:—

(a) It formed at a time of year when storms are practically unknown; the only other instance on record of a storm formed over the Bay in January occurring in 1906.

(b) It was a disturbance of comparatively great elevation, differing materially in this respect from the storms usually formed during the period October to December. These invariably fill up while moving westwards across the plateau of Mysore and the West Ghats, the average elevation of which in the part traversed by the storm under discussion is about 5,000 feet.

(c) Its passage across the south of the peninsula was marked by the occurrence of unprecedentedly heavy rain (for the time of year) over Madras. The largest amounts occurred in the Nilgiris which obtained a total of over 9 inches from the 1st to the 3rd.

The effects of the storm lasted in southern India until the 6th when dry weather was re-established.

As ordinarily happens when conditions during the cold weather months are unsettled in the south, weather was quiet throughout the first week in northwest India except in Kashmir where light local precipitation was received on one or two days. In Persia on the other hand a depression was in the course of formation of which the following is a brief history:—

Cold weather disturbance of the 3rd to the 11th.—The daily charts published by the English Meteorological office and the Egyptian reports do not indicate the passage eastwards of any definite depression from Europe into Asia Minor or Mesopotamia. They show however the existence on the 2nd and 3rd of a belt of low pressure over the region extending from the head of the Persian Gulf to Syria. It was presumably within this trough that the disturbance under discussion was generated during the next three days. From its place of origin it moved rapidly eastwards through the southwest of Persia on the 7th, Baluchistan on the 8th, north Rajputana and the adjacent districts of the Punjab on the 9th and the southeast Punjab on the 10th into the west of the United Provinces on the 11th after which it disappeared. It was well marked throughout this course—a fact which would show that it was one of fairly high elevation. The accompanying precipitation was nowhere heavy as frequently happens in the case of storms with a more northerly course than usual, and within India was restricted to Baluchistan, Kashmir, the east Punjab, the west of the United Provinces and Rajputana. The formation of the disturbance coincided with the transfer of a depression from the north of Russia to the neighbourhood of the Caspian.

On the 12th, whilst the unsettled conditions in northwest India were passing away, another depression was appearing over Asia Minor and Syria. The meteorological records of the Persian and Baluchistan stations for the next week indicate that the main disturbance instead of advancing eastwards followed a northeasterly course which led it into Turkestan.

Its effect on the Indian weather was accordingly slight and was confined to the country forming the eastern limits of the region traversed by it, namely, Baluchistan and Kashmir.

The only other disturbance which entered India from the west during January was formed, according to available evidence, on the 18th over Greece and thence transmitted along an easterly course to Sind and the neighbouring districts of Rajputana where it shewed itself first on the 24th as a large diffused low pressure area. From here it moved into the United Provinces, filling up at the same time. It was a mere wave of low pressure and produced only light precipitation in upper India and Baluchistan.

On the 26th the only noteworthy feature of the meteorological conditions over India was a very slight irregularity of pressure over the south of the Central Provinces—a region characterized by high temperature for some days previously; this passed northwards occasioning thunderstorms, in some cases with hail, over Baghelkhand and the adjacent districts to the east and south, and light precipitation or snow in the Simla-Kumaon Hills and the neighbouring plains.

Weather was quiet generally over India on the last three days of the month.

Pressure.

10. In most of the observing stations in India mercurial barometers on Fortin's principle of fiducial point adjustment, with tubes of 0·4″ bore throughout are in use. These are on the whole preferable to the pattern of barometer on the Kew principle, still in use at some Indian stations, which has its scale calibrated to compensate for the change of level of the mercury in the cistern as the pressure alters.

The following list contains the names of all stations equipped with Casella instruments of the latter class:—

Aden.	Faridpur.	Rangpur.
Akyab.	Gorakhpur.	Ratnagiri.
Arrah.	Jalpaiguri.	Sambhar.
Barisal.	Midnapore.	Cochin.
Bhamo.	Minbu.	Comilla.
Bogra.	Negapatam.	Cuddapah.
Bushire.	Noakhali.	Monywa.
Chapra.	Nowgong.	Mymensingh.
Delhi.	Perim.	Tavoy.
Dinajpur.	Rangoon.	Toungoo.
Dunga (Zanzibar).		Zanzibar.

The instruments at the following stations are by various makers and of various kinds:—

Colombo.	Katmandu.	Pusa.
Dehra.	Kurnool.	Trincomalee.
Goa.	Patiala.	Trivandrum.

At Calcutta and Bombay the standards are Newman instruments on the Fortin principle, with adjustable scales and fiducial points, and tubes of large bore. Some portable Wild-Fuess standards for purposes of comparison during inspections are now in use; the principle of the instruments allows of the determination at any time of changes that occur in their corrections caused by the access during transport of small quantities of air to the vacuum spaces above the mercury.

All instruments are compared at Calcutta before issue, and their corrections determined to the Calcutta standard, which is believed to be ·011″ higher than the Kew standard.

The barometers are in all cases kept in masonry buildings to protect them as much as possible from rapid changes of temperature.

Those heights above mean sea-level of the barometers of all stations given in Table B or Table A which have been obtained accurately by actual measurement are given in Roman figures. In the great majority of cases they have been referred to datum levels determined by the Great Trigonometrical Survey of India; of the remaining stations those heights which have been determined barometrically are printed in italics, and those which are only approximate are indicated by a note of interrogation.

The readings of the barometers are reduced to 32°F., and from 1st January 1905, have been corrected to constant gravity in all cases. They are reduced to sea-level in the cases of stations the elevations of which are accurately known and are below 3,200 feet. Each reading is separately corrected, and the means of the month are the means of the daily corrected readings.

In Table B (2), columns 4 to 11, under the general heading "Pressure, 8 hrs. in inches," are given for each station, the 8 hrs. barometric data of the month, including—

(1) The mean 8 hrs. pressure reduced to 32°F., and its departure from the normal mean pressure (reduced to 32°F.) of the month.

(2) The mean 8 hrs. pressure corrected to sea-level and to constant gravity, or to constant gravity only in cases of stations the elevations of which are above 3,200 feet.

(3) The highest and lowest pressures recorded during the month, with their respective dates of occurrence.

(4) The total range of 8 hrs. pressure during the month. In Table A, columns 4 to 9, under the general heading "Pressure," are given for all stations recording observations at 10 hrs. and 16 hrs.—

(1) The monthly means of the two hours of observation, 10 hrs. and 16th hrs. reduced to 32°F.

(2) The mean daily range.

(3) The mean of daily mean pressures reduced to 32°F., and its departure from the normal.

(4) The mean of daily mean pressures reduced to 32°F., and corrected to constant gravity and to sea-level, or to constant gravity only in cases of stations the elevations of which are above 3,200 feet.

The means of daily pressures have been obtained by taking the means of the 10 hrs. and 16 hrs. observations and applying corrections for each month, derived from the observations of the same or neighbouring stations, to give true daily means.

The distribution of the mean 8 hrs. pressure of the month is shown on two charts. The first chart (Plate I) gives the distribution of the mean pressure of the month reduced to sea-level and to constant gravity (that of Lat. 45°) by means of isobars drawn for differences of pressure of 0·05″ or $\frac{1}{20}$ of an inch. The second chart (Plate II) gives the departures from the normal of the actual mean 8 hrs. pressure reduced to 32°F.

The greater part of the normal 8 hrs. daily and monthly means of pressure utilized in the pressure section of the review have been deduced from the barometric observations of the whole of the twenty-two years' period 1878—99, and in all except 22 cases the periods employed equalled or exceeded ten years.

A small chart, No. 2 of Plate IV, gives the distribution of the monthly mean daily pressure corrected to standard gravity and to sea-level, and of the mean winds; it is in the same form as in the monthly charts which were issued with the annual reports on the meteorology of India previous to the year 1891. The data on which this chart is based will be found in Table A.

The monthly means employed in the determination of the departures of the mean actual from the mean normal pressures of the month given in Table A are derived from all the available trustworthy pressure data for each station. These normal means are given in the "Indian Meteorological Memoirs," Vol. XVII, pages 66 to 69.

The more important barometric changes and movements during the month are described in the statement of depressions and cyclonic storms of the month. The data that are chiefly used in that discussion are the 8 hrs. reduced observations and the departures derived from comparison of these observations with the normal daily 8 hrs. values.

Except locally at one or two stations the mean 8 hrs. pressure of the month was lower than usual throughout the country—a circumstance by no means favourable to winter rains. In the plains the defect was least in upper India where it averaged ·011″, and greatest in Bengal, the Central Provinces and Mysore (about ·043″). The decreased pressure accompanied increased temperature over the whole Indian area except northwest India and Bombay where temperature was either normal or in defect.

The following comparative statement illustrates these characteristics :—

TABLE 8.

Division.	Departure from normal of	
	Mean 8 hrs. pressure.	Mean temperature of month.
	″	°
Burma	—·033	+0·5
Eastern Bengal and Assam	—·038	+1·0
Bengal	—·043	+2·2
United Provinces	—·038	+0·3
Punjab	—·010	—1·9
North-West Frontier Province	—·017	—3·1
Sind	—·006	—1·8
Rajputana	—·022	—1·5
Bombay	—·031	0
Central India	—·034	+0·8
Central Provinces	—·044	+2·1
Hyderabad	—·038	+2·1
Mysore	—·041	+1·6
Madras	—·038	+0·6

The defect of pressure was even more marked at the level of the hill stations in northwest India than in the neighbouring plains; in other words the vertical gradient was steeper than usual. This is shown below :—

TABLE 9.

Hill station.	Departure from normal pressure. A.	Plain station.	Departure from normal pressure. B.	Departure of pressure difference. B—A.
	″		″	″
Quetta	—·023	Jacobabad	—·007	+·016
Leh	—·099	Lahore	—·022	+·077
Murree	—·046	Peshawar	—·026	+·020
Simla	—·057?	Ludhiana	—·020	+·037?
Chakrata	—·014?	Roorkee	—·020	—·006?
Darjeeling	—·035	Dhubri	—·035	0
Mount Abu	—·040	Deesa	—·028	+·012
Pachmarhi	—·031	Khandwa	—·046	—·015
Kodaikanal	—·045	Madura	—·029	+·016

As temperature also was largely below the normal in the hill districts of northwest India it is certain that the low pressure of the month in that region was not a temperature effect but was the result of a decided rarefaction of air, more especially in the middle and perhaps upper atmospheric strata. Although the vertical distribution of pressure in northwest India was of the type ordinarily associated with abundant precipitation the horizontal gradient tending to drive air in the upper strata from south to north, as determined from the data of Kodaikanal in the Palni hills and of the stations situated at the same elevation on the face of the Himalayas, was not favourable.

Temperature.

11. The mean temperature data are given in Table B and Table A under the heading "Temperature of Air." In Table B they are based upon observations of the dry bulb thermometers recorded at 8 hrs. and of the maximum and minimum thermometers. In the preparation of the normal means of maximum and minimum temperature the same periods have been employed as for the normals of pressure, regarding which information has been given in the pressure section, p. 5 of this Review. Departures of the mean maximum and minimum temperatures from the corresponding normal means for the month are given in Table B. The monthly mean of the mean between maximum and minimum, as given in this table, differs from the true mean of the day by a small amount which varies from month to month.

It should be noted that for the purposes of Table B the mean temperature of the day really denotes the mean temperature of the 24 hours preceding 8 hrs. of the day in question, and that therefore the month for which the means are given in this table terminates at 8 hrs. of the last day of the month. In the case of Table A, however, the day or 24 hours period terminates at midnight (and not at 8 hrs. as in Table B,) and the monthly means apply therefore to monthly periods ending at midnight of the last day of the month in question.

In Table A the mean of daily mean temperatures for each month is obtained by taking the mean of the maximum and minimum temperatures and applying a correction given on pages XV to XXI of Vol. XVII of the "Indian Meteorological Memoirs." This correction was determined from the hourly observation data given in Volumes V, IX and X of the "Indian Meteorological Memoirs." The data at once furnish the necessary corrections for the stations at which these observations were recorded. At the remaining stations the corrections were determined from the values at the nearest stations with similar conditions of exposure, etc., at which the hourly observations were recorded.

The departures from normal of the mean daily mean temperature of the month given in Table A have been obtained by a comparison of the actual mean with normal means calculated in the same manner. The normal means derived from all the available trustworthy temperature data for each station are given in the "Indian. Meteorological Memoirs," Volume XVII, pages 16 to 20.

The methods of exposing thermometers will be found fully described in the hand-book of instructions to observers in India, or briefly in the Annual Report on the Meteorology of India for the year 1887, page 37. All thermometers in use have been verified by comparison with Kew standard thermometers at Calcutta, and all thermometer readings are corrected to their true values, and hence are strictly comparable.

The mean distribution of temperature in India in each month is exhibited by means of three charts, which show the departures of the mean maximum, mean minimum and mean daily temperature from their normal values for the month. These charts are Nos. 1 and 2 of Plate III and No. 1 of Plate IV. In these charts equal departures of temperature are indicated by lines, the lines being drawn for differences of 2 degrees of departure. A continuous line indicates that the temperature was in excess by the amount shown by the number given near the line, and a broken line that it was in defect by the amount indicated by the number similarly placed. The line of no departure, separating areas of excessive from areas of deficient temperature, consists of a continuous and of a broken line placed parallel and near to each other, the broken line being on the side of deficient temperature and the continuous line on that of excessive temperature. The departures of the temperature of the month from the normal at the hill stations are given in figures with a positive or negative sign to indicate excess or defect; they are not taken into account when the lines are drawn.

Tables of normal mean maximum, mean minimum and mean of daily mean temperatures for each month and for the whole year are given in pages 1 to 10 and pages 16 to 20 of the "Indian Meteorological Memoirs," Vol. XVII, and are based on the data for the twenty-two years, 1878 to 1899.

Temperature was lower than usual, both by day and night, over practically the whole of northwestern India; the deficiency was on the whole more marked in the hill districts than in the plains, and was probably a result chiefly of heavy snowfall in the Central Asian region. At Kabul in Afghanistan the day temperature was 7° and the night temperature 11½° below the normal. In the plains the coolest area with respect to the normal was the North-West Frontier Province with a temperature 3° below the average value

Over the remainder of the country the temperature conditions approximated closely to the normal except locally in the tract stretching from the Bombay Deccan northeastwards to Bengal, in which both day and night temperatures were from 2° to 5° in excess.

As might be expected from the character of the disturbances of the month no marked cool or warm waves were recorded in northern India. The more persistent features of the temperature conditions from day to day were :—(1) the prevalence of warm weather over the Deccan until nearly the

end of the month ; over the United Provinces from the 11th to the 19th and over northeast India from the 14th to the 28th with a very brief interruption : (2) a steady defect of temperature over northwest India during the 1st week, again from the 10th to the 14th, and from the 25th to the end of the month.

Winds.

12. The 8 hrs. wind data, consisting of observations of the direction of the wind and of the air movement as registered by Robinson anemometers, are given in Table B under the headings "Wind directions," "Wind velocity" and "Wind steadiness." In these columns are shown the number of days the wind at 8 hrs. blew from each of eight points, the resultant direction of the wind, the mean hourly air movement and the steadiness. The wind resultant is calculated in all cases by the use of Lambert's formula, in which equal values are given to each wind observation irrespective of velocity. The mean wind directions are shown in Plate I by means of arrows in the usual manner.

The wind data for 10 hrs. and 16 hrs. are given in a similar form in Table A. Under the heading "Wind direction" are shown the number of times that each of eight wind directions was observed at the hours of record, and the direction of the resultant of winds of unit strength in these directions. The ratio of the magnitude of the resultant so obtained to that which it would have if the wind always blew in the same direction (*i.e.*, to the total number of observations) is called the wind steadiness, and is given as a percentage, with a table of normals, under the heading "Wind steadiness." The mean diurnal movement of the air at each station and average monthly value are to be found under the heading "Wind velocity."

The mean wind directions of the month for stations recording at 10 hrs. and 16 hrs. are indicated in the small chart No. 2 of Plate IV by means of arrows flying with the wind. The lengths of the arrows are so proportioned as to indicate the comparative wind prevalence in the mean direction on a scale such that five-eighths of an inch would represent a wind blowing continuously throughout the month from the mean direction.

The figures of normal values for wind used in Tables A and B are computed from all available data previous to 1899, or in some cases 1902, and have been published in Vol. XVII of the Indian Meteorological Memoirs.

Winds were remarkably steady over northwest India owing mainly to the comparative absence of cold weather storms, and were more variable than usual in Eastern Bengal and Assam and Bombay.

The rate of air movement agreed generally with the normal except in the case of Hyderabad, where it was considerably less than the average. In other respects there was little that was anomalous.

Humidity and cloud.

13. The hygrometric data of the month registered at certain stations are given in Table A. In that table appear columns giving the means of the wet bulb readings at 10 hrs. and at 16 hrs., of the minimum wet bulb readings, of the vapour tension and humidity at the same hours, and also the mean of daily means of these elements and of its departure from normal mean. The hygrometric data are taken from the tables accompanying "*The Indian Meteorologist's Vade Mecum*," which were computed by means of Regnault's modification of August's formula. The means of daily means are obtained by taking the means of the minimum, 10 hrs and 16 hrs. observations, and reducing them to true means, by applying in case of vapour tension, the corrections given on pages XXXVIII to XLII, and in case of humidity the corrections given on pages XLIV to XLVIII of Vol. XVII of the "Indian Meteorological Memoirs." These corrections were determined from the hourly observation data given in Volumes V, IX and X of the "Indian Meteorological Memoirs." The normal values, which have been used for obtaining the departures, are the means calculated in the same way.

The distribution of humidity in each month in India is exhibited by means of two charts in Plate V. The first chart shows the departure from normal of 8 hrs. absolute humidity, and the second that of the relative humidity.

The proportion of cloud is estimated in tenths of the sky expanse, an overcast sky being denoted by 10 and a cloudless sky by 0. The monthly means in Table A are the arithmetical means of the cloud amounts at 10 hrs. and 16 hrs. and the normal means, with which the actual monthly means are compared, are derived from the available cloud data for the same hours.

The departure from normal of the mean distribution of cloud amount at 8 hrs. in each month in India is shown in chart No. 1 of Plate VI, and the discussion of this and of the hygrometric features is based on the data given in Table B.

Normal values are deduced chiefly from ten or more years records previous to 1899, but in some cases from observations extending from 1877 to 1902.

In point both of absolute and relative humidity the air was drier than usual over the greater part of northern India, while the opposite conditions obtained over nearly the whole of the peninsula and Burma. The departures were however nowhere very marked except locally in the coast districts from Goa to Mangalore where the amount of moisture was in decided excess of the normal. The abnormal features of the hygrometric conditions were thus similar in their general character to those of the rainfall.

Skies were less clouded than usual in Lower Burma, the North-West Frontier Province and the greater part of the Punjab, but over the rest of the country the proportion of cloud exceeded that of an average January.

The statement below illustrates the principal features of the humidity and cloud distribution of the month.

Rainfall.

14. Rainfall observations are made at about 2,700 stations in India. The time of observation is 8 hrs. The rainfall data for each province are tabulated in the office of the Meteorologist, Director of Land Records, or other office in the province, and published in the provincial gazettes.

The charts illustrating the distribution of rainfall in the month under discussion are based in part upon the rainfall data of the meteorological observatories throughout India, and in part upon the rainfall statements of the month published by the Local Governments.

Plate VII (based on all the rainfall data available at the time of publication) shows the normal average rainfall and the departure of the rainfall from the normal of the month of the 34 meteorological or rainfall divisions, over each of which the meteorological conditions (more especially the rainfall) are fairly uniform, and the staple crops similar in character.

The distribution of the total number of rainy days in each month is exhibited in chart No. 2 of Plate VI and is based entirely on the data furnished by the meteorological observatories. A "rainy day" is one on which 0·10 inch or more of rain is received within 24 hours.

The normal figures of rainfall, and of the number of "rainy days," in table B. are based on observations which extend in most cases over a period of 30 or 40 years ending in 1900.

Weather was very dry over at least two-thirds of the country. Gujarat was rainless throughout the month, while the total rainfall over Berar, the Konkan, the Bombay Deccan, Hyderabad South, the Punjab Southwest, the Bay Islands and Burma was less than a tenth of an inch in amount. The only areas where the month's aggregate exceeded the normal were Madras, Mysore, Hyderabad North, Chota Nagpur, Central India East and Assam; the excess was very large in the first two areas, ranging from 352 to 1,490 per cent in amount and was due almost entirely to the action of the cyclonic storm which advanced from the Bay across the south of the peninsula into the Arabian Sea at the beginning of the month. The defect in the remainder of India was on the whole most marked in upper India and Baluchistan, which under ordinary conditions constitute the region of greatest precipitation during the month. The United Provinces East and Bihar also showed a shortage, which was serious in view of the prevalence of a similar condition during the previous three or four months.

The distribution of rainfall was thus very abnormal, and resembled in several important respects that of the corresponding period of 1906.

Snowfall.

I.—AFGHANISTAN.

15. Snow fell at Kabul on six days to a total depth of about 2 feet. The largest amount received on any single day was 5¾ inches on the 8th. The accumulation on the adjoining hills at the end of the month varied from 6″ to over 12″ in amount.

II.—NORTH-WEST FRONTIER PROVINCE.

(*a*) *Tochi* (North Waziristan).—Moderate snow fell on the night of the 8th down to a level of about 6,000 feet.

(*b*) *Dera Ismail Khan.*—The total fall received during the month measured 3 inches in depth on the Gabarghar, two feet on the Girni Sar and 3 feet 2 inches on the Saraghar.

(*c*) *Kurram.*—There were altogether seven falls on the Sufed Koh and at Parachinar. In the latter locality the total fall was equivalent to 1·74 inches of rain. At the end of the month all the higher passes were open.

(*d*) *Kohat.*—Snow storms occurred occasionally and gave the following amounts:—

TABLE 16.

Date.	Place.	Amount.	
		Ft.	Ins.
8th January 1909	Samana Range	0	1
10th "	"	0	6
15th "	"	0	2
15th "	Mahorah	1	6
15th "	Mozioghar	1	0
15th "	Koram	1	0
16th "	Samana Range	0	4
16th "	Zawa	2	0
19th "	"	0	6
20th "	Samana Range	0	10
20th "	Fort Lockhart	0	10

(*e*) *Hazara.*—The statement below shows the total depth of snowfall on the well-known ranges during the first 15 days of the month, for which alone information is available at present:—

TABLE 17.

Range.	Total snowfall.	
	Ft.	Ins.
Kagan (Jared)	1	6
" (Siri Kagan)	4	1½
" (Narang)	10	3½
Siran (Bhogurmang)	7	8
Tandiani	0	9
Dungagali	1	9

III.—KASHMIR.

Several snowstorms occurred in this region. The aggregate amount received during the month was equivalent to 14·95 inches of rain at Sonemarg and 7·91 inches at Minimarg. So far as can be judged from the limited information available at present it appears that on the whole the snowfall of the month was in excess of the normal quantity on the higher elevations, and normal or in defect in the valleys.

At the close of the month the accumulated snow measured about 5 feet in depth in the grounds of the Dras observatory and 18 to 21 feet on the Zoji-la.

IV.—PUNJAB.

(*a*) *Murree.*—Snow fell on five days at Murree and on one day at Kahuta; the total fall amounted to 17 inches in the former and 3 feet in the latter locality.

(*b*) *Chamba.*—The snowfall in this district occurred almost entirely during three well-defined periods, *viz.*, from the 9th to the 11th, the 16th to 19th and 24th to the 27th.

In the Pangi valley each of the storms gave snow down to the bank of the river Chenab.

The statement below shows the total amount of snow received during the month at the recording stations, and the depth of accumulation at the end of the month :—

TABLE 18.

Recording station.	Total amount of snowfall.		Reported depth of accumulation at the end of the month.

(*c*) *Dalhousie.*—A total of 8 feet 4 inches fell during seven days. At least double that quantity is believed to have been received at Bakrota, Kalatop, Dainkund and Khajiar. The most severe storm was that of the 11th when the snowfall at Dalhousie is reported to have been about 4 feet in amount.

(*d*) *Kulu.*—Snow fell on eight days in the Kulu tahsil and six days in the Saraj tahsil; the lowest elevation reached by the snow line was 4,000 feet.

The statement below gives the reported depth of accumulation on the various passes at the end of January 1909 with the corresponding average data :—

TABLE 19.

KULU TAHSIL.			SARAJ TAHSIL.		
Name of pass.	Reported.	Normal.	Name of pass.	Reported.	Normal.
Rohtang	23 ? feet	14½ feet.	Sirikand	19 feet.	12 feet.

			Supakun	6 „	6½ „
			Bashleo	7 „	6 „
			Placha	15 „	7 „
			Tirath	8 „	8 „

(*e*) *Kilba.*—Snowstorms occurred on the 10th, 13th, 15th, 18th, 21st, 24th, 26th, 28th, 30th and 31st; the snow line on these occasions was at 5,750 feet at which elevation the total fall was estimated at 5½ feet. At the close of the month there was from 3½ to 5 feet of snow on the Hindustan-Tibet road which was accordingly impassable. All the higher passes were closed.

V.—UNITED PROVINCES.

(*a*) *Garhwal.*—Frequent snowstorms occurred during the month. The snowfall was heaviest on the 10th, 15th and 27th when the snow line descended in places to 3,000 feet.

(*b*) *Almora.*—On the Nuwe pass there fell 27½ feet of snow on seven days, in Chaudas 12 feet on ten days, in Malla Johar 11½ feet on two days, in Byans 7 feet on five days and in Malla Danpur 6 feet on five days.

On the 9th and 11th snow fell down to elevations lower than 6,500 feet but melted as it fell.

16.—SUMMARY.

(*a*) Weather was probably more disturbed than usual in Persia, Turkestan and parts of Afghanistan, but in Baluchistan and the greater part of the mountainous region of the North-West Frontier Province the precipitation was perhaps slightly below the normal. Very low temperatures were experienced in Kabul and the surrounding region.

(*b*) In Kashmir the snowfall was very unevenly distributed, being greater than usual on the higher mountains and normal or below it at the lower levels. The accumulation on the Zoji-la was estimated at 18 to 21 feet at the end of the month.

(*c*) In the Punjab Himalayas the precipitation, although irregular in distribution, was on the whole above normal. The accumulations were generally considerably greater than usual on the hill ranges in Kangra and Chamba.

(*d*) More than the average amount of snow fell in the Kumaon Himalayas. In parts of Garhwal the snow line came down as low as 3,000 feet. The accumulations in Almora at the end of the month were not as deep as usual.

Crop report.

17. *Burma.*—Threshing and winnowing were in progress. In Upper Burma the cultivation of spring crops was progressing satisfactorily and the standing crops were in good condition.

Eastern Bengal and Assam.—Prospects of standing crops were fair, but they were likely to suffer from want of moisture. Cotton and rape crops were being reaped.

Bengal.—Standing crops had been benefitted by rainfall but more rain was wanted in Bihar, and prospects were unfavourable in north Bihar, Birbhum, Midnapore, Jessore and Khulna.

United Provinces.—More rain was urgently needed in some districts, but standing crops were generally in good or fair condition, except in the dry tracts of Kheri and Fyzabad.

Punjab.—Pressing of sugar-cane and harvesting of toria were in progress. Spring crops were generally in good condition, but more rain was urgently needed.

North-West Frontier Province.—The condition of the standing crops was generally good, but rain was badly wanted throughout the province.

Jammu and Kashmir.—Standing crops were in good condition. Fodder was sufficient.

Rajputana.—Standing crops had been damaged slightly by frost and rats. The season's prospects were favourable.

Central India.—Harvesting of autumn crops and sowing of spring crops were being completed. Some slight damage had been caused by frost and insects.

Central Provinces.—Threshing and winnowing of autumn crops and picking of cotton were completed in most districts. The condition of standing crops was fair to satisfactory.

Bombay.—Crops had been damaged slightly in parts by frost, disease, and want of moisture, but otherwise were in fair to good condition. The picking of cotton and harvesting of spring crops were in progress in some districts and had been begun in others.

Hyderabad.—Spring crops were generally in fair condition except in parts of Raichur and other isolated tracts. Late rice was still being sown.

Mysore.—Paddy and minor dry crops were being harvested. Prospects of the season were not satisfactory and in parts of the state fodder and water were becoming scarce.

Coorg.—Rice was being threshed and the picking of coffee was in progress, water and fodder were sufficient.

Madras.—Standing crops were generally fair, but some were withering for want of rain. The condition of cattle was on the whole good and prospects fair. Harvesting was being carried on with poor to normal outturn.

HEM RAJ.

N. B.—Elevations in italics indicate barometrical determinations.
NOTE.—The barometric readings are not reduced to sea-level in the case of hill or plateau stations, the elevations of which exceed 3,200 feet.

(e) Mean of 29 days.
(d) " 30 "
(m) " 21 "
(j) " 24 "
(f) " 28 "

3.

Stations in India, etc., in January, 1909.

Wind Direction. Number of winds from N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind Velocity. Mean velocity, miles per hour.	Normal.	Departure from normal.	Wind Steadiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hr.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st Dec. 1908 to 31st Jany. 1909.	Normal rainfall for period, 1st Dec. to 31st January.	Departure from normal of period, 1st Dec. 1908 to 31st Jany. 1909.	Heaviest rainfall during month.	Station

(d) Mean of 30 days
(h) " 26 "
* Uncorrected for scale error.

Table

(2) Abstract of observations taken at 8 hrs. at 238

Number of sub-division.	Station.	Elevation of barometer cistern above sea-level, in feet.	Pressure, 8 hrs., in inches.								Temperature of air.												
			Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

(d)—Mean of 30 days.
(a)—Indeterminate.
* Uncorrected for scale error.

Table

(2) *Abstract of observations taken at 8 hrs. at 238*

Number of sub-division.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

TABLE

(2) *Abstract of observations taken at 8 hrs. at 238*

Number of sub-division.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches.								Temperature of air.												
			Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

Table

(2) *Abstract of observations taken at 8 hrs. at 238*

Number of sub-division.	Station.	Elevation of bar-cistern above sea level, in feet.	Pressure, 8 hrs., in inches.								Temperature of air.												
			Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

N.B.—Elevations in italics indicate barometrical determinations.
NOTE—The barometric readings are not reduced to sea-level in the case of hill or plateau stations, the elevations of which exceed 3,200 feet.

(d) Mean of 30 days.

B—*contd.*

tations in India, etc., in January, 1909—contd.

Wind direction. Number of winds from. Calm.	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind velocity. Mean velocity, miles per hour.	Normal.	Departure from normal.	Wind stradiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st Dec. 1908 to 31st January 1909.	Normal rainfall for period, 1st Dec. to 31st January.	Departure from normal of period, 1st Dec. 1908 to 31st January 1909.	Heaviest rainfall during month.	Station.

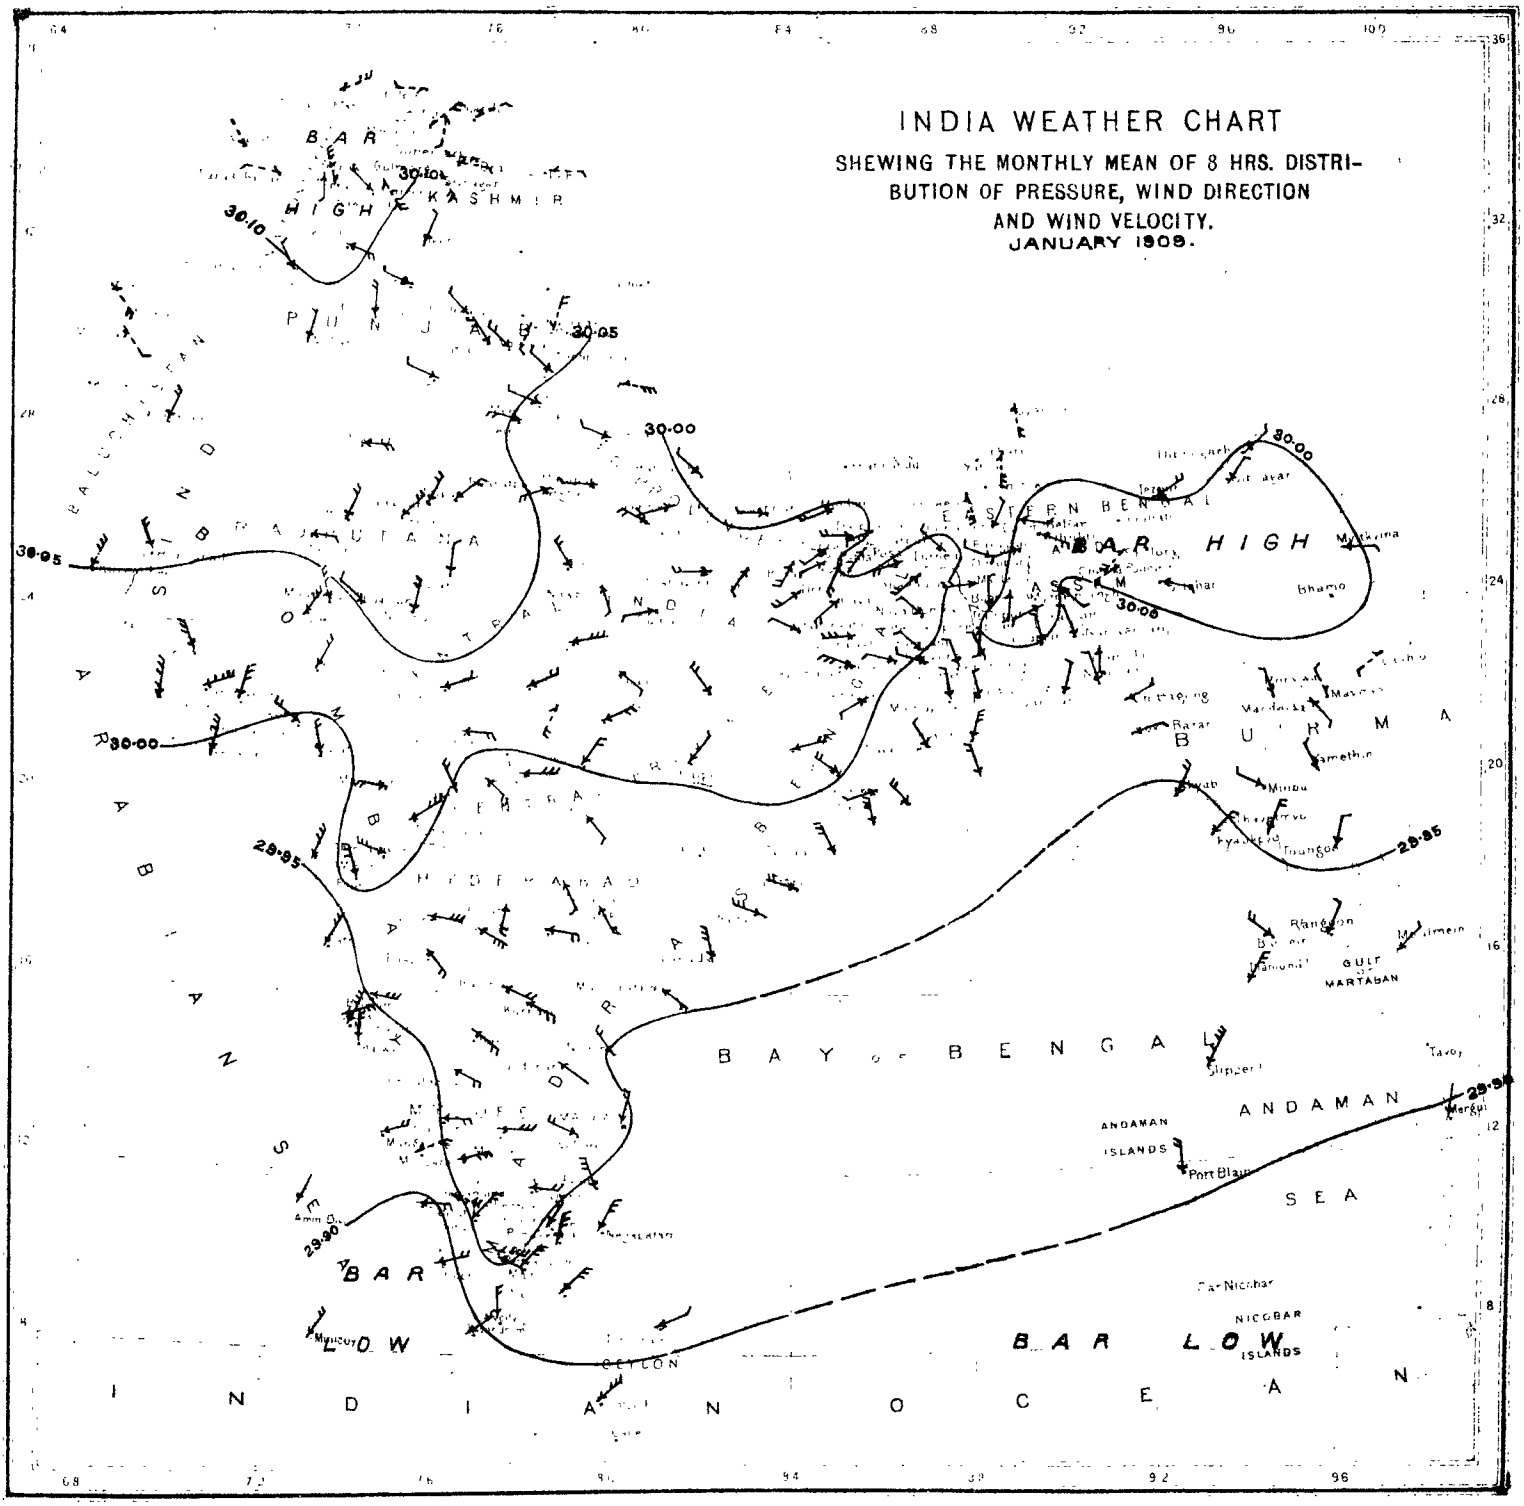
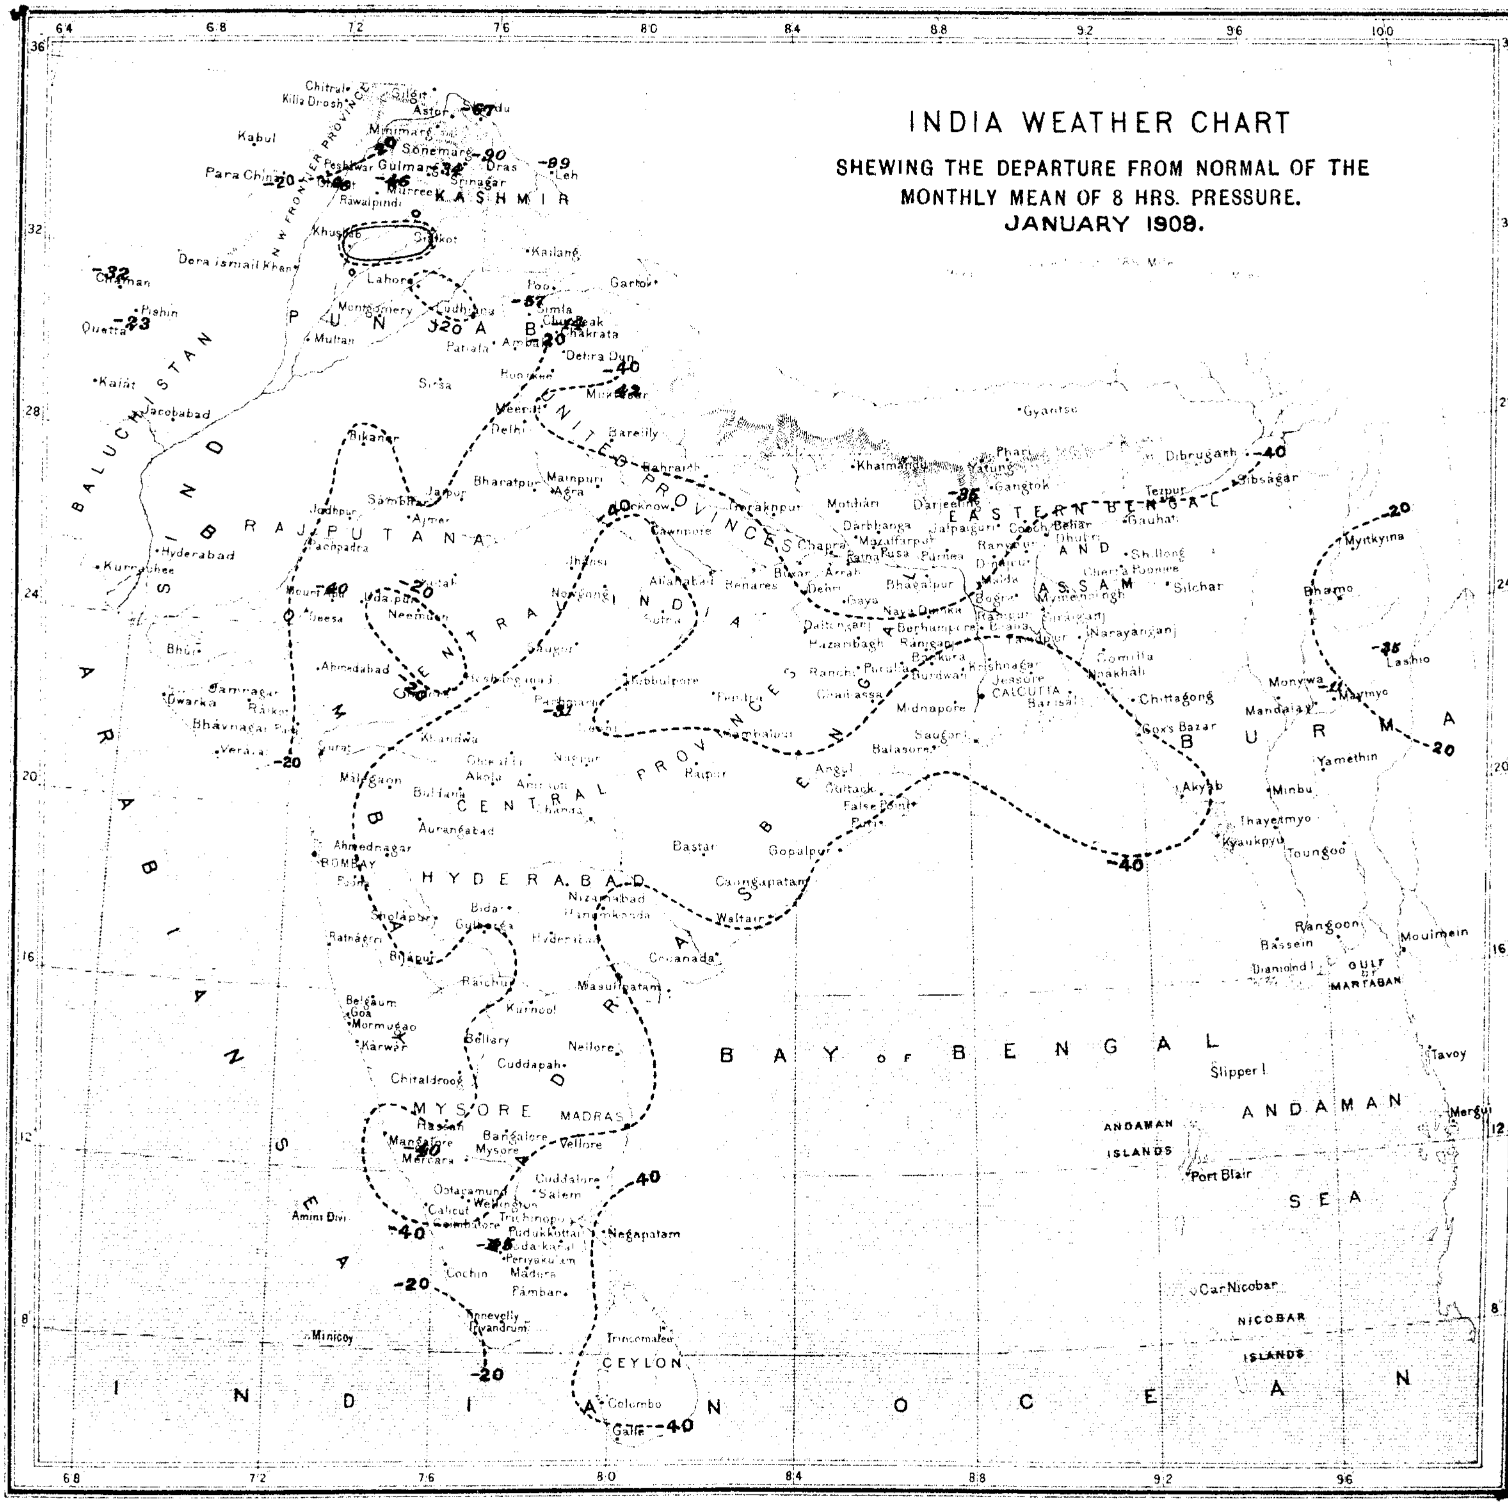
* Wind observations less 1. ‡ Wind observations less 9.
(d) Mean of 16 days.
(e) Mean of 14 days.
(f) Mean of 30 days.
† Snow water.



The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2	miles per hour	...	one	feather	added	to	the	wind	arrow.
,, ,,	2 to 5	,, ,,	...	two	feathers	,,	,,	,,	,,	,,
,, ,,	5 to 10	,, ,, ,,	...	three	,,	,,	,,	,,	,,	,,
,, ,,	10 to 20	,, ,, ,,	...	four	,,	,,	,,	,,	,,	,,
	over 20	,, ,, ,,	...	five	,,	,,	,,	,,	,,	,,



The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020" or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

The country is divided into 34 areas as shewn in the list below. The numbers in that list correspond with the red numbers on the chart, and serve to identify the areas. The numbers in brackets on the chart give the average over the divisions of the normal monthly rainfall, the numbers above these give the departures from normal of the average actual rainfall over the divisions.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, FEBRUARY, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of February, 1909, is based on observations taken daily at 8 hrs. at 240 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 35 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the provincial Governments up to the date of the preparation of the review, have been utilized.

The brief notes on solar, seismic and magnetic disturbances are supplied by the chief observatories.

Summary of the chief features of the weather in India during the month of February, 1909.

2. Weather in the Indian region was on the whole less disturbed than is usual in February, and with one exception the disturbances which advanced into northwest India from the west were very weak and followed an abnormal course. Two local depressions, however, were formed in central India and were productive of a series of thunderstorms in that region.

The total precipitation of the month was short of the average over a large part of the country, the only divisions which received more than their normal supply being Kashmir, Baluchistan, the North-West Frontier Province, the Punjab Southwest, Berar, the west of the Central Provinces and Burma. The largest defect occurred in Assam which received a third of an inch instead of the usual inch and a half.

No marked hot or cool waves were felt and the mean temperature conditions of the month were accordingly very nearly normal over practically the whole of the country. Humidity was low generally; cloud was in defect over the greater part of northern India but above normal in the peninsula and Burma.

Pressure as measured near the earth's surface was only ·007″ in excess of the normal. The conditions at the level of the hill stations were such as are associated with the prevalence of drier weather than usual.

Solar, seismic and magnetic disturbances.

SOLAR PHYSICS OBSERVATORY, KODAIKANAL.

3. *Solar Observations.*—Observations were possible on all the days of the month, but on three days the prominence record was imperfect on account of cirrus cloud.

Sunspots.—The spot activity was slightly lower in February than in January. There were 16 new groups with a daily average of 4·2 and an average life of 7·7 days; the corresponding figures for January having been 19, 4·5 and 8·0 respectively. There were 3 returns of old spots during the month. As in January, the southern spots occupied a wider belt and their mean latitude

was higher than the northern spots. The latitude distribution was as follows :—

TABLE 1.

	1°-10°	11°-20°	Above 20°	Extreme latitudes.	Mean latitude.
North	4	1	...	4, 17	9·0
South	5	5	1	3, 21	12·4

The five large groups 1593, 1594, 1595, 1596, and 1598, lying between longitudes 210° and 150°, which were mentioned in last month's report continued to be seen for the first few days in February. Another large display of spots began on the 20th when group No. 1609 came round the east limb; the affected area lay between longitudes 190° and 125° and contained the groups Nos. 1609, 1611, 1612, 1613, and 1615, all of which, except 1612 contained fairly large spots. The only large spots outside these regions were 1605 and 1607. Most of these groups were spectroscopically active, reversals and displacements of C and darkening of D3 were very frequently observed in them.

Prominences.—Sixty-four large, 6 metallic and 8 eruptive prominences were recorded during the month. Two prominences photographed on the 25th reached a height of 240″. Half the eruptive prominences of the month were in or near the large spotted region which came round towards the end of the month. The general prominence activity was higher in February than in January, the mean daily profile areas for the two months having been roughly 4·9 and 4·4 square minutes respectively.

Magnetic disturbances.—There was a "great" magnetic disturbance on the 2nd and 3rd, a "moderate" one on the 6th and 7th, and "small" ones on the 4th and from the 21st to the 27th. Spot group No. 1598, the last of the first five groups referred to above, crossed the central meridian on the 2nd; the five other groups 1609 to 1615, also mentioned above, all lay between the central meridian and the east limb during the period February 21 to 27.

C. MICHIE SMITH,
Director,
Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Note on the Alibag magnetic record.

4. During the month the traces showed 13 calm days, 14 days of small, and one day of moderate disturbance.

The days selected as quiet for the purposes of the magnetic survey of India are the 11th, 12th, 15th, 16th and 19th.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and declination for the month are as follow :—

Easterly declination . . .	1° 0′ 59″ ,,
Horizontal force . . .	0·36848 C. G. S. unit.
Vertical force . . .	0·15972 ,, ,,
Dip (calculated) . . .	23° 26′·1.
Dip (observed) . . .	23° 25′·9.
Horizonal force range . . .	0·00038 C. G. S. unit.
Horizontal force summed range .	0·00233 ,, ,,
Declination range . . .	1′·76
Declination summed range .	6′·03

[NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequality.]

The following table represents the magnetic character of each day during the month :—

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.
1	S	10	S	19	C
2	M	11	C	20	C

Solar Radiation.—The following figures give the intensity of solar radiation, as measured at Simla by Angstrom's pyrheliometer. The values are corrected to local noon, and expressed in grammecalories per square centimetre per minute. :—

Maximum	1·54
Minimum	1·41
Mean	1·46
Number of days of observation . .	10

J. H. FIELD,
Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. *Solar observations.*—Observations were taken on the 1st, 2nd, 4th, 12th, 13th, 15th, 16th, 18th to 20th, 22nd, 26th and 27th. Groups of sunspots were observed throughout. The sunspots were especially numerous from the 1st to the 4th and faculæ were seen on each day of observation.

Magnetic Disturbances.

TABLE 7.

Day.	Time.	Disturbance.
2nd	5¼h. to 8h.	Wave in H. F. (+47).
2nd	10½h. to 11½h.	Wave in H. F. (+40) steep at commencement, decrease in H. F. continued until 15 h.
2nd	17½h. to 18¼h.	Wave in H. F. (+20).
2nd to 3rd	22½h. to 12h.	Wave in H. F. (+50), occasional undulations throughout (±6), in decl.
2nd	5½h. to 8½h.	Double wave in decl. (—20 to +43).
2nd	10h. to 11½h.	Wave in decl. (+33), 19 to 35 undulation in decl. (±7).
3rd to 4th	23½h. to 1h.	Wave in H. F. (+15).
6th	4·50h.	Sharp increase in H. F. 20.
6th	11h. to 21h.	General decrease in H. F. (111).
6th	21½h. to 23¾h.	Wave in H. F. (+57), in decl. (+30).
7th	1¼h. to 2h.	Wave in H. F. (+30, in decl. (—10).
8th	1h. to 4h.	Wave in H. F. (+20).
9th	...	Accentuated diurnal variations in decl.
9th to 10th	12h. to 22h.	Occasional small fluctuations in H. F.
9th	16h. to 4h.	Sharp decrease in H. F. (10).
10th	5h. to 7h.	Wave in H. F. (+17).
17th	0h. to 1h.	Wave in H. F. (+12).
21st	1½h. to 3h.	Wave in H. F. (+9).
21st	21h. to 23h	Occasional small irregular waves in H. F. with superposed small fluctuations.

T. F. CLAXTON,
Director.

Weather in the Indian monsoon region.

8. In the subequatorial region as represented by Zanzibar and the Seychelles the pressure agreed closely with the average value and winds were fairly normal both as regards direction and intensity: rainfall was about 50 per cent. in defect at the former and 30 per cent. in excess at the latter station. Further south at Mauritius pressure was low and rainfall in excess; the air motion was considerably below the normal strength.

Depressions and cyclonic storms.

9. A remarkable feature of the meteorology of February, as of the preceding month, was the comparative rareness and feebleness of the disturbances. The Egyptian and English charts show that several depressions were transmitted from the Mediterranean across Syria and Asia Minor eastwards into Persia but only two were continued into north-west India, and even these were shallow low pressure areas rather than well-defined cold weather storms. The first of these entered Sind in the interval between 8 hrs. of the 18th and the same hour of the 19th and was dissipated on the 20th while passing eastwards across the south Punjab and north Rajputana. Judging from the character of the vertical pressure distribution it was of low elevation and its influence on the weather was not large.

The second disturbance appeared over north-west India on the 21st and disappeared on the 24th after producing light to moderate precipitation over the plains and hill districts of upper India. In the course of the disturbed period over north-west India two slight depressions were formed over the central parts of the country during the prevalence of high temperatures and were the cause of numerous light thunder showers over the Central Provinces, Central India and the east of the United Provinces.

In connection with the unusual character of the disturbances of the month it may be noted that the distribution of pressure over eastern Europe was abnormal on most days, pressure there being low instead of high as is normally the case.

Pressure.

10. The low pressure conditions which had characterized January did not persist during February, and the mean 8 hrs. pressure was ·007″ above the normal. Greater excesses were recorded over northern India, particularly over the Punjab, but in the peninsula and Burma pressure was in defect both actually and relatively to the average condition. The horizontal gradient near the earth's surface from north to south was accordingly much greater than is usual in February, and an area of high pressure was developed over Rajputana where ordinarily pressure is lower than in the Punjab.

In the hill districts of northern India the excess was almost the same in amount as in the plains below with the result that the vertical gradient did not differ appreciably from the normal value.

In southern India, on the other hand, pressure was markedly in defect at the level of 8,000 feet.

Temperature.

11. Day temperature differed but little from the normal in the plains of India, except in a narrow strip at the foot of the hills from Bareilly to Jalpaiguri where it was high. Night temperature also was within 2° of the normal almost everywhere, the only exceptions being Lower Burma (+2°·3), Berar (+2°·5), Bihar (—2°·8) and Rajputana West (—3°·3).

In Kashmir both day and night temperatures were lower than usual, the latter however to a greater extent than the former, but elsewhere in the hills the deviations from the normal, although similar in character to those in the adjacent plains, were very feebly marked.

The temperature conditions were on the whole more stable than usual, a frequent character during a mild winter. In most parts of northern India and in the north Deccan weather was cooler than usual during the first week and unusually warm during the third week. The second disturbance of the month initiated a spell of cold weather over northwest India lasting from the 24th to the end of the month: but throughout the month there were none of the rapid and large fluctuations of temperature which frequently characterize the cold weather season in northern India.

Winds.

12. (*a*) Winds were very variable in the United Provinces and considerably steadier than usual in north-west and central India and the greater part of the peninsula.

(*b*) The air motion was on the whole of about the average intensity except in Hyderabad, Central India, the North-West Frontier Province and north-east India where it was at least 20 per cent. weaker than usual.

(*c*) The deviations from normal of the direction of wind were chiefly local and of little significance.

It may be noted that abnormalities (*a*) and (*b*) were in part at least related to the absence of regular cold weather storms.

Humidity and cloud.

13. The air was slightly damper than usual in Burma and dry over the plains of northern and central India. At the hill stations in Baluchistan and northern India, on the other hand, humidity was, if anything, in excess of the normal. Over the peninsula the departures from the normal hygrometric conditions were small and irregular.

Notwithstanding the defect of rainfall there was more cloud than usual in the peninsula, Central India and Sind; while in the plains of northern India, where the precipitation was generally below normal the proportion of cloud also was low. In Burma there was a marked excess of cloud, as of rainfall.

Rainfall.

14. Precipitation received under ordinary conditions in February is light except in Baluchistan and upper and north-east India. In the month under review, as has been pointed out in a previous section, no regular cold weather storms visited India and the precipitation was accordingly even lighter than usual in all parts of the country with the exception of Baluchistan, Kashmir, the North-West Frontier Province, the Punjab South-west, Berar, the Central Provinces West, and Burma. The defect was most pronounced over the west of the United Provinces and the greater part of north-east India, regions almost beyond the influence of the slight disturbances of the month.

Rainfall was, on the other hand, much above the normal in the Bay Islands—a circumstance detrimental to the occurrence of rain in north-west India.

Snowfall.

I.—AFGHANISTAN.

15. Snow fell in Kabul on six days to a total depth of 15½ inches. Heavier falls are said to have occurred on the Hazara and Ghazni hills. At the end of the month the plain of Kabul was clear of snow, but on the Paghman hills there was still an accumulation of about 2½ feet or more. Severe cold was experienced during the first sixteen days of the month.

II.—NORTH-WEST FRONTIER PROVINCE.

(*a*) There were altogether four falls on the Sufed Koh and all of these extended to Parachinar. The total amount was not large enough to block the passes. Weather during the month was unusually warm.

(*b*) *Kohat.*—Snow fell on two or three occasions. The statement below gives the total fall recorded in the various localities:—

TABLE 17.

Locality.	Total amount received during the month.	
	Ft.	In.
Mahorah	3	0
Mazioghar	2	0
Koram	1	0
Zawaghar	0	6
Samana Range	0	6

(*c*) *Hazara.*—The following statement shows the total depth of snowfall received during the month on the mountain ranges in this district:—

TABLE 18.

Name of Range or station.	Snowfall during month.	
	Ft.	In.
Narang	5	10
Kagan	3	1
Jared	3	4

III.—KASHMIR.

According to the available information the snowfall of the month in this region was on the whole greater than usual. The snow accumulations at the end of the month were estimated at 12 feet in Sonemarg, 5 feet in Dras and at 10 to 15 feet on the Zoji-la and other higher passes.

IV.—PUNJAB.

(*a*) *Murree.*—Snow fell on five days at Murree and on two days on the hills near Kahuta; the total fall amounted to nearly a foot in the former and 7 feet in the latter locality.

(*b*) *Dalhousie.*—Snow fell on four days. The fall at Dalhousie was 3¼ feet deep but was believed to be at least double that amount at Bakrota, Kalatop, Khajiar and Dainkund.

(*c*) *Kulu.*—Snowstorms occurred on nine days in the Kulu tahsil and on eight days in the Saraj tahsil. The lowest level reached by the snowline was 4,000 feet.

The statement below gives the reported depth of accumulation on the various passes at the end of February 1909 with the corresponding average data:—

TABLE 19.

KULU TAHSIL.			SARAJ TAHSIL.		
PASS.	DEPTH OF ACCUMULATION.		PASS.	DEPTH OF ACCUMULATION.	
	Reported.	Normal.		Reported.	Normal.
Rohtang	21 feet	17½ feet	Sirikhand	18 feet.	18 feet
Hamta	34 "	15 "	Chul	8½ "	10 "

			Gargarasan	5½ "	12 "
			Sakiran	7½ "	9 "
			Supakun	5½ "	9 "
			Bashleo	7 "	9 "
			Placha	5 "	11 "
			Tirath	9 "	12½ "

(*d*) *Kailang.*—Feeble snowstorms occurred on eight days, chiefly during the second half of the month. The total quantity received was a little over 2 feet.

(*e*) *Kilba.*—There were four falls of snow on the hills near Kilba. The snowline descended to about 5,750 feet at which level the total quantity received during the month was estimated at 1½ feet. Most of the higher passes were closed. Weather was unusually cold and damp; avalanches were frequent.

V.—UNITED PROVINCES.

(*a*) *Garhwal.*—Snowstorms occurred on nine days, those of the 1st, 2nd and 3rd being severe; the snowline descended to about 4,000 feet on that occasion. Later the weather was generally mild and the falls did not descend to low altitudes. The total fall on the higher ranges was believed to be up to the average.

(*b*) *Almora.*—Occasional falls occurred during the month. The total fall measured 14½ feet on the Nuwe pass, 5 feet in Malla Danpur, 4 feet in Byans and 3½ feet in Malla Johar. The snowline came down to the inhabited area.

TABLE 20.

NAME OF PASS.	DEPTH OF ACCUMULATION AT THE END OF THE MONTH.	
	Reported.	Normal.
Untadhura	7 feet	25 feet
Ralamdhura	3 "	20½ "
Nuwe Pass	28 "	35 "
Lipu lekh "	7 "	19 "
Lampia "	7 "	21½ "

Weather was colder than usual.

SUMMARY.

16. (*a*) So far as can be judged from the scanty information available at present snowfall was on the whole either normal or in defect in the Afghan hills.

(*b*) According to newspaper accounts in the last week of February snow lay thickly on the Baluchistan hills as far down as Pishin where it had not been seen for years.

(*c*) In Kashmir the snowfall although irregularly distributed was on the whole probably somewhat in excess of the normal quantity.

(*d*) In the Punjab Himalayas, regarding which the information is imperfect, there was probably an average fall.

(*e*) Snowfall was normal or in defect in the Kumaon Himalayas. The accumulations at the end of the month were considerably smaller than usual.

On the whole it is probable that the snowfall of the month was not above the average.

Crop report.

17. *Burma.*—Harvesting of the winter rice crop was nearly completed in Lower Burma. The cultivation of the spring crops was in progress in Upper Burma.

Eastern Bengal and Assam.—The standing crops were in fair condition, but more rain was needed for them as well as for the preparation of land for jute and other autumn crops.

Bengal.—Land was being prepared for the autumn crops, and pulses and oil-seeds were being harvested. In parts of north Bihar fodder and the water-supply were becoming insufficient, and the prospects of the spring crops were bad.

United Provinces.—Standing crops were poor in Kheri and parts of Hardoi, Bahraich, Cawnpore and Sitapur, and some damage was reported by hail and frost: otherwise standing crops were in fair to good condition.

Punjab.—Crop prospects showed a marked improvement towards the end of the month and were generally good on irrigated and average to fair on unirrigated lands. More rain was still needed in Ambala, Ferozepore and Mianwali.

North-West Frontier Province.—The condition of standing crops was generally good on irrigated and average on unirrigated lands. More rain was wanted in Bannu, where fodder was scarce.

Jammu and Kashmir.—Standing crops were in good condition and fodder was sufficient.

Rajputana.—Standing crops were doing well and cattle were in good condition. Gram was being harvested in Kotah.

Central India.—Extraction of opium was in progress in Bhopawar. Spring crops were doing well almost everywhere, and except for some cattle disease, agricultural stock was satisfactory.

Central Provinces.—Threshing and winnowing of autumn crops and picking of cotton were nearly completed, and spring crops were being reaped. Standing crops were in fair to good condition.

Bombay.—Crops had been damaged in parts by insects, frost, disease and want of moisture, but elsewhere they were in fair to good condition. Autumn crops were being threshed and spring crops were being harvested.

Hyderabad.—Late rice sowings were completed. The spring crop was fair except in parts of the Raichur district.

Mysore.—Cattle disease was prevalent in parts and water and fodder were available in only limited quantities. Prospects of the season were unsatisfactory.

Coorg.—Rice was being threshed, and the picking of coffee was completed.

Madras.—Ploughing, sowing, weeding and transplanting were in progress. Standing crops were generally fair, but in parts they required more rain and were withering.

HEMRAJ.

(a) Indeterminate. § Mean of 25 days. ‖ Mean of 26 days. * Uncorrected.

Tabl

(2) *Abstract of observations taken at 8 hrs., at 240 station*

Number of subdivision.	Station.	Elevation of barcistern above sea-level in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

** Uncorrected.

¶ Wind observations of 25 days.

Table

(2) *Abstract of observations taken at 8 hrs., at 240 station*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

Tabl

(2) *Abstract of observations taken at 8 hrs., at 240 station*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

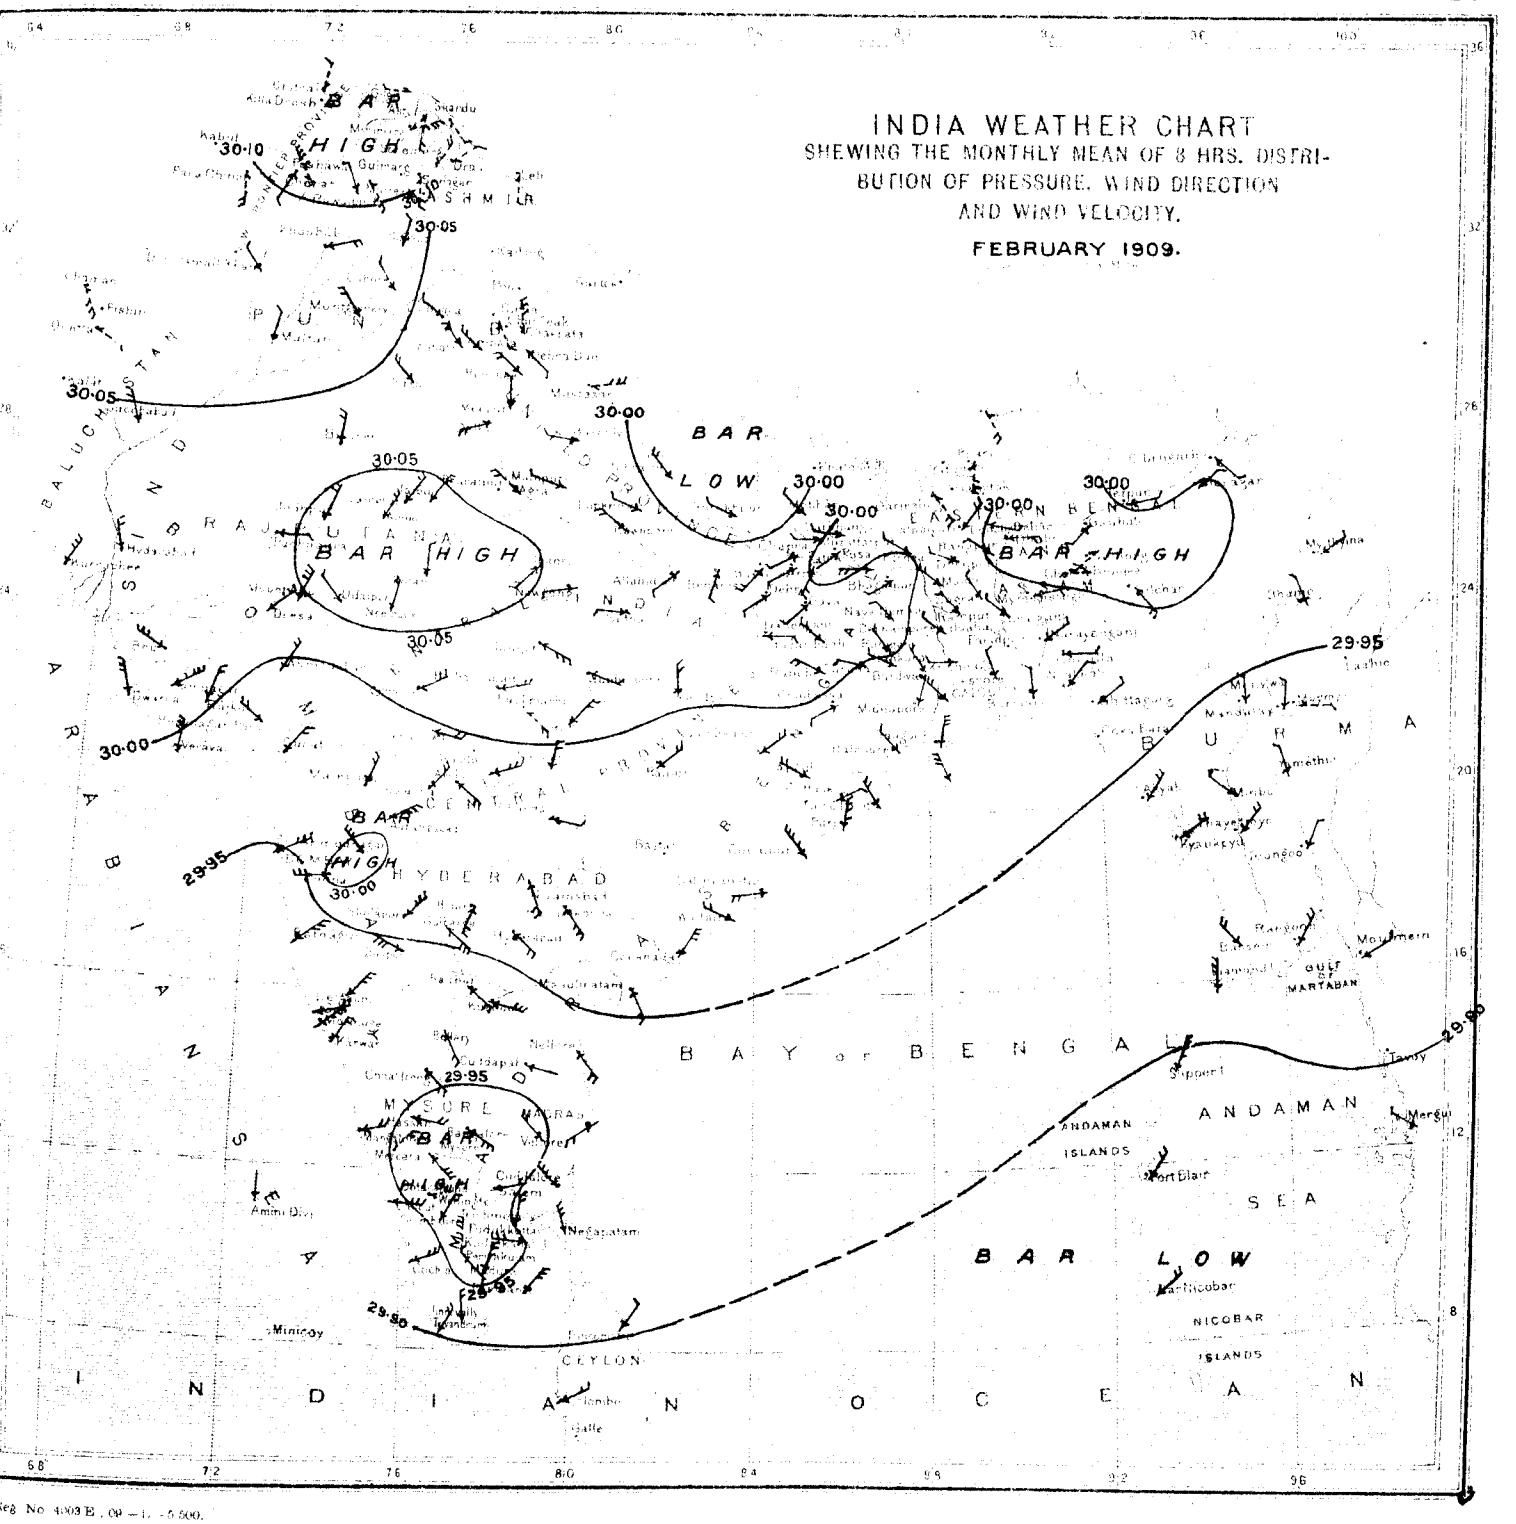
† Snow water. ‡ Wind less 26. ¶ Mean of 16 days.

** Wind variable 2.

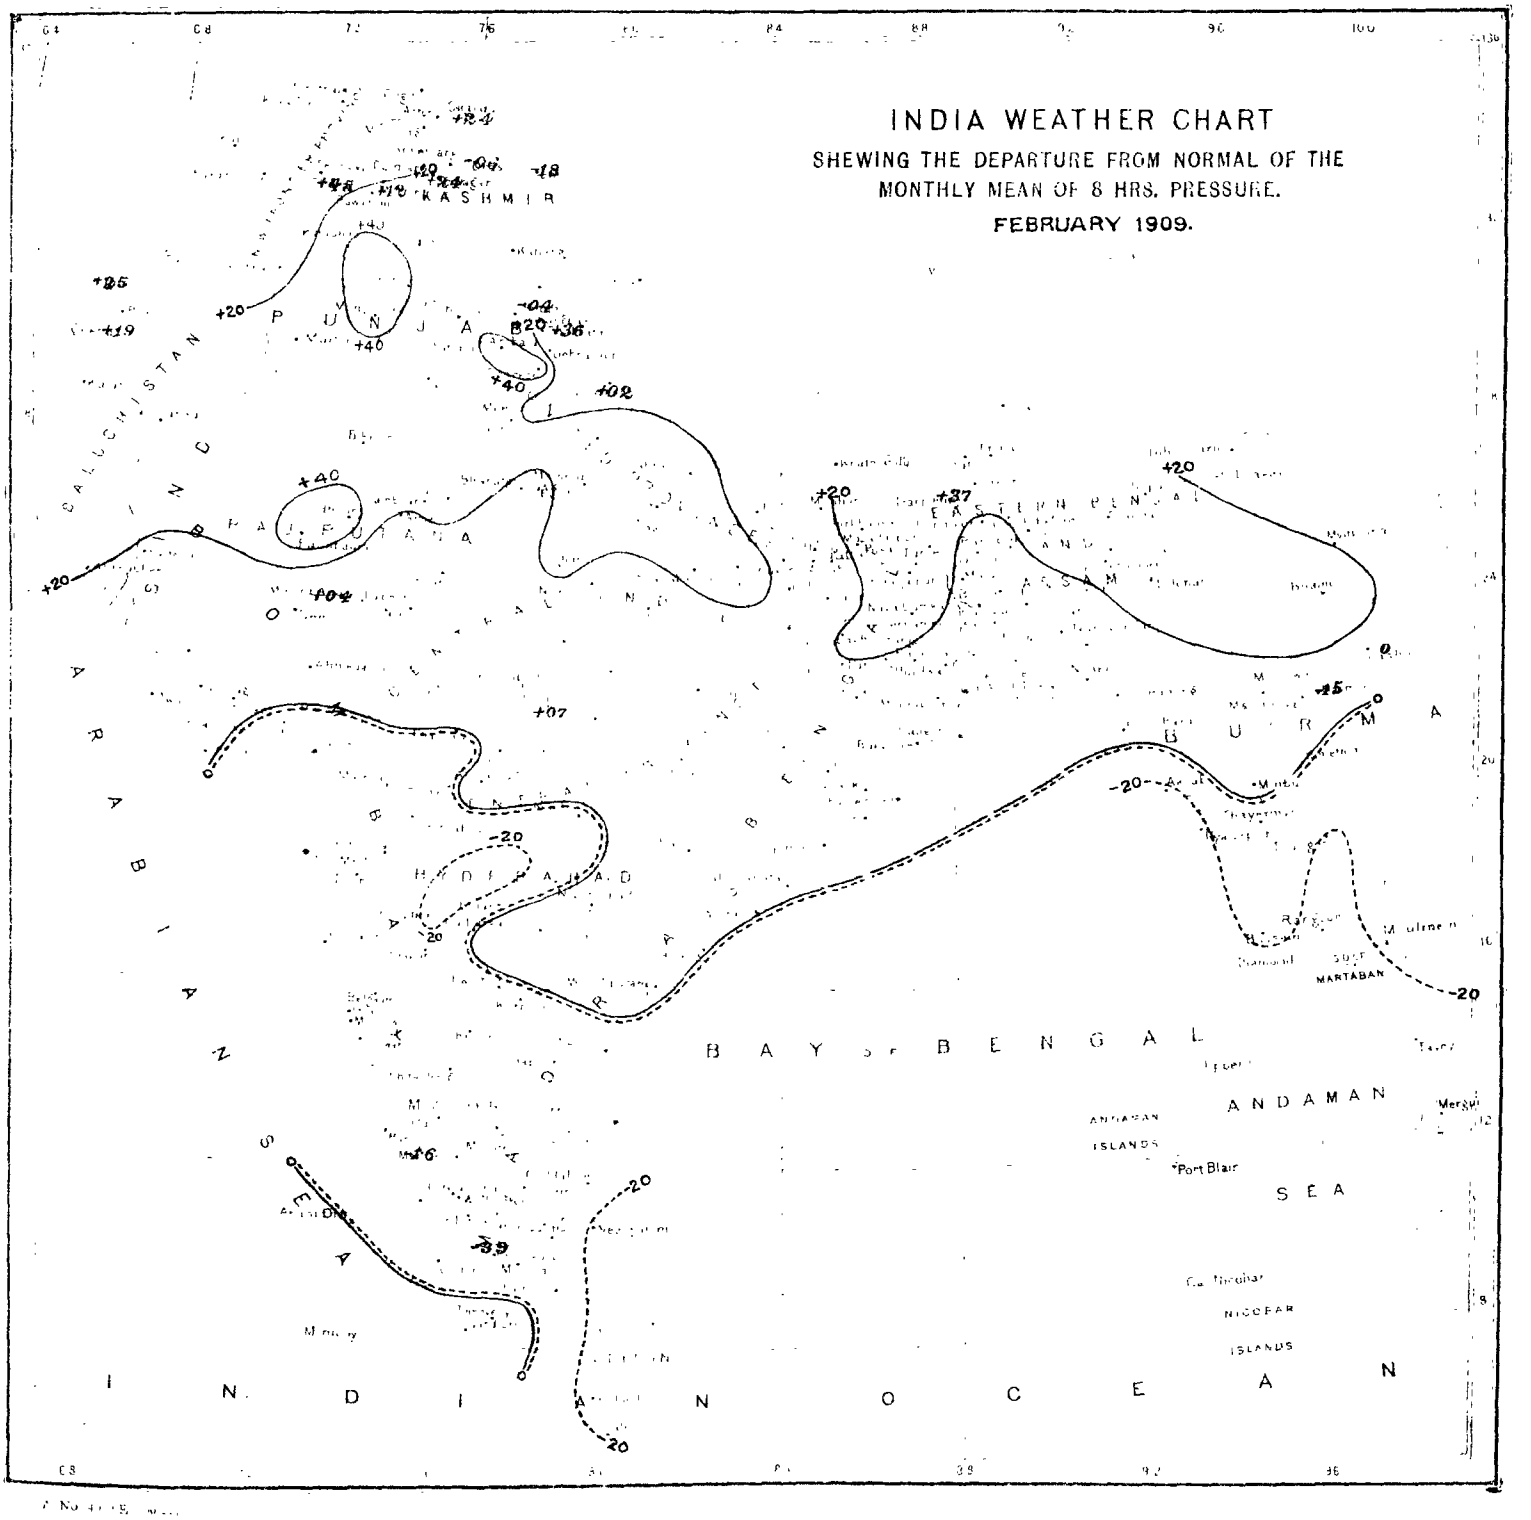


Reg No 4003 E. 09—1.—5 500.

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	...	one feather	added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,	...	two feathers	,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	...	three ,,	,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	...	four ,,	,, ,, ,, ,,
	over 20 ,, ,, ,,	...	five ,,	,, ,, ,, ,,



The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020 or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line tacing the area of deficient pressure or negative departures.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

SIMLA, MARCH, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of March, 1909, is based on observations taken daily at 8 hrs. at 240 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 35 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the provincial Governments up to the date of the preparation of the review, have been utilized. The brief notes on solar, seismic and magnetic disturbances are supplied by the chief observatories in the Indian area.

Summary of the chief features of the weather in India during the month of March, 1909.

2. March 1909 was almost as dry as the corresponding month of 1898, which was the driest March on record. No rain fell in the United Provinces, Sind and Rajputana and practically none in Bengal, Central India and the greater part of Bombay. As, however, the quantity of rainfall received normally during March does not exceed half an inch over three-fourths of the country the defect recorded in the month under review was in general small. The total fall of the month was seriously below normal in northeast India, particularly in Assam which received barely a sixth of an inch, instead of 4½", its normal supply for the month.

Humidity was remarkably low over a large part of the country, while cloud was in defect in northern India and Bombay and in excess over the eastern half of the peninsula.

Except in northeast India, Berar and the adjacent districts to the west where it was rather high, temperature differed little from the normal. The excess in the northeast occurred entirely in the day temperature which was 3° to 8° above the average.

Mean 8 hrs. pressure averaged over the whole country was ·001" in defect of the corresponding normal value. There was a decided excess in northwest India and a similar defect in the northeast, a type of distribution favourable for the prevalence of dry westerly winds over northern India.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar observations.*—The weather was fine throughout the month except on the 3rd when neither spots nor prominences could be observed, and the 2nd on which the prominence record was imperfect.

Sunspots.—The number of new spot groups recorded was 24 with a daily average of 4·4 as against 16 and 4·2 in February, but most of them were shortlived, the average life of a spot being only 5·3 days as against 7·7 in February.

Three of the new groups of the month were returns of old ones. The latitude distribution of the spots was as follows :—

TABLE 1.

—	1°—10°	11°—20°	Above 20°	Extreme lat.	Mean lat.
				° °	°
North	4	2	...	2, 13	8·7
South	8	8	2	2, 22	11·9

thus showing three times as many groups in the southern as in the northern hemisphere.

Groups Nos. 1611, 1613, 1615, 1629, 1631, 1632 and 1637 contained fairly large spots. The first three of these were groups which appeared towards the end of the previous month. Nos. 1611, 1613, 1629, and 1632 were scattered trains and very active, as indicated by the behaviour of the C and D_3 lines. The region about longitude 180° which showed a great spot activity during several previous rotations contained the groups 1628 to 1633 in March.

Prominences.—Fifty-two large, six metallic, and six eruptive prominences were recorded during the month. The tallest of them, which was 175″ high, was photographed on the 7th.

Magnetic disturbances.—There was a "great" magnetic disturbance on the 28th, "moderate" ones on the 18th, 19th, 20th and 27th and "small" ones on 10 other days. The region containing the 6 spot groups 1628 to 1633, mentioned above, crossed the central meridian from the 24th to the 28th.

C. MICHIE SMITH,

Director,

Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Note on the Alibag Magnetic Record.

4. During the month of March 1909 the traces showed 12 calm days, 15 days, of small, 3 days of moderate and 1 day of great disturbance.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 9th, 10th, 15th, 16th and the 24th.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and declination for the month as follow:—

Easterly declination	1° 1′ 14″.	
Horizontal force	O. 36847 C. G. S.	
Vertical force	O. 15968	Ditto
Dip (calculated)	23° 25′·8	
Dip (observed)	23° 25′·1	
Horizontal force range	O. 00058 C. G. S.	
Horizontal force summed range	O. 00346	Ditto
Declination range	2′·2	
Declination summed range	8′·0	

(NOTE.—Summed range means sum without regard to signs of 24 cordi of diurnal inequality).

The following table represents the magnetic character each day of the month.

TABLE 2.

29th	0h. to 9h.	Undulations in H. F. (± 16).

T. F. CLAXTON,

Director.

Weather in the Indian monsoon region.

8. There was no marked departure from the normal pressure conditions in the subequatorial region as represented by Zanzibar and the Seychelles.

Winds were nearly normal as regards velocity: their direction was however considerably more easterly than usual at Zanzibar.

Rainfall was unusually scanty at the Seychelles (—86 per cent) and 66 per cent above the average at Zanzibar.

At Mauritius both pressure and rainfall were in marked defect.

TABLE 7.

Depressions and cyclonic storms.

9. The disturbances which usually affect the weather in India during March belong either to the type of cold weather storms or to the class of local hot weather disturbances, such as hailstorms or thunderstorms. During the month under review the disturbances of the former class were very ill-defined and followed a somewhat more northerly course than usual. The precipitation associated with them was accordingly almost restricted to Kashmir and Baluchistan and on one occasion only, *viz.*, the 25th and 26th, did it extend to the plains of upper India.

There was thus a great similarity as regards general characteristics between the depressions of this and those of the previous two months.

Disturbances of the second class occur chiefly in Assam and Eastern Bengal, where under ordinary conditions sea breezes prevail. During the present month thunderstorms and hailstorms were of very rare occurrence in consequence of the prevalence in northern India of pressure conditions inimical to the sea breeze action.

Pressure.

10. The mean 8 hrs. pressure was more or less above the average over the greater part of northwest and central India, and in defect over the rest of the country. The excess was greatest (+·030″) in Sind, north Rajputana and the Punjab, while the largest defect, (—·032″), occurred along the foot of the eastern Himalayas from Darbhanga to Sibsagar. The gradient from west to east across northern India was thus considerably stronger than usual.

TABLE 8.

Division.	Departure from normal of mean 8 hrs. pressure.
	″

Temperature.

11. Deviations from normal of mean temperature were small in almost all parts of the country.

The monthly average of minimum temperature was within ½° of the normal value, except locally in Rajputana West where nights were 3° cooler than usual. Day temperature on the other hand did not correspond so closely with the normal, for in Assam, Eastern Bengal, Bengal, Bihar, the east of the United Provinces and Hyderabad North the maximum temperature of the air was from 3° to 8° higher than the average.

In comparison with normals, the hill stations of Darjeeling, Muktesar. Chakrata and Simla were warmer, both by day and night, than the neighbouring plains, but elsewhere in the hills the temperature conditions were approximately normal.

A spell of cold weather was felt over northwest India from the 26th to the 30th after the passage of the last depression of the month: temperature was as much as 13° to 14° below normal at Rawalpindi, Cherat and Murree on the 26th.

Winds.

12. The abnormal character of the pressure distribution over northern India resulted in a strengthening of the usual dry westerly current down the Gangetic Plain and in its extension into Bengal as far as the eastern confines of Bihar. Thus at Patna the mean direction for the month was S57°W the normal being S63°E, and at Purnea the usual northeast winds were replaced by winds from between southwest and west. In the peninsula and Burma, regions of nearly uniform pressure, the deviations from the normal type were rather irregular and of no great significance from the standpoint of weather.

Humidity and cloud.

13. The air was drier than usual, in point both of absolute and relative humidity, throughout the country with some local exceptions. The dryness was great in the east of the United Provinces, Bihar and the adjacent districts of Chota Nagpur on the one hand and over central Madras and the neighbouring districts on the other.

TABLE 13

Lucknow	—·133	—20
Bahraich	—·157	—21
Hyderabad	—·155	—16
Bellary	—·172	—13

In the former regions the low humidities were associated mainly with dry westerly winds caused by the abnormal pressure conditions which prevailed, and were most marked about the middle of the month and again towards the end of the last week: at several stations the percentage of saturation on these occasions was as low as 10 to 18.

In the latter area, central Madras and the neighbouring districts, the greatest dryness occurred between the 12th and 18th when humidities of 8 to 24 per cent were observed at a number of stations.

The dryness of the air was not a phenomenon of the lower atmosphere merely, for at all the hill stations below the level of Leh, which is over 11,000 feet in height, the humidity was as much in defect as in the plains below.

The departures of cloud were parallel with those of the rainfall except in Madras, Mysore, the Central Provinces and the east of Central India, where notwithstanding the shortness of the rainfall skies were clouded to an unusual extent.

Rainfall.

14. Owing partly to the abnormal track of the cold weather depressions and partly to the prevalence of unusual pressure conditions, which checked almost completely the flow of damp air from the Bay into the interior, the precipitation of the month was in defect of the normal over practically the whole of the country; the only divisions where an excess occurred were the Bay Islands, Lower Burma and the Konkan. The deficiency exceeded half an inch in amount in northeast India, Kashmir, the North-West Frontier Province and the Punjab, and was absolutely greatest in Assam which received a total of 0·16," in place of the normal 4·51".

No rain fell during the month in Bihar, the United Provinces, Sind, Rajputana, Gujarat, Central India West, and scarcely any in Upper Burma, Eastern Bengal, Bengal, Chota Nagpur, the Punjab East and North, Central India East, Hyderabad South, the Madras Deccan and Madras Coast, North.

On the mean of the whole month and of the whole area there was a defect of 83 per cent in the rainfall; in respect of dryness the month was almost unique, being surpassed only by March 1898.

Snowfall.

I.—*Afghanistan.*

15. Snow to a depth of 9 inches is reported to have fallen at Kabul on the 3rd of the month. At the close of the month the plain of Kabul, as well as the adjoining low hills, was clear of snow.

II.—*North-West Frontier Province.*

(*a*) *Wano.*—There was a fall of about 5 inches on the 5th down to 11,000 feet and another of about 2 inches on the 11th 3,000 feet lower. By the end of the month the hills had become quite bare of the snow covering.

(*b*) *Dera Ismail Khan.*—No snowfall took place on the Saraghar, Girni Sar and Gabar ghar peaks.

(*c*) *Kurram.*—There were in all seven falls on the Sufed Koh and the surrounding hills. Weather was unusually warm throughout. All the passes were open at the end of the month.

(*d*) *Kohat.*—Snow fell on the 3rd, 4th and 25th on the Tirah hills. The total fall amounted to 5 inches on the Mozioghar and 3½ inches on the Mahorah. No snow fell on the Samana Range.

(*e*) *Hazara.*—The statement below shows the character of the snowfall in this district :—

TABLE 17.

Name of Range.	Total snowfall of month.	
	Ft.	In.
Narang	4	2½
Kagan	1	4½
Jared	0	5

III.—*Kashmir.*

Snowfall was very irregular in occurrence and distribution. One slight fall occurred in Srinagar. At Skardu there were three snowstorms resulting in about half a foot of snow. At Sonemarg and on the Zoji-la and Hangsathu passes no less than sixteen falls occurred adding considerably to the existing accumulations, with the result that at the end of the month snow to a depth of about 12 feet was reported to be lying in the former and 24 feet in the latter locality. At Dras the total fall of the month was 2½ feet while on the Kargil hills about 2 feet were measured at a level of 15,000 feet.

IV.—*Punjab.*

(*a*) *Murree.*—No snow fell during the month at Murree nor on the hills adjacent to Kahuta.

(*b*) *Kulu.*—Snowfall was confined to the higher peaks and occurred on eight days in the Kulu and on three days in the Saraj tahsil.

The depth of accumulation as reported on the 25th of the present month, together with the corresponding normal values, is given below :—

TABLE 18.

KULU TAHSIL.			SARAJ TAHSIL.

			Sakiran	7½ "	6½ "
			Supakun	5½ "	7 "
			Bashleo	7 "	7 "
			Placha	5 "	9 "
			Tirath	9 "	10½ "

(*c*) *Kailang.*—Altogether eight inches of snow fell on three days.

(*d*) *Kilba.*—There were eight falls of snow on the hills near Kilba extending down to about 7,500 feet, at which level the total fall measured about 3½ feet in depth. All the well known and higher passes were free of snow.

V.—*United Provinces.*

Almora.—Snowstorms were of occasional occurrence. The total fall measured 6½ feet on the Binkaru pass, 4 feet on the Untadhura, 3 feet in Byans and 4½ inches in Malla Danpur. The snow line descended from the perpetual snows to the inhabited area.

The statement below shows a comparison of the reported depth of snow accumulations on the various peaks and passes in the district with the average values :—

TABLE 19.

Name of pass.	Depth of Accumulation at the end of the month.	
	Reported.	Normal.
Binkaru pass	16 feet ...	27½ feet.
Lipu lekh „	9 „ ...	22½ „
Lampia „	9 „ ...	22½ „

Summary.

16. (*a*) The available data indicate that there was heavy fall of snow in the mountain regions of Persia durin the first week of the month.

(*b*) Very heavy rain fell at Herat and was accompanie by snow on the neighbouring hills. Further east in Kabı and the hills of the North-West' Frontier Province th snowfall was apparently less than usual.

(*c*) The snowfall of the month was in general ligh and below normal in Baluchistan as well as in the wester Himalayan region.

Crop report.

17. *Burma.*—Standing crops were in good condition. Clearings for hill rice, and cultivation of spring rice were in progress.

Eastern Bengal and Assam.—Standing crops had suffered from continued drought, and the prospects of summer rice had been seriously affected. Sowings had been greatly retarded for want of moisture.

Bengal.—Sugarcane was being planted and spring crops harvested. More rain was urgently wanted for preparation of lands for next season's crops in southwest Bengal and Bihar.

United Provinces.—Prospects were bad in Kheri and a part of Bahraich. Standing crops were suffering from want of rain in the dry parts of Debra Dun and Garhwal and from high winds in Moradabad, Bareilly, Aligarh, and Sitapur.

Punjab.—Standing irrigated crops were generally in good to fair condition, but unirrigated crops were below the average in Rohtak, Ambala, Jullundur, Gujranwala, Jhang and Multan. Extra spring and autumn crops were being sown.

North-West Frontier Province.—Sowings of extra spring crops and of sugarcane were in progress. The condition of standing crops was generally good in irrigated areas and average elsewhere. More rain was wanted for unirrigated tracts.

Jammu and Kashmir.—Standing crops were in fair condition. Fodder was sufficient.

Rajputana.—Spring crops were being harvested, with fair to good outturn. Standing crops were doing well and fodder and water were sufficient.

Central India.—Spring crops were being harvested: agricultural stock was satisfactory.

Central Provinces.—Reaping, threshing and winnowing of spring crops were in progress, but some damage was reported from hail. Cattle were doing well and fodder and water were sufficient.

Bombay.—Standing spring crops had been damaged in parts by insects, wind, want of moisture and rain, but were generally in fair to good condition. Agricultural stock was sufficient except in parts of the Deccan and Cutch, and was generally in good condition.

Hyderabad.—Lands were being prepared for next autumn sowings. Spring crops were generally in fair condition but some damage had been caused by rain.

Mysore.—Prospects of the season were uncertain. Cattle were generally healthy and water and fodder were procurable.

Coorg.—Threshing of rice was completed. Water and fodder for cattle were sufficient.

Madras.—Ploughing, sowing, weeding and transplanting were in progress. Standing crops were generally in fair condition, but in some parts they required more rain. The condition of cattle was on the whole good.

† Departures from old normals.
(a) Mean of 30 days.
(b) Mean of 19 days.

* Corrected.

‡ Wind variable 3.

Table B.—Abstract of observations taken at 8 hrs. at 240 stations in India, etc., in March 1909.

(1) Provincial means.

(2) Data of stations.

(1) Provincial means based on the material in Table B, (2) except that the statement of rainfall depends on the complete data of about 2,500 stations.

	Pressure departure from normal.	Temperature of air.								Wind.		Hygrometry.				Cloud.		Rainfall.		
		Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Absolute range during month.	Departure of velocity from normal.	Departure of steadiness from normal.	Mean humidity.	Departure from normal.	Mean vapour tension.	Departure from normal.	Mean cloud amount.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.

Table

(2) *Abstract of observations taken at 8 hrs. at 240*

Number of sub-division.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

(a) Indeterminate.
* Uncorrected for scale error.
(d) Mean of 30 days.

Tabl

(2) *Abstract of observations taken at 8 hrs. at 24*

Number of sub-division.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

N. B.—Elevations in italics indicate barometrical determinations.

NOTE.—The barometric readings are not reduced to sea-level in the case of hill or plateau stations, the elevations of which exceed 3,200 feet.

(g) Mean of 27 days.
(h) " 26 "
(d) " 30 "

B—*continued.*

***stations in India, etc., in March, 1909*—continued.**

Wind Direction. Number of winds from Calm.	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind Velocity. Mean velocity in miles per hour.	Normal.	Departure from normal.	Wind Steadiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st Dec. 1908 to 31st March 1909.	Normal rainfall for period, 1st Dec. to 31st March.	Departure from normal of period, 1st Dec. 1908 to 31st March 1909.	Heaviest rainfall during month.	Station.

TABL

(2) *Abstract of observations taken at 8 hrs. at 24*

Number of sub-division.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

* 8 hrs. velocity.
(e) Mean of 29 days.

* Uncorrected for scale error.

Tabl

(2) *Abstract of observations taken at 8 hrs. at 24*

Number of sub-division.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of Air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

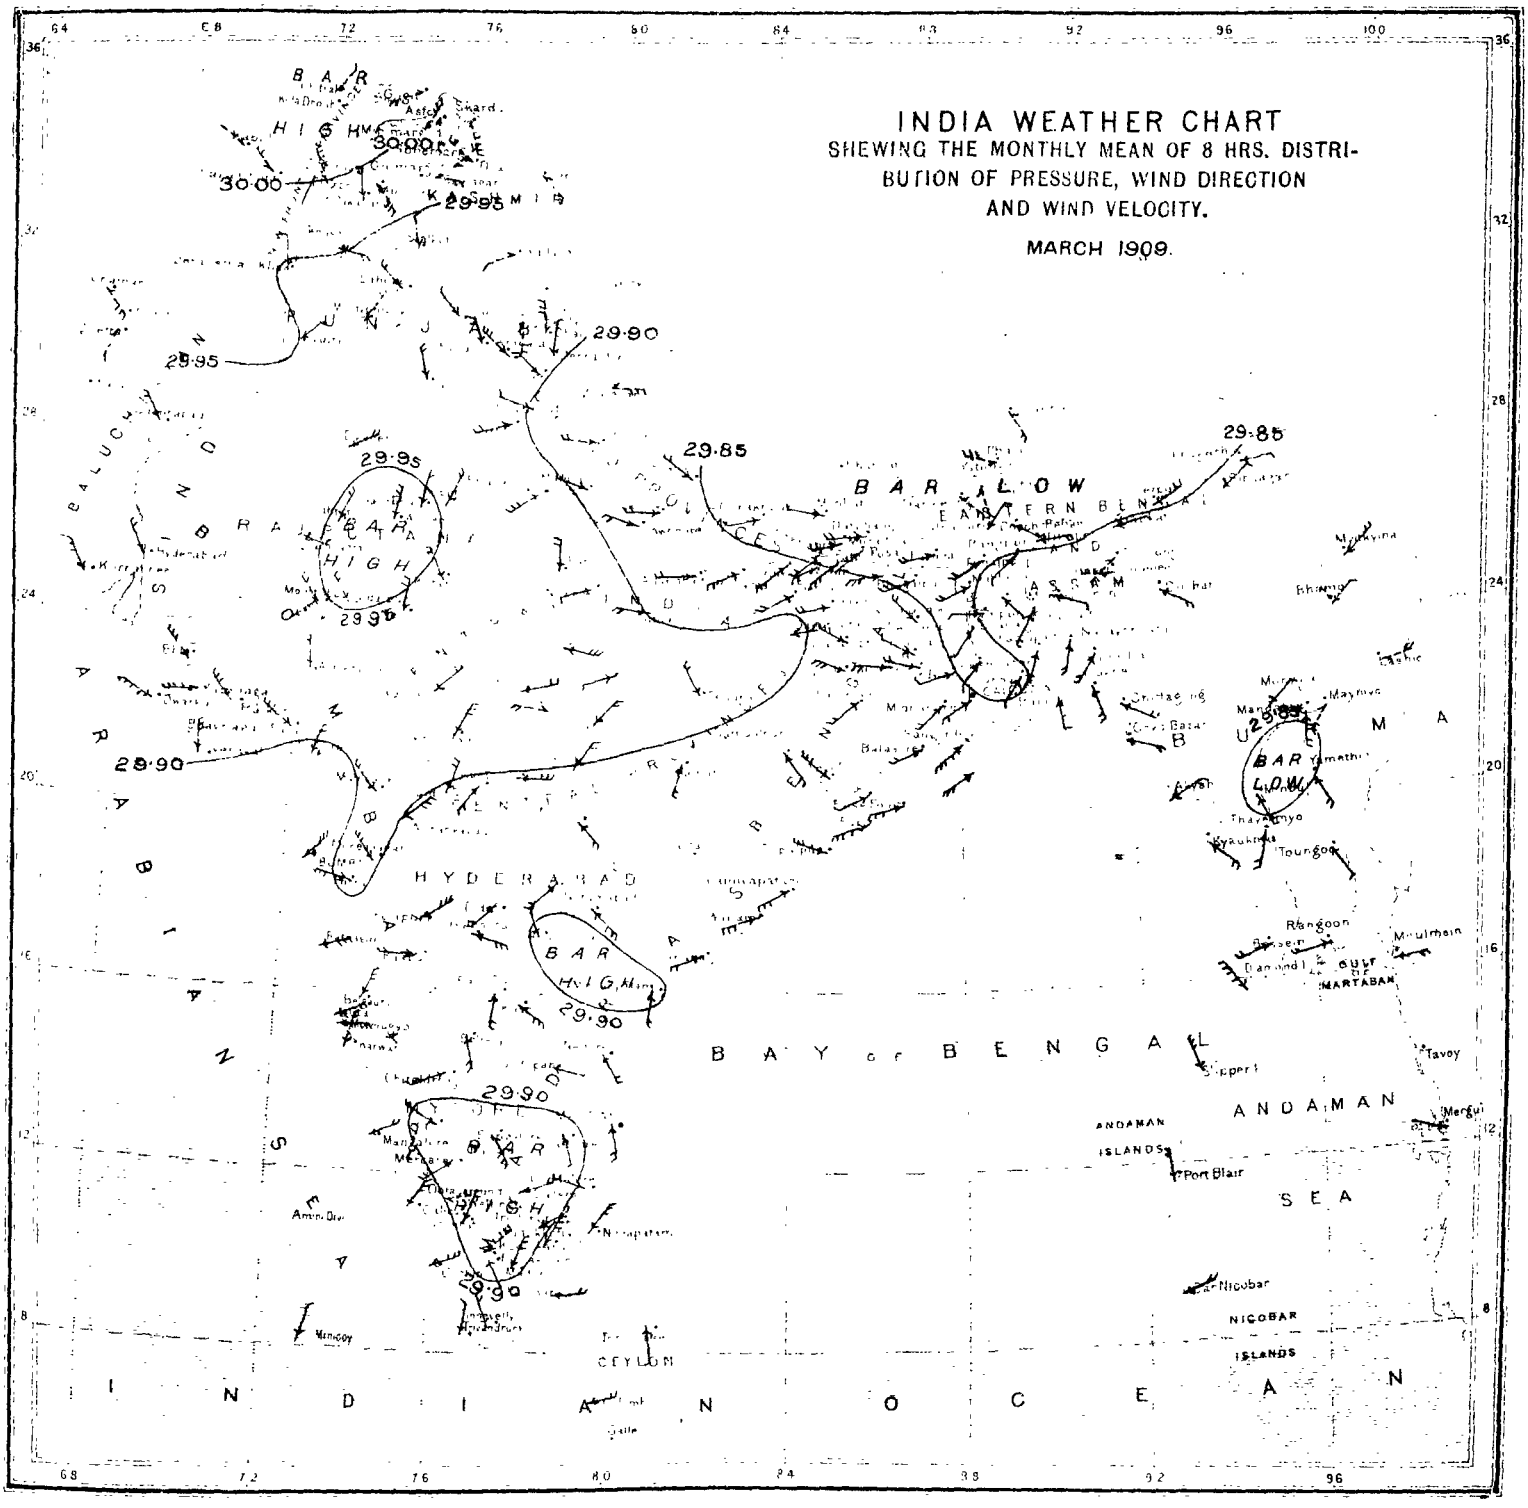
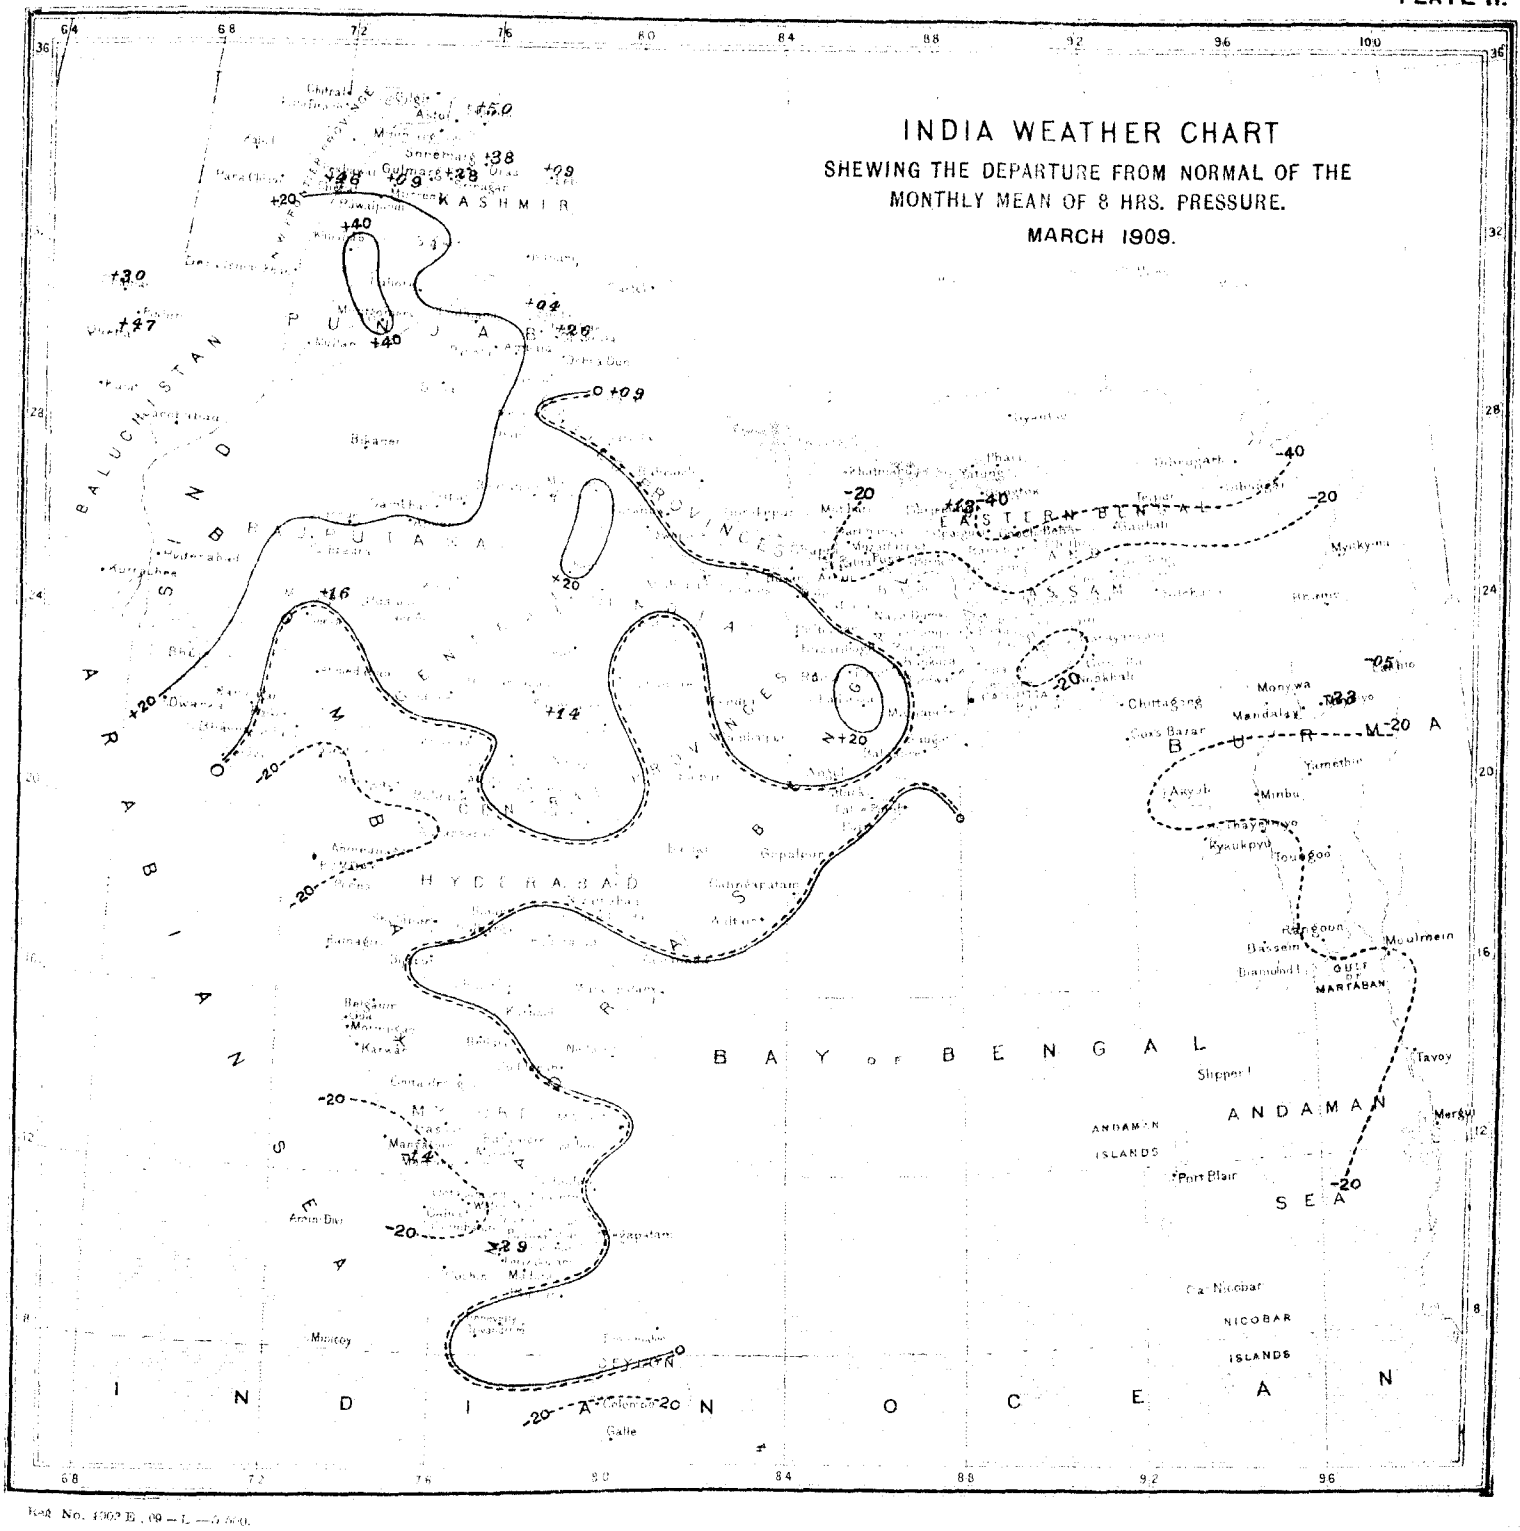
†† Indeterminate. ‡ Wind observations less 1. (a) Mean of 28 days. † Wind variable 5.



The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	.	one feather added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,		two feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,		three ,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,, ,,
	over 20 ,, ,, ,,	..	five ,, ,, ,, ,, ,,



Reg. No. 1002 E. 09 — L — 5,500.

The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020′ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

MONTHLY WEATHER REVIEW

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, APRIL, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of April, 1909, is based on observations taken daily at 8 hrs. at 238 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 35 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the provincial Governments up to the date of the preparation of the review have been utilized The brief notes on solar, seismic and magnetic disturbances are supplied by the chief observatories.

Summary of the chief features of the weather in India during the month of April, 1909.

2. In the west of the peninsula, Kashmir and the North-West Frontier Province weather was drier than usual in April, but elsewhere the month's rainfall was unusually abundant, in many parts ranging from four to twenty times the normal quantity.

Temperature, and especially day temperature, was low over practically the whole of the country. The air was drier than usual over the peninsula and a large part of Burma and northeast India, but was remarkably damp over the rest of the country. Departures of cloud were generally parallel with those of humidity.

The barometric pressure in the lowest stratum of the atmosphere was ·015″ in excess of the normal. At the leve of the hills on the other hand pressure was in decided defect, so that the vertical pressure gradients were steeper than usual.

Solar, seismic and magnetic disturbances.

KODAIKANAL.

3. *Solar observations.*—Spot observations were possible during the whole month but on the 24th prominences could not be observed, and on 4 other days the prominence record was imperfect.

Sunspots.—Twenty-two new spot groups were observed during the month with a daily average of 3·1. The average life of a spot was only 3·8 days and there were only two groups which passed across the whole disc. The sun was free from spots on one day—the 10th. Of the 22 new groups seen only 4 were in the northern hemisphere. The latitude distribution was as follows :—

TABLE I.

—	1° - 10°	11° - 20°	Extreme latitudes.	Mean latitude.
North . .	4	0	2°, 9°	6°·8
South . .	6	12	2°, 20°	11°·9

Nos. 1643 and 1649 were the only new groups which contained fairly large spots. The latter group developed large companions as it neared the central meridian and by the time it reached it had become a train of 3 large spots. Groups Nos. 1635 and 1637 mentioned in the report for March continued to be seen till April 9. Disturbances in C and D_3 were frequently observed in group No. 1635 after it crossed the central meridian. Group No. 1651 appeared within 2 days' march of the west limb and was associated with a small but very active prominence.

Prominences.—Seventy-three large, 4 metallic, and 6 eruptive prominences were recorded during the month. The main part of an eruptive prominence recorded on the 21st was a bright straight jet 220″ high in Ca but in hydrogen it was only a faint detached streak about 90″ high. The prominence associated with group No. 1651, mentioned above, was bright and metallic but its height, though changing, did not exceed 30″. C was displaced and the direction and amount changed frequently during the whole time of observation—9h. 45m. to 11h.; the greatest displacement observed corresponded to a radial velocity of 115 miles a second towards the observer. The prominence showed about 30 bright lines between C and F.

Magnetic disturbances.—There were "small" magnetic disturbances on 12 days but nothing of greater intensity.

C. MICHIE SMITH,

Director,

Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Alibag Magnetic Record.

4. During the month of April 1909 the traces showed 16 calm days and 14 days of small disturbance.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 6th, 8th, 15th, 21st and 22nd.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and declination for the month are as follow:—

Easterly declination	1° 0′ 43″	
Horizontal force	0·36861	C. G. S. unit.
Vertical force	0·15982	" "
Dip (calculated)	23°26′·4	
Dip (observed)	23°25′·9	
Horizontal force range	0·00062	C. G. S. unit.
Horizontal force summed range	0·00388	" "
Declination range	3′·5	
Declination summed range	13′·5	

[NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequality.]

The following table represents the magnetic character of each day of the month.

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Character.
1	C	9	C	17	S	25	S
2	C	10	S	18	S	26	S
3	C	11	S	19	S	27	S
4	C	12	S	20	C	28	C
5	S	13	S	21	C	29	S
6	C	14	S	22	C	30	C
7	C	15	C	23	C		
8	C	16	S	24	C		

C=calm, S=small, M=moderate, G=great, V. G.=very great.

Seismic disturbances recorded at Bombay.

Ten seismic disturbances were recorded during the month on the 9th, 10th (3 disturbances), 11th, 12th, 14th, 25th, 27th and 29th.

List of seismic disturbances.

25th	3h. to 15h.	Occassional small undulations in decl.
26th	6h. to 10h.	Wave in decl. (−54).
27th	21½h. to 22½h.	Wave in decl. (+10).

T. F. CLAXTON,
Director.

Weather in the Indian monsoon region.

8. In the subequatorial region pressure was practically normal at Zanzibar and in slight defect at Seychelles. The direction of air movement was abnormal in both localities, but particularly at Seychelles where southeasterly winds were established much earlier than usual. Rainfall was unusually heavy at Zanzibar which received a total of 26″, in place of the normal 13″; it was also in slight excess at Seychelles.

TABLE 8.

	Mauritius.	Zanzibar.	Seychelles.
Departure from normal of mean pressure.	−·011	+·005	−·015
Actual mean wind direction	S 76° E	S 12° W	S 50° E

Normal mean wind velocity (miles per diem).	252	170	112
Rainfall departure from normal	−2·25	+13·57	+1·85

Depressions and cyclonic storms.

9. Several disturbances affected the weather in Persia during the month but of these only two were important from the point of view of Indian weather. The central area of the first crossed on the 19th into Sind and was thence displaced eastwards into Rajputana and the neighbouring districts of Central India, where it disappeared on the 22nd. Widespread light to heavy rain was received over northern and central India during its existence. The second disturbance entered Sind on the 25th but failed to advance any further, with the result that the rainfall associated with it did not extend eastwards beyond the central parts of the United Provinces.

Barometrically both these depressions were feeble; their rain-producing action was however supplemented largely by a strong influx of damp winds from the neighbouring seas occasioned by favourable pressure conditions over northern India.

Pressure.

10. The general distribution of pressure over India was even less stable than is ordinarily the case in April.

On the average of the whole month and of the whole country the 8 hrs. pressure was ·015″ higher than the corresponding normal value.

Relatively to this general condition pressure was markedly high in northeast India and low in most other parts, particularly in Sind. There was in fact an abnormal gradient of about ·07″ between the eastern and western extremities of northern India. This type of distribution was on the whole most marked during the second half of the month and was an important factor in the production of an unusual burst of rainfall over northern and central India.

In the Baluchistan hills the defect was greater than in the plains below, and this was also the case in Rajputana, the Central Provinces and southern India. In upper India the excess in the lowest strata did not extend upwards to any great height for at the level of 7,000 feet and above pressure was well below the normal. The vertical pressure gradients were thus stronger than usual in all parts of the Indian region.

TABLE 9.

Temperature.

11. Both day and night temperatures were more or less below the normal throughout the plains of India with the exception of the North-West Frontier Province and Sind where on the average of the month nights were very slightly warmer than usual. The lowness was on the whole most marked in northern and central India and was, as usually happens during rainy periods, exhibited much more largely in the day than in the night temperature.

In Baluchistan and at stations on the southern face of the Himalayas temperature was nearly as much below normal as in the adjacent plains, but further north in Afghanistan and Kashmir weather was on the whole warmer than usual.

A spell of abnormally cool weather was experienced over the plains of northern India from the 18th to the end of the month; the lowness of temperature was, as is usual during periods of rainfall in the hot weather, shown chiefly in the day temperature, and this was at times as much as 20° to 30° below normal.

Winds.

12. As usually happens in periods of great instability of pressure conditions the deviations of air movement from the normal were local rather than general and not very marked; the only conspicuous abnormalities were deficiencies of steadiness and velocity in Burma, Eastern Bengal and Assam, and Hyderabad, and excesses of steadiness in the Central Provinces and Bombay.

Humidity and cloud.

13. Humidity, both relative and absolute, was well above the average over practically the whole of the plains of northern and central India, and normal or in defect over the peninsula, Burma and northeast India. In comparison with the normal the air was dampest in the region represented by the stations of Delhi, Bareilly, Mainpuri, Lucknow, Jhansi, Kotah and Sutna where the percentage of saturation exceeded the average by 23 or more. The air was drier, both absolutely and relatively, in the hill districts of Baluchistan and only relatively in Kashmir, a region characterized by excessive temperature. Elsewhere near the elevated regions there was a general agreement between hills and plains.

The distribution of cloud was characterized by almost the same abnormal features as that of humidity: thus cloud was generally in excess in extra tropical India and the north of the peninsula, and below the customary amount over the rest of the country. Over Central India and the United Provinces the actual proportion was more than double of the normal value.

Rainfall.

14. The month was abnormally wet over the whole land area of India excluding Assam, Kashmir, the North-West Frontier Province and the west of the peninsula. Over northern and central India the precipitation was associated with two storms of the cold weather type but was due chiefly to the prevalence at the time of their appearance in India of a peculiar type of pressure distribution favouring an indraught of damp sea winds. The excess was upwards of 200 per cent. in amount over practically the whole of the region stretching northwestwards from Bengal and north Madras to the Indus and was absolutely greatest in Central India which received twenty times its normal supply.

The rainfall for the whole country was 110 per cent. in excess and was the heaviest on record for April since 1899.

Snowfall.

I.—AFGHANISTAN.

15. The usual report from Kabul has not been received. There was apparently heavy snowfall in the mountainous region of Herat during the third week.

II.—NORTH-WEST FRONTIER PROVINCE.

(*a*) *Wano.*—Slight falls occurred on the Marwatti and Pirghal ranges on the 6th and 19th; on the latter date the snowline was at about 8,000 feet.

(*b*) *Dera Ismail Khan.*—No snow fell during the month on the hills bordering the district.

III.—KASHMIR.

There were four slight snowfalls at Sonemarg and on the neighbouring mountains and one fall on the ranges surrounding the valley of Srinagar, but elsewhere the weather was unusually settled. At the end of the month the accumulations on the Zoji-la and Hangsathu passes were believed to be about 14 feet in depth. In the grounds of the observatory at Sonemarg the unmelted snow was estimated at about 2 feet.

IV.—PUNJAB.

(*a*) *Kulu.*—Snow fell on the higher passes on nine days in the Kulu tahsil and on 14 days in the Saraj tahsil.

The statement below gives the reported depth of accumulation on the various passes at the end of April 1909 with the corresponding normal data:—

TABLE 17.

KULU TAHSIL.			SARAJ TAHSIL.		
NAME OF PASS.	Reported.	Normal.	NAME OF PASS.	Reported.	Normal.
Rohtang	7 feet	12½ feet	Sirikhand	12 feet	12½ feet
Barsai	3 "	4 "	Chul	1 foot	3 "
Boja Dhar	3½ "	4 "	Raghopur	2 feet	3½ "
Chandar Khani	8 "	6½ "	Jalori	1 foot	3 "
Lohri Achhri	5 "	6 "	Lambri	3 feet	2½ "
Sari	6 "	4½ "	Gargarasan	2½ "	7 "
Bhubu	4 "	2½ "	Sakiran	3 "	3½ "
Bastari	2 "	1½ "	Supakun	1 foot	4½ "
			Tirath	3 feet	6½ "

(*b*) *Kilba.*—Light snow fell on five occasions down to about 8,500 feet. All the higher passes were passable at the end of the month.

V.—UNITED PROVINCES.

Almora.—Frequent snow storms occurred chiefly during the second half of the month. The total fall amounted to about 18 feet on the Nuwe pass, 13 feet in

Byans, 5 feet in Malla Johar and 4 feet on the Binkaru pass. The snow line descended to the inhabited region.

TABLE 18.

NAME OF PASS.	DEPTH OF ACCUMULATION AT THE END OF THE MONTH.	
	Reported.	Normal.
Nuwe Pass	25 feet	17¼ feet
Unta Dhura	8 "	10 "
Ralam "	5 "	8 "
Binkaru Pass	17 "	20 "
Lipulekh "	12 "	10½ "
Lampia "	12 "	11¼ "

Weather was damper, cooler and more cloudy than usual.

SUMMARY.

16. (*a*) The snowfall was probably heavier than usual in Afghanistan and about normal in the hill districts of the North-West Frontier Province.

(*b*) The fall was deficient in Kashmir.

(*c*) According to the imperfect information available, the month's fall was in excess in the Punjab Himalayas. The quantity received in Kulu was regarded as unusually heavy. The accumulations at the end of the month were however by no means excessive.

(*d*) In Almora the fall was apparently greater than usual. At the end of the month the accumulations of snow were of about the average depth.

Crop report.

17. *Burma.*—Harvesting of spring rice and dry spring crops was approaching completion. Standing crops were generally in good condition.

Eastern Bengal and Assam.—Prospects of tea and all ordinary field crops were good. Summer rice was being reaped in several places.

Bengal.—Lands were being prepared for autumn crops and sowings of jute and other early crops had commenced. Cattle disease was reported from several districts.

United Provinces.—The rainfall during the latter part of the month caused considerable damage to crops and grain on threshing floors, but prospects were on the whole satisfactory except in Dhera and Kheri.

Punjab.—Spring crops were being harvested. Rain had damaged gram to an appreciable extent in all districts. Extra spring and autumn crops were being sown.

North-West Frontier Province.—In irrigated lands standing crops were generally in fair condition, but they were not in so good a condition in unirrigated tracts. Spring crops were being harvested.

Jammu and Kashmir.—The condition of standing crops was average to fair. Ploughing for autumn crops was in progress

Rajputana.—Spring crops were being harvested and preparations for autumn sowings were in progress. Fodder was sufficient.

Central India.—Spring crops were being harvested but some damage was reported from Gwalior on account of heavy rain. Lands were being prepared for autumn sowings.

Central Provinces.—Field embankments were being constructed in the rice districts and land was being prepared for the sowing of autumn crops. Threshing and winnowing of spring crops were being carried on, but were retarded in some districts by wind and rain.

Bombay.—Standing crops were generally in fair to good condition. Harvesting and threshing of spring crops were in progress. Lands were being prepared for next season.

Hyderabad.—Lands were being prepared in all districts for the next monsoon sowings. The harvesting of spring crops had suffered somewhat from rain. The late rice crop was fair throughout.

Mysore.—The prospects of the season had improved, but more rain was needed all over the state. Lands were being ploughed.

Coorg.—Coffee blossoms were out. The prices of food-grains were high. Water and fodder for cattle were sufficient.

Madras.—Standing crops were generally fair and had benefitted by rain, but some were withering in north Arcot and South Canara. Harvesting was in progress with poor to normal outturn.

HEM RAJ.

† Departures from old normals.

Table B.—Abstract of observations taken at 8 hrs. at 238 stations in India, etc., in April, 1909.

(1) Provincial means.

(2) Data of stations.

(1) Provincial means based on the material in Table B (2) except that the statement of rainfall depends on the complete data of about 2,700 stations.

		Temperature of air.								Wind.		Hygrometry.				Cloud.		Rainfall.		
	Pressure departure from normal.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Absolute range during month.	Departure of velocity from normal.	Departure of steadiness from normal.	Mean humidity.	Departure from normal.	Mean vapour tension.	Departure from normal.	Mean cloud amount.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.

ons, the elevations of which exceed 3,200 feet.

(a) Indeterminate.

§ Uncorrected fo sca.e error.

Tab

(2) *Abstract of observations taken at 8 hrs. at 2*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

ons, the elevations of which exceed 3,200 feet.

(a) Indeterminate.

* Uncorrected for scale error.

Tab

(2) *Abstract of observations taken at 8 hrs., at 2*

Number of subdivision.	Station.	Elevation of barometer cistern above sea-level, in feet.	Pressure, 8 hrs. in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

† Mean of 29 days.

Ta

(2) *Abstract of observations taken at 8 hrs. at*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

(a) Indeterminate.

Tabl

(2) *Abstract of observations taken at 8 hrs. at 23*

Number of subdivision.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

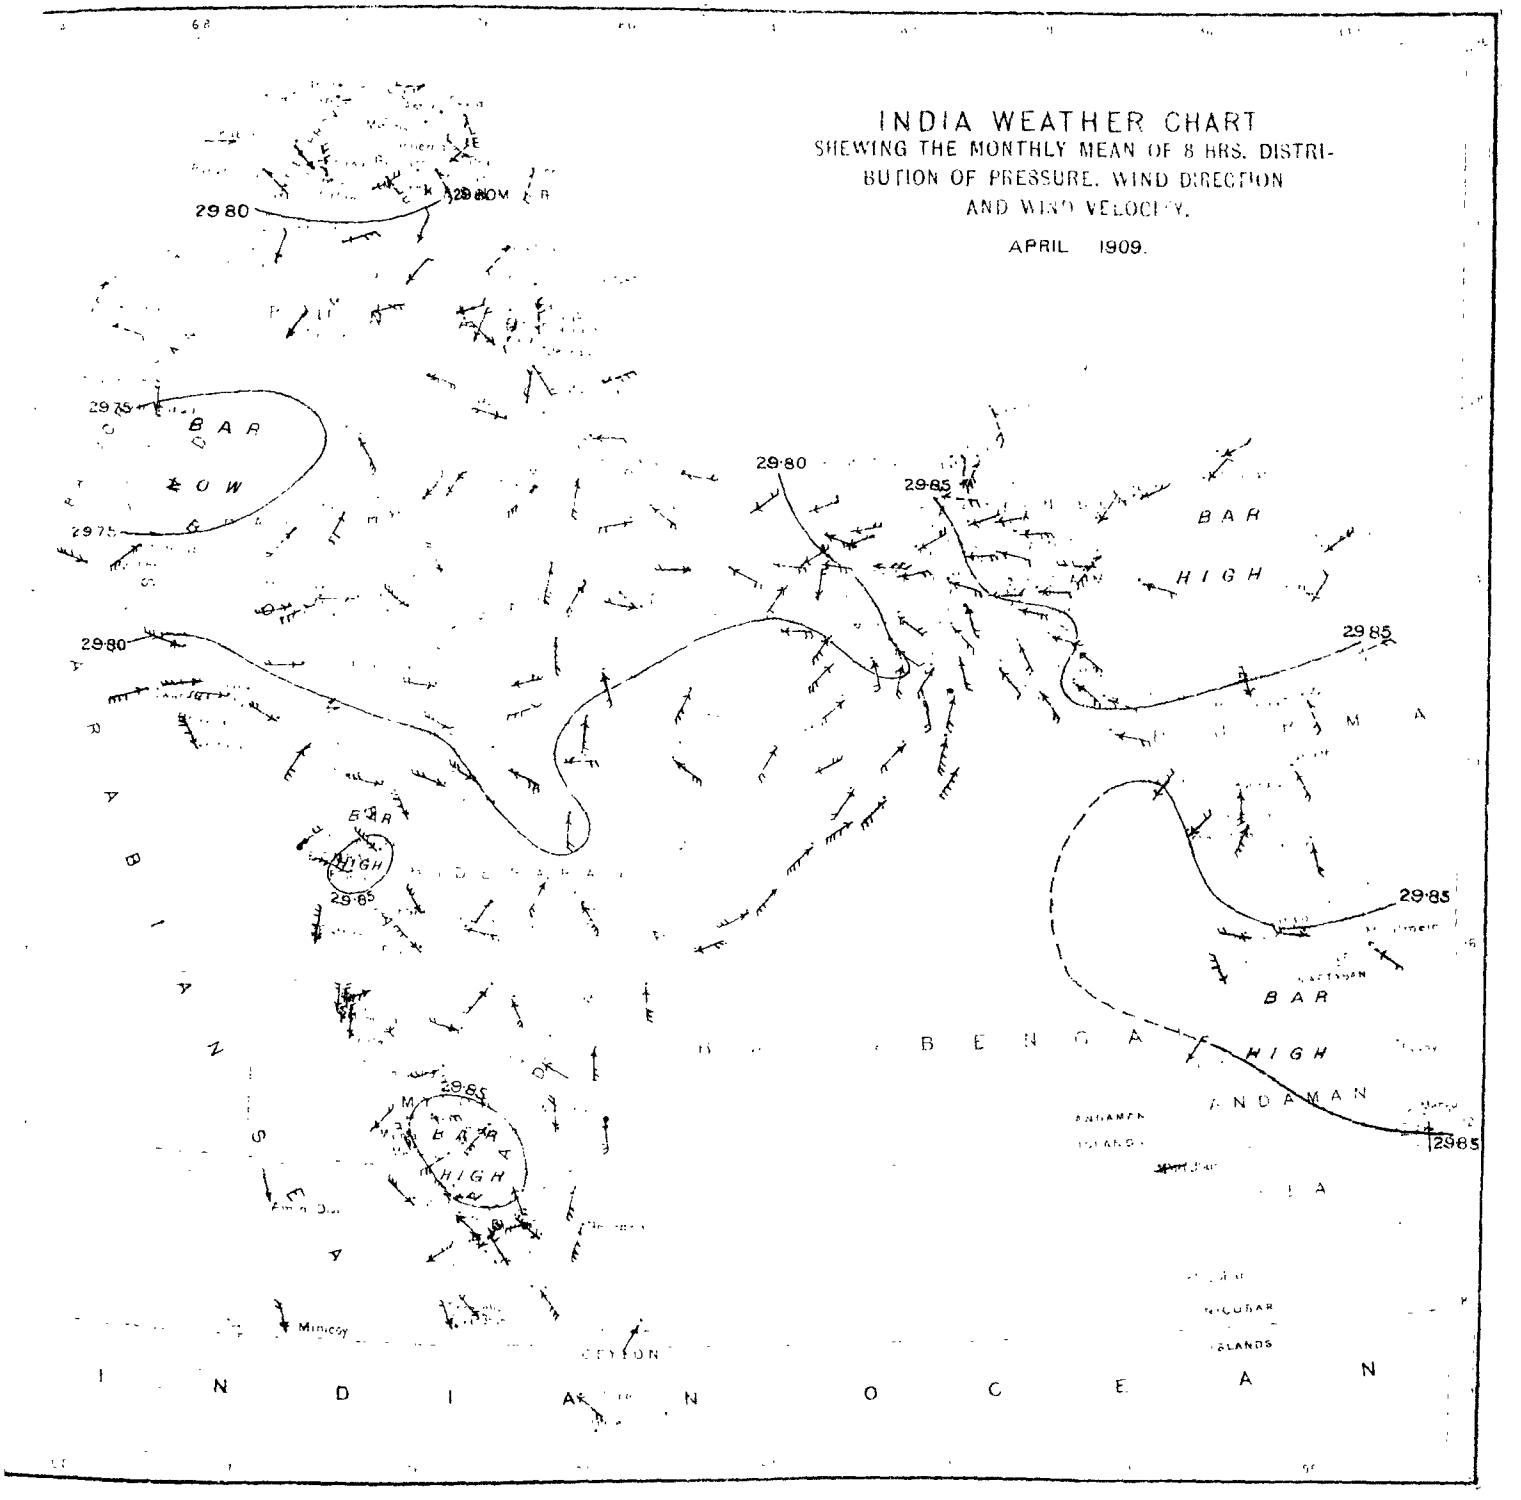
§ Mean of 22 days.
‖ Wind observations less 3.
¶ Rain with snow water.

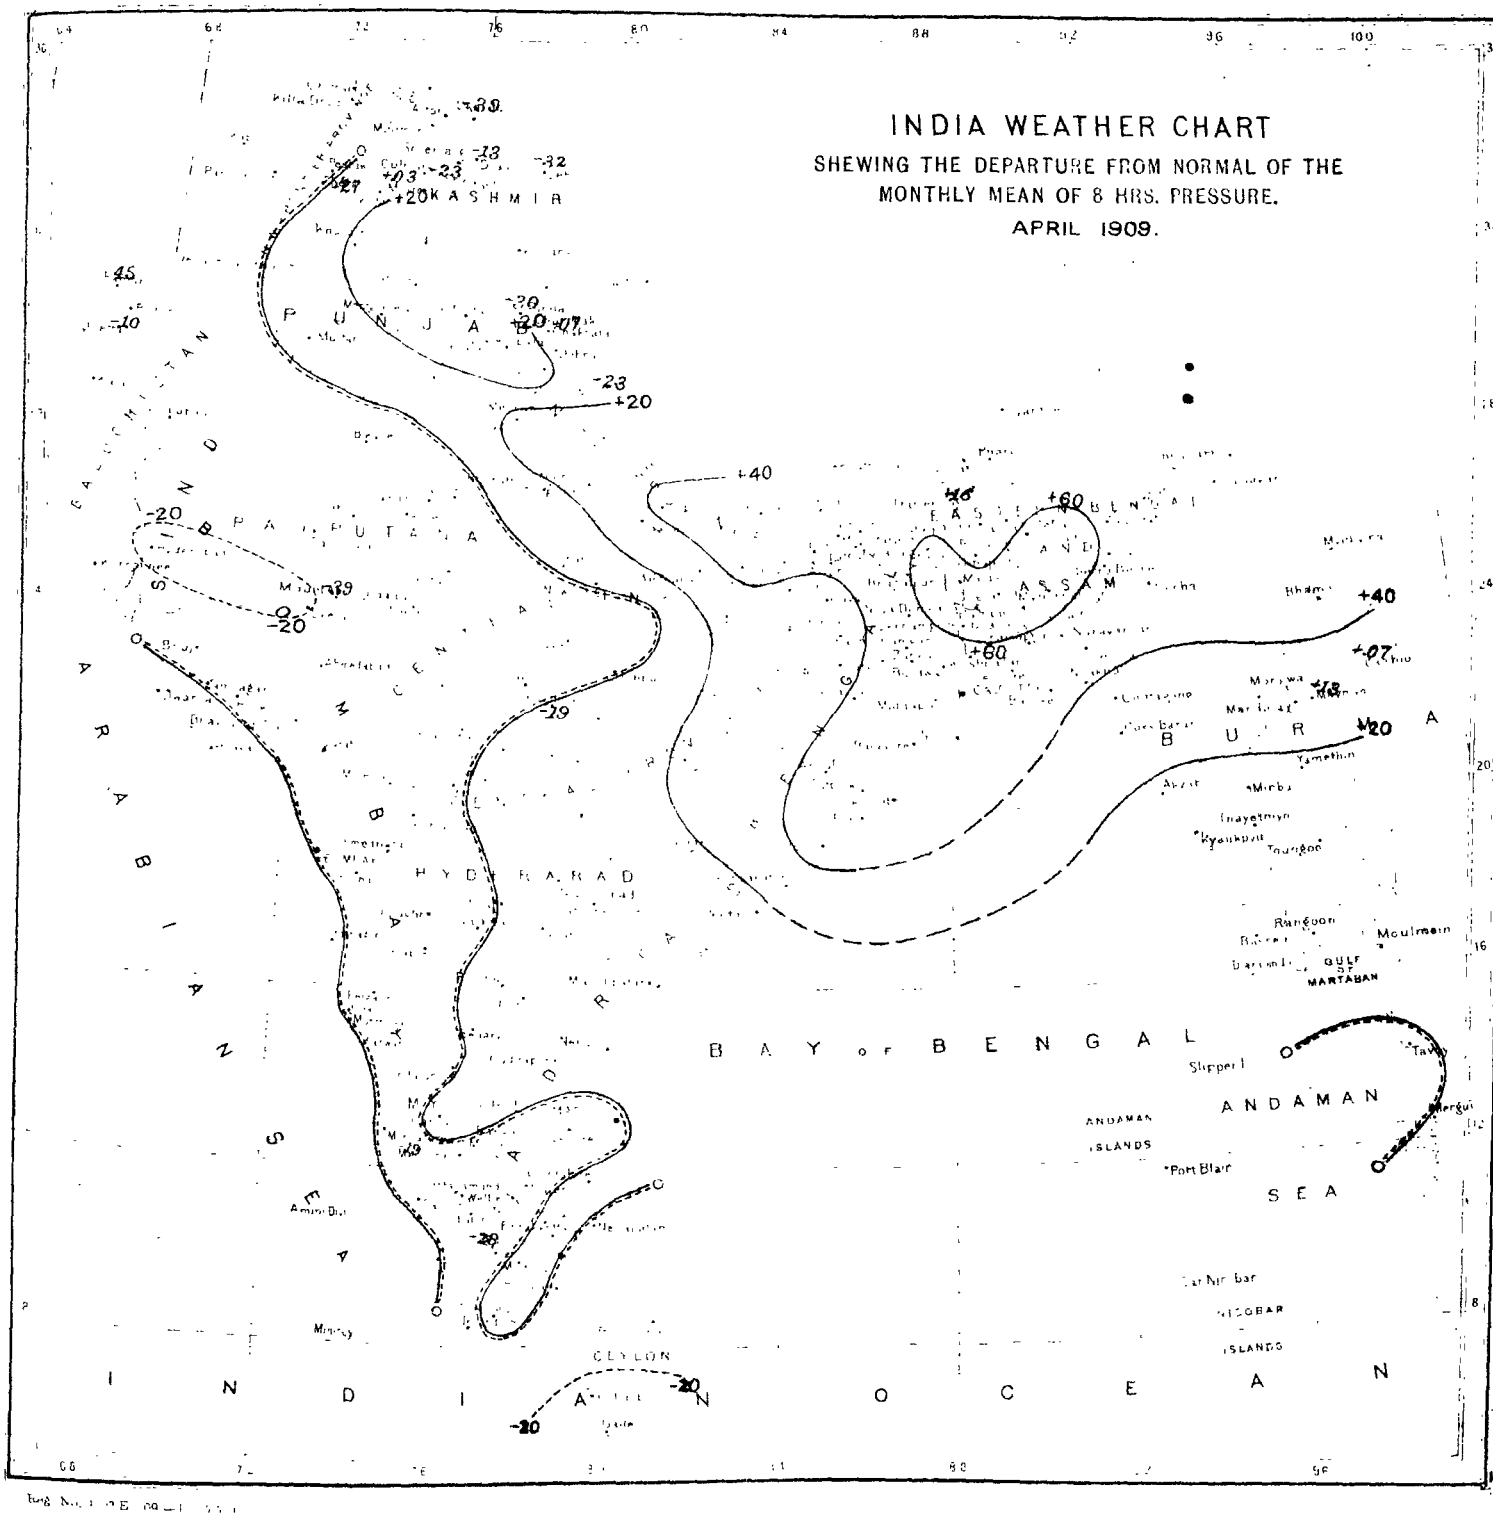
** Wind variable 2.



The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	one	feather added to the wind arrow
,, ,,	2 to 5 ,, ,, ,,	two	feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	three	,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	four	,, ,, ,, ,, ,,
	over 20 ,, ,, ,,	five	,, ,, ,, ,, ,,



The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020 or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF DAILY MAXIMUM TEMPERATURE.

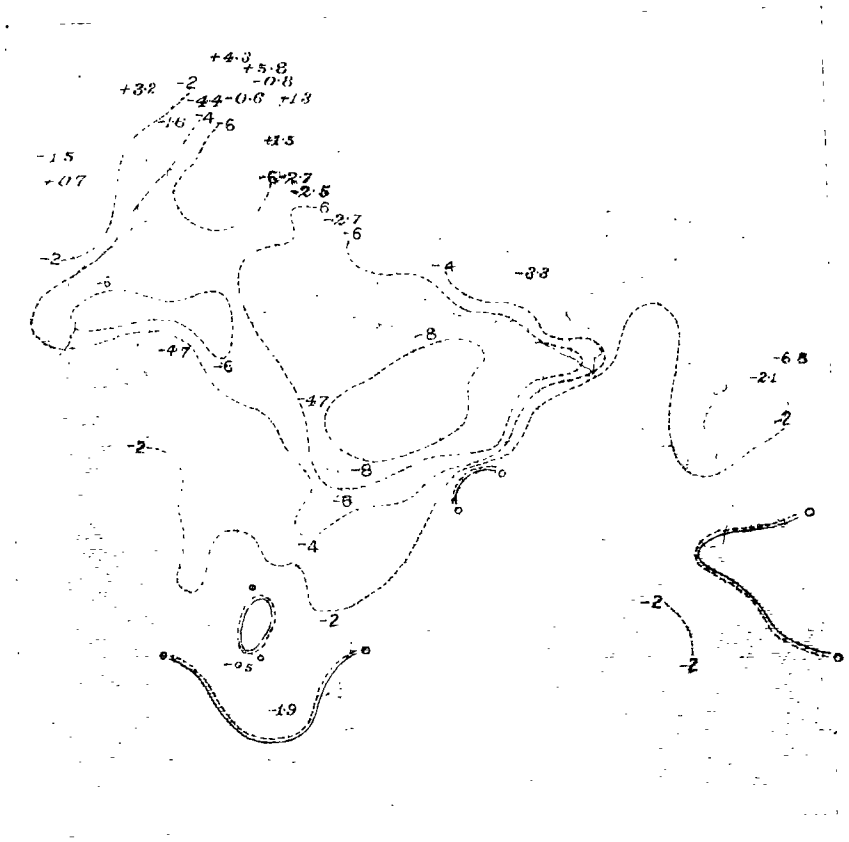


CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF DAILY MINIMUM TEMPERATURE.

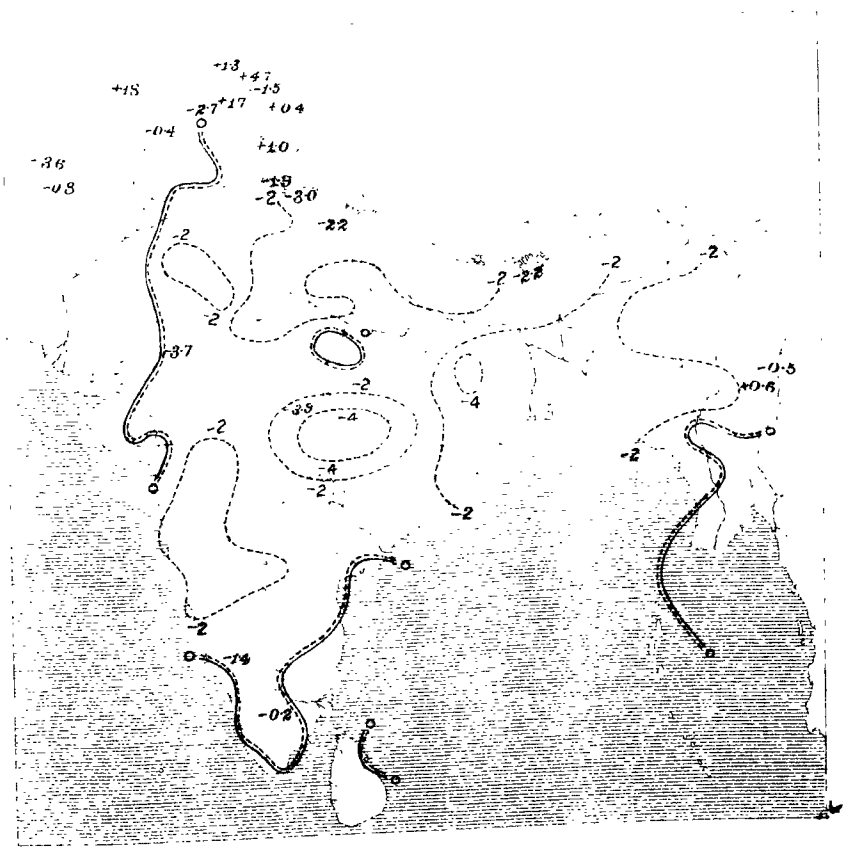

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF DAILY MEAN TEMPERATURE.

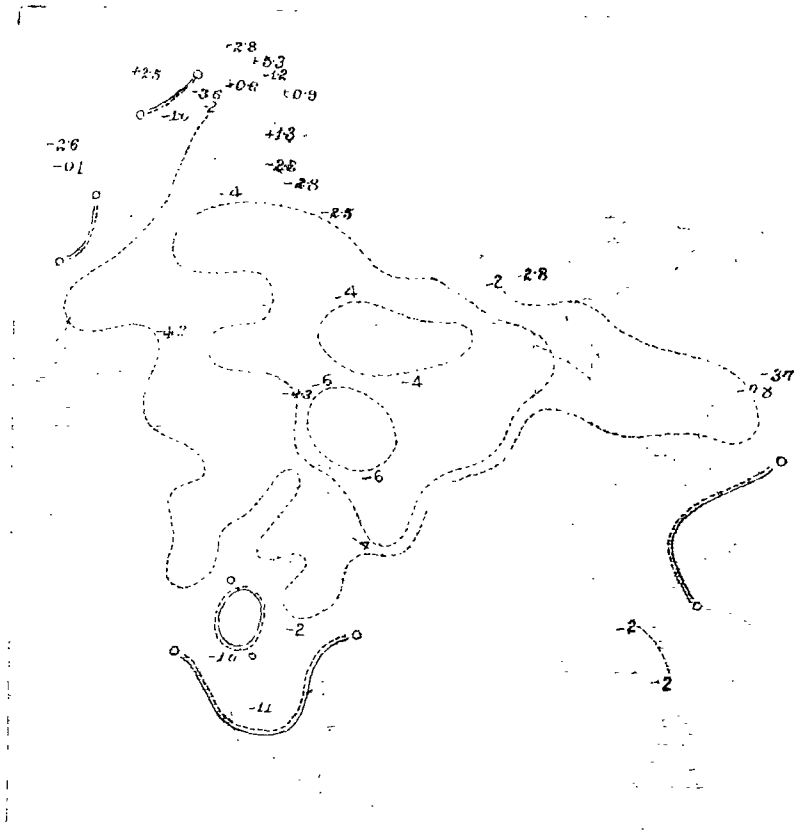

CHART SHEWING THE MONTHLY MEAN OF PRESSURE AND RESULTANT WIND DIRECTION.

GOVERNMENT OF INDIA.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, MAY, 1909.

INTRODUCTION.

THIS review of the weather in India for the month of May 1909 is based on observations taken daily at 8 hrs. at 239 stations and on additional observations recorded at 10 hrs. and 16 hrs. at 35 stations. In the case of the rainfall section of the review there are utilized the data afforded by the meteorological observatories and such rainfall statements of the month as had been published in the Government Gazettes by the Provincial Governments prior to the date of the publication of the review. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

For a statement of the methods adopted in recording and tabulating the data for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of May, 1909.

2. On the average of the month the weather was drier and clearer than usual over northern India, and unusually wet and cloudy over a large part of the peninsula and of central India. The largest excess of rainfall occurred in Malabar which received a total of 20 inches in place of the normal 7 inches. On the other hand little or no rain fell over the Punjab, Sind and Baluchistan which formed the region of greatest percentage deficiency of rainfall.

Humidity was low in the northwest of India, rather high in central India and approximately normal over the rest of the country. Temperature was lower than usual both by day and night in Baluchistan, Afghanistan, Sind and west Rajputana but elsewhere the temperature conditions were practically normal. Pressure was on the average low by ·002″ and the departures from this general condition were small except in Sind and the adjacent districts to the east where a marked excess occurred.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar Observations.*—The monsoon broke early and there were in May three days on which no observations were possible, one on which prominences could not be observed, and four other days on which the prominence record was imperfect.

Sunspots.—There were only 10 new groups—the smallest number observed since September 1903; the daily average was 2·7, but the average life of a spot was 6·5 days. One of the new groups was the return of an old one. The

latitude distribution shows, as usual, a preponderance of southern spots. It is as follows:—

TABLE 1.

	0°—10°	11°—20°	Extreme latitudes.	Mean latitude.
North	2	1	3°, 13°	8°·7
South	2	5	6°, 17°	12°·6

Four of the new groups Nos. 1659, 1662, 1663, and 1667 contained fairly large spots. No. 1663 was first seen as a double spot group with the two spots nearly equal; but the leader gradually diminished, and the following spot increased in size till, on the 15th, the former was almost a mere dot and the latter quite a large spot, but of irregular outline. Disturbances in C and D_3 were frequently observed in that group, but there was nothing striking about any of the other three groups.

Prominences.—Only 43 large and 1 metallic and eruptive prominences were recorded during the month. Two of the largest prominences of the month were two clouds 270″ and 240″ high photographed near the west limb on May 16.

Magnetic disturbances.—There was a "very great" magnetic disturbance from the 14th to the 16th, a "moderate" one on the 18th and 19th, and slight ones on 14 days. The active group 1663 crossed the central meridian on the 14th.

C. MICHIE SMITH,

Director,

Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Note on the Alibag magnetic record.

4. During the month of May 1909, the traces showed 9 calm days, 18 days of small, 3 days of moderate and one day of great disturbance.

The days of the month selected as quiet for the purposes of the magnetic survey of India are 7th, 10th, 12th, 24th and 25th.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and declination for the month are as follow:—

Easterly declination . . .	1° 0′ 19″	
Horizontal force . . .	0·36846	C. G. S. unit.
Vertical force	0·16001	,, ,,
Dip (calculated)	23°28′·4	
Dip (observed)	23°27′·6	
Horizontal force range . . .	0·00051	C. G. S. unit.
Horizontal force summed range .	0·00339	,, ,,
Declination range . . .	3′·9	
Declination summed range . .	17′·7	

[NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequality.]

The following table represents the magnetic character of each day during the month.

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Character.
1	S	9	S	17	S	25	C
2	S	10	C	18	M	26	S
3	S	11	S	19	M	27	S
4	S	12	C	20	S	28	S
5	C	13	C	21	S	29	S
6	S	14	G	22	S	30	C
7	C	15	M	23	S	31	S
8	C	16	S	24	C		?

C=calm, S=small, M=moderate, G=great, V. G.=very great.

The commencement and the progress of the great disturbance of the 14th are typical of those usually observed in case of large disturbances at Colaba. The disturbance commenced at about 9·9 hrs. with a sharp characteristic rise of force of about 68γ. The force falls thereafter with oscillatory movements till the minimum is attained at about midnight, indicating a total range of movement of about 439γ. A slow and steady rise of force occurs thereafter accompanied by minor fluctuations till more or less quiescent conditions are established at about 1 hr. on the 16th.

Seismic disturbances recorded at Bombay.

Five disturbances were recorded during the month, on the 10th, 12th, 17th (2 disturbances) and 30th.

List of disturbances.

T. F. CLAXTON,
Director.

Weather in the Indian monsoon region.

8. The barometric pressure was very nearly normal at the two insular stations and at Zanzibar. The wind direction differed but slightly from the average except at the Seychelles where it was much more southerly than usual: the velocity was low at Mauritius and Zanzibar and high at the Seychelles.

The rainfall of the month was in defect, mostly so at Zanzibar which obtained only 44 per cent. of its normal supply. The general conditions were thus favourable for the prospects of Indian monsoon rainfall.

Depressions and cyclonic storms.

9. Weather was more or less unsettled over the Indian seas during the first half of the month owing to temporary advances of humid winds from the south, which resulted in the formation of two cyclonic storms over the Bay. Below is given a brief history of these disturbances.

Cyclonic storm of the 3rd to the 9th.—On the 1st and 2nd pressure was low along the Madras coast and high over Burma and the sea to the south. In consequence the flow of moist air into the Bay from the equatorial belt was directed towards this region of low pressure and a storm was generated during the 24 hours succeeding 8 A.M. of the 2nd. According to the information contained in the logs of ships weather was squally with much rain over the strip of the Bay lying between the Coromandel coast and the meridian of 88°E, and winds although not very strong tended to circulate cyclonically around a centre in about Lat. 9°, Long. 83½°. The disturbance travelled northwestwards during the day and at 8 hrs. of the 4th, its centre was close to Cuddalore where pressure was however less than a tenth of inch below the normal. On the 5th it was hardly traceable as a definite system in the pressure chart, although the winds pointed to its continued existence. It changed rapidly however in character during the next 24 hours owing to a strong influx of moist winds from across the Malabar coast, and on the morning of the 6th was shown as a well defined low-pressure area covering the north of Malabar and the adjacent districts to the east. It developed still further during the day without however changing appreciably in position. On the morning of the 7th the lowest pressure was recorded at and near Mangalore, and

was nearly a quarter of inch below the normal value. The observations made on the morning of the 8th showed that the storm was passing out into the Arabian Sea, over the southeast of which winds of force 4 to 8 were blowing. The disturbance travelled rather quickly during the next 24 hours decreasing considerably in intensity at the same time, and on the morning of the 9th was shown as a diffused low pressure area over Gujarat and the neighbouring part of the Arabian Sea. Winds were then even stronger than on the previous day over the southeast of the Arabian Sea but their direction indicated that they were not being drawn into the depression. The marine information for the next three days is too limited to enable the future career of the disturbance to be traced with any certainty: it suffices however to indicate that the residual action was transmitted northwestwards towards the Gulf of Oman, and that it was too feeble to exercise any large influence on the weather.

Although not strongly marked the storm occasioned heavy rain over southern India, particularly in Malabar where Mangalore received a total of nearly 26 inches between the 5th and the 9th.

According to newspaper accounts the high winds and sea in the southern quadrant inflicted much damage on shipping in the port of Calicut.

It may be noted that cyclonic disturbances formed during the pre-monsoon period and advancing westwards across the peninsula are usually broken up by the obstructive action of the Ghats, but the fact that these hill ranges had no disintegrating influence on the present storm would show that it was one of greater depth than usual.

Feeble cyclonic storm of the 12th to the 14th over the Bay of Bengal.—According to the information contained in ships' logs there was a second advance of monsoon winds over both the Arabian Sea and the Bay of Bengal towards the end of the first week, but that unlike the previous advance it was directed towards the centre and south east of the Bay. As usually happens in such circumstances a storm was developed in front of the wave of humid winds; this showed itself first on the 12th to the west of the Andamans. The disturbance thus formed travelled north-eastwards towards the coast of Arakan which it crossed between Diamond Island and Akyab on the night of the 14th, after which it was speedily broken up by the obstructive action of the Arakan Yoma. Throughout its existence it was a diffused depression rather than a well-defined storm, but it gave moderately heavy rain to practically the whole of Burma.

In the north the only disturbance of any importance was recorded between the 20th and the 23rd. It was of the usual hot weather type and occasioned a series of dust-storms and thunderstorms (some attended with heavy rain) in Kashmir.

Pressure.

10. The atmospheric pressure at 8 hrs. averaged over the Indian region corresponded closely with the normal value, being only ·002″ in defect. The defect was not, however, universal, for over north west India there was an appreciable excess which was on the whole most marked in Sind and the adjacent districts of Rajputana (about ·035″).

TABLE 9.

DIVISION.	Departure from normal of mean 8 hrs. pressure.
	″
Burma	—·009

Central India	+·004
Central Provinces	+·001
Hyderabad	—·007
Mysore	—·013
Madras	—·011

The excess in northwest India extended upwards in a modified degree to the level of the hill stations in Baluchistan and Rajputana, but was replaced by a slight defect at and above the elevation of about 7,000 feet.

The vertical distribution of pressure as determined from the data of 8 pairs of hill and plain stations was very nearly normal.

Temperature.

11. The departures from normal of mean temperature were small over a large part of the country, in few places exceeding 1½°. In Baluchistan and Afghanistan a defect of 4° to 8° was recorded and in Sind and Rajputana temperature was on the average 2° below the normal, the defect in all these areas being greater in the night than in the day temperature. In the region of approximately normal conditions there was hardly any marked difference between the departures of day and night temperatures.

During the first fortnight temperature was very unsteady, the most remarkable abnormal feature being the prevalence of cool weather over northwestern India from the 1st to the 10th and over the southern half of the peninsula from the 5th to the 10th.

The highest maximum temperature of the month was as usual observed at Jacobabad and was from 2° to 7° lower than the corresponding readings on record since 1885.

Winds.

12. (*a*) As might be expected from the character of the pressure distribution, the southerly element in the mean wind direction over Kathiawar, Sind, Rajputana and the adjacent districts of the United Provinces was not only weaker than usual but was in some cases replaced by a northerly component. At Kabul and in the north of the North-West Frontier Province on the other hand the prevailing direction was more westerly or less northerly than the normal, an indication that there was less than the usual influx of air from the Afghan mountains into the plains of upper India.

(*b*) Over central India and the peninsula, excepting the east coast, there was less than the average amount of northing in the wind's direction, while in Chota Nagpur and the east coast of the peninsula the direction was on the whole slightly more southerly than usual.

These deviations from the normal type of air circulation are the opposite of those which characterize the hot weather movement in years of excessive and late snowfall.

(*c*) Except locally in Mysore the air movement was equal to or below the average amount in all parts of the country.

(*d*) Winds blew with more than their normal steadiness in Madras and the greater part of northern and central India, while in the remainder of the peninsula, as well as in Rajputana, the directions were not so steady as usual.

Humidity and cloud.

13. Both humidity and vapour tension were in marked defect in the plains of the Punjab, the North-West Frontier Province and Sind, and to a less degree in the neighbouring mountain region, but over the rest of the country the conditions were nearly normal.

The proportion of cloud also agreed closely with the normal value, the only important departures occurring in Rajputana, the Punjab and northeast India where skies were on the average much less clouded than is normally the case in May.

Rainfall.

14. The month's aggregate rainfall was more or less below the normal in all parts of northern India, the defect being on the whole most pronounced in actual amount in Assam and Eastern Bengal (—1·7″) and by percentage comparison with the normal in Sind and the southwest Punjab which were rainless throughout the month. In central India and the peninsula the distribution was marked by much irregularity: thus while the precipitation was unusually abundant in Berar, the Central Provinces West, the Bombay Deccan, Mysore, Malabar, Madras Southeast and Madras Deccan, it was equal to or in defect of the normal in central India, the Central Provinces East, the Konkan, Hyderabad and Madras Coast, North. The excess in southern India was due to the action of the cyclonic storm which passed through that area from the Bay during the first week; the defect in northeast India on the other hand was a result of the comparative feebleness and infrequence of the usual thunderstorms. In Burma the total fall was 13 per cent. above the normal.

On the average of the whole of the plains there was an excess of 1 per cent in the month's rainfall.

Snowfall.

I.—AFGHANISTAN.

15. There were snowstorms during the first week in Badghis and on the high hills of Paghman, and on one occasion in the plain of Kabul itself.

II.—NORTH-WEST FRONTIER PROVINCE.

(*a*) *Wano.*—No snow fell and the weather was hot and dry.

(*b*) *Kurram.*—A few light falls occurred on the higher parts of the Sufed Koh.

(*c*) *Chitral.*—Feeble snowstorms occurred on three days on the neighbouring hills above 8,000 feet.

(*d*) *Drosh.*—On five days slight snow fell on the surrounding hills down to about 10,000 feet.

III.—KASHMIR.

About 2 feet of snow fell on parts of the Zoji-la and Hangsathu passes and a few inches on the ranges near Dras, while a heavy fall occurred on the mountains near Gulmarg. The accumulations at the end of the month measured about 5 feet in depth on the Zoji-la and Hangsathu, and 1 to 2 feet on the high ranges in the Kargil district.

IV.—PUNJAB.

(*a*) *Chamba.*—No snow fell during the month on the Dalhousie, Bhandal and Tisa ranges, but occasional falls occurred on the Chamba and Pangi ranges during the second and third weeks. The total fall amounted to 8 and 4 inches on the Bakani and Tundah peaks (elevation 11,000 feet) respectively, and to 6 feet on the Sach pass (elevation 14,400 feet).

The statement below shows the total amount of snow received during the month at the recording stations, and the depth of accumulation at the end of the month.

TABLE 17.

NAME OF PASS OR PEAK.	Total amount of snowfall.		Reported depth of accumulation at the end of the month.	
	Feet.	Inches.	Feet.	Inches.
Bakani Peak	0	8	2	6
Tundah "	0	4	2	6
Sach Pass	6	1	7	6
Cheni			8	6
Droti			9	6

(*b*) *Kilba.*—Feeble snowstorms occurred on four occasions, the fall was restricted to the Sutlej and Baspa valleys. On the hills opposite Kilba the snow line came down to about 9,700 feet and at that level the total fall was estimated at 3 inches. The accumulations on the Brua, Rupan and Shatul passes varied in depth between 4 and 6 feet as compared with a normal of about 8 feet.

Weather was on the whole drier, clearer and warmer than usual.

(*c*) *Kangra.*—There were altogether six falls in the Kulu tahsil on the passes over 10,000 feet high, while it rained below that level. In the Saraj tahsil the snowfall was confined to the Gargarasan and Tirath passes and was altogether not more than six inches in depth.

TABLE 18.

Chandar Khani	4 "	4 "			
Lohri Achhri	1 foot	2½ "			
Sari	3 feet	1½ "			

V.—UNITED PROVINCES.

(*a*) *Garhwal.*—There were occasional snowstorms in the last three weeks at elevations above 10,000 feet, but they were not severe. Temperature was equal to or above the normal.

(*b*) *Almora.*—During the first three weeks, for which period alone information is available, several falls occurred in Malla Darma and Chaudas and one fall in Malla Johar. The total quantities were estimated at about 7 feet on the Nuwe pass, 3 feet on the Binkaru pass and 1 foot in Malla Johar.

TABLE 19.

	Reported.	Normal.
Binkaru Pass	14 feet	22 feet.
Nuwe "	23 "	18 "

VI.—ASSAM.

Sadiya.—Snow is said to have fallen in the early part of the month on the hills near Sadiya. By the end of the month snow had disappeared from all peaks below 12,000 feet in height.

SUMMARY.

16. (*a*) According to the limited information available there was more than the average amount of snowfall in parts of Afghanistan.

(*b*) In the hills of the North-West Frontier Province the quantity of snowfall received during the month was by no means unusual.

(*c*) In the western Himalayas the fall, although heavy in one or two places, was on the whole not above the average, The accumulations at the end of the month were, if anything, below the average depth. The snowline was probably at a somewhat lower level than usual in the Punjab Himalayas.

Crop report.

17. *Burma.*—Sowing of hill side rice and ploughing for early sesamum, cotton and early autumn rice were in progress. Standing crops were generally in good condition.

Eastern Bengal and Assam.—The prospects of crops were fair. Winter rice was being sown and plucking of tea was in progress.

Bengal.—Sowing of jute, paddy and other autumn crops was in progress and land was being prepared for the next season's crops. Rain was needed in parts of Bihar.

United Provinces.—Standing crops were in good condition. Fields were being prepared for autumn sowings.

Punjab.—Spring crops were being harvested and the outturn was good to average on irrigated and average to below average on unirrigated areas. Extra spring and autumn crops were generally in good condition.

North-West Frontier Province.—Spring crops were being harvested and the outturn was reported to be average. Standing crops were generally good on irrigated lands and from average to below the average on unirrigated areas.

Jammu and Kashmir.—The condition of standing crops was fair to below the average. Autumn crops were being sown.

Rajputana.—Preparations were being made for monsoon sowings, and sowings had commenced in parts of Bikaner. Cattle were generally in good condition and sufficient fodder was available.

Central India.—Land was being prepared for autumn crops. Harvesting of spring crops was nearly completed.

Central Provinces.—Field embankments were being constructed and land prepared for the sowing of autumn crops. Cattle were in good condition.

Bombay.—Preparation of lands for autumn cultivation was generally in progress and sowings were being made in parts. Agricultural stock was on the whole in good condition.

Hyderabad.—The late rice crop was being harvested in parts, with a fair outturn though it had been slightly damaged by the recent rain. Land was being prepared for autumn sowings.

Mysore.—Ploughing and sowing were in progress and the prospects of the season were hopeful.

Coorg.—Sufficient water and fodder for cattle were available.

Madras.—Standing crops were generally in fair condition, but in Salem some required more rain. Ploughing, sowing, weeding and transplanting were in progress.

HEM RAJ.

Table A.—Abstract of observations taken at 10 hrs. and 16 hrs. at 35 stations in India, etc., in May, 1909.

‡ Mean of 29 days.

(a) Indeterminate.

* Uncorrected for scale error.

‖ Mean of 21 days.

Tab

(2) *Abstract of observations taken at 8 hrs., at 239 statio*

Number of subdivision	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

§ Mean of 25 days. ‖ Uncorrected for scale error. (*a*) Indeterminate.

T

(2) *Abstract of observations taken at 8 hrs., at 239 sta*

Number of subdivision.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

ases of hill or plateau stations, the elevations of which exceed 3,000 feet.

* Mean of 30 days.

‖ Uncorrected for scale error.

T

(2) *Abstract of observations taken at 8 hrs., at 239 sta*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

stations, the elevations of which exceed 3,000 feet.

Tabl

(2) *Abstract of observations taken at 8 hrs., at 239 station*

Number of subdivisions.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

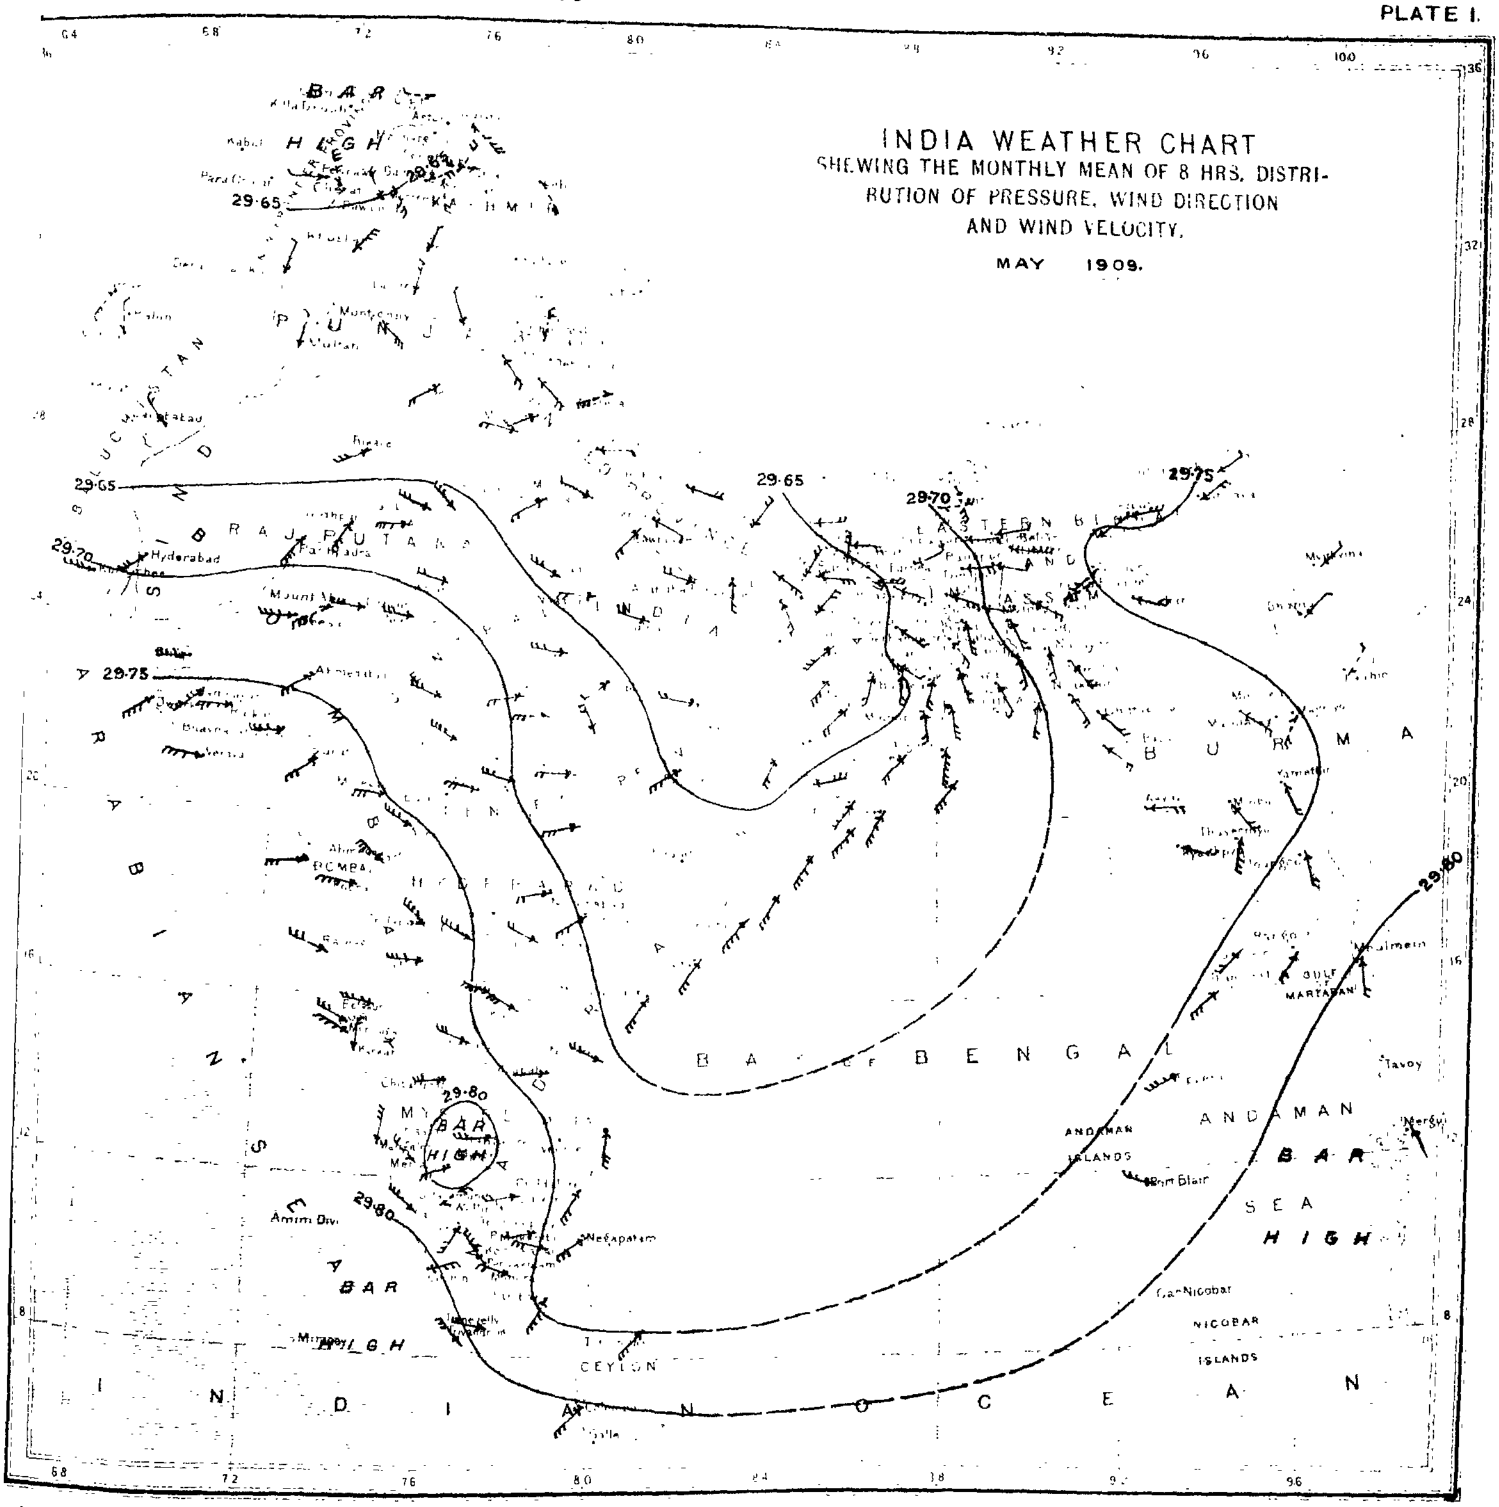
†† Wind observations less 2.
‖ Mean of 30 days.

‡‡ Wind variable 1.
** Wind variable 5.

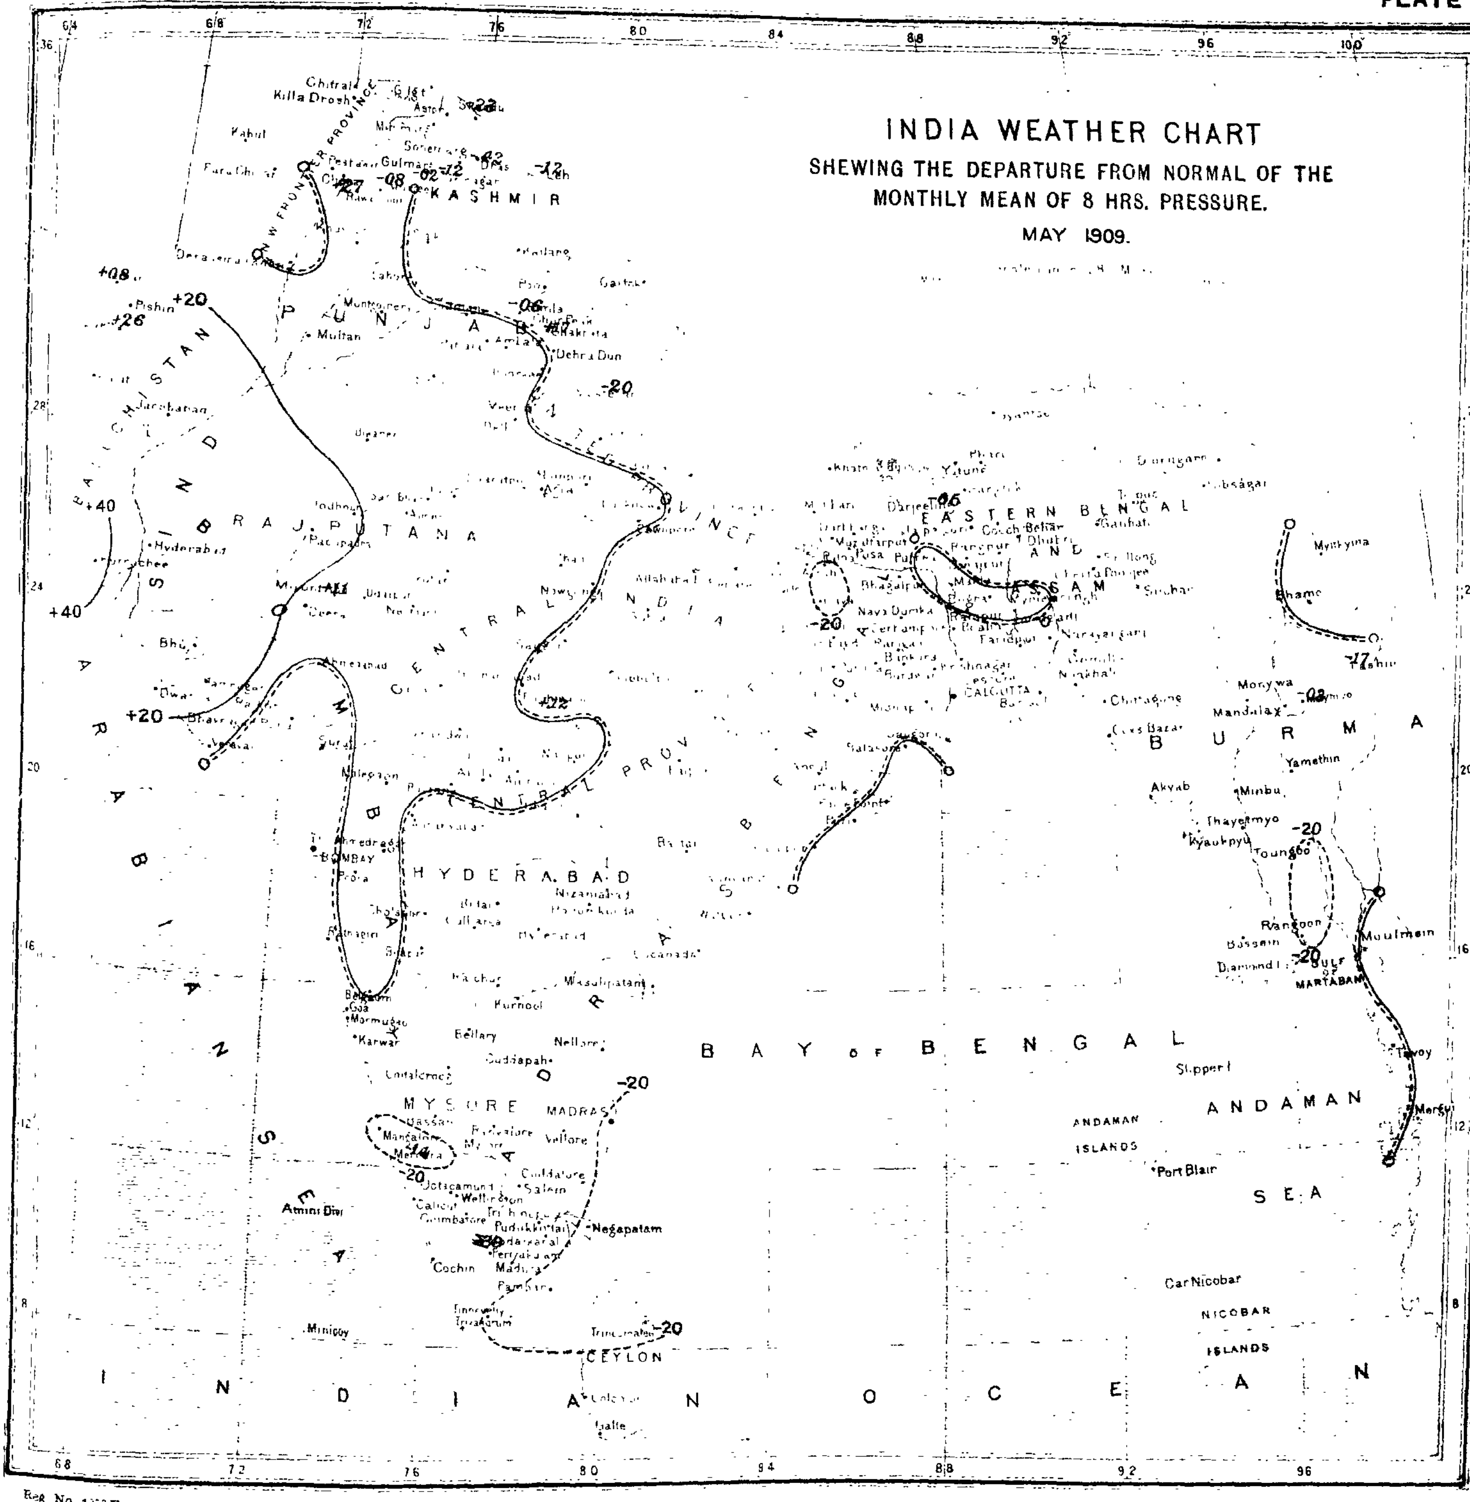


Reg. No. 1 63 B. 09.—L—6,500.

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour ..	one feather added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,	two feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	three ,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,, ...	four ,, ,, ,, ,, ,,
	over 20 ,, ,, ,, ...	five ,, ,, ,, ,, ,,



The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020″ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF CLOUD AMOUNT AT 8 HRS.

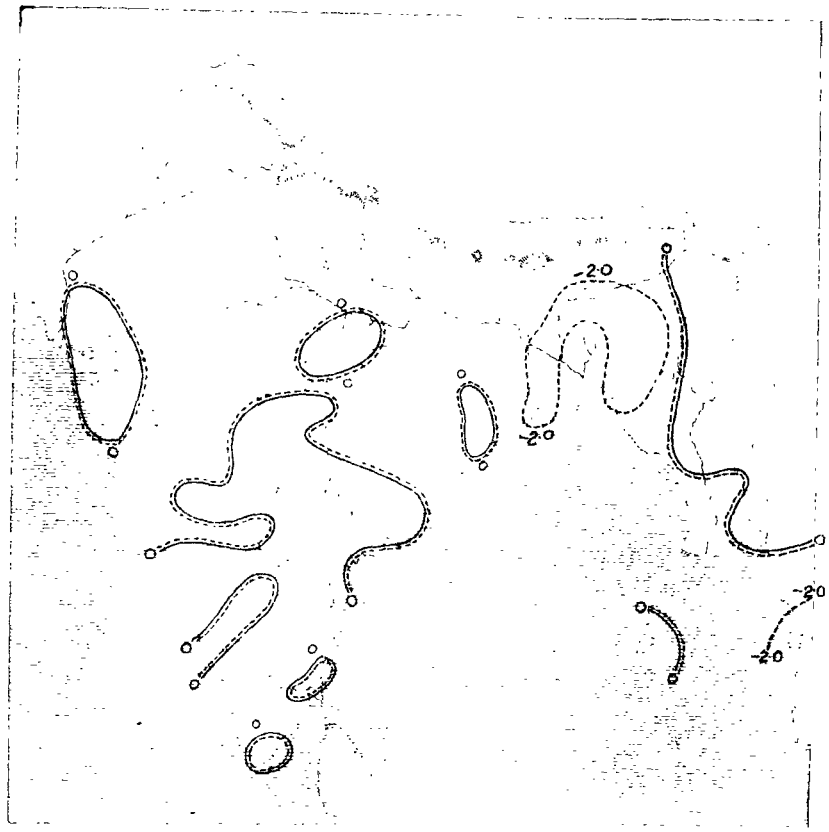

CHART SHEWING THE TOTAL NUMBER OF DAYS IN THE MONTH ON WHICH RAINFALL EQUALLED OR EXCEEDED 0·10 INCH.

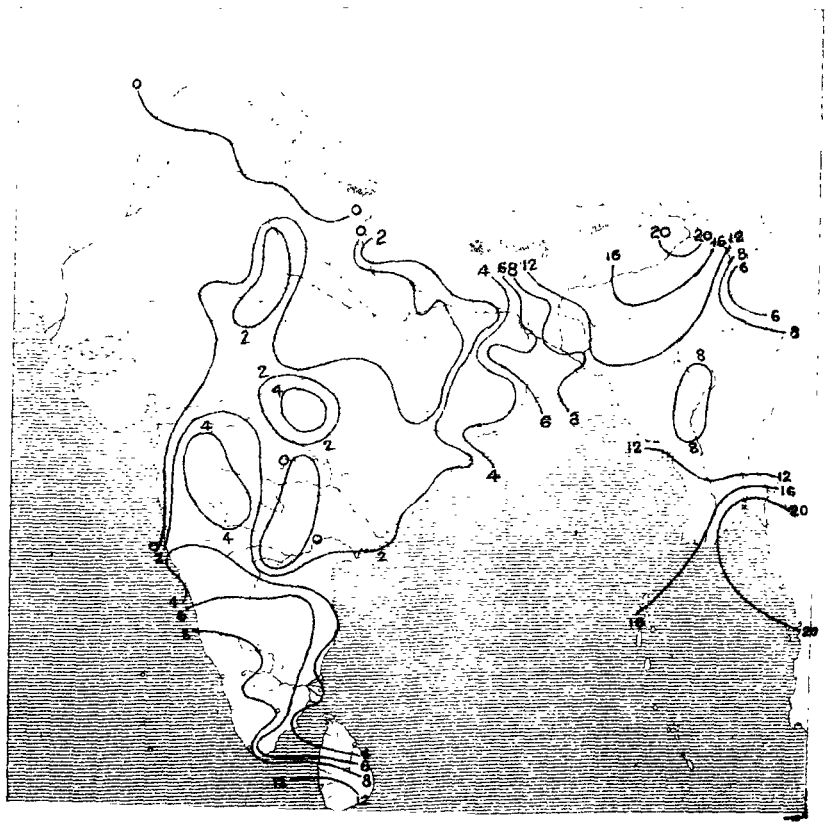
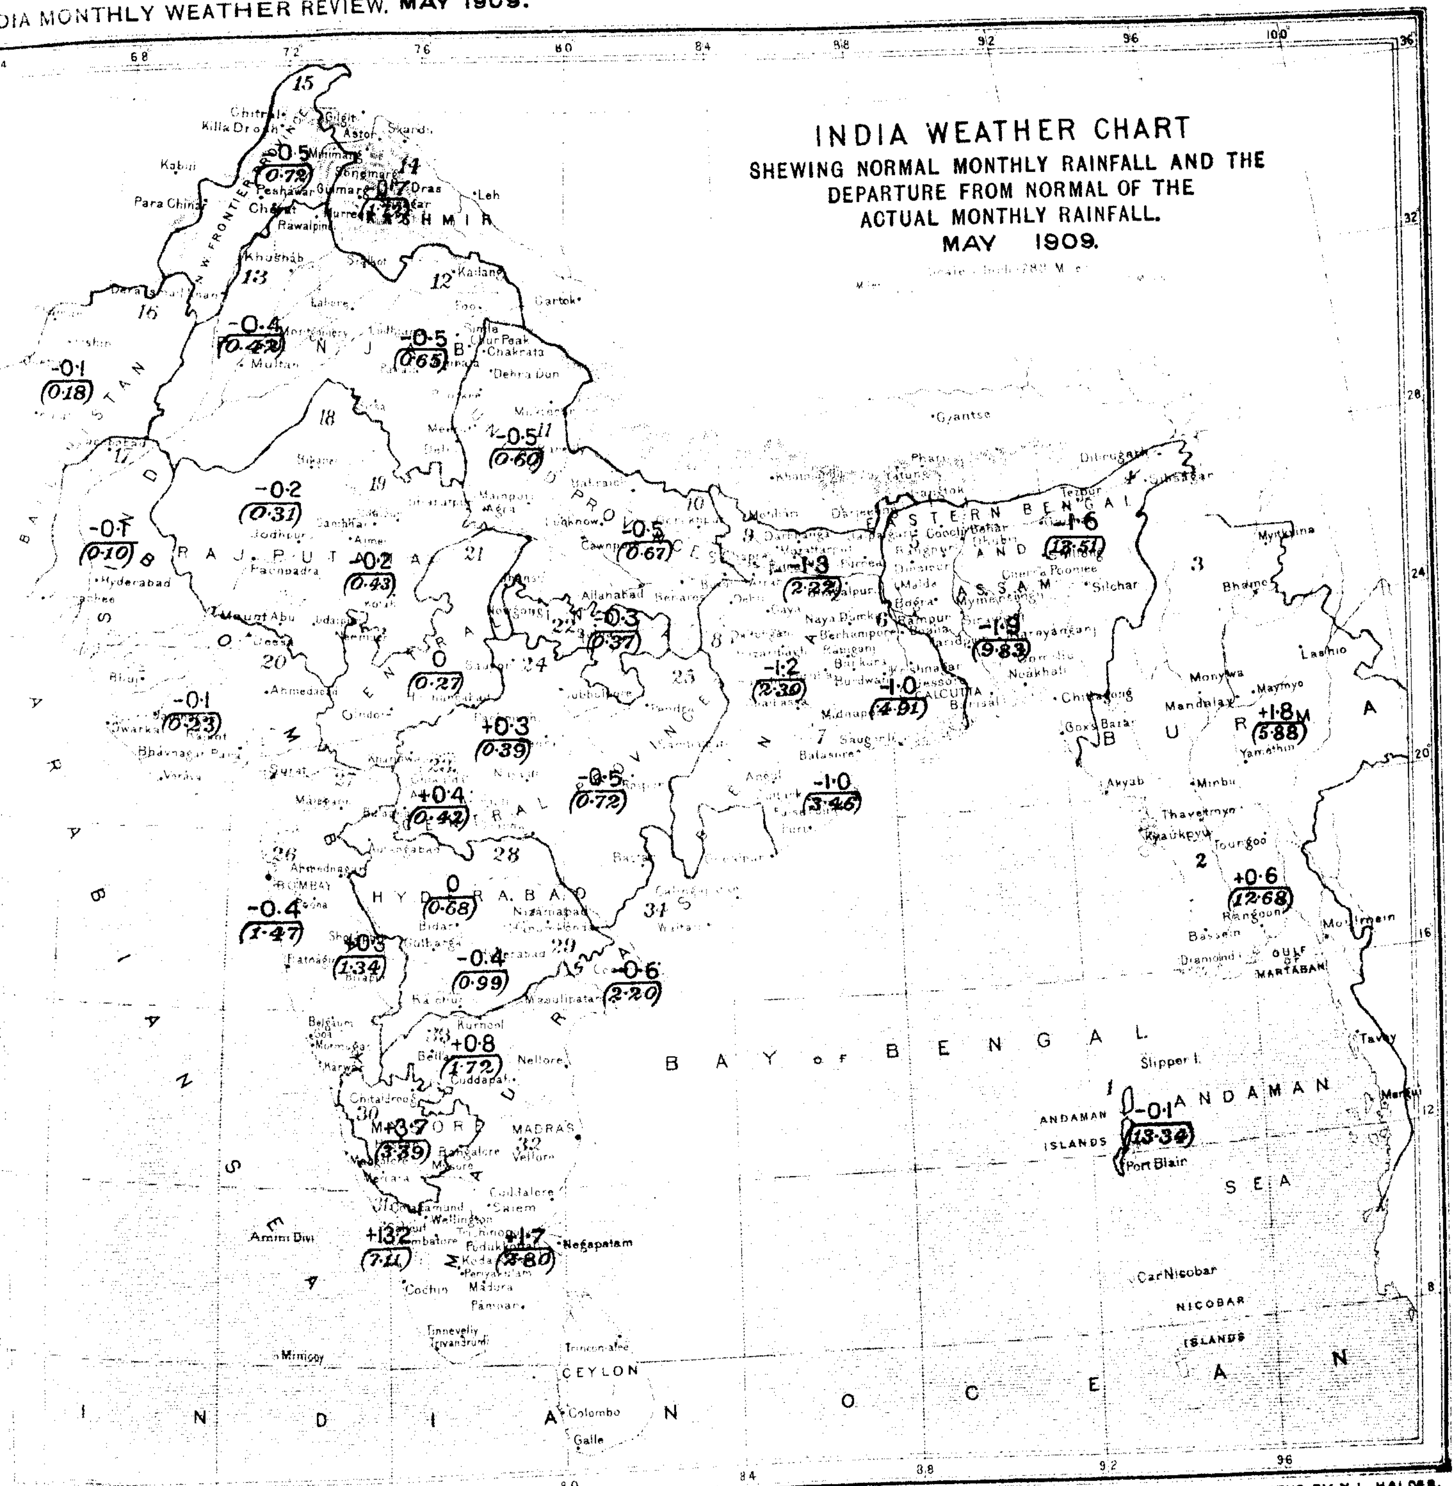
(BASED ON THE RETURNS OF TABLE B.)





LITHO. BY N. L. HALDER.

Reg. No. 4963 E.; 09 — L — 5500.

The country is divided into 34 areas as shown in the list below. The numbers in that list correspond with the red numbers on the chart, and serve to identify the areas. The numbers in brackets on the chart give the average over the divisions of the normal monthly rainfall; the numbers above these give the departures from normal of the average actual rainfall over the divisions.

GOVERNMENT OF INDIA.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, JUNE, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of June, 1909, is based on observations taken daily at 8 hrs. at 239 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 35 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the Provincial Governments up to the date of the preparation of the review, have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories in the Indian area.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of June, 1909.

2. As in June 1889, the first burst of the monsoon occurred about the normal date on the west coast of the peninsula, and a week before the usual time in north-east India. The Bay current extended with great rapidity over the Gangetic plain, with the result that the rains there were established by the 8th, nearly two weeks earlier than usual. The advance inland of the Arabian Sea current on the other hand was greatly retarded. In the result the month's rainfall was in marked excess over the greater part of northern India and up to the average in the peninsula, Central India and Burma.

Humidity was high in the United Provinces, the Punjab and Central India, and about normal elsewhere. The cloud amount was above normal except in the Punjab, Rajputana, parts of Sind and of the United Provinces, the west of the peninsula and the south coast of Madras.

Mean temperature was rather low in the region of excessive rainfall in northern India, owing chiefly to a defect of day temperature, but over the rest of the country the temperature conditions were practically normal.

Pressure was on the average of the month low almost everywhere, the defect being largest in Sind, Gujarat, Rajputana and the adjacent districts of Central India, where it ranged between ·02″ and ·04″.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar observations.*—The month was on the whole unfavourable for solar observations. There was only one day which was too cloudy for any observation, but there were four on which prominences could not be observed, and ten on which the prominence record was imperfect.

Fifteen new spot groups were observed during the month with a daily average of 2·2; the average life of a spot was 4·5 days. There was one day, the 3rd, on which the sun was free from spots. All the new groups except

two formed on the visible disc. The latitude distribution was as follows :—

TABLE 1.

	0°—10°	11°—20°	Extreme latitudes.	Mean latitude.
	°	°	° °	°
North . . .	3	1	5, 12	7·5
South . . .	7	4	1, 18	8·4

Spot groups Nos. 1671, 1673, 1678, 1681, and 1683 contained large spots. Numbers 1671, 1678 and 1681 first appeared on the disc as small spots, some of which grew in size as they advanced westwards. Numbers 1673 and 1683 came round the east limb as large spots, but the former dwindled away and disappeared before it reached the west limb.

Only 1 eruptive and 29 large prominences were recorded during the month. The latter was observed at latitude +25° west on the 23rd. At 8^h 50^m C was displaced to violet over the whole prominence, the maximum displacement being 4A°. The prominence was changing rapidly. The height in Ca varied from 70″ at 8^h 7^m to 230″ at 9^h 21^m and 150″ at 9^h 50^m. A rather faint prominence 90″ high was photographed at this position on the next day.

There were "small" magnetic disturbances on 19 days but nothing of a greater intensity was recorded during the month.

C. MICHIE SMITH,
Director,
Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Alibag Magnetic Record.

4. During the month of June 1909, the traces showed 13 calm days, 16 days of small and 1 day of moderate disturbance.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 6th, 9th, 13th, 20th and the 27th.

The mean observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms as also the ranges and the summed ranges of the horizontal force and declination for the month are as follows :—

Easterly declination . . .	0° 59′ 53″
Horizontal force . . .	0·36861 C. G. S. unit.
Vertical force . . .	0·16015 ,,
Inclination (calculated) . .	23° 29′·0.
Inclination (observed) . . .	23° 27′·8.
Horizontal force range . .	0·00045 C. G. S. unit.
Horizontal force summed range .	0·00311 ,,
Declination range . . .	3′·8.
Declination summed range . .	17′·9.

NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequality.]

The following table represents the magnetic character of each day during the month.

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Character.
1	S	8	C	15	S	22	S
2	S	9	C	16	S	23	S

Earthquakes reported :—

The only earthquake reported this month was felt at Rangoon on the 3rd at 5 hrs. 50 min. G. M. T. There were two shocks of slight intensity: they were not recorded in Simla.

Solar radiation.—Measurement of the intensity of solar radiation, by Angstrom's pyrheliometer was possible on one day only, the 6th of the month. The value, corrected to local noon and expressed in grammecalories per square centimetre per minute, was 1·32.

J. H. FIELD,
Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. *Solar Observations.*—Observations were taken on the 2nd, 4th, 5th, 8th, 10th, 12th, 13th, 16th, 20th, 21st, 23rd to 27th and 29th. Groups of sunspots and faculæ were seen on each day of observation.

Magnetic disturbances.

T. F. CLAXTON,
Director.

Weather in the Indian monsoon region.

8. In the subequatorial region pressure was normal at Zanzibar and slightly above it at the Seychelles. Winds over the area as a whole were of about the average strength but their direction was more southerly than usual; rainfall was markedly in defect, particularly at Zanzibar which received only 11 per cent. of its normal quantity. At Mauritius pressure was well below the average and rainfall decidedly above its normal value: the air movement was practically normal in character. Thus general conditions in the Indian Ocean as represented by the three insular stations were such as favour the occurrence of abundant rainfall over India during the monsoon period.

Depressions and cyclonic storms.

9. No storms affected the weather during the month. The advance of the monsoon over the Indian seas resulted only in the production of a feeble depression of which the following is a brief history.

Depression of the 4th to the 10th.—The trough of low pressure which usually constitutes an important feature of the pressure distribution of the summer season over northern India was on the first three days of June, prolonged further east than usual into Orissa and the adjacent portion of the Bay, and it was here that a depression was generated by the advancing monsoon current during the 24 hours succeeding 8 hrs. of the 4th. The disturbance extended westwards on the 5th, and on the following morning covered a large area comprising Orissa, the southern half of Chota Nagpur and the east of the Central Provinces. It subsequently moved northwards, being deepest near Hazaribagh on the 7th, Benares on the 8th, Patna on the 9th, Purnea on the 10th and Darjeeling on the 11th, on which day it was but faintly marked. Its depth was not great, being about a quarter of an inch during the earlier stages and a seventh of an inch when breaking up.

Most of the disturbances formed in front of the first rush of the monsoon are strongly marked and travel in some westerly direction, and the abnormal behaviour in these respects of the depression described above was due almost solely to the failure of the Arabian Sea current to feed into it.

The advance of the monsoon over the Arabian Sea although not associated with a regular disturbance, was marked by winds of unusual violence which inflicted much damage on shipping at the north Malabar ports.

Pressure.

10. Pressure at 8 hrs. over the Indian land region averaged ·007″ lower than the corresponding normal, and the only important deviation from this mean condition occurred over a small area in northwest India, defined by the stations of Jacobabad, Hyderabad, Deesa, Ahmedabad, Surat, Udaipur, Neemuch, Kotah and Bikanir; over this region the barometer was still lower by about ·02″.

Madras	0

In the hills of Baluchistan and northern and central India, pressure was also low, but the defect was either less than or nearly equal to that in the neighbouring plains; in consequence the vertical gradients departed but little from the normal value except between Leh and Lahore where they were rather steep.

The pressure conditions over India were thus such as are conducive to a normal or abundant monsoon rainfall.

Temperature.

11. The temperature conditions agreed fairly well with the normal throughout the plains except in the tract stretching northwestwards from Orissa to the southeast Punjab, where day temperature was from 2° to 7° and the night temperature from 1° to 3½° lower than usual.

The stations on the southern face of the western Himalayas were slightly cooler than usual, both by day and night, but in Kashmir, Afghanistan and Baluchistan there were no marked deviations from the average condition; this is an indication that the snowfall in these regions was exercising no abnormal influence on the weather.

The highest temperatures of the month in northern India were in general recorded during the first week of the month: they were however in most cases much lower than the corresponding highest on record in previous years.

Of the temperature changes which occurred during the month the most marked were:—

(*a*) A cold wave which affected the northeast of the peninsula during the first week and between the 7th and the 15th spread northwestwards with the advance of monsoon winds and rainfall up the Gangetic plain. The largest defect recorded in this area was 16°.

(*b*) A spell of cold weather which prevailed over upper India from the 18th to the 21st; during this period the recorded readings of temperature were from 4° to 16° below their normal values.

Winds.

12. In northern India generally winds were neither so strong nor so steady as usual except locally in the Punjab and the North-West Frontier Province, where the steadiness was high. In the peninsula the reverse was the case, both steadiness and velocity exceeding the normal values. The direction of movement was approximately normal over nearly the whole of the country, the only striking exception occurring at Darjeeling where the mean actual direction was N 63°W, while the normal for the month is S 76°E.

According to the marine information light unsteady winds prevailed over the central portion of the equatorial belt during the second and third weeks of June, and were almost certainly the cause of the weakness of the Arabian Sea current between the 15th and the 26th.

Humidity and cloud.

13. Humidity, both absolute and relative, was in excess in the United Provinces, the Punjab and Central India, but elsewhere the hygrometric conditions were nearly normal.

Skies also were covered to about the usual extent; the only important exceptions occurred in the North-West Frontier Province and Central India where the proportion of cloud was decidedly high.

Rainfall.

14. The monsoon rains began on the 6th in northeast India and extending very rapidly westwards, were established over the Gangetic plain during the course of the next two days. The advance of the monsoon over the Bay was, as is frequently the case, attended with the formation of a depression; this disturbance followed a rather unusual course which led it eventually into the Assam Himalayas. Heavy rain accompanied its march through northeast India from the 7th to the 11th. The disappearance of the depression was followed by an appreciable decrease in the activity of the current, with the result that the rainfall due to it during the next two weeks was comparatively light and almost restricted to northeast India and Burma. The current strengthened considerably on the 27th and during the rest of the month gave satisfactory rain over practically the whole of the region usually dominated by it.

The Arabian Sea current arrived on the 2nd on the Malabar coast and four days later on the Konkan coast, but owing to the setting in of unfavourable conditions (described in the section on winds) over the central portion of the equatorial belt it failed to attain its proper intensity until the 27th. At that time contemporaneously with the Bay current it became very active, and penetrating quickly inland became established over the Central Provinces, Gujarat and Rajputana.

The most influential factors in the distribution of the rainfall of the month were thus—(*a*) the early commencement and rapid extension of the Bay current, (*b*) the timely arrival of the Arabian Sea current on the coast, with its inability to extend inland till nearly the end of the month. The statement below showing the normal and actual dates of the complete establishment of the monsoon illustrates these two peculiarities.

TABLE 14.

AREA.	Actual date of establishment of rains.	Normal date of establishme of rains.
Bengal	June 6th	June 15th
Bihar	„ 6th	„ 15th
Chota Nagpur	„ 6th	„ 15th
United Provinces, East	„ 7th	„ 16th
United Provinces, West	„ 8th	„ 25th
Punjab, East and North	Not established	„ 30th
Rajputana	June 28th	„ 15th
Gujarat	„ 27th	„ 15th
Central India	Not established	„ 15th
Central Provinces	June 28th	„ 10th
Konkan	„ 6th	„ 5th
Malabar	„ 2nd	„ 3rd

The aggregate rainfall of the month was abundant an favourably distributed over the greater part of the regio served by the Bay current; it was on the other hand norma though somewhat irregularly distributed, in the field of th Arabian Sea current. The excess was more than 20 pe cent. over a large part of the plains of northern India and i Hyderabad, and was absolutely greatest in Bihar (110 pe cent). The deficiency was nowhere marked, being less tha one inch in amount in all cases.

Snowfall.

I.—AFGHANISTAN.

15. Light snow is reported to have fallen in the beginning of the month on the high hills of Paghman and Hazara.

II.—NORTH-WEST FRONTIER PROVINCE.

Very little snowfall occurred.

III.—KASHMIR.

There were some light falls on the higher mountains. At the end of the month scarcely any accumulations existed on the Deosai pass, while on the high mountains near Sonemarg the depth of accumulations was estimated at about 2 feet.

IV.—PUNJAB.

(*a*) *Kangra.*—The snowfall was confined to heights above 19,000 feet.

(*b*) *Kilba.*—There were feeble snowstorms on the 7th, 11th, 16th, 26th and 28th at levels above 11,000 feet. The depth of snow on the Shatul, Brua and Rupin passes was estimated at 4 feet, which is about the normal amount.

V.—UNITED PROVINCES.

Almora.—There were frequent falls during the month and the snowline descended to a distance of about four miles from the perpetual snows. The total fall measured about 10 feet in depth on the Nuwe pass, 8 feet in Byans, 2½ feet on the Binkaru pass and one foot in Malla Johar. At the close of the month there was about 22 feet of snow on the Nuwe pass and 14 feet on the Binkaru pass, as compared with 16 and 23 feet, the respective normal values.

SUMMARY.

16. (*a*) Except perhaps in Kumaon the snowfall of the month was slightly less than the average.

(*b*) The quantity of accumulations of snow at the close of the month was on the whole normal or in defect.

Crop report.

17. *Burma.*—Standing crops were generally in good condition. Ploughing for the main rice crop was in progress, and in upper Burma the cultivation of autumn crop was being carried on.

Eastern Bengal and Assam.—Floods had damaged crops on low lands. Prospects of rice on high lands and of jute were good; prospects of tea had improved.

Bengal.—Autumn crops were being sown and transplantation of winter rice had commenced. Crops had been damaged to some extent by floods and insects.

United Provinces.—Autumn sowings were in progress. Standing crops were in good condition. Fodder and water were adequate.

Punjab.—Extra spring crops were being harvested and autumn crops were being sown. Sugar, cotton and juar had been slightly damaged by insects.

North-West Frontier Province.—The condition of standing crops was average. Autumn crops were being sown.

Jummu and Kashmir.—The condition of standing crops was fair to good. Fodder was sufficient.

Rajputana.—Monsoon sowings were in progress. Fodder was sufficient and the condition of cattle was generally good.

Central India.—Autumn crops were being sown. The condition of agricultural stock was on the whole satisfactory.

Central Provinces.—The sowing of autumn crops was in progress, and the germination of the seed sown was reported good. More rain was required in some districts.

Bombay.—Land was being prepared and sowings made for autumn crops, but in several districts more rain was needed. The supply of fodder and of drinking water was generally adequate.

Hyderabad.—Early rice was being sown in some districts. Lands were under preparation for autumn crops and sowings were in progress in most parts.

Mysore.—Prospects of the season were fair. Ploughing and sowing were being carried on.

Coorg.—Ploughing for and transplantation of rice were in progress. Water and fodder were sufficient.

Madras.—Standing crops were generally fair but some required more rain. The outturn of the harvests was poor to normal. The condition of cattle was generally good.

HEM RAJ.

§ „ „ 27 „
‖ „ „ 25 „

N.B.—Elevations in italics indicate barometrical determinations.

NOTE—The barometric readings are not reduced to sea-level, in the cases of hill or plateau stations, the elevations of which exceed 1,200 feet.

B.

stations in India, etc., in June, 1909.

Wind direction. Number of winds from Calm. (25)	N. (26)	N.E. (27)	E. (28)	S.E. (29)	S. (30)	S.W. (31)	W. (32)	N.W. (33)	Resultant direction. (34)	Normal direction. (35)	Wind velocity. Mean velocity, miles per hour. (36)	Normal. (37)	Departure from normal. (38)	Wind steadiness. Actual percentage. (39)	Departure from normal. (40)	Hygrometry, 8 hrs. Mean humidity at 8 hrs. (41)	Departure from normal. (42)	Mean vapour tension at 8 hrs. in inches of mercury (43)	Departure from normal in inches of mercury. (44)	Cloud. Mean cloud amount at 8 hrs. (45)	Departure from normal. (46)	Rainfall. Number of rainy days. (47)	Normal number of rainy days. (48)	Departure from normal. (49)	Rainfall of month. (50)	Normal rainfall of month. (51)	Departure from normal. (52)	Total rainfall from 1st May to 30th June, 1909. (53)	Normal rainfall for period, 1st May to 30th June. (54)	Departure from normal of period, 1st May to 30th June, 1909. (55)	Heaviest rainfall during month. (56)	Station. (57)

(a) Indeterminate.

* Uncorrected for scale error.

Tabl

(2) *Abstract of observations taken at 8 hrs. at 239 station*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

§ Uncorrected for scale error.

¶ Mean of 25 days.
‖ „ „ 28 „

Tabl

(2) *Abstract of observations taken at 8 hrs. at 239 station*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

ations, the elevations of which exceed 3,200 feet. † Uncorrected for scale error. ‖ Mean of 28 days. " 18 " ¶ Mean of 23 days.

Tab

(2) *Abstract of observations taken at 8 hrs. at 239 statio*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

* Uncorrected for scale error. § Mean of 24 days. ‖ Mean of 28 days.

Tabl

(2) *Abstract of observations taken at 8 hrs. at 239 station*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

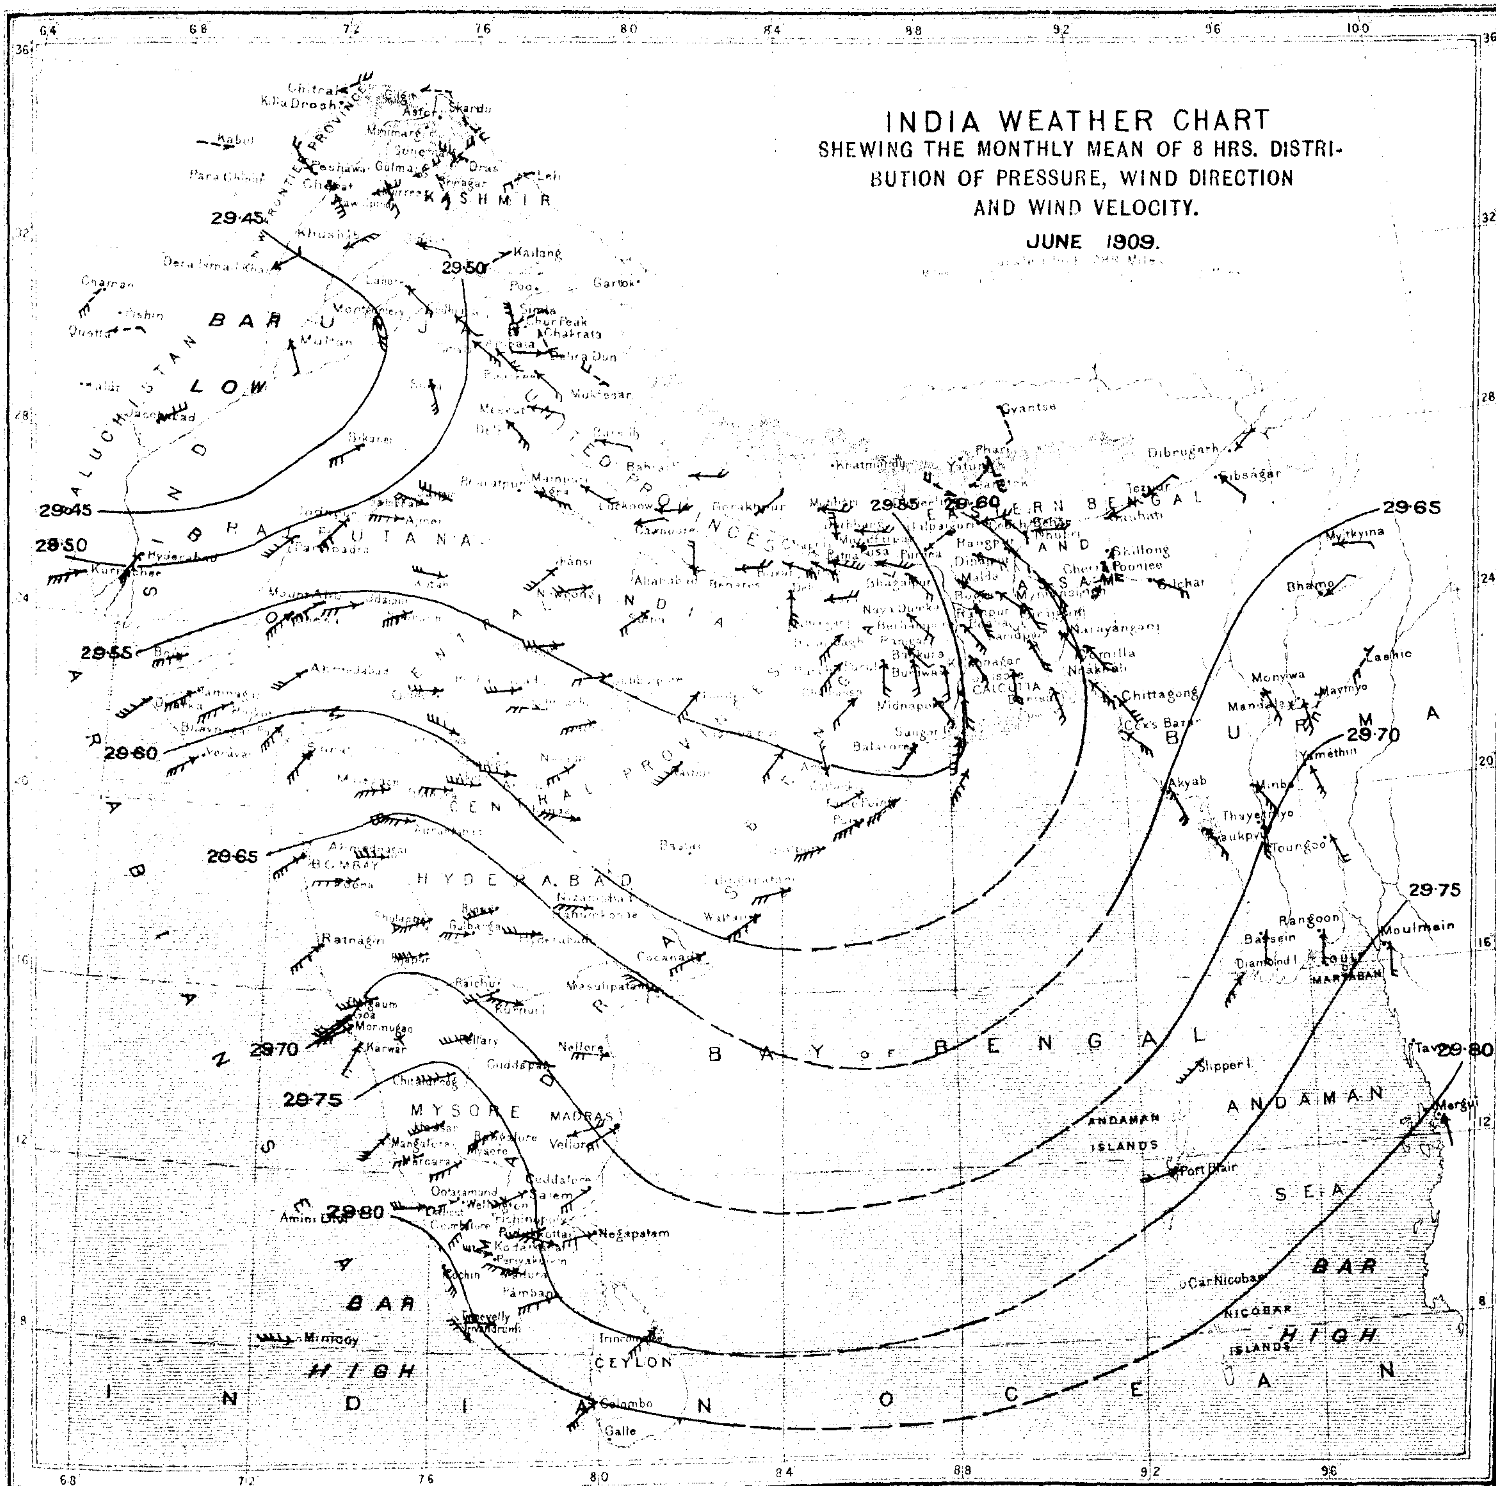
§ Wind variable 4. †† Observations of 22 days. ¶ Wind observations 5 less. ** Mean of 26 days.

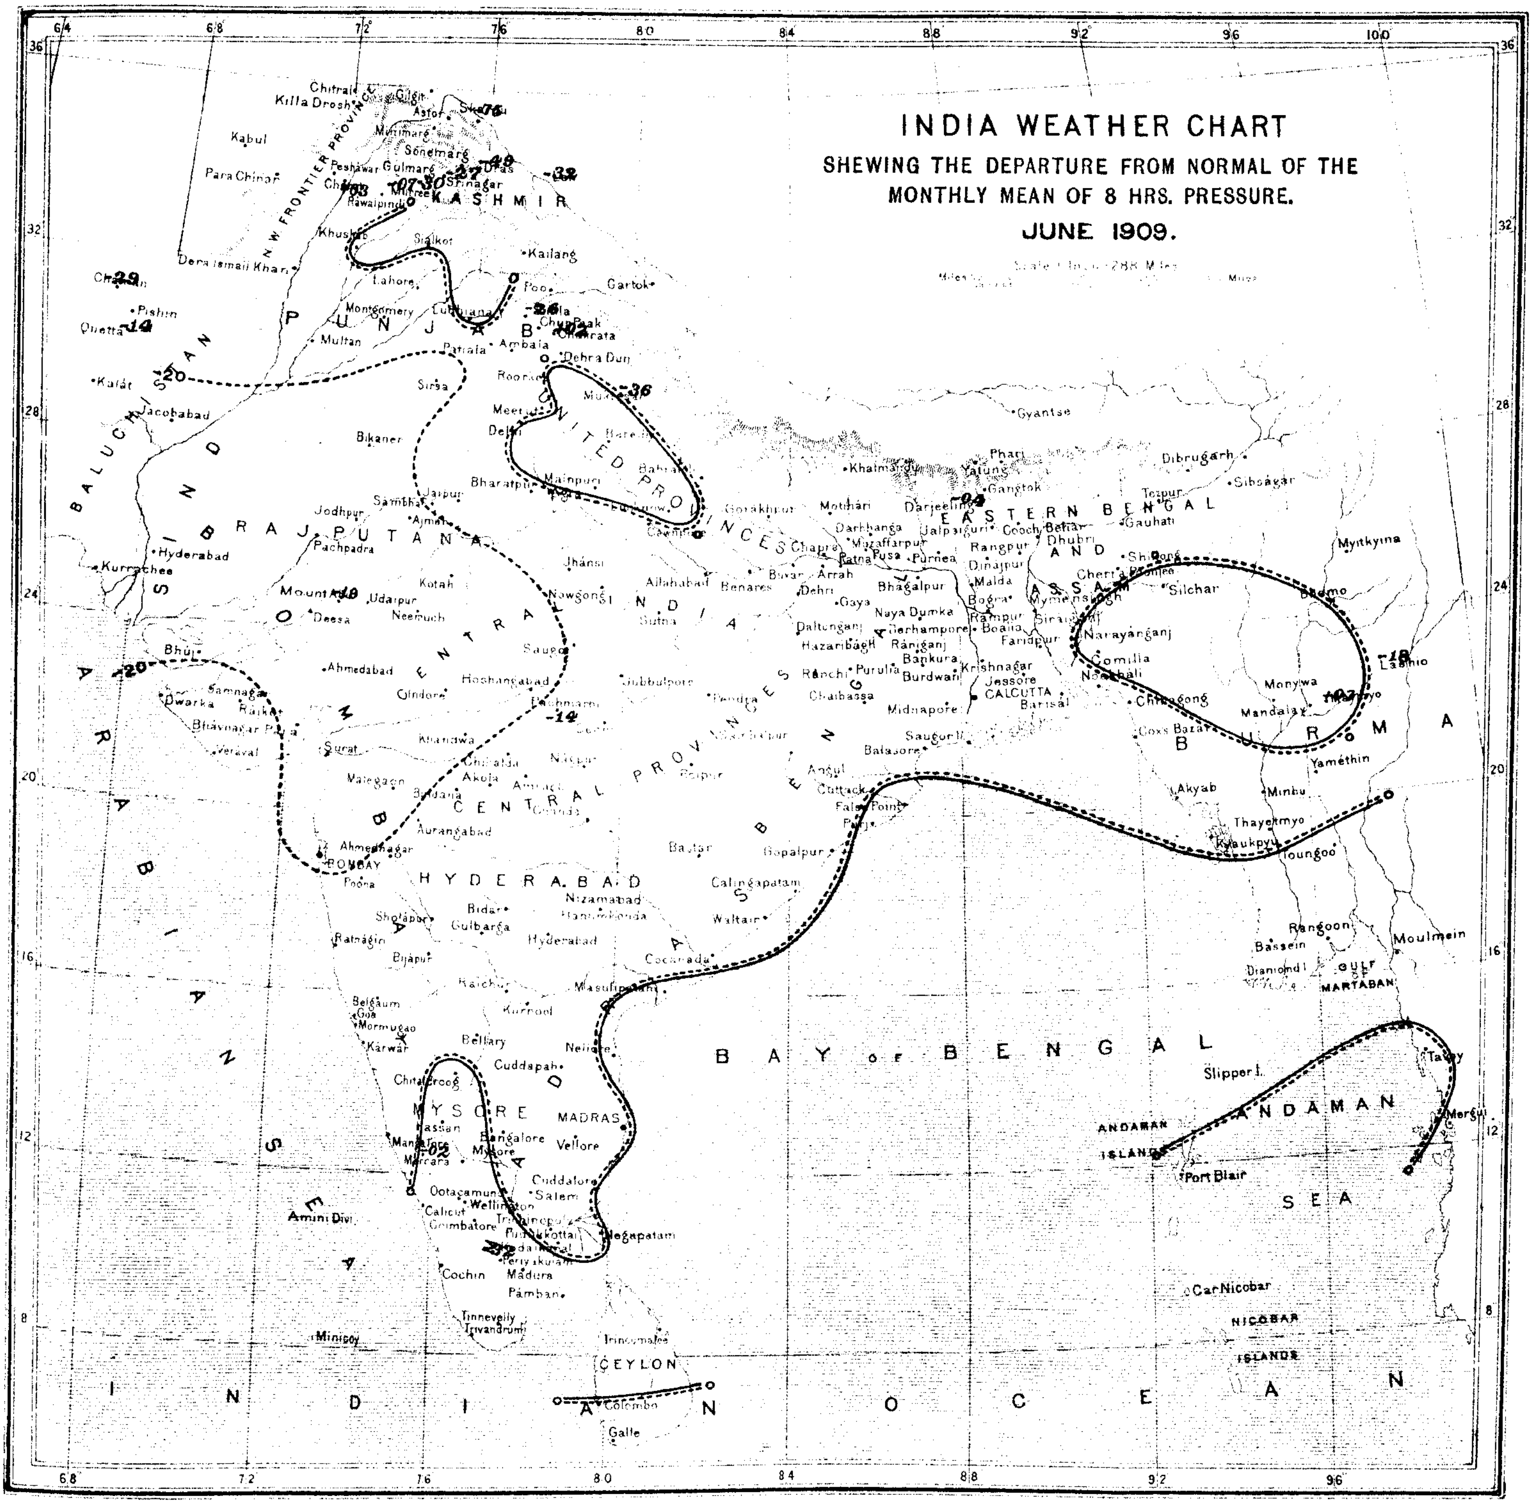


Reg. No. 4003 E. 09—1—5,500. LITHO. BY S. B. MUNDLE.

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of 0 to 2 miles per hour	...	one feather added to the wind arrow.
,, ,, 2 to 5 ,, ,, ,,	...	two feathers ,, ,, ,, ,,
,, ,, 5 to 10 ,, ,, ,,	...	three ,, ,, ,, ,, ,,
,, ,, 10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,, ,,
,, ,, ... 20		five ,, ,, ,, ,, ,,



Reg No. 4003 E., 09—L—5,500. LITHO. by N.L.HALDER.

The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020″ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

GOVERNMENT OF INDIA.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, JULY, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of July, 1909, is based on observations taken daily at 8 hrs. at 238 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 34 stations. In the case of the rainfall section of the review there are utilized the data afforded by the meteorological observatories, and such rainfall statements of the month as had been published in the Government Gazettes by the Provincial Governments prior to the date of the publication of the review. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories in the Indian area.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of July, 1909.

2. Strongly marked monsoon conditions prevailed on most days and cloud, relative humidity and rainfall were above normal over by far the greater part of the country. Indeed the only areas where the month's rainfall was deficient to any important extent were Madras Southeast (—43 per cent.) and Eastern Bengal (—34 per cent.). Both monsoon currents were directed more largely than usual to northwest India with the result that the month's total precipitation was from 40 to 87 per cent. in excess over a large part of that region.

As might be expected from the abundance of rainfall, humidity (relative) and the amount of cloud were high in most parts of the country.

The temperature conditions agreed closely with the normal, the departures of mean temperature being within 2° of the average value in all divisions with the exception of Rajputana (—3°·1) and the North-West Frontier Province (—2°·4). Mean monthly pressure was in defect by ·009″.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar observations.*—The weather was very unfavourable for solar observations during the month. No observations could be made on 3 days (11th, 12th, and 20th) and on 16 other days it was not possible to observe prominences.

Sunspots.—There were 12 new spot groups observed with daily average of 2·2 as against 15 and 2·2 respectively in June. The average life of a spot was 5·8 days. Up till the 18th of the month there were never more than two groups visible at once, but on the 19th the number suddenly increased to six and the number exceeded two till the 28th. The region of the sun between longitude 30° and 75° and latitude 12° north and 6° north showed the greatest activity.

The distribution of spots in latitude was as follows:—

TABLE 1.

—	0° - 10°	11° - 20°	Extreme latitudes.	Mean latitude.
North . .	4	3	6°, 15°	9°·7
South . .	4	1	5°, 18°	8°·4

Two large spots were seen—Nos. 1690 and 1693. The former came round the east limb on the 16th and disappeared at the west on the 27th. When traversing the eastern half of the sun it developed a number of companions which began to vanish after it had crossed the central meridian. No. 1693 was the largest spot of the month and first appeared near the east limb on the 19th as a scattered group. It soon developed a main spot of round and regular outline which was visible to the naked eye. When crossing the central meridian on the 24th the group covered about 12° of longitude between 35° and 47°, and 5° of latitude between 5° and 10° north. Some of the smaller companions now began to disappear and except for one or two small dots the main spot alone traversed the greater part of the western half of the sun, and went round the west limb on the 30th.

Prominences.—There was a considerable falling off in the record of the large prominences, due to some extent to the bad observing weather of the month. Only 11 of about one minute in height were noted, and 36 of less than half a minute. One metallic prominence was observed on July 6th at latitude 8° south on the eastern limb of the sun.

Magnetic disturbances.—There was a "small" magnetic disturbance on the 13th, but otherwise the magnets were very quiet during the month.

C. MICHIE SMITH,
Director,
Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

Note on the Alibag Magnetic Record.

4. During the month of July 1909, the traces showed 16 calm days, and 15 days of small disturbance.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 6th, 7th, 18th, 19th and 26th.

The mean observed absolute values of the several magnetic elements, reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and declination for the month are as follow:—

Easterly declination . . .	0° 59′ 52″	
Horizontal force . . .	0·36860	C. G. S. unit
Vertical force . . .	0·16019	" "
Inclinat on (calculated) . . .	23° 29′·4	
Inclinaton (observed) . . .	23° 28′·9	
Horizontal force range . . .	0·00042	C. G. S. unit.
Horizontal force summed range .	0·00283	" "
Declination range . . .	3′·4	
Declination summed range . .	15′·9	

[NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequality.]

The following table represents the magnetic character of each day during the month.

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Character.
1	S	9	C	17	S	25	C
2	C	10	C	18	C	26	C

All times are given in G. M. T.
A = E—W component.
B = N—S component.

Magnification of each instrument was 15.
† Displacements less than 0·2 mm. are reported as "Small".

The shock recorded in Simla on the 7th was felt at many places in northwest India and is reported as consisting of 2 or 3 sharp shocks and many minor ones. The following places reported it:—Multan, Lahore, Sialkot, D. I. Khan, Khushab, Rawalpindi, Abbottabad, Murree, Mussooree, Cherat, Nowshera, Chitral, Srinagar, Dras, Gulmarg and Skardu.

In addition the following shocks were reported:—

TABLE 6.

Place at which felt.	Date.	G. M. T. of earthquake.		Intensity.	Duration.	REMARKS.
		H.	M.		Sec.	
Murree	8th	0	30	...	...	1 shock.
Drosh	9th	11	0	1	3	2 shocks.
„	22nd	23	10	1	10	2 „
Chitral	„	23	17	4	12	2 „
Rawalpindi . . .	„	23	40	3	3	1 shock.
Murree	„	23	25	1	3	2 shocks.

NOTE.—The scale of intensity was published in the Monthly Weather Review for January 1909.

Solar Radiation.—Cloudy weather prevented any measurement of the intensity of solar radiation in Simla by Angstrom's pyrheliometer.

J. H. FIELD,
Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. *Solar observations.*—Observations were taken on the 1st, 4th, 6th to 10th, 12th, 13th, 18th, 19th, 21st, 22nd and from the 25th to the end of the month. Sunspots singly and in groups were observed throughout. The sunspots were numerous between the 21st and the 27th and faculæ were seen on each day of observation.

Magnetic disturbances.

T. F. CLAXTON,
Director

Weather in the Indian monsoon region.

8. Pressure was lower than usual at Mauritius and Seychelles and about normal at Zanzibar. Winds were approximately normal as regards strength, but were inclined to be more easterly than usual except at Zanzibar. Rainfall was within 10 per cent. of the average at Zanzibar, in marked excess at Mauritius, and nearly 40 per cent. in defect at the Seychelles.

The general conditions as represented by these data are such as are favourable to Indian rainfall.

TABLE 8.

Depressions and cyclonic storms.

9. Three depressions affected the weather during the month. The first lasted from the 9th to the 18th, the second from the 23rd to the 27th and the third from the 29th to the 4th of August. All the three appeared first over the north of the Bay as a mere prolongation of the trough of low pressure and were thence transmitted across northern India, the first and second to the centre of the Gangetic plain and the third to the Western Desert. Their intensity as measured by the departures of pressure at the centre was small, as is usually the case in disturbances of this class; they were however a potent factor in depriving northeast India of its normal share of rainfall.

Pressure.

10. The geographical mean of 8 hrs. pressure was ·009″ below the normal value, as compared with ·002″ in May and ·007″ in June. This steady diminution of pressure relatively to the normal conditions of the period was probably related to the strength of the monsoon currents, and indicated greater ascensional movement than usual over India.

Relatively to the general condition pressure was in excess over the peninsula to the south of the parallel of 17° N, in upper Burma and along the base of the Himalayas from Assam to the North West Frontier Province; and was in defect over the remainder of the country.

The monsoon trough of low pressure was thus even better defined than is ordinarily the case, and its western extremity occupied an unusually southerly position—a circumstance favourable to abundant precipitation in northwest India.

TABLE 9.

DIVISION.	Departure from normal of mean 8 hrs. pressure.
	″

Temperature.

11. Owing to the abundance of rainfall temperature was below normal over by far the greater part of the country. The departures were in general small in amount but reached values between 2° and 4° in the south of the North-West Frontier Province, the southeast Punjab, Rajputana and the adjacent districts of the United Provinces and at a few stations in Gujarat, Hyderabad and Madras. As usual during the rains this result was due largely to the lowness of the day temperature, which was from 2° to 5° in defect over the Bombay Deccan, the northeast of the peninsula and the greater part of northwest India. In the dry region of Baluchistan, on the other hand, the defect was shown almost solely in the night temperature.

The changes of temperature conditions from day to day were not large or important.

Winds.

12. (*a*) The mean wind directions contained an unduly easterly element over the Indo-Gangetic plain, an indication that the field of the Arabian Sea current was smaller, and that of the Bay current more extensive, than usual. Further the westerly component was very weak over the east of Central India and strong over the Central Provinces.

(*b*) At Sibsagar the resultant direction of the wind was north-east instead of south as usual. A possible inference from this deflection is that there was a frequent flow of dry air from the north down the valley of the Brahmaputra.

(*c*) Except in the North-West Frontier Province, where it was decidedly low, the rate of air movement did not differ to any extent from the normal.

(*d*) The steadiness was considerably greater than the average in the United Provinces, the Punjab, the Central Provinces, Bombay and Hyderabad, and much below the normal in Rajputana where at Jaipur and Sambhar the prevalent direction of wind was northerly and not westerly as is normally the case.

Humidity and cloud.

13. The air was on the mean of the month somewhat more humid than usual in Central India, the United Provinces, the Punjab, the North-West Frontier Province, Sind and Rajputana, but elsewhere in the plains the deviations from normal of the hygrometric conditions were small and of no significance. In the hills the air was excessively dry in Baluchistan in point both of absolute and relative humidity, and on the whole rather damp in the western Himalayas. These departures agreed roughly with those of rainfall.

Like rainfall, the cloud proportion also was in excess of the normal in most parts of the country, the only important exceptions being Eastern Bengal and Assam, and Bengal.

Rainfall.

14. The month's rainfall was abundant over a large part of India and its distribution bore a strong resemblance to that of the corresponding month of last year. Precipitation in the region served by the Bay current was deficient except in the Bay Islands, Burma and Orissa; while that in the field of the Arabian Sea current was above normal except in Berar, the Central Provinces West, Madras Southeast and Madras Deccan. The excess was more than 30 per cent. in amount over the whole tract of country extending from the western limits of Bihar to Sind and the North-West Frontier Province, and was greatest in the Punjab Southwest which received nearly double its normal quantity: it was considerable also in the Bay Islands, Orissa, the Central Provinces East, the Konkan, Hyderabad South, Mysore, Madras Coast North and Kashmir.

In the area of scanty rainfall the defect ranged from 3 per cent. in Berar to 34 per cent. in Eastern Bengal and 43 per cent. in Madras Southeast.

Snowfall.

I.—AFGHANISTAN.

15. No information has been received.

II.—NORTH-WEST FRONTIER PROVINCE.

No snow fell beyond a light shower on the 18th on the hills to the east of Chitral.

III.—KASHMIR.

Feeble local snowstorms occurred on the higher mountains on the 7th, 8th, 9th, 15th, 18th, 20th and 21st and 25th to 27th. The accumulations diminished materially, so much so that at the end of the month there was only about half a foot left on the higher mountains near Sonemarg.

IV.—PUNJAB.

(*a*) *Chamba.*—Snowstorms occurred on the Drati pass (elevation 13,000 feet) on the 18th, 19th, 24th and 25th; 18 inches were measured on the last two days.

(*b*) *Kangra.*—There was practically no snowfall below 19,000 feet.

(*c*) *Kilba.*—A snowstorm occurred on the 13th on the Shatul and Rupin passes resulting in a fall of 9 inches in the former locality, and of a few inches in the latter.

V.—UNITED PROVINCES.

(*a*) *Garhwal.*—There was on the whole probably less than the usual amount of snowfall.

(*b*) *Almora.*—During the first twenty days, for which alone information is available, snow fell to a total depth of 7 feet on the Nuwe pass, while 2 to 6 inches were received on the Untadhura, Ralamdhura, Pindari, Kuntela, Byans and Binkaru.

SUMMARY.

16. According to the available information there were in the Himalayan and Afghan mountain regions no heavy general falls of snow, and the previous accumulations had diminished largely in amount, particularly in Kashmir.

Crop report.

17. *Burma.*—The condition of crops generally was good except in parts of Katha and Bhamo. More rain was needed in some of the northern and central districts.

Eastern Bengal and Assam.—Tea was suffering from want of rain. The prospects of jute and rice were generally good.

Bengal.—Winter rice was being transplanted but more rain was wanted. Sugarcane, jute and other autumn crops were doing well.

United Provinces.—Standing crops were good almost everywhere, but a break in the rains was needed; some damage was reported from floods.

Punjab.—Standing crops were generally in good condition except in parts of Sialkot. Autumn crops were being sown.

The North-West Frontier Province.—The condition of crops was on the whole fairly good in Peshawar, and average elsewhere. Extra spring crops were being harvested in Bannu.

Jammu and Kashmir.—Standing crops were in fair to good condition. Fodder was sufficient.

Rajputana.—Standing crops were doing well and prospects were favourable.

Central India.—Autumn crops were being weeded and land prepared for spring crops.

Central Provinces.—Continuous rain had done some damage. Lands were being prepared for spring crops.

Bombay.—Some damage to standing crops was reported from insects and insufficient moisture. Autumn crops were being sown.

Hyderabad.—Crops were in fair to good condition, but some damage had been caused by excessive rain and insects. Early rice was being sown.

Mysore.—Prospects of the season were fair, but more rain was needed in parts.

Coorg.—Rice was being transplanted. Water and fodder were sufficient.

Madras.—Standing crops were generally in fair condition but in some parts they required more rain. Prospects were on the whole fair.

HEM RAJ.

§ Wind observation less 1.

Table B.—Abstract of observations taken at 8 hrs. at 238 stations in India, etc., in July, 1909.

(1) Provincial means.

(2) Data of stations.

1) Provincial means based on the material in Table B (2) except that the statement of rainfall depends on the complete data of about 2,700 stations.

	Pressure departure from normal.	Temperature of air.								Wind.		Hygrometry.				Cloud.		Rainfall.		
		Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Absolute range during month.	Departure of velocity from normal.	Departure of steadiness from normal.	Mean humidity.	Departure from normal.	Mean vapour tension.	Departure from normal.	Mean cloud amount.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.

stations, the elevations of which exceed 3,200 feet.

** Uncorrected for scale error.

Ta

(2) *Abstract of observations taken at 8 hrs. at*

umber of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

§ Uncorrected for scale error.

Table

(2) Abstract of observations taken at 8 hrs. at 238

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs. in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

B—*continued.*

Stations in India, etc., in July, 1909—continued.

Calm.	Wind direction: Number of winds from N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind velocity: Mean velocity, miles per hour.	Normal.	Departure from normal.	Wind steadiness: Actual percentage.	Departure from normal.	Hygrometry, 8 hrs.: Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs., in inches of mercury.	Departure from normal, in inches of mercury.	Cloud: Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall: Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st May to 31st July 1909.	Normal rainfall for period, 1st May to 31st July.	Departure from normal of period, 1st May to 31st July 1909.	Heaviest rainfall during month.	Station.

(2) *Abstract of observations taken at 8 hrs. at 2*

Number of sub-division.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

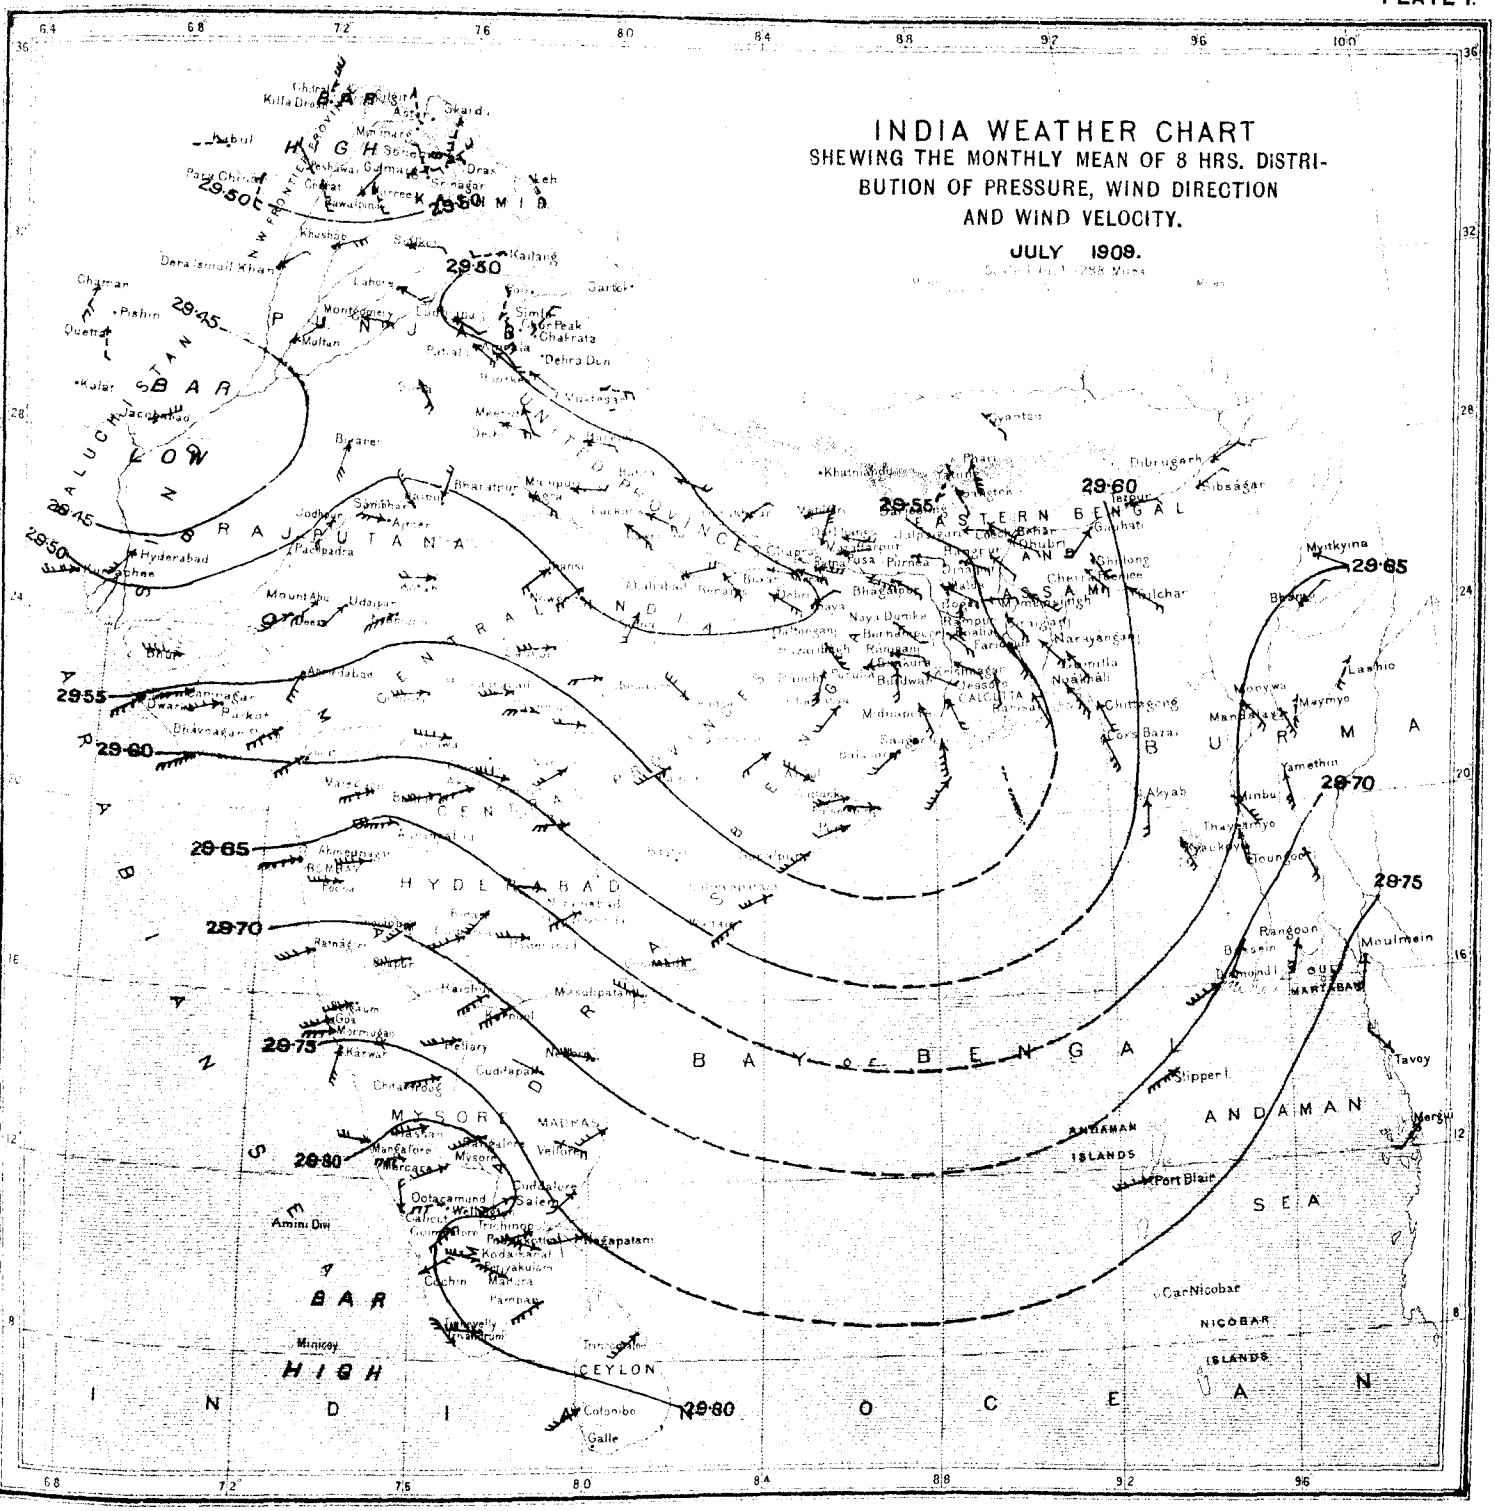
‡‡ Wind variable 5.
‖ Wind observations less 4.



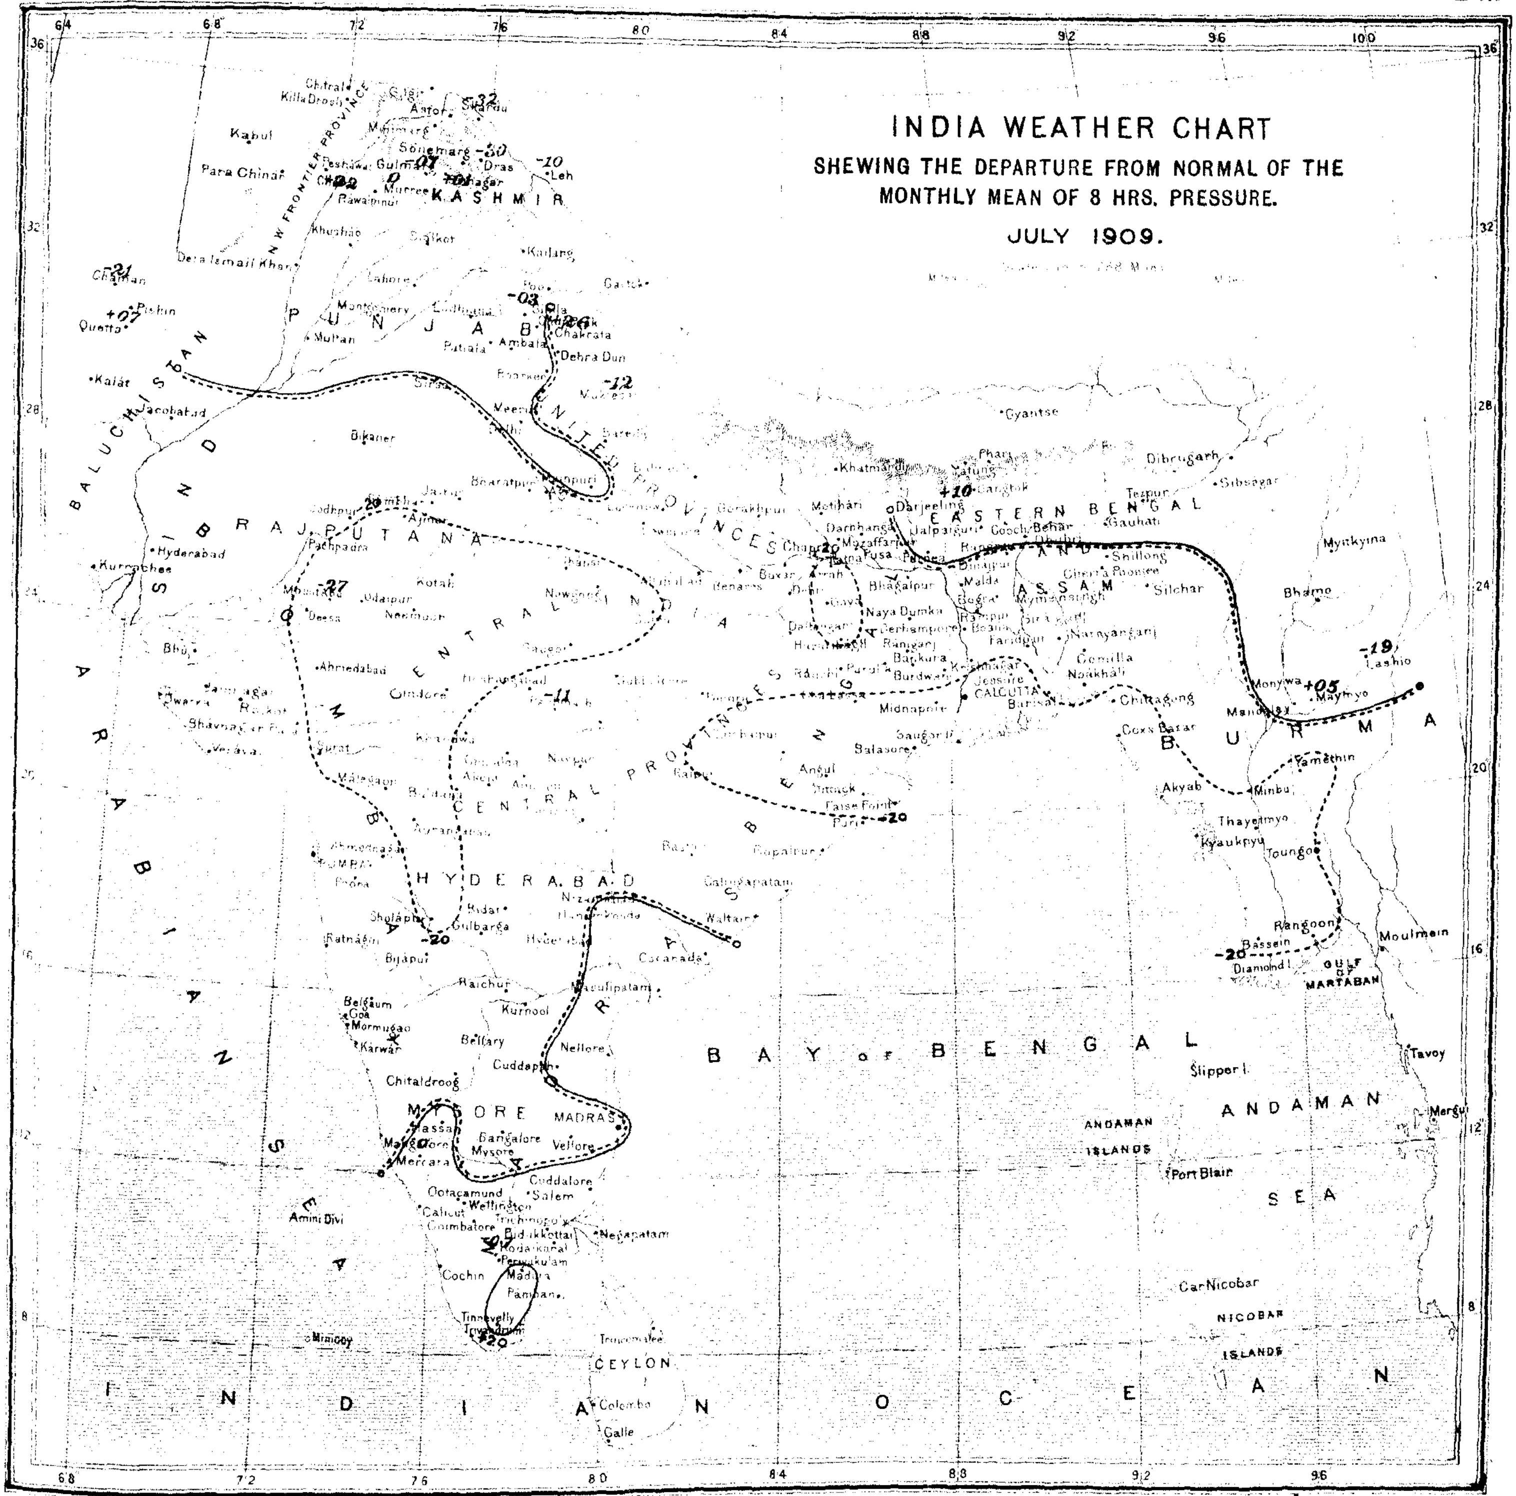
Reg. No. 4003 E. 09.—L.—5 500.

Litho. by S.B. Mundle.

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	...	one feather added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,	...	two feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	...	three ,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,, ,,
,, ,,	20 ,, ,, ,,	...	five ,, ,, ,, ,, ,,



Reg. No. 4003 E . 09.—L.—5.500.

LITHO. BY H.L.HALDER.

The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020″ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

GOVERNMENT OF INDIA.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, AUGUST, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of August, 1909, is based on observations taken daily at 8 hrs. at 240 stations and on additional observations recorded at 10 hrs. and 16 hrs. at 34 stations. In the rainfall summary the data furnished by the meteorological observatories and such rainfall statements of the month as had been published by the Provincial Governments up to the date of the publication of the review have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of August, 1909.

2. Both monsoon currents were less steady than usual, and a well-marked break in the rains obtained over the greater part of the country from the 8th to the 19th. The total measurements of rainfall were short of the normal in all the larger provinces with the exception of Eastern Bengal and Assam, Bengal, the North-West Frontier Province, Mysore and Madras. The excess in these districts was, however, sufficient exactly to counterbalance, in the average for India, the defect recorded in the remainder of the country.

The actual values of relative humidity and vapour tension differed to no important extent from the normal; skies were covered more fully than is customary in the North-West Frontier Province and at most stations in Rajputana, and were clearer than usual in Assam, the central districts of the United Provinces, the east of the Central Provinces and at Tavoy and Mergui. The departures of temperature were feebly marked, being less than 1° in amount everywhere except locally in Rajputana where weather was cooler than usual throughout the 24 hours. The barometer over India stood ·043" higher than is ordinarily the case in August, and the trough of low pressure was considerably to the north of its normal position.

Solar, seismic and magnetic disturbances.

KODAIKANAL

3. *Solar Observations.*—The observing conditions were slightly better than in July. There was only one day which was too cloudy for any observations and five others on which prominences could not be observed, but the prominence record was imperfect on ten days.

Sunspots.—There were 16 new spot groups with a daily average of a 2·3, and the average life of a spot was 4·4 days. Three of the new groups were returns of old ones. There

was one day—the 28th—on which no spots were seen, but the weather was poor and a small spot might have been missed. In July, for the first time for many months, the northern spots had a higher mean latitude than the southern, but in August the usual condition was restored. The latitude distribution was as follows :—

TABLE 1.

—	1°—10°.	11°—20°.	Extreme latitudes.	Mean latitude.
North	6	...	3°, 10°	7°·8
South	2	8	6°, 17°	12°·9

There were only 2 groups—No. 1695 of the previous month and No. 1704—which contained spots of any size, but even they were small ; and there is nothing special to be recorded regarding any of the groups.

Prominences.—24 prominences one minute or more in height were recorded during the month. The highest recorded was only 120″ high. The only prominence which showed any striking activity was a very bright one, 45″ high, seen at latitude + 9° east at 10h. 10m. on the 14th. At 10h. 20m. there was only a detached streak, 20″ high, left of it. There was nothing at this position at 9h. 6m, nor on the calcium photographs of that day (8h. 28m., 8h. 35m. and 8h. 49m.)

Magnetic disturbances.—"Moderate" magnetic disturbances were recorded from the 7th to the 10th, on the 19th andfrom the 28th to the 31st and "slight" ones on ten other days. There were 3 small spot groups near the central meridian on the 19th, but on the other hand the sun was free from spots on the 28th, as mentioned above.

Solar radiation.—Cloudy weather prevented any measurement of the intensity of solar radiation in Simla by Angstrom's pyrheliometer.

J. H. FIELD,
Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. The report of this observatory will be published in the September Monthly Weather Review.

Weather in the Indian monsoon region.

8. Pressure was almost normal at Zanzibar and the Seychelles. The air movement was of the normal character at the Seychelles but was inclined to be weak and less easterly than usual at the other station. Rainfall was very irregularly distributed, being 84 per cent. in excess at Zanzibar, and markedly in defect at the Seychelles.

The abnormalities of rainfall and air movement at Zanzibar were such as are prejudicial to good rain over India from the Arabian Sea current.

Depressions and cyclonic storms.

9. The month was singularly free from disturbance, no well-defined depression or storm having formed over or crossed into India.

Pressure.

10. The low pressure conditions which had prevailed over India during May, June and July were reversed completely during August, for which the mean 8 hrs. pressure was as much as ·043" above the normal. The excess was common to the whole Indian area with the exception of Malabar and Ceylon, but was by no means uniformly distributed as will be seen from the statement below :—

TABLE 6.

DIVISION.	Departure from normal of mean 8 hrs. pressure.

Madras	+·021

As ordinarily the barometer stands highest in the extreme south and lowest in the north the effect of the deviations from the normal conditions was a marked diminution of the barometric gradient. Thus the range of pressure between Ceylon and the north of the Bay and of the Arabian Sea was reduced to about half of the normal value. Also the trough of low pressure lay further north than usual, with its axis running eastwards from Multan to Darbhanga instead of from Multan to Calcutta.

No great connection is traceable between the departures of pressure and those of temperature; the latter differed by less than 1° from the normal over practically the whole of the country.

The atmospheric strata at and above the level of the hill stations in northern India and Burma were denser than usual though not to the same extent as those near the earth's surface. In southern India, on the other hand, the excess of pressure disappeared below the level of Kodaikanal:—

Temperature.

11. On the mean of the month temperature was approximately normal in all the provinces with the exception of Rajputana where day temperature was 3½° and night temperature 2½° lower than usual. This average condition was not a feature of the whole month but was the result of a series of rises and falls which very nearly counterbalanced each other. The most noticeable of these fluctuations occurred from the 6th to the 13th and towards the end of the month; on these occasions the weather was from 2° to 8° cooler over the tract of country stretching eastwards from the Indus to Upper Burma.

Winds.

12. Owing to the prevalence of unusual pressure conditions the air movement departed from the normal type in some important respects. The chief abnormalities were:—

(*a*) There was an excess of the southerly element in the wind direction over the Arakan coast, Eastern Bengal and the greater part of the Gangetic plain. At the stations along the base of the Himalayas from Lahore to Tezpur the easterly element was suppressed or weak, while at the hill stations of Darjeeling and Chakrata the mean direction contained an abnormal northerly component. These deviations indicate that the activity of the Bay current was almost restricted to northeast India; and that the region of ascensional movement over the Gangetic plain was situated near the foot of the Himalayas, considerably to the north of its normal position.

(*b*) The resultant direction over the west and centre of the peninsula was more westerly than usual, and in some cases northerly.

(*c*) Both monsoon currents were on the whole below their normal strength and steadiness over the land area, as is shown below:—

TABLE 10.

Division.	Departure from normal of	
	Hourly wind velocity.	Wind steadiness.
Burma	−1·2	−11
Eastern Bengal and Assam	−1·1	−12
Bengal	−0·3	+ 3
United Provinces	+0·1	+ 4
Punjab	+0·5	0
North-West Frontier Province	−0·6	+ 4
Sind	−1·8	0
Rajputana	+0·3	−12
Bombay	−2·0	−11
Central India	−1·1	+ 5
Central Provinces	−1·1	− 8
Hyderabad	−4·6	−16
Mysore	−1·8	− 1
Madras	−0·8	− 8

(*d*) The limited information available at present for the Indian Ocean shows that during the second and third weeks light unsteady and irregular winds prevailed in parts of the equatorial belt.

Humidity and cloud.

13. The comparative unsteadiness of the monsoon currents was reflected also in the humidity conditions which were more than usually variable. The high humidities recorded during rainy periods, however, very nearly compensated for the dryness experienced at other times, with the result that the monthly values of both vapour pressure and percentage of saturation differed but little from the corresponding normals.

The cloud proportion was unusually high in the North-West Frontier Province and the greater part of Rajputana, and low in Assam, the central parts of the United Provinces, the east of the Central Provinces, and the south Tenasserim coast; elsewhere the deviations from the average were not significant.

Rainfall.

14. During the first four days the monsoon was on the whole of more than the average strength, but its activity was focussed chiefly in a depression which advanced westwards from the east of the Central Provinces and Chota Nagpur on the 1st to the western desert on the 3rd. The rainfall was heaviest on the southern margin of the depression, and particularly at Mount Abu and Deesa which recorded 19 and 11 inches respectively between the mornings of the 2nd and 4th. The disappearance of the depression on the 4th was followed by a displacement to the foot of the Himalayas of the trough of low pressure, in consequence of which rainfall became almost confined to Burma and northeast India. The break thus initiated lasted until the 19th after which a slow improvement took place, with the result that by the 27th rainfall had again become general and abundant.

A notable feature of the last four days was the occurrence of heavy downpours of rain in Bengal in connection with a small low pressure area. Thus Burdwan recorded a total of 16·78″, and Jessore of 15·55″ on the 28th and 29th.

Notwithstanding the prevalence of an almost complete "break" in the rains from the 8th to the 19th, the month's aggregate precipitation over the whole Indian land area was equal to the normal. An excess occurred in Upper Burma, northeast India, the Punjab East and North, Kashmir, the North-West Frontier Province, Rajputana West, Central India West, Mysore and Madras and a defect elsewhere. The region driest by percentage comparison with the normal was defined by Sind, Baluchistan and the Punjab Southwest, which obtained only one-fifth of their normal supply. Eastern Bengal, Bengal and Madras Southeast and Madras Deccan, on the other hand, received almost double the normal quantity.

The defect was thus almost confined to the region served by the Arabian Sea current.

Snowfall.

15. I. and II.—AFGHANISTAN AND THE NORTH-WEST FRONTIER PROVINCE.

No reports have been received.

III.—KASHMIR.

A feeble snowstorm occurred on the ranges above Dras on the last day of the month.

IV.—PUNJAB.

Kilba.—There were slight falls on the surrounding hills down to about 10,000 feet on the 30th and 31st. The accumulations of snow on the higher passes were of about the usual depth.

V.—UNITED PROVINCES.

Almora.—There were frequent falls in Malla Darma, and occasional falls in Byans and Chaudans. The total quantity was reported to measure 11¼ feet on the Nuwe pass, 1½ feet on the Binkaru pass, and 3 feet in Byans.

The snow line came down to about half a mile from the region of perpetual snows.

TABLE 14.

SUMMARY.

16. (*a*) No information is available for the Afghan mountains. It is probable, however, that no snowfall occurred there during the month.

(*b*) Scarcely any snow fell in Kashmir and perhaps also in the Punjab Himalayas. At the end of the month the higher passes near Kilba were covered with snow to about the usual depth, while the passes and peaks near Kargil in Kashmir were quite bare.

(*c*) Several snowstorms occurred on the higher passes and peaks in Almora. The total fall was probably not excessive. The accumulations were on the whole about normal.

Crop report.

17. *Burma.*—Winter rice was being transplanted in Lower Burma, and cultivation was also progressing favourably in Upper Burma. Crop prospects were generally good, but considerable damage had been caused by floods in the Sittang valley.

Eastern Bengal and Assam.—Autumn rice and jute were being harvested and winter rice transplanted. The condition of tea had improved, and the prospects of standing crops generally were fair.

Bengal.—Autumn paddy had suffered in Sambalpur from want of moisture, but in some other parts of the province crops had been damaged by excessive rain. Prospects were on the whole fair.

United Provinces.—Agricultural operations were well advanced, and early autumn crops were being harvested. The condition of agricultural stock was generally good.

Punjab.—Some injury had been caused by westerly winds and want of rain, but towards the close of the month crop prospects greatly improved and the condition of standing crops was generally good.

North-West Frontier Province.—The outturn of extra spring crops was average. The condition of standing crops was on the whole fairly good in Peshawar and average elsewhere.

Jammu and Kashmir.—The condition of standing crops was fair to good. Fodder was sufficient.

Rajputana.—Standing crops were good but more rain was needed in Jodhpur. Insects had caused some damage. Pasturage and fodder were ample.

Central India.—Autumn crops were being weeded and land prepared for spring crops. More rain was needed in Gwalior.

Central Provinces.—Weeding, transplantation and preparation of land for spring crops were in progress. Opportune rainfall occurred towards the end of the month and was of great benefit to the standing crops.

Bombay.—Autumn crops were being sown. Some damage to the standing crops was reported from insufficient moisture, rats and insects, but otherwise the crops were in good condition.

Hyderabad.—The standing autumn and early rice crops were generally in fair to good condition. Land was being prepared for spring crops.

Mysore.—Standing crops were in good condition and prospects of the season were good.

Coorg.—Rice was being transplanted. Water and fodder supplies were sufficient.

Madras.—Crops were being harvested in parts of the presidency, mostly with fair to normal outturn. Standing crops were in fair to good condition, and prospects were generally good.

HEM RAJ.

Table A.—Abstract of observations taken at 10 hrs. and 16 hrs. at 34 stations in India, etc., in August, 1909.

† Departures from old normals. ‡ Mean of 30 days. * Uncorrected for scale error. § Mean of 29 days.

Table B.—Abstract of observations taken at 8 hrs., at 240 stations in India, etc., in August, 1909.

(1) Provincial means.

(2) Data of stations.

(1) Provincial means based on the material in Table B (2) except that the statement of rainfall depends on the complete data of about 2,700 stations.

	Pressure departure from normal.	Temperature of air.								Wind.		Hygrometry.				Cloud.		Rainfall.		
		Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Absolute range during month.	Departure of velocity from normal.	Departure of steadiness from normal.	Mean humidity.	Departure from normal.	Mean vapour tension.	Departure from normal.	Mean cloud amount.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.

NOTE.—The barometric readings are not reduced to sea-level in the cases of hill or plate

B.

in India, etc., in August, 1909.

Wind direction. Number of winds from: Calm.	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind velocity. Mean velocity, miles per hour.	Normal.	Departure from normal.	Wind steadiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st May to 31st August 1909.	Normal rainfall for period, 1st May to 31st August.	Departure from normal of period, 1st May to 31st August 1909.	Heaviest rainfall during month.	Station.

(a) Indeterminate.

* Uncorrected for scale error.

stations, the elevations of which exceed 3,200 feet.

Ta

(2) *Abstract of observations taken at 8 hrs., at 240 stati*

Number of subdivisions.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

N.B.—Elevations in italics indicate barometrical determinations.

NOTE.—The barometric readings are not reduced to sea-level, in the cases of hill or plateau stations, the elevations of which exceed 3,200 feet.

* Mean of 20 days. † Mean of 30 days. ‡ Mean of 29 days.

B—*continued.*

in India, etc., in August, 1909—continued.

Wind direction. Number of winds from Calm.	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind velocity. Mean velocity miles per hour.	Normal.	Departure from normal.	Wind steadiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st May to 31st August 1909.	Normal rainfall for period, 1st May to 31st August.	Departure from normal of period, 1st May to 31st August 1909.	Heaviest rainfall during month.	Station.

§ Mean of 28 days.

‖ Uncorrected for scale error.

Tab

(2) *Abstract of observations taken at 8 hrs., at 240 statio*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

Ta

(2) *Abstract of observations taken at 8 hrs., at 240 stat*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

stations, the elevations of which exceed 3,000 feet.

¶ Mean of 6 days.

(a) Uncorrected for scale error.

Tal

(2) *Abstract of observations taken at 8 hrs., at 240 stati*

Number of subdivisions.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure, reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

(2) *Abstract of observations taken at 8 hrs., at 240 stat*

Number of sub-division.	Station.	Elevation of barometer above sea-level in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

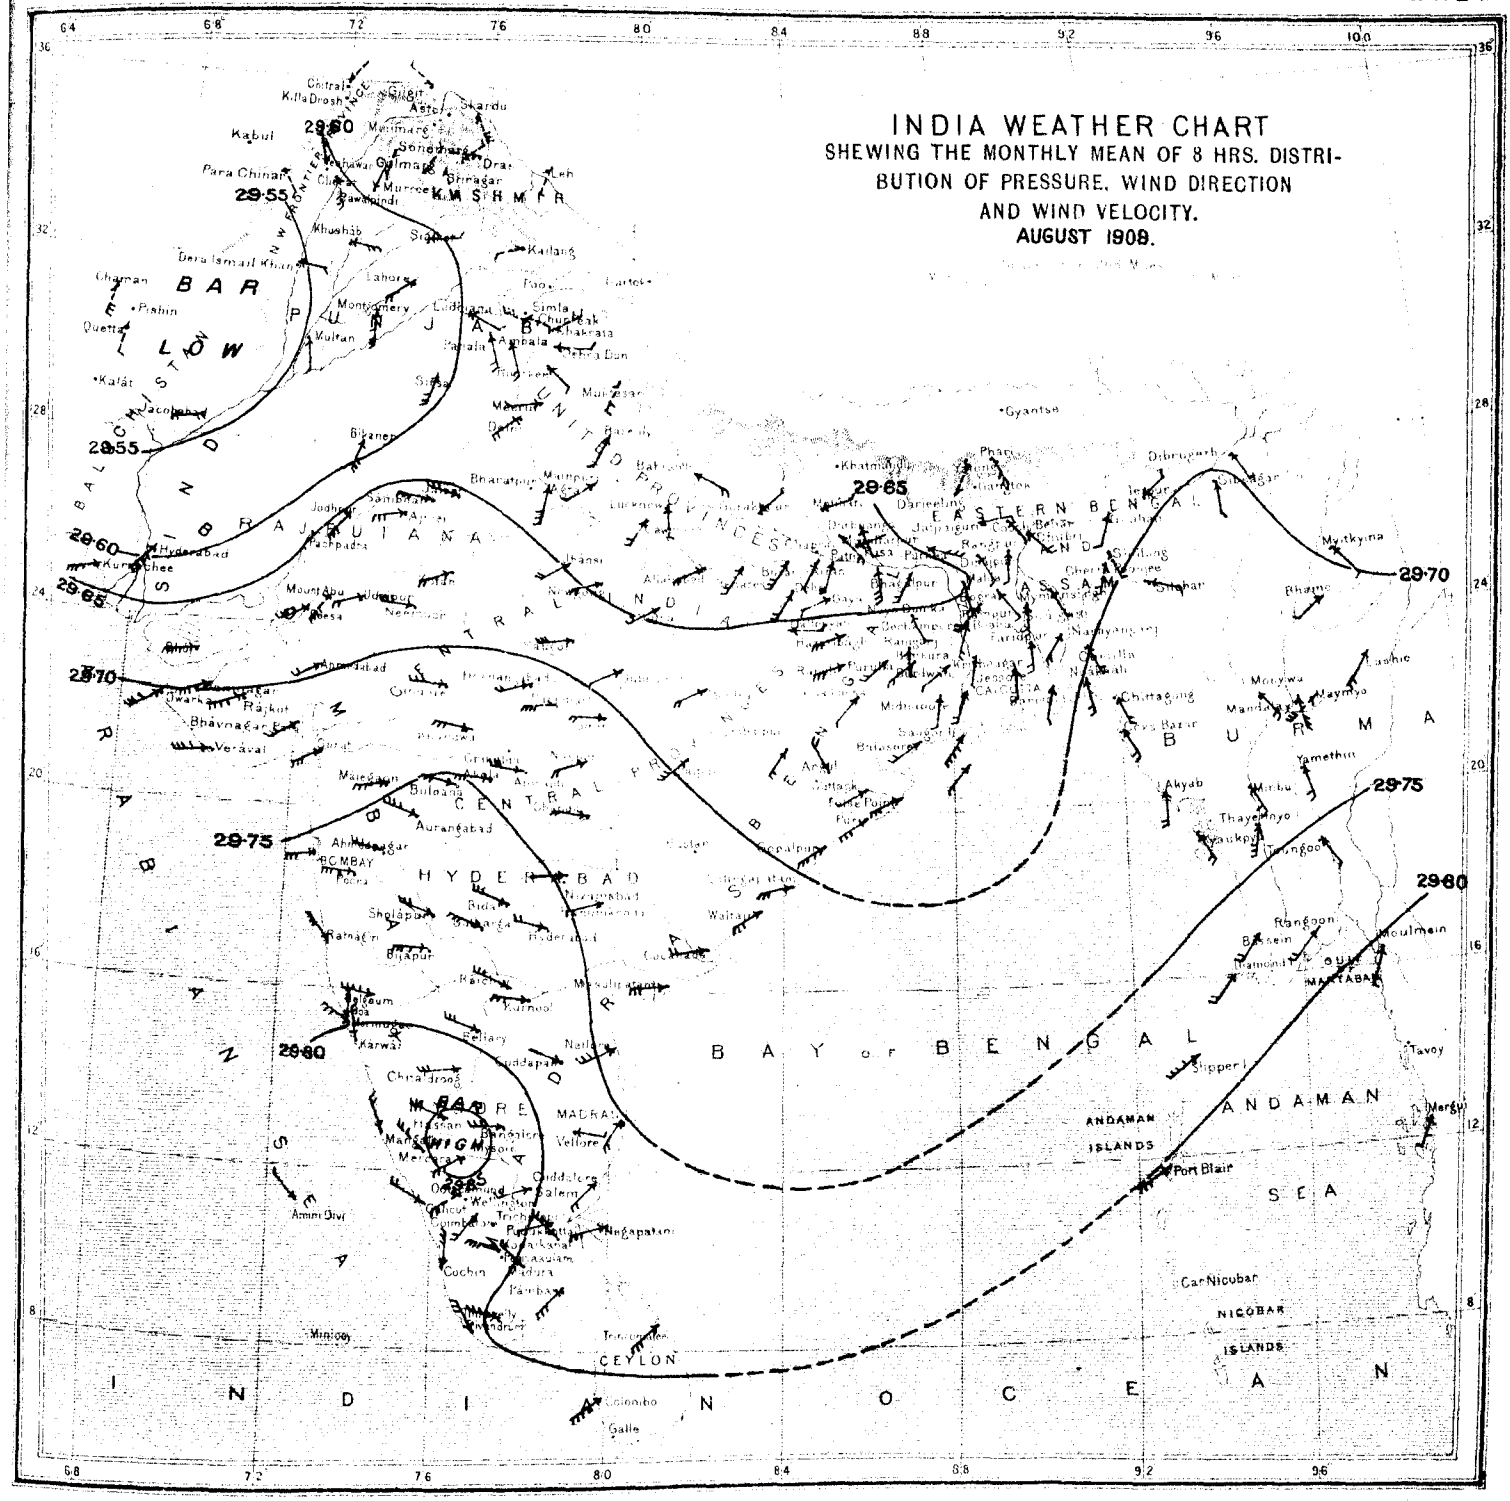
§§ Wind variable 2.



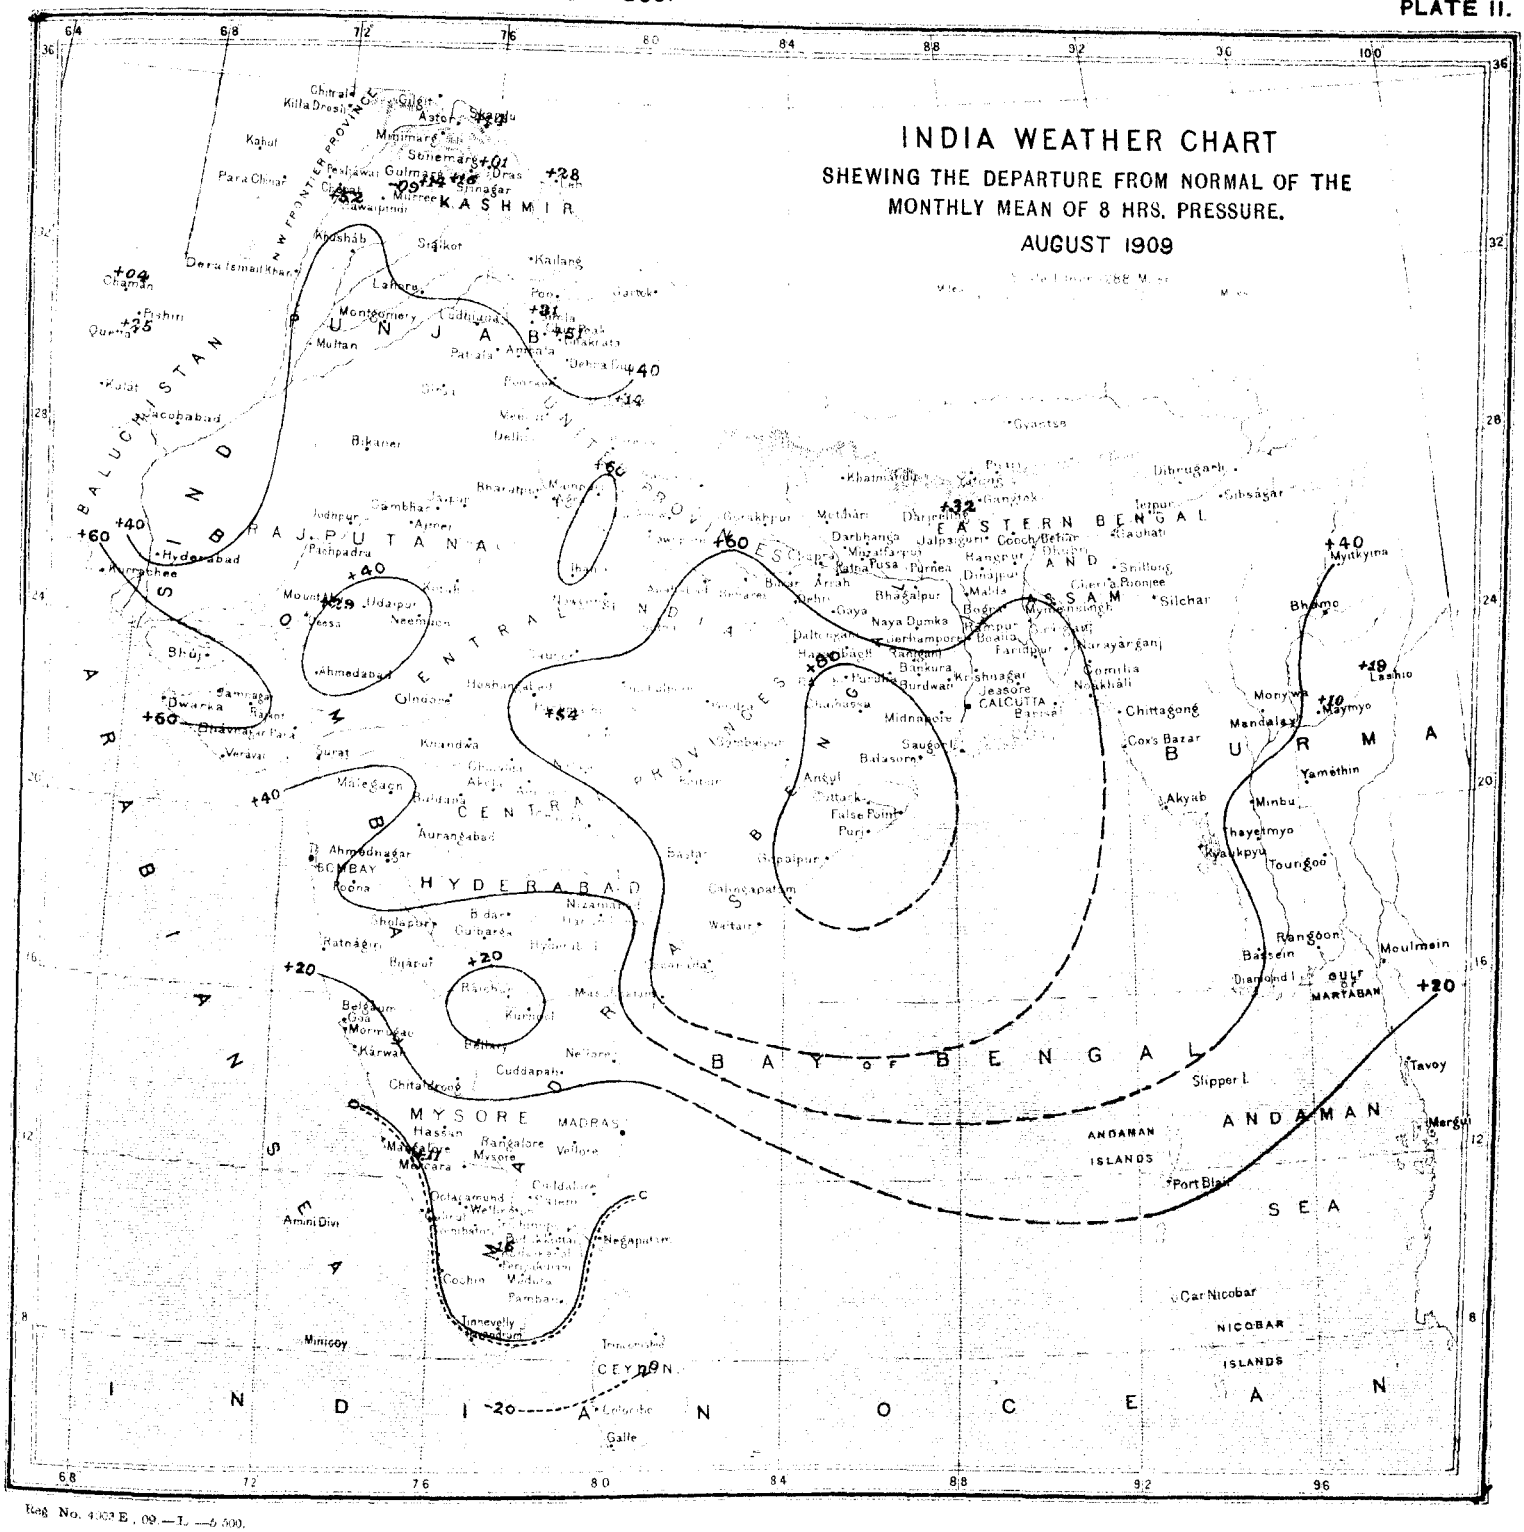
Reg. No. 4103 E., 09—L.—5,500.

LITHO. BY S.S.M.

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	...	one feather added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,	...	two feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	...	three ,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,, ,,
	over 20 ,, ,, ,,	...	five ,, ,, ,, ,, ,,



Reg. No. 4303 E. 09.—L.—6 500.

The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020′ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

CALCUTTA, SEPTEMBER, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of September, 1909, is based on observations taken daily at 8 hrs. at 238 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 34 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by Provincial Governments up to the date of the preparation of the review have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of September, 1909.

2. The rain-producing capacity of the monsoon currents, considered over the whole month, was lower than usual, the total quantity of precipitation recorded over the country falling short of the normal by 5 per cent. The defect was not universal, for the month's usual aggregate measurements were exceeded over the greater part of northwest India as well as in Chota Nagpur, Berar, the Konkan, the Madras Deccan and Lower Burma. The region of largest defect was defined by Central India and the Central Provinces which obtained only two-thirds of the usual fall, while the excess was most pronounced in Baluchistan, Kashmir, Rajputana West and the Punjab, all of which received more than double their normal quantity. As in 1908 the final cessation of the monsoon rains in upper India occurred about the 11th, which is within a few days of the normal date.

There was about the usual amount of vapour in the air in almost all parts of the country, but owing to the defect of temperature the relative humidity exceeded the normal value in Rajputana, the Punjab and Kashmir. Cloud amount was conspicuously high over the greater part of the plains of northwest India, and in decided defect in Eastern Bengal and Assam, and the United Provinces.

Mean temperature was from 2° to 5° lower than usual in Rajputana, the Punjab, Kashmir and Baluchistan, in the first three areas owing chiefly to a defect of day temperature; elsewhere the monthly conditions were very nearly normal.

Pressure was low on the average of the whole month by ·015″, the defect being most marked in Burma and Eastern Bengal and Assam.

In the hills the departures of pressure were similar to those in the plains below and vertical gradients were thus closely coincident with the normal values.

Solar, seismic and magnetic disturbances.

KODAIKANAL.

3. *Solar observations.*—The weather was on the whole favourable for solar observations. There were only two days on which no observations were possible, two other days on which prominences could not be observed, and three others on which the prominence record was imperfect.

Sunspots.—During the month there was a very remarkable outburst of solar activity such as is unusual at this epoch of the spot cycle. It was shown not so much in the number as in the size and persistence of the spot groups. Thirteen new groups of spots were recorded during the month with a daily average of 2·4 and an average life for each spot of 6·7 days. The northern and southern spots were nearly equal in number and the former had a higher mean latitude than the latter; but while all the northern spots were comparatively small and unimportant most of the southern groups were large and active. The latitude distribution was as follows :—

TABLE 1.

	1°—10°	11°—20°	Extreme latitudes.	Mean latitude.
North . . .	2	1	4°, 16°	11°.3
South . . .	3	4	1°, 16°	8°.9

Spot groups Nos. 1714, 1715, 1719, 1725 and 1726 contained large spots. Groups Nos. 1725 and 1726 were returns of 1714 and 1715. No. 1714 was first seen on the 5th as a train of small spots at about four days' march from the east limb. On the 6th a similar group No. 1715 formed in nearly the same longitude, but nearer the equator. A day after crossing the central meridian both the groups developed suddenly into trains of large spots. When they reached the west limb No. 1715 was associated with a metallic and highly eruptive prominence. Spot No. 1719 came round the east limb on the 18th as quite a large spot. There was nothing striking about it till the 28th, except that C was observed reversed on and near it on several days, but on the 28th at or a little before $10^h\ 30^m$ there was a sudden and very violent outburst of bright gases on and near the spot. The whole thing was seen as a bright prominence projected on the sun's disc, though the observing conditions were poor. The prominence showed displacements of the hydrogen lines but the direction and amount of the motion indicated, as well as the form of the prominence, were rapidly changing. D_1, D_2, D_3 b_1, b_2, b_3, b_4 were bright on one of the umbræ of the spot and D_3 was very dark on the whole prominence between the spot and the west limb. A Ca flocculus photograph taken at $10^h\ 39^m$ showed the spot region to be completely filled with bright matter and the spot itself was not visible. It is not possible to give the exact time of the outburst as it was cloudy from $10^h\ 3^m$ to $10^h\ 30^m$ but it was not visible at 10^h. The 29th was cloudy and on the 30th when the spot was at the west limb a highly eruptive prominence was observed near it.

Prominences.—Forty-six large, three metallic, and seven eruptive prominences were recorded during the month. The tallest and one of the most eruptive of them was photographed at latitude —15° west on the 23rd and reached a height of 330″. On several days in the month the sun's limb was covered with numerous little jets, the total number of separate prominences rising to nearly 50 a day. Another feature noticed on seven days of the month was the continuation of prominences inside the disc on flocculi photographs.

Magnetic disturbances.—A "very great" magne disturbance was recorded on the 25th and 26th, a "grea one on the 30th and "moderate" ones on the 3rd, 4 21st, and 22nd. On the 22nd spot No. 1719 was 21° e of the central meridian and on the 25th 18° west of it. the 28th, about the time of the outburst near this sp referred to above, there was a sudden and large rise in horizontal force record; the time of the rise was 10^h I. S. T. and there is no reasonable doubt that the so outburst and the magnetic disturbance were directly c nected with each other.

C. MICHIE SMITH,

Direct

Kodaikanal and Madras Observatori

BOMBAY OBSERVATORY.

Alibag magnetic record for August 1909.

4. During the month of August 1909 the traces show 10 calm days, 19 days of small and 2 days of moderate d turbance.

The days of the month selected as quiet for purposes of the Magnetic Survey of India are the 6th, 15 16th, 17th and the 24th.

The mean observed absolute values of the seve magnetic elements, reduced to the mean monthly tabulatio of the magnetograms, as also the ranges and the summ ranges of the horizontal force and the declination for t month are as follow :—

Easterly declination . . .	0° 59′ 57″	
Horizontal force . . .	0·36851	C. G. S.
Vertical force . . .	0·16023	"
Inclination (calculated) . . .	23° 30′·0	
Inclination (observed) . . .	23° 29′·1	
Horizontal force range . . .	0·00041	C. G. S.
Horizontal force summed range .	0·00269	"
Declination range . . .	5′·2	
Declination summed range . .	21′·2	

(NOTE.—Summed range means sum without regard to signs of the 24 ordina of diurnal inequality.)

The following table represents the magnetic character each day during the month :—

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Charact

Solar radiation.—Measurements of the intensity of solar radiation in Simla by Angstrom's pyrheliometer were possible only towards the latter end of the month when the monsoon cloud had disappeared. Observations on four days only were taken, and showed a mean value at local noon of 1·41 gramme-calories per square centimeter per minute.

J. H. FIELD,

Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. *Solar observations.*—August and September reports not received.

Weather in the Indian monsoon region.

8. In the subequatorial region as represented by Zanzibar and the Seychelles pressure and air movement were fairly normal in character; rainfall was about 30 per cent. in excess at the former station and about 70 per cent. in defect at the latter.

Depressions and cyclonic storms.

9. Four depressions occurred in the course of the month but they were, with one exception, of no great barometric depth.

The first was formed by the deepening over the southwest of the Bay of a low pressure wave which appeared on the 1st in the extreme south, and thence advanced northwards over the peninsula and the adjacent seas during the next two days. By the morning of the 4th it had become definitely marked with a depth of about one-eighth of an inch. During the day it moved in a northwesterly direction and crossing the central Madras coast lay over the Nizam's Dominions at 8 hrs. of the 5th. It continued to travel in the same direction during the succeeding 24 hrs. and by the morning of the 6th had coalesced with an area of low pressure which was approaching Gujarat from the south. The resulting disturbance, which had a depth of about a sixth of an inch, subsequently advanced in a northeasterly direction towards the Simla-Mussoorie hills, which it reached in a greatly reduced form on the 10th. General and moderate to heavy rain was induced by its action in the peninsula, Gujarat, Rajputana and the Punjab.

The disturbance although of slight intensity was nevertheless remarkable, as being the only one on the September record which formed to the south of latitude 16°N.

The second depression, which was as diffuse and shallow as its predecessor, appeared on the 13th at the southern extremity of the trough which at that time stretched almost due north from the head of the Bay to the foot of the Sikkim and Nepal Himalayas. It travelled north-westwards to the neighbourhood of Benares during the next three days, and had disappeared by the morning of the 17th after having caused general rain, in places heavy, over northeast India, and light rain in the east of the United Provinces and of central India.

The third disturbance was the development of an area of deficient pressure which on the 17th and 18th covered the whole of northern India and Burma and was most marked in upper Burma. Slight development occurred on the 19th and by the morning of the 20th the depression, at the centre of which pressure was over a quarter of an inch in defect, had passed into Eastern Bengal and the north of the Bay. During the day it deepened still further, and on morning of the 21st its centre was crossing inland near Saugor Island and Balasore where pressure was three-tenths of an inch below the normal. The westerly move-

ment was maintained during the next two days and by 8 hrs. of the 23rd it had reached the west of the Central Provinces. It had however become very much reduced in intensity and it disappeared in the course of the next 36 hrs. Moderate to heavy rainfall occurred along its path.

The final depression of the series was formed on the 28th over Orissa and the adjacent portion of the Bay; from there it moved northwards into Bihar where it was very faintly shown on the 30th. It was throughout very feeble, and exercised no appreciable influence on the weather.

Pressure.

10. The mean pressure of the Indian land area as determined from the 8 hrs. observations was ·015″ below the normal. Since August, when the geographical mean was ·043″ in excess, there had thus occurred a rapid decrease relatively to the normal pressure conditions of the month. The defect was least and unimportant in upper and central India (about ·005″) and greatest in Burma and Eastern Bengal and Assam where it ranged between ·02″ and ·06″.

TABLE 8.

Mysore	—·010
Madras	—·014

The departures of pressure at the level of the hill stations in northern and central India were almost identical with those of the adjacent plains, and the vertical gradient was thus approximately normal in value. In southern India, on the other hand, the defect of pressure was considerably greater at the altitude of Kodaikanal than at the earth's surface, and the vertical gradient there was accordingly very steep.

Temperature.

11. The mean temperature conditions of the month were normal over the greater part of the country. In the north-west, however, Kashmir and the Punjab experienced appreciably lower day temperatures than usual, while in Baluchistan and the greater part of Rajputana both maximum and minimum temperatures were in defect.

Weather was continuously cooler than the normal in the Punjab, Rajputana and Kashmir during the first fortnight, and in Madras and Mysore during the first week,

but no large persistent departures from the ordinary conditions occurred during the second half of the month.

Winds.

12. (*a*) The air motion was on the whole neither as steady nor as strong as usual in northern India and Bombay. Over the rest of the peninsula on the other hand the steadiness was in general high, and the velocity about the average. In Burma the air motion was normal in both these respects.

(*b*) The direction of the air motion departed considerably from the average, being unusually southerly at the great majority of stations in Burma and northeast India, and more westerly than usual in Rajputana and the Central Provinces. The direction was conspicuously abnormal along the foot of the Himalayas from Gorakhpur to Roorkee where the easterly element was altogether suppressed, thus indicating the entire exclusion of the Bay current from the region lying to the west of Bihar. At Darjeeling the prevailing direction was north-by-west instead of east: this would indicate the existence of a dry air current at that elevation.

Humidity and cloud.

13. Over the region of low temperature in the northwest the percentage of saturation was somewhat higher than usual, but in the rest of the country there was nothing anomalous in the hygrometric conditions of the month.

The proportion of cloud was decidedly low in Eastern Bengal and Assam, the United Provinces and Hyderabad and above the normal in upper and central India.

Rainfall.

14. During the first nine or ten days the activity of the monsoon was displayed chiefly in the peninsula and north-west India, but during the rest of the month the effect of the depressions was to confine the rainfall to Burma, north-east India, and the central parts of the country. Little or no rain fell in upper India during this period, and the monsoon rains of 1909 may therefore be regarded to have terminated there on the 11th, only five days before the normal date.

The total monthly amounts failed to reach their normal values in most parts of the country, the only districts which received appreciably more than their ordinary share being Lower Burma, Chota Nagpur, the Punjab, Kashmir, Baluchistan, Rajputana West, Berar and the Madras Deccan.

The deficiency was however less than 25 per cent. except in the case of Assam (27 per cent.), Central India (32 per cent.), the Central Provinces West and East (35 per cent.).

On the mean of the whole country there resulted a defect of 0·37 or 5 per cent.

Snowfall.

15. I AND II.—AFGHANISTAN AND THE NORTH-WEST FRONTIER PROVINCE.

No information is available regarding these regions.

III.—KASHMIR.

Snow fell on the Afferwata mountains on the 2nd and 25th; on the higher ranges near Srinagar on the 9th; on the Olding, Sadpara, Kawardos and Nar ranges in Skardu on the 2nd, 3rd and 5th to 11th; on the ranges and passes near Dras on the 1st, 2nd, 8th to 10th, 12th and 24th, and on the Nakthula and Chaskar (near Kargil) on the 11th and 25th. The fall was heavy on the Skardu hills where it amounted to about 3 feet. The Deosai pass was blocked for a fortnight.

IV.—PUNJAB.

Kilba.—Feeble snowstorms occurred on ten days on the hills near Kilba down to a level of about 10,500 feet. At the end of the month the depth of snow accumulations on the Brua and Shatul passes was considered as normal.

V.—UNITED PROVINCES.

Almora.—Snow fell on several days on the Nuwe and Binkaru passes and in Byans, and on one day in Malla Johar. The total fall measured 12½ feet on the Nuwe pass, 3 feet in Byans, about 2 feet on the Binkaru pass, one foot on the Untadhura and six inches on the Ralamdhura. The snowline descended to a distance of about a mile from the perpetual snows.

The statement below gives the reported and normal depths of snow accumulations on the well known peaks and passes :—

TABLE 16.

Name of pass.	Depth of accumulation at the end of the month.	
	Reported.	Normal.
Nuwe Pass	26 feet	20 feet
Lipulekh "	3½ "	4½ "
Lampia "	3½ "	5 "
Binkaru "	12 "	12½ "

SUMMARY.

16. The information available is very limited but suffices to indicate that there were several falls of snow in Almora, the Simla Hills and parts of Kashmir. The total quantity received on some of the ranges near Skardu in Kashmir was heavy for the time of year, and had the effect of blocking the Deosai pass for a fortnight.

The accumulations in the Simla and Almora hills were apparently of about the average thickness.

Crop report.

17. *Burma.*—The transplanting of winter rice was completed. In upper Burma cultivation of miscellaneous winter crops was in progress. Standing crops were generally in good condition and prospects were satisfactory.

Eastern Bengal and Assam.—The prospects of sugarcane, tea and winter rice were good, but cotton did not promise well. The harvesting of jute was almost completed.

Bengal.—Sugarcane and winter paddy were doing well, but some damage had been done to the latter crop in flooded tracts.

United Provinces.—Rain was urgently needed in Bahraich, Farrukhabad and parts of Kheri, but elsewhere the prospects of standing crops were most favourable. Autumn crops were being harvested and gram was being sown.

Punjab.—Standing crops in parts of the Mianwali district were suffering for want of rain, autumn crops were being harvested, and the picking of cotton had commenced in some districts.

North-West Frontier Province.—Rain was needed in the Peshawar district. The condition of standing crops was generally average. Spring crops were being sown.

Jammu and Kashmir.—The condition of crops was generally fair, but floods in Kashmir had caused some damage. Land was being prepared for spring crops.

Rajputana.—Standing crops were good and prospects hopeful. Harvesting of autumn crops had commenced and land was being prepared for spring crops.

Central India.—Autumn crops were being harvested and the sowing of spring crops had commenced in parts of Baghelkhand and Bhopawar.

Central Provinces.—The condition of autumn crops was generally good. Early crops were being harvested and linseed and gram were being sown; more rain was required in Seoni, Chhindwara, Nagpur and Chhattisgarh.

Bombay.—The autumn harvest was progressing generally and lands were being prepared for spring crops. In some parts crops were suffering from insufficient moisture and in other parts some damage had been caused by rats and insects.

Hyderabad.—The autumn crop was generally fair, but had been damaged in some parts by excessive rain and in others had suffered from want of moisture. Early rice was being weeded and lands were being prepared for spring crops.

Mysore.—Standing crops were in good condition, and the prospects of the season were favourable.

Coorg.—Cardamom was being picked. Water and fodder for cattle were sufficient.

Madras.—Standing crops were in fair to good condition and harvests continued in parts with a fair to normal outturn. Prospects were generally good.

HEM RAJ.

§ „ „ 11 „
‖ „ „ 7 „

N.B.—Elevations in italics indicate barometrical determinations.

NOTE—The barometric readings are not reduced to sea-level, in the cases of hill or plateau stations, the elevations of which exceed 3,000 feet.

...tions in India, etc., in September, 1909.

Wind direction. Number of winds from N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind velocity. Mean velocity, miles per hour.	Normal.	Departure from normal.	Wind steadiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st May to 30th September 1909.	Normal rainfall for period, 1st May to 30th September.	Departure from normal of period, 1st May to 30th September, 1909.	Heaviest rainfall during month.	Station.

in India, etc., in September, 1909—continued.

Wind direction. Number of winds from Calm. (25)	N. (26)	N.E. (27)	E. (28)	S.E. (29)	S. (30)	S.W. (31)	W. (32)	N.W. (33)	Resultant direction. (34)	Normal direction. (35)	Wind velocity. Mean velocity, miles per hour. (36)	Normal. (37)	Departure from normal. (38)	Wind steadiness. Actual percentage. (39)	Departure from normal. (40)	Hygrometry, 8 hrs. Mean humidity at 8 hrs. (41)	Departure from normal. (42)	Mean vapour tension at 8 hrs. in inches of mercury. (43)	Departure from normal in inches of mercury. (44)	Cloud. Mean cloud amount at 8 hrs. (45)	Departure from normal. (46)	Rainfall. Number of rainy days. (47)	Normal number of rainy days. (48)	Departure from normal. (49)	Rainfall of month. (50)	Normal rainfall of month. (51)	Departure from normal. (52)	Total rainfall from 1st May to 30th September, 1909. (53)	Normal rainfall for period, 1st May to 30th September. (54)	Departure from normal of period, 1st May to 30th September 1909. (55)	Heaviest rainfall during month. (56)	STATION. (57)

Tab

(2) *Abstract of observations taken at 8 hrs. at 238 statio*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

tions, the elevations of which exceed 3,200 feet. * Uncorrected for scale error. ‖ Mean of 27 days.

Tabl

(2) *Abstract of observations taken at 8 hrs. at 238 station*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

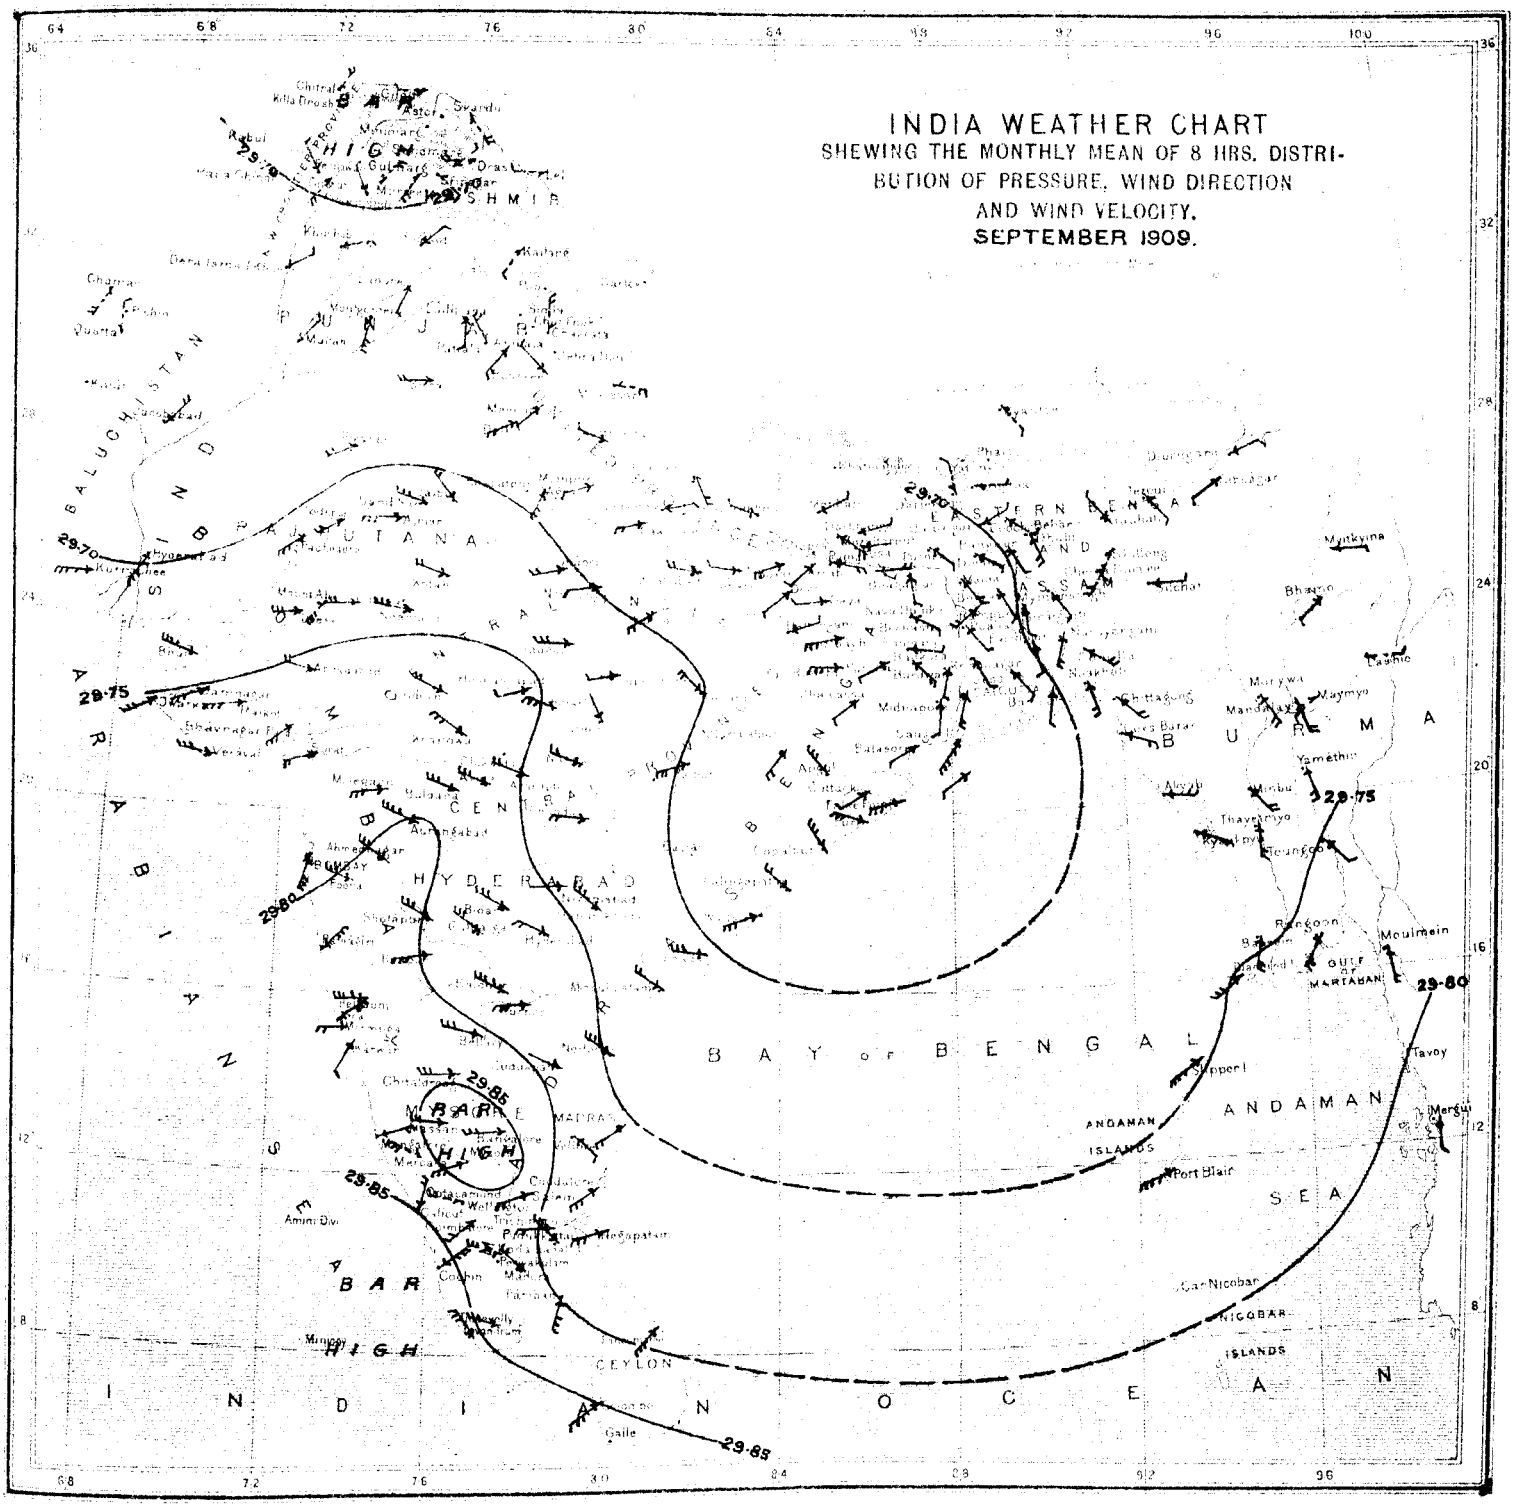
† Observations of 20 days.

(*a*) Indeterminate.

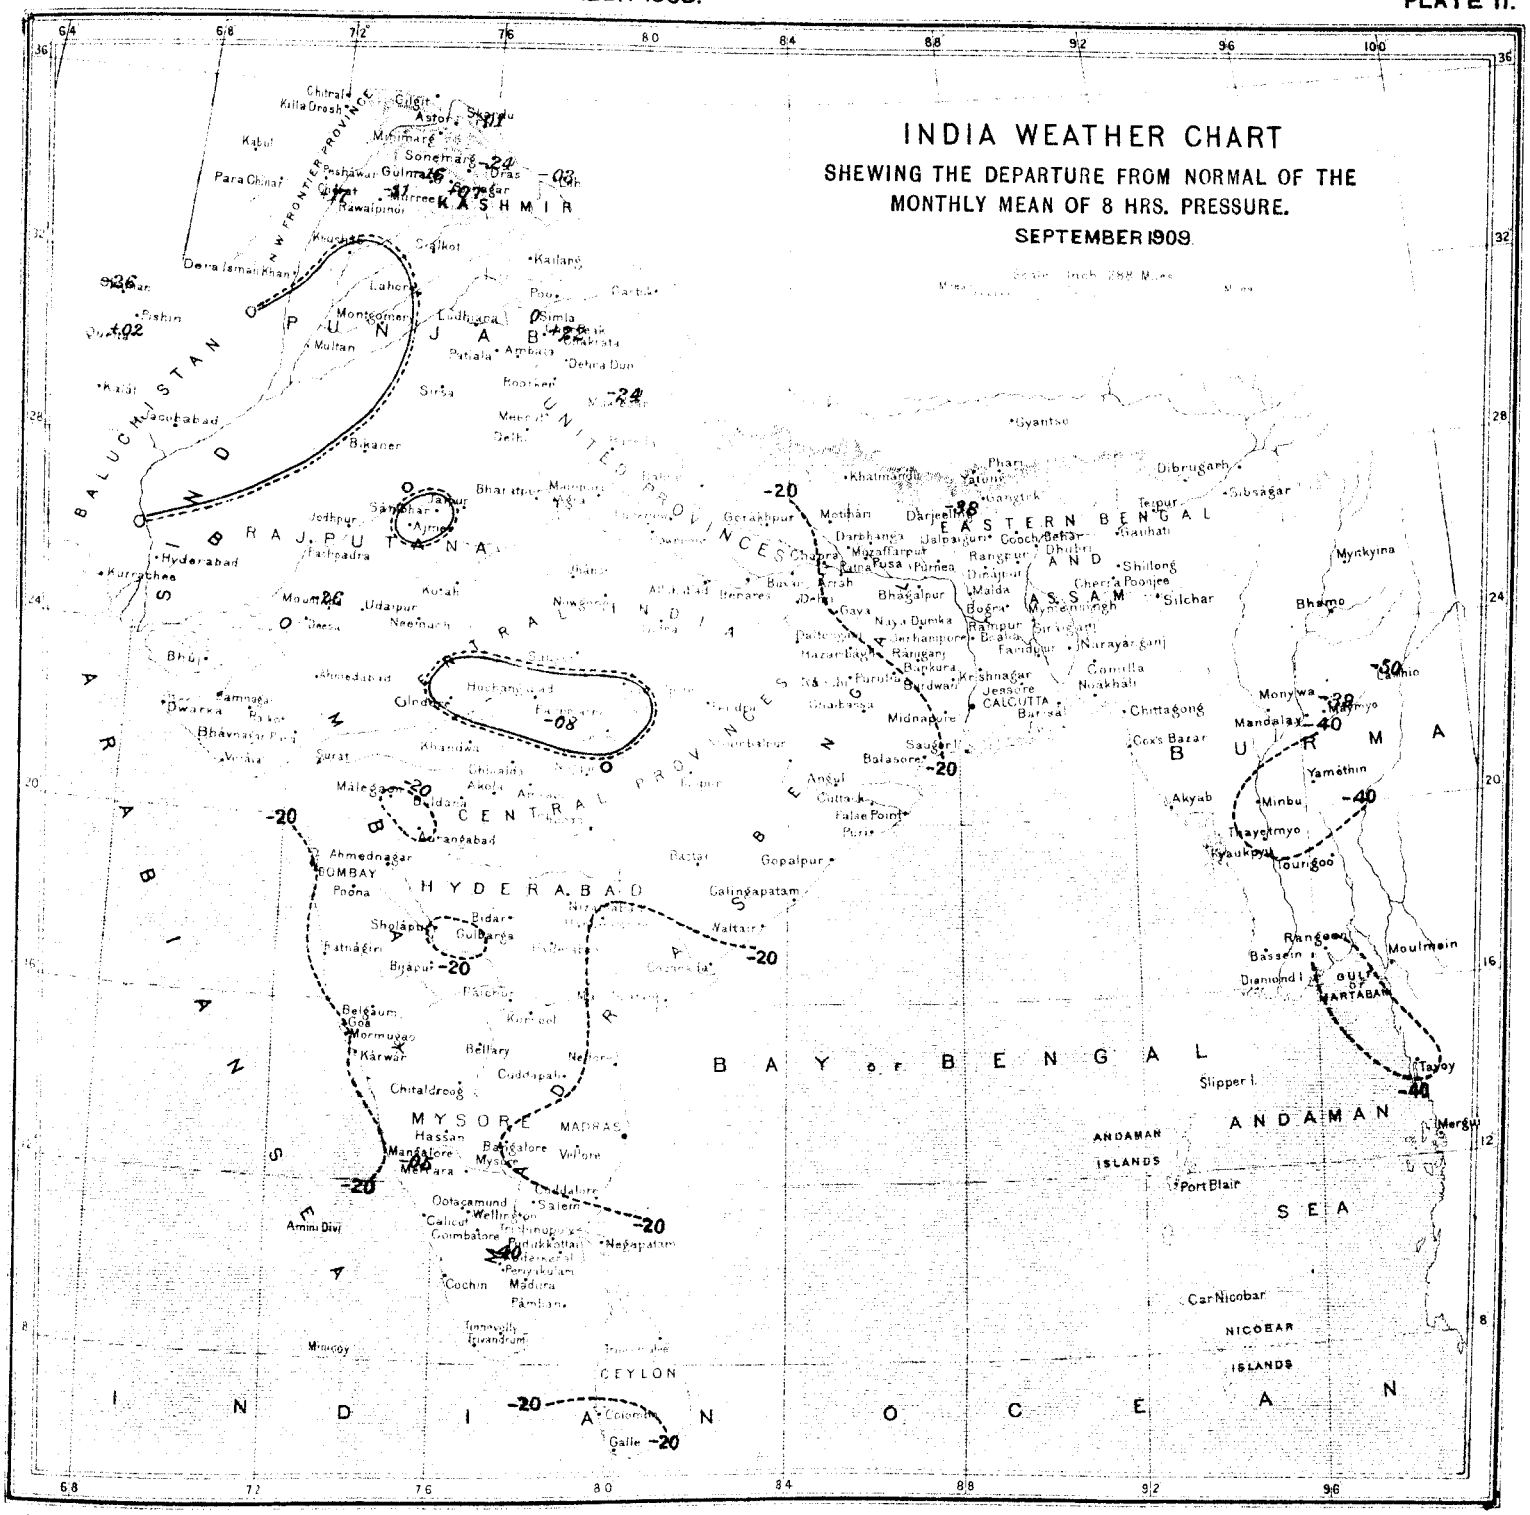


Reg. No. 4903 E. (9—1—5 500).

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	...	one feather added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,	...	two feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	...	three ,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,, ,,
	over 20 ,, ,, ,,	...	five ,, ,, ,, ,, ,,



Reg. No. 4903 E. 09 — L. — 5 500.

LITHO. BY S.B.M.

The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020″ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, OCTOBER, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of October, 1909, is based on observations taken daily at 8 hrs. at 240 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 34 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the Provincial Governments up to the date of the preparation of the review, have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of October, 1909.

2. October 1909, like the corresponding months of the three previous years, was drier than usual over a large part of the country. After retreating from the Gangetic plain and the Central Provinces in the fourth week of September the monsoon current was directed chiefly to the Bay Islands, Burma and Eastern Bengal which areas accordingly received abundant rainfall in October at the expense of the peninsula. The defect in the latter region was universal and was most marked in the north coast of Madras where the autumnal rains which ordinarily set in during the second week had not begun by the end of the month. In north-western and central India the precipitation was even less than usual.

As might be expected from the shortness of the rainfall, humidity and the amount of cloud were low in most districts. A significant exception occurred however in the case of northwest India, where in the plains in spite of the prevalence of unusually dry weather humidity, both relative and absolute, was in excess.

The mean monthly temperature agreed with the normal within $1\frac{1}{2}^{\circ}$ in the case of all the larger divisions. Day and night temperatures also differed but little from the average at the great majority of stations, although the former was inclined to be above and the latter below the mean.

Pressure was below normal on the average of the whole country by ·022″, the defect being insignificant in the peninsula and large in amount over Burma and the greater part of northern India—a type of distribution unfavourable to the proper occurrence of autumnal rains.

Two storms of great severity visited the Bay during the second half of the month and in conjunction with the unfavourable pressure conditions noted above were instrumental in depriving the peninsula of its normal share of rainfall.

Solar, seismic and magnetic disturbances.

KODAIKANAL.

3. *Solar Observations.*—There was one day on which solar observations were not possible, one other on which prominences could not be observed, and seven others on which the prominence record was imperfect.

Sunspots.—The great solar activity noticed in the previous month continued in October. There were 23 new spot groups (the largest number since March) with a daily average of 4·5, and an average life for each spot of 6·3 days. This is quite an unusual development of spots for the present epoch of the spot cycle. Ten groups contained

fairly large spots; two of them, Nos. 1744 and 1748, were returns of Nos. 1726 and 1731. Northern groups slightly exceeded the southern in number; but only two among the northern contained large spots. The latitude distribution was as follows:—

TABLE 1.

	1° - 10°	11° - 20°	Extreme latitudes.	Mean latitude.
North . .	11	2	2°, 12°	7°·7
South . .	6	4	3°, 16°	9°·1

Though there were 10 groups containing large spots, few of them call for any special remarks. Groups Nos. 1729 and 1734 (*a*) contained only small spots, till they reached about 25° west of the central meridian, at which position they developed into trains of large spots. No. 1731 was a very long group extending over 15° of longitude. It was found to drift steadily westwards, and its position in longitude differed very much when it returned as No. 1748. It underwent much change of form from day to day, and bright C and dark D_3 were frequently observed in it. On October 15, when the group was within 2 days of the west limb, C was brightly reversed over an extensive area on, and near the easternmost spot, and it was seen as a changing prominence projected on the sun's disc. It was first observed at 9 h. 13 m. and there was nothing left of it by 10 h. 30 m.

Prominences.—Thirty-seven large, 2 metallic, and 2 eruptive prominences were recorded during the month. The tallest of them was 240″ in height.

Magnetic disturbances.—"Moderate" magnetic disturbances were recorded on the 2nd, 18th to 20th, and 23rd to 26th. The disturbance of the 18th to 20th was a return after one rotation of the very great disturbance of September 25. Spot groups Nos. 1725 and 1726 were 25° east of the central meridian on the 2nd; and on the 19th group No. 1738 was 19° to 26° east of the central meridian.

C. MICHIE SMITH,
Director,
Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY (ALIBAG).

Magnetic Observations for September, 1909.

4. During the month of September, 1909, the traces showed 10 calm days, 15 days of small, 2 days of moderate, 2 days of great, and 1 day of very great disturbance which occurred on the 25th.

The horizontal force trace of the 24th September shows that it was a quiet day, and these conditions prevail practically up to 13 h. of the 25th, when a slight disturbance with increasing force just begins to be indicated. The large disturbance seems to overlap the former and appears to have commenced at 16·5 h., with a sudden large increase of force equal to about 100γ. After this the curve, for about one hour, shows large irregular movements, but without any marked decrease in the value of force. At 17·4 h., however, a sudden drop occurs and the trace passes beyond the paper at about 18·5 h. The time hence of the attainment of the maximum of the disturbance in the horizontal force, indicating the least value of force is lost. The indications of the vertical force show that it must have been attained at about 18·5 h., while the maximum effect in the declination curve shows that it must have occurred at 19·5 h. A deflector was subsequently employed to get the trace back on the paper which showed roughly that the total fall of force must have exceeded 800γ. After 22 h. the disturbance appears to have spent its force and conditions of restitutions supervening, the curve rises rapidly till 5 A.M. and slowly thereafter for the next 24 hours. Normal conditions were not reached till after the 28th.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 11th, 12th, 13th, 18th, and 20th.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and the declination for the month are as follow:—

Easterly declination . . .	1° 0′ 3″
Horizontal force	0·36823 C. G. S. unit.
Vertical force	0·16026 ,, ,,
Dip (calculated) . . .	23° 31′·2.
Dip (observed)	23° 29′·4.
Horizontal force range . .	0·00064 C. G. S. unit.
Horizontal force summed range .	0·00397 ,, ,,
Declination range . . .	4′·4.
Declination summed range . .	18′·5.

NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequality.]

The following table represents the magnetic character of each day during the month:

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Character.
1	S	8	S	15	S	22	S

N. A. F. MOOS,
Director,
Bombay and Alibag Observatories.

BOMBAY OBSERVATORY.

Note on the Alibag magnetic record.

During the month of October, 1909, the traces showed 12 calm days, 16 days of small, 2 days of moderate and 1 day of great disturbance.

The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 5th, 14th, 15th, 17th and 28th.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and the declination for the month are as follow :—

Easterly declination	1° 0′ 3″.
Horizontal force	0·36808′ C. G. S. unit.
Vertical force	0·16027 " "
Dip (calculated)	23° 31′·8.
Dip (observed)	23° 31′·7.
Horizontal force range	0·00046 C. G. S. unit.
Horizontal force summed range	0·00262 " "
Declination range	2′·3.
Declination summed range	8′·4.

(NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurnal inequalty.)

The followng table represents the magnetic character of each day during the month :—

TABLE 4.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Character.

Solar Radiations.—The following figures give the intensity of solar radiation, as measured at Simla by Angstrom's pyrheliometer. The values are corrected to local noon, and expressed in grammecalories per square centimetre per minute:—

Maximum	1·51
Minimum	1·35
Mean	1·44
Number of days of observation . . .	18

J. PATTERSON,
Imperial Meteorologist.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

7. *Solar observations.*—Observations not received.

Weather in the Indian monsoon region.

8. Barometric pressure was well above the normal both at Zanzibar and the Seychelles; this is an indication that the actions giving rise to the low pressure conditions in India did not extend southwards to equatorial regions. Wind direction was nearly normal at the Seychelles and much more easterly than usual at Zanzibar: the velocity was much in excess at the former and in defect at the latter station.

The rainfall of the month was above normal, the excess being as much as 85 per cent. at Zanzibar.

Thus the general conditions in the equatorial belt as represented by the two stations were, if anything, detrimental to the Indian rainfall.

Depressions and cyclonic storms.

9. Weather was unusually disturbed over the Bay where two storms of great intensity occurred during the second half of the month. The marine information received up to the present respecting this period is however very scanty, and the account of their origin, character and course given below is therefore to some extent doubtful.

Storm of the 14th to the 19th.—This storm appears to have advanced into the Bay from the Gulf of Siam on the

14th. It lay over the Andaman Sea on the morning of the 15th, to the west of the coast between Diamond Island and Akyab on the 16th and over the north of the Bay on the 17th. It had thus travelled over a distance of about 600 miles in two days or at an average rate of 13 miles an hour.

The S.S. *Malda* proceeding to Chittagong from Calcutta was involved in the northern semi-circle of the storm on the morning of the 17th. She experienced violent squalls and tremendous seas, and a barometric pressure more than three-quarters of an inch below the normal. The Light vessels *Comet*, *Hesperus* and *Luna* also experienced winds of great violence (force 10-12) in the western quadrant, thus showing that the storm was one of dangerous character at this stage.

The centre passed over the Sandheads in the afternoon and had reached Faridpur by 8 hrs. of the 18th: the passage over land had as usual weakened the storm very considerably, pressure at the centre having increased by probably about half an inch. It continued to travel in a northerly direction during the succeeding 24 hours and on the morning of the 19th was situated over Mymensingh and the adjoining districts. It had become reduced still further and disappeared almost entirely during the day.

The rainfall produced by the storm over the land was by no means remarkable but the violent winds associated with it inflicted much injury on life and property in Eastern Bengal, particularly in the Backergunge district where 172 human beings and over 15,000 cattle are reported to have been lost.

Storm of the 22nd to the 29th.—This storm was the severest that has occurred in October in the Bay of Bengal for at least fifteen years. It was generated in the Andaman Sea on the 22nd and after intensifying rapidly on the 23rd while travelling northwestwards, it became on the 24th a dangerous cyclone with an inner area of hurricane wind and probably a calm centre.

The S.S. *Shahzada* and *Bharat* ran into it on the 24th; the former was involved in the inner area for upwards of 24 hours. Both experienced a perfect hurricane, while the barometric records of the *Shahzada* make it not improbable that on the early morning of the 25th pressure at the centre was at least an inch below normal. No large change occurred in its line of advance till the morning of the 26th when owing to some unknown circumstance it became westerly and the cyclone, travelling much faster than hitherto, struck the north Madras coast near and to the north of Gopalpur about midnight on the 26th.

According to the Gopalpur observatory records there was a fall in pressure of a little over an inch between midnight and 3 hrs. on the 27th and an equally rapid rise during the succeeding three hours. The barometer there stood lowest a little after 3 hrs and was no less than 1·4″ in defect of the normal value. Winds of destructive violence were felt at the station and caused much damage to property, the loss in the Gopalpur district alone being estimated at about 15 lacs of rupees.

The rotary motion was, as is usual in the case of storms of low elevation, broken up speedily by the high ground to the west of Gopalpur, so that by 8 hrs. (that is only five hours after its passage inland) the defect at the centre had diminished to less than two-tenths of an inch.

The residual depression continued advancing westwards and by the morning of the 29th had reached the east of the Arabian Sea. It was however no longer of any significance.

The storm was of a very unusual character and in some important features resembled that of November, 1886.

Pressure.

10. Barometric pressure at 8 hrs. was in somewhat larger defect than in September, the geographical mean of the whole month being ·022″ below the corresponding normal value. The low pressures contributing most largely to this result were recorded in Burma and northeast India —areas affected to the greatest extent by the two storms of the month.

The deficit was moderately large also in the United Provinces, the Punjab and the North-West Frontier Province, but over the regions lying to the south the departures were much less marked and in the region comprised by Gujarat, Lower Sind and the Konkan, on the other hand, a small excess was recorded.

The defect in the plains of northern India extended upwards in only a modified degree and was replaced by a trifling excess at the level of Leh. Opposite conditions obtained in southern India.

Temperature.

11. Days were warmer than usual in the United Provinces, Chota Nagpur, Eastern Bengal and Assam, Central India and the greater part of the peninsula, but more especially in south Hyderabad, the Madras Deccan and the coast districts from Negapatam to Gopalpur, where maximum temperature was from 2° to 4½° above normal. Night temperature on the other hand ruled below the average everywhere in the plains except locally in the Indus valley, Burma, Assam and Eastern Bengal and the coast districts of Madras. The defect averaged 3° in amount in the Central Provinces where it was greatest.

The distinction between the departures of day and night temperature was caused mainly by the abnormalities of cloud; the only notable exception occurred in the Indus valley and here the excess of night temperature was a result of high humidity, the effect of this on heat radiation being similar to that of cloud.

Of the temperature changes which occurred during the course of the month the most noteworthy was a very large fall in Kashmir from the 14th to the 17th: it was induced by heavy snowfall and was subsequently transmitted to the plains of north-west and central India by an outflow of air.

Winds.

12. (*a*) The air movement was on the whole even feebler than usual during October, particularly in the peninsula. The steadiness was however decidedly greater than the normal except in Burma and Eastern Bengal and Assam.

(*b*) The mean direction of air motion was westerly to north-westerly over the Central Provinces and the Bombay Deccan, where ordinarily winds from between north and east are prevalent; elsewhere the deviations from the normal were very irregular and of no significance.

Humidity and cloud.

13. The amount of aqueous vapour present in the air was in defect of the normal throughout the country with the exception of Burma, Eastern Bengal and Assam, the south of the peninsula and the plains of northwest India. The defect was most marked in the Deccan and the northern coast districts of Madras—the area of exceedingly dry weather. Departures of relative humidity were generally parallel with those of absolute humidity.

Skies were more clouded than usual in Burma, Ceylon and at some stations in the peninsula, but over the rest of the plains the cloud amount was more or less below normal and this condition was present also in the hill districts of north-western and central India. The region of maximum defect was defined by the coast stations from Madras to Gopalpur and thus coincided roughly with that of lightest rainfall.

Rainfall.

14. October is essentially a month of transition from the conditions characteristic of the summer to those of the autumnal rains. The retreat of the monsoon which usually begins in upper India about the middle of September is continued during the next three weeks, and about October 10 the current in the Bay is expected to bring the first burst of what are known as the retreating monsoon rains to the coast districts of Madras. During the present October the pressure and other conditions were such as usually tend to deflect the moist current from its proper course and to concentrate its activity over Burma and Eastern Bengal. The abnormal set of the Bay current to regions constituting the eastern margin of its usual field was strengthened still further by the two storms which occurred during the month. As a result the month's aggregate rainfall measurements were considerably short of the normal in all parts of the peninsula but more especially in the Madras Coast North which obtained only an inch in place of the usual seven inches, while the Bay Islands, Burma and Eastern Bengal received total amounts much in excess of the normal. Over north-western and central India conditions were even more settled than is ordinarily the case in October.

There was also a marked defect in Chota Nagpur, Bihar and the east of the United Provinces which usually receive moderate falls during the first half of the month.

Snowfall.

I AND II.—AFGHANISTAN AND THE NORTH-WEST FRONTIER PROVINCE.

15. No reports have been received.

III.—KASHMIR.

(*a*) *Dras.*—There were snowfalls from the 13th to the 16th and again on the 22nd and 23rd. The quantity received at Dras itself was small, not exceeding 3 inches altogether, but it was said that about 2 feet of snow fell on the Zoji-la.

(*b*) *Sonemarg.*—A total fall of about 3 feet occurred in the grounds of the observatory and about 7 or 8 feet was reported on the Zoji-la.

(*c*) *Gulmarg.*—There were in all three falls on the surrounding mountains, while in the valley itself sleet occurred on the 14th and 15th.

(*d*) *Srinagar.*—Snow fell on the higher mountains on the 14th, 15th and 16th. The fall of the 16th was heavy and extended unusually low.

(*e*) *Kargil.*—Snowstorms of feeble intensity occurred on the Nakthula, Barula and Darket passes on the 14th, 15th, 16th and 23rd.

(*f*) *Leh.*—On the 17th there was a fall of snow on all the heights beyond the Indus as well as on the Kardong pass north of Leh. In the latter locality it extended down to the level of Gonpa, a village situated at the foot of the pass.

IV.—PUNJAB.

(*a*) *Kailang.*—There was a fall of 4½ inches on the 16th and 17th.

(*b*) *Kilba.*—Snowstorms occurred on the surrounding hills on the 6th, 14th, 15th and 16th. The snowline was at 9,000 feet on the last three dates. The storm of the 14th is said to have extended over a large area. The amount of each fall on the higher passes was estimated at 2 to 2½ feet. It however melted away fast, so that at the close of the month all the higher passes in the district were open.

V.—UNITED PROVINCES.

(*1*) *Garhwal.*—Snow fell on the 15th and 23rd, but the falls were not heavy and were confined to the higher peaks in the north.

(*2*) *Almora.*—There were occasional snow storms, chiefly during the first half of the month. The total quantity received was estimated at 7¾ feet on the Nuwe pass, 4⅓ feet in Byans, 2¾ feet on the Binkaru pass and a few inches on the Untadhura and the Ralamdhura. In Malla Darma the snowline came down to a distance of about 7 miles from the perpetual snows.

TABLE. 18.

NAME OF PASS.	DEPTH OF ACCUMULATION AT THE END OF THE MONTH.	
	Reported.	Normal.
Nuwe Pass	28 feet	23 feet.
Binkaru ,, ...	16 ,,	12 ,,
Lipulekh ,, ...	4 ,,	3 ,,
Lampia ,, ...	4 ,,	4½ ,,

Temperature was lower than usual.

SUMMARY.

16. The available data indicate that there was an extensive, and in places heavy, fall of snow on the higher ranges of the North-West Himalayas from the 13th to the 16th. As little or no snowfall occurred at other times, it is almost certain that the snowfall conditions of the month as a whole were not of an unusual character. The accumulations at the end of the month in Kumaon, for which alone actual data are forthcoming, were on the whole greater than usual.

Crop report.

17. *Burma.*—The cultivation of miscellaneous winter crops was in progress and the transplanting of winter rice was practically completed. Standing crops were generally in good condition.

Eastern Bengal and Assam.—The prospects of winter rice, tea and pulses were good and of cotton fair. Storms caused some damage to crops in Faridpur, Noakhali and the Chittagong Hill Tracts.

Bengal.—Sowings of spring crops were being made. Much damage was caused by the storm which crossed the coast on the 17th to all crops in Nadia, Murshidabad, Jessore and Khulna; in the last district cattle also suffered considerably.

United Provinces.—Autumn crops were being harvested and spring crops sown. The outturn of harvested crops and the condition of standing crops were good.

Punjab.—The condition of standing crops was generally good to average, except in parts of Shahpur and Mianwali where rain was badly wanted. Spring crops were being sown and autumn crops harvested.

Jammu and Kashmir.—Autumn crops in Kashmir had been damaged by floods and were below the average. In Jammu standing crops were in fair condition.

Rajputana.—Ploughing and sowing for spring crops were in progress. Standing crops and prospects were good.

Central India.—Crops had sustained some damage from insects. Harvesting of autumn and sowing of spring crops were in progress.

Central Provinces.—Spring crops were being sown and the germination was good except in Chanda. Cotton was being picked and autumn crops harvested.

Bombay.—Standing crops had suffered from insufficient moisture in Kolhapur and had been damaged by rats and insects in some other parts. Autumn crops were being harvested. Agricultural stock was generally sufficient and in good condition.

Hyderabad.—Autumn crops were generally fair to good and were being harvested. Spring sowings were in progress. More rain was needed in many parts.

Mysore.—Standing crops were generally in good condition, but more rain was wanted. Prospects of the season were good.

Coorg.—Rice was in good condition. Cardamom was being picked; water and fodder were sufficient.

Madras.—Crops were being harvested with fair to normal outturn. Standing crops were fair to good, but some required more rain and some in Ganjam had been damaged by the cyclonic storm which crossed the coast on the 26th. Prospects were generally good.

HEM RAJ.

TABLE A.—Abstract of observations taken at 10 hrs. and 16 hrs. at 34 stations in India, etc., in October, 1909.

tions, the elevations of which exceed 3,200 feet. (a) Indeterminate. † Uncorrected for scale error.

Tal

(2) *Abstract of observations taken at 8 hrs. at 2*

Number of sub-division.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

ions, the elevations of which exceed 3,200 feet.

† Mean of 30 days.

(a) Indeterminate.

* *Uncorrected for scale error.*

Tab

(2) Abstract of observations taken at 8 hrs. at 24

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

r plateau stations, the elevations of which exceed 3,200 feet.

‖ Mean of 26 days.
¶ „ „ 28 „

* Uncorrected for scale error.

(a) Indeterminate.

Ta

(2) *Abstract of observations taken at 8 hrs. at*

Number of subdivision.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

Tal

(2) *Abstract of observations taken at 8 hrs. at*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range

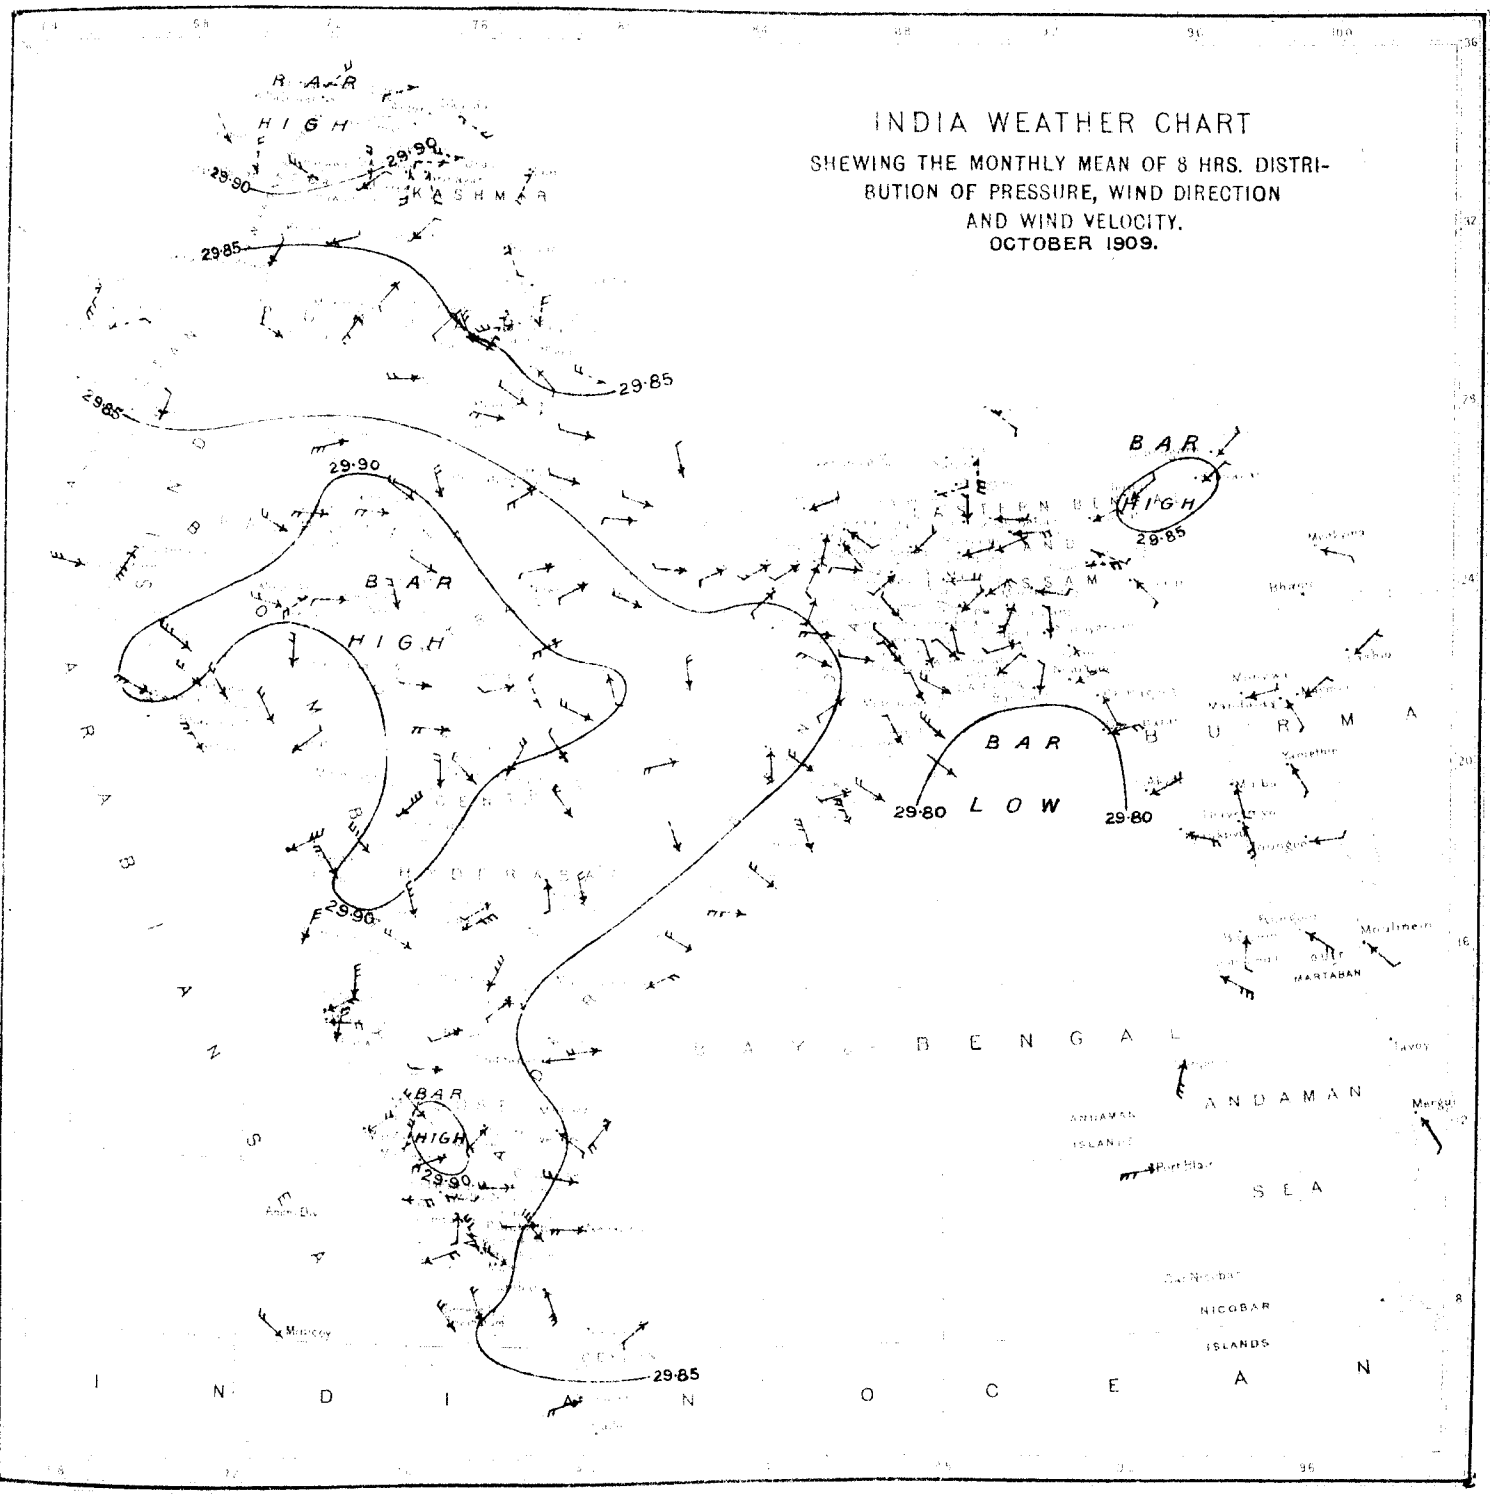
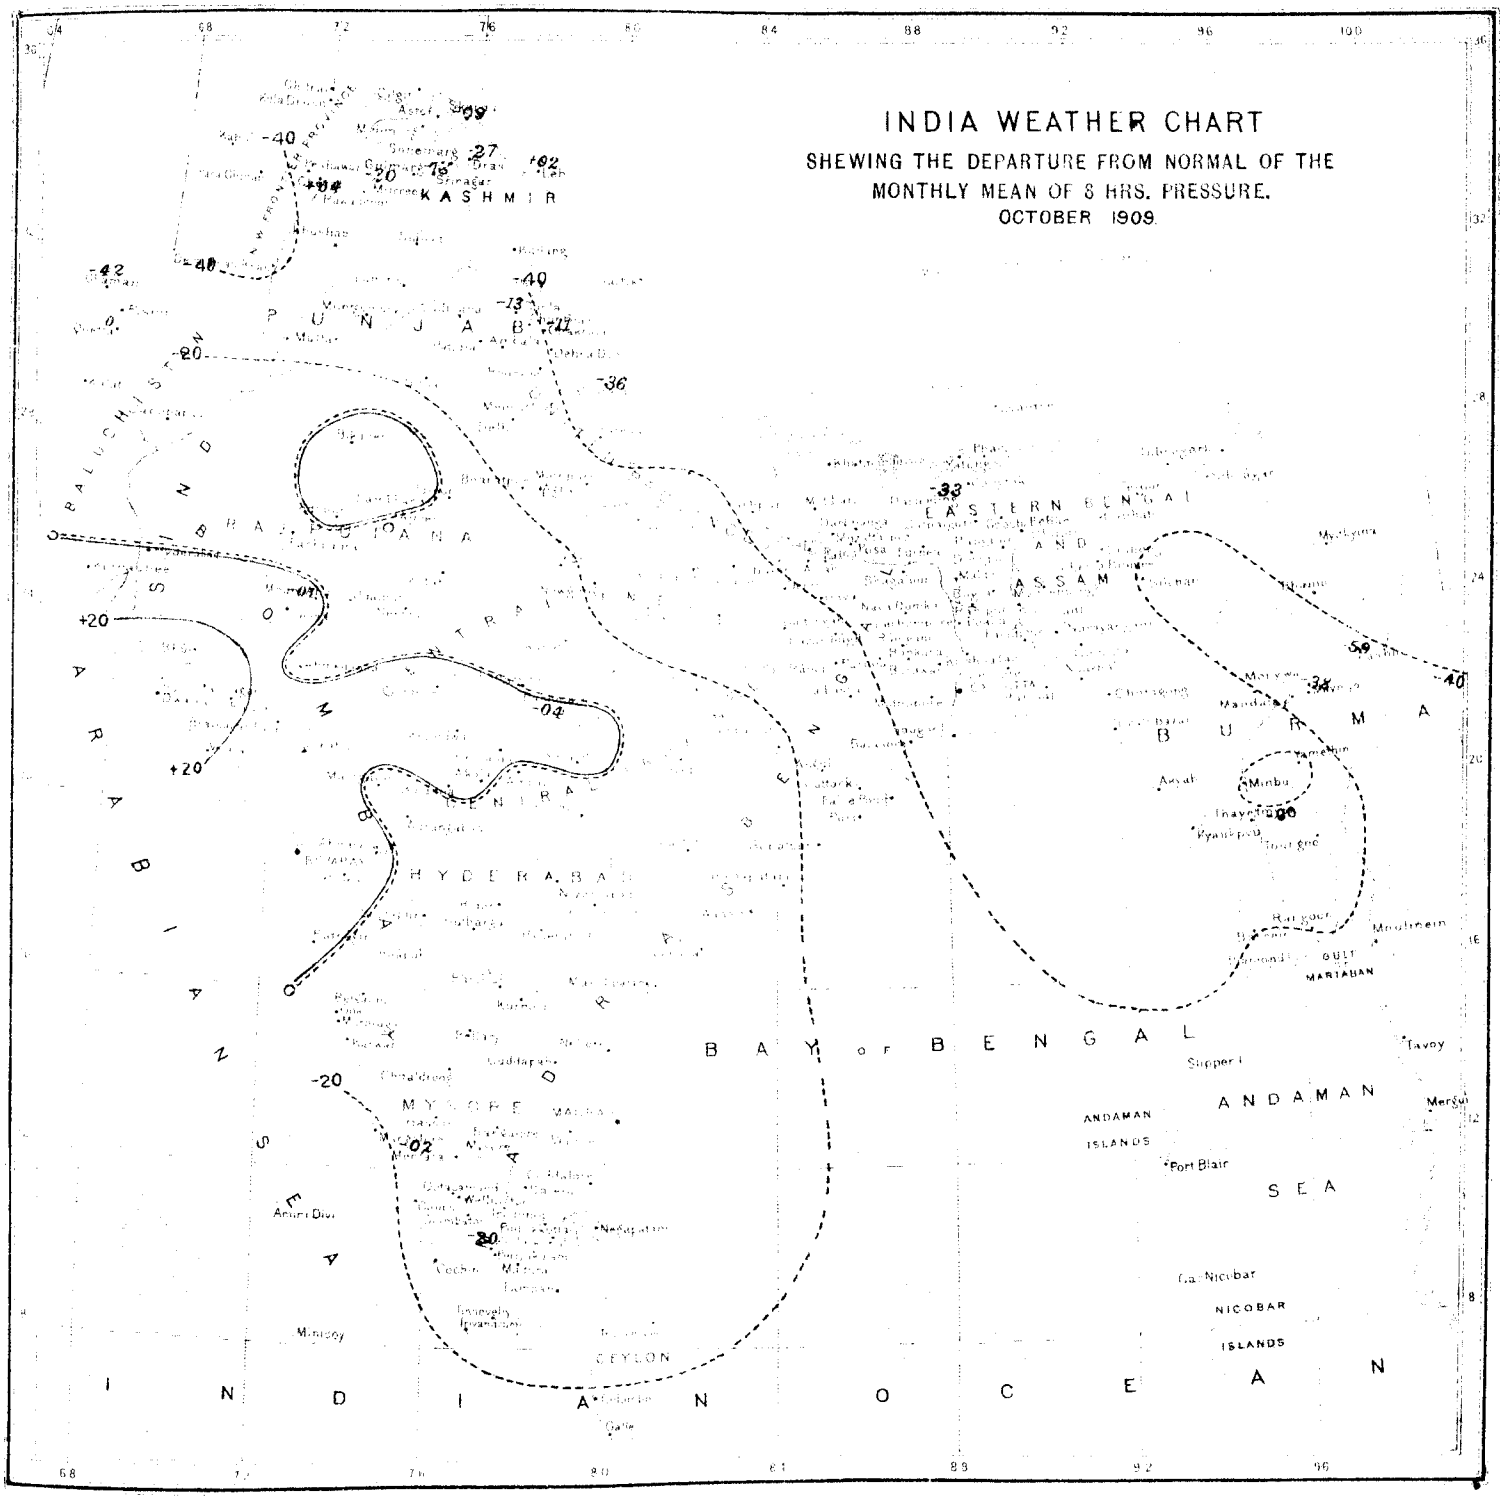
‡ Mean of 23 days.



The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	...	one feather added to the wind arrow.
,, ,,	2 to 5 ,, ,, ,,	...	two feathers ,, ,, ,, ,,
,, ,,	5 to 10 ,, ,, ,,	...	three ,, ,, ,, ,, ,,
,, ,,	10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,, ,,
	over 20 ,, ,, ,,	...	five ,, ,, ,, ,, ,,



The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020 or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, NOVEMBER, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of November, 1909, is based on observations taken daily at 8 hrs. at 236 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 35 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the Provincial Governments up to the date of the preparation of the review, have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of November, 1909.

2. The barometer stood lower than usual in almost all parts of the country; the defect was insignificant in the peninsula and moderate to large in Burma and northern India. The scheme of pressure distribution was thus similar to that of October and, as in that month, the associated rainfall was unusually heavy over the greater part of the region constituting the eastern margin of the usual field of the Bay current, and was scanty and in marked defect over practically the whole of the peninsula. Scarcely any rain fell over Hyderabad, the Madras Coast North and Madras Deccan which under ordinary conditions receive moderate to heavy falls. The month was rainless also over the whole of northern India excepting East Bengal; the deficiency was however not important as the normal there averages only a third of an inch.

There was more aqueous vapour present in the air than usual except in the Deccan, central India and west Bengal, but the percentage of saturation was low also in Eastern Bengal and Assam. Skies were much clouded in Burma, Ceylon, the west coast districts from Goa to Trivandrum, and at a few places on the east coast of the peninsula, but elsewhere the quantity of cloud was less than usual. Temperature was high, both by day and night over northern India, particularly in the Punjab, the North-West Frontier Province and Sind where it was from 2° to 5° above normal. In the peninsula generally the days were slightly warmer than usual, and nights in Madras and Mysore only; while over the Central Provinces and the northern districts of the Deccan nights were cooler than is normally the case. In the mountain region bordering upper India temperature was in decided excess by day and about normal by night.

Only one disturbance passed into India from the Bay. Although feeble it was the cause of moderately heavy rain in Burma, which in some places proved injurious to crops.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar observations.*—There were two days on which there were no solar observations, one other on which prominences were not observed, and six others on which the prominence record was imperfect.

Sunspots.—The increased spot activity which has been

noticed for the previous two months has continued and there was a still further increase in November. Thirty-one new groups were recorded during the month (the largest number since April, 1908) with a daily average of 4·9. Fourteen of them however were seen for only one day and the average life of a spot was only 4·8 days. Groups 1762, 1770 and 1776 were returns of 1738, 1744 and 1748, respectively. The latitude distribution was as follows:—

TABLE 1.

—	1°—10°.	11°—20°.	Extreme latitudes.	Mean latitude.
North	5	8	3°, 17°	10°·3
South	9	9	1°, 19°	9°·6

Five of the new groups Nos. 1762, 1766, 1769, 1770 and 1772 contained large spots. Number 1766 formed near the central meridian and soon developed large spots and showed disturbance in the C line. Number 1772 also formed on the visible disc and, after it crossed the central meridian, became a fine and active train of large spots.

Prominences.—Forty-five large, two metallic, and four eruptive prominences were recorded during the month. The tallest prominence recorded was a highly eruptive one observed at +13° East on the 30th. C was displaced and the amount and direction of the displacement, as well as the form of the prominence, underwent rapid changes. The maximum displacement corresponded to a velocity, towards the observer, of 200 miles a second and the maximum height observed was 360″. A lower but equally active and brighter prominence had been observed at the same position on the previous day. A curious feature about it was that, during one of the transformations it was undergoing, the main part of it consisted of a number of bright concentric arches.

On November 5, 68° of the eastern limb was covered by a continuous series of prominences.

Magnetic disturbances.—"Moderate" magnetic disturbances were recorded on the 27th, 28th and 30th. The large spot groups Nos. 1769, 1770 and 1772 were near the central meridian on the 27th, and on the 30th the highly eruptive prominence mentioned above was observed.

J. PATTERSON,
Imperial Meteorologist, Simla.

ROYAL ALFRED OBSERVATORY, MAURITIUS.

(*No information yet received for September, October and November. The following report relates to August, 1909, and is compiled from information communicated by the Director of the Observatory.*)

7. *Solar observations, August.*—Observations were taken on the 2nd, 3rd, 5th to 11th, 14th, 18th, 21st to 23rd and 25th to 31st except 27th. Groups of sunspots were seen throughout. They were numerous from 2nd to 6th and on the 14th and 18th and faculæ were seen on each day of observation.

Magnetic disturbances.

TABLE 5.

Day.	Time.	Disturbance.
3rd	1h. to 1½h.	Increase in H. F. (17): 4h. to 6h. wave in H.F. (+20): 8h. to 12h. wave in H. F. (−21).
5th	½h. to 1h.	Increase in H. F. (10): 11h. to 14h. wave in H. F. (−18).
7th	14h. to 18h.	Wave in H. F. (−18).
9th	7½h. to 9½h.	Decrease in H. F. (66): 21½h. to 22½h. wave in H. F. (+12).
10th	11h. to 18h.	Double wave in H. F. (+29 to −21).
11th	15h. to 17h.	Wave in H. F. (−12).
19th	3h. to 16h.	Two successive waves in H.F. (+50 and + 45).
20th	12h to 18h.	Double wave in H. F. (−18 to +12).
25th	2h. to 4h.	Wave in H. F. (+15).
26th		Accentuated diurnal variation in H. F. with small superposed fluctuations.
27th	7h. to 16h.	Three successive waves in H. F. (+16, +12 and + 20).
28th to 29th	21h. to 16h.	Small rapid fluctuations in H. F.
29th	6h. to 9½h.	Wave in declination (−50).
29th	14½h. to 18½h.	Wave in H. F. (−30); 22½h. to 30th ½h. wave in H. F. (+40); in declination (−38).
30th to 31st	13h. to 8h.	Wave in H. F. (−70), with superposed double wave from 20h. to 22h. (−20 to +18) and wave 30th 23½h. to 31st 1h. (+35): wave in declination 30th 13h. to 18h. (−37) and 20½h. to 28½h. (+28).
31st	13h. to 17h.	Wave in H. F. (+30) and 20h. to 22h. (+20).

Depressions and cyclonic storms.

9. Two disturbances occurred over the Bay, one from the 11th to the 16th and the other towards the end of the month. The former, according to the limited information received up to the present from ships, was generated on the 11th and 12th over the Andamans and the adjacent sea area, and thence travelled in a direction between west and north-east to Barisal and its neighbourhood, where it disappeared on the 16th. Its barometric depth wa small and the greatest strength of the winds due to it influence was equal to force 6 or 7.

The second disturbance was a well-formed storm. A its influence on the Indian weather did not becom appreciable before December, its history will be given i the review for that month.

Pressure.

10. The low pressure conditions which had characterised October continued with but slightly diminished intensity through November for which month the geographical mean of 8 hrs. pressure was ·018″ below the normal value. The local features of the pressure distribution in the plains were also the same in the two months, except that the slight defect shown in the extreme south in the chart for October had become replaced by an appreciable excess. In November, as in October, the defect was largest in northern India and parts of Burma and least in the peninsula — a type of distribution usually associated with a diversion of the monsoon current from west to the east of the Bay. It is noteworthy that in November the deficient pressures in the greater part of the plains of India accompanied high temperatures, and that both were most marked in the west of upper India. At the hill stations of Baluchistan, upper India and of the Central Provinces pressure was in excess of the normal and the vertical gradients were well below their normal value. The reverse was the case in southern India.

Temperature.

11. Except in Burma and the coast districts from Trivandrum to Ratnagiri where, owing to excess of cloud it was somewhat lower than usual, day temperature ruled above the normal throughout the Indian region. The excess ranged between 2° and 5° in most of the plains districts and between 2° and 7° at the great majority of the hill stations in northern and central India. The distribution of minimum temperature resembled that of humidity rather than that of day temperature. Nights were appreciably warmer than usual in Burma, the greater part of north-east India, the southern half of the peninsula, Sind, the North-West Frontier Province, the Punjab, the northeastern districts of Rajputana and the west of the United Provinces; elsewhere temperature during the night was low, more especially in Berar and the neighbouring districts where also the air was unusually dry.

Mean daily temperature was high over the greater part of the country. The monthly averages of day and night temperatures were however within 2° of the usual values except in northwest India excluding Gujarat, and at some stations in Madras and Bengal where excesses of 2° to 5° were recorded.

No large changes occurred from day to day.

Winds.

12. (*a*) The air movement was very abnormal in character in the Andamans where at Port Blair calms were recorded on eleven days, and winds, from between south and north-west on ten occasions. As in ordinary years the dominant winds are there from between north and east, and calms are but little known, the indication is that the monsoon was not only less vigorous but was directed to an unusual extent to the Burmese Peninsula. Down the Coromandel coast and also at Colombo the westerly element was more predominant than usual, but further north on the Circars coast this component was in defect. Elsewhere the anomalies were such as did not indicate any important diversion of the air currents.

(*b*) The rate of air motion was lower than usual over the greater part of the country, particularly in the North-West Frontier Province and Central India where it was barely half of the small normal value.

(*c*) Winds blew with more than their usual steadiness in Bengal, north-west India and Hyderabad, but were exceedingly unsteady in Mysore.

Humidity and cloud.

13. Humidities, both absolute and relative, were well above the normal over Burma, the plains of north-west India and the west coast of the peninsula, and the former also in northeast India. The maximum defect occurred over the Deccan and the largest excess over lower Sind. The increased dampness in north-west India appeared mainly in the lower stratum, for in Kashmir and Baluchistan the air was drier than usual in both respects.

There was more than the customary amount of cloud in Malabar, Ceylon and the greater part of Burma, but in all other places the skies were unusually clear. The defect was most conspicuous in the hill districts of Baluchistan and Kashmir, where it was equal to one-fourth of the whole sky expanse.

Rainfall.

14. As in October, the humid current over the Bay was, owing to peculiar distribution of pressure, diverted from the west to the east of the Bay. Accordingly the month's total rainfall measurements, while they surpassed the normal values in the Andamans, Burma and Eastern Bengal, were far short of the normal over nearly the whole of the peninsula and more especially in the Madras Coast North and the Madras Deccan which obtained only 8 per cent. of their usual supply.

Over northern India also, excepting the districts in the extreme east, the month was unusually dry. The quantity of precipitation received there under ordinary conditions is however less than half an inch.

Snowfall.

AND II.—AFGHANISTAN AND THE NORTH-WEST FRONTIER PROVINCE.

15. Snow to a depth of about six inches fell on the hills near Kabul and in the Khugiani country during the first week.

III.—KASHMIR.

No information has been received.

IV.—PUNJAB.

Kilba.—Weather was dry throughout.

TABLE 15.

NAME OF PASS.	DEPTH OF ACCUMULATION AT THE END OF THE MONTH.	
	Reported.	Normal.
Brua Pass	1½ feet	5 feet
Harang "	½ foot	¾ foot
Shatul "	2½ feet	4¾ feet

V.—UNITED PROVINCES.

(1) *Garhwal.*—There was a snowstorm on the higher ranges on the 11th; it was not however severe.

(2) *Almora.*—There were a few falls. The total quantity received during the month was estimated at 7½ feet on the Nuwe Pass, 3 feet on the Untadhura, and 2½ feet on the Ralamdhura and in Byans. The snowline came down to the level of the inhabited area. No information is available for Chandas.

TABLE 16.

NAME OF PASS.	DEPTH OF ACCUMULATION AT THE END OF THE MONTH.	
	Reported.	Normal.
Nuwe Pass	30 feet	19¾ feet
Lipu Lekh	4 "	4 "
Lampia	4 "	7½ "

Temperature was lower than usual.

SUMMARY.

16. The available information, although unusually scanty, suffices to indicate that the snowfall of the month in the mountain zone bordering upper India was if anything below the average.

Crop report.

17. *Burma.*—Heavy rain occurred in some parts causing injury to the standing crops. Keeping of autumn rice and cultivation of miscellaneous crops were proceeding normally.

Eastern Bengal and Assam.—Winter rice was being harvested and a good outturn was expected. The prospects of all crops were satisfactory.

Bengal.—The prospects of all crops were good.

United Provinces.—The condition of standing crops was good and prospects were favourable everywhere.

Punjab.—Rain was wanted in Ambala. The outturn of autumn crops was generally good to average except in parts of Mianwali. Sowings of spring crops were progressing satisfactorily. Water supply remained short in parts of the Lyallpur district.

North-West Frontier Province.—Rain was urgently wanted all over the province. Standing crops were generally average on irrigated lands and below the average on unirrigated areas.

Jammu and Kashmir.—Standing crops were fair in Jammu and below the average in Kashmir.

Rajputana.—Standing crops and prospects were good.

Central India.—Autumn crops were being harvested and spring crops sown.

Central Provinces.—The condition of the standing crops was generally good, though showers were still needed in Jubbulpur, Betul, Seoni, Nagpur, Wardha, Chhindwara and the Vindhyan districts. In the Feudatory States prospects were in general favourable.

Bombay.—Standing crops were suffering from insufficient moisture in Kaira, Ahmednagar, Poona and Kolhapur, and had been damaged slightly by insects in Belgaum; elsewhere their condition was good. Rain was still wanted in parts of the Deccan and Bijapur.

Hyderabad.—The autumn crops were generally fair to good. Rain was badly wanted in almost all places for the early rice crops.

Mysore.—Prospects of the season were generally good. More rain was however needed for late sown dry crops in Bangalore, Kolar and Tumkur.

Coorg.—Rice was in good condition. Picking of cardamom continued.

Madras.—Standing crops were fair to good, but some were withering for want of rain.

HEM RAJ.

(a) Indeterminate.

¶ Uncorrected for scale error.

stations, the elevations of which exceed 3,200 feet.

Table

(2) *Abstract of observations taken at 8 hrs., at 236 stations*

Number of subdivisions.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

(a) Indeterminate. ¶ Uncorrected for scale error. ‖ Mean of 18 days.

Ta

(2) *Abstract of observations taken at 8 hrs., at 236 stat*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

ases of hill or plateau stations, the elevations of which exceed 3,000 feet.

¶ Mean of 28 days.

* Uncorrected for scale error.

(a) Indeterminate.

** Mean of 18 days.

Ta

(2) *Abstract of observations taken at 8 hrs., at 236 stati*

Number of subdivision.	Station	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

GOVERNMENT OF INDIA.

METEOROLOGICAL DEPARTMENT.

MONTHLY WEATHER REVIEW.

PUBLISHED BY ORDER OF

THE GOVERNMENT OF INDIA.

CALCUTTA, DECEMBER, 1909.

INTRODUCTION.

THIS review of the weather in India during the month of December, 1909, is based on observations taken daily at 8 hrs. at 239 stations, and on additional observations taken at 10 hrs. and 16 hrs. at 34 stations. In the rainfall summary the data furnished by the meteorological observatories, and such rainfall statements of the month as had been published by the Provincial Governments up to the date of the preparation of the review, have been utilized. The brief notes on solar, seismic and magnetic disturbances have been supplied by the chief observatories.

For a statement of the methods adopted in recording and tabulating the data, for each of the elements of observation, reference should be made to the introductory portion of the review for January.

Summary of the chief features of the weather in India during the month of December, 1909.

2. Two disturbances of a somewhat peculiar character affected the weather in northwestern and central India, the first during the second week, the other towards the end of the month, and gave rise to widespread and in places heavy rainfall. The Bay was visited by a storm which caused very heavy rain in the Andamans and on the Orissa and Circars coasts, and moderate rain in lower Bengal, Upper Burma and north Arakan. The aggregate measurements of the precipitation of the month were much greater than the corresponding normal values over nearly the whole of northern and central India, and also in Madras Coast North, and the Bay Islands, and were short of the average in the south and west of the peninsula and in Assam. The defect was serious in Madras Southeast, which received only 0·86 inch in place of the normal 4·13 inches.

The air was somewhat drier than usual in southeast and central Madras and also at several stations in Assam and Eastern Bengal, but was very damp over the rest of the plains.

Skies were covered to more than the customary extent over practically the whole tract of country to the north of the parallel of 19°N., as well as in the extreme south, and were unusually clear in Tenasserim, Pegu, the Bombay Deccan, Mysore and central and southeast Madras.

Days were warm in central and southeast Madras and were distinctly cooler than usual in northwest India. Night temperature was decidedly high in the Deccan, Orissa, north Madras, the Central Provinces and the east of Central India. Elsewhere the temperature conditions were nearly normal.

Pressure as recorded at the earth's surface was only ·008″ in defect of the average. The vertical gradients were remarkably strong in northwest and southern India.

Solar, seismic and magnetic disturbances.

KODAIKANAL OBSERVATORY.

3. *Solar observations.*—There were two days on which there were no solar observations, one other on which prominences could not be observed, and 5 others on which the prominence record was imperfect.

Sunspots.—The large increase in solar activity noticed in October and November continued and on the 25th no less than 10 groups of spots were visible at once.

Twenty new spot groups were recorded during the month, with a daily average of 4·8; the average life of a

spot was 6·4 days. Groups Nos. 1786, 1787, and 1788 were returns of Nos. 1769, 1770, and 1772, respectively. The latitude distribution was as follows:—

TABLE 1.

	1° - 10°.	11° - 20°.	Extreme latitudes.	Mean latitude.
North . .	7	1	3°, 15°	8°·4
South . .	5	7	4°, 16°	10°·0

Of the new groups Nos. 1782, 1786, 1787, 1788, 1790, 1793 and 1797 contained fairly large spots. These lay between longitudes 57° and 253°. The other half of the sun was comparatively inactive. On December 12th the visible disc lay between longitudes 250° and 70° and was quite free from spots. Group No. 1779 had just gone round the west limb and No. 1782 had not yet appeared on the east. Of the large groups mentioned above No. 1782 was the only one which showed any striking features, spectroscopically or otherwise. On the 17th C was brilliantly reversed on the main spot and D_3 was slightly dark.

Prominences.—Fifty-eight large, 5 metallic, and 5 eruptive prominences were recorded during the month. The tallest of them was a detached vertical strip 360″ high which was photographed at latitude +55″ east at 8h. 13m. on December 23rd.

Magnetic disturbances.—"Moderate" magnetic disturbances were recorded on the 1st, 2nd, 13th, 14th, 15th, and 16th. Seven spot groups containing many large spots lay on both sides of the central meridian on the 1st and 2nd and these groups were probably near the central meridian on the other side of the sun between the 13th and the 16th.

C. MICHIE SMITH,

Director,

Kodaikanal and Madras Observatories.

BOMBAY OBSERVATORY.

The report for December has not yet been received. The following report relates to November.

Alibag magnetic record.

4. During the month of November 1909, the traces showed 14 calm days, 13 days of small, 2 days of moderate and 1 day of great disturbance. The days of the month selected as quiet for the purposes of the Magnetic Survey of India are the 4th, 10th, 13th, 24th and 25th.

The observed absolute values of the several magnetic elements reduced to the mean monthly tabulations of the magnetograms, as also the ranges and the summed ranges of the horizontal force and declination for the mont are as follow:—

Easterly declination . . .	0° 59′ 43″
Horizontal force . . .	0·36838 C. G. S. unit.
Vertical force . . .	0·16037 „ „
Dip (calculated) . . .	23° 31′·5
Dip (observed) . . .	23° 31′·5
Horizontal force range . .	0·00053 C. G. S. unit.
Horizontal force summed range .	0·00329 „ „
Declination range . . .	1′·5
Declination summed range .	6′·8

(NOTE.—Summed range means sum without regard to signs of 24 ordinates of diurn inequality.)

The following table represents the magnetic characte of each day during the month.

TABLE 2.

Day.	Character.	Day.	Character.	Day.	Character.	Day.	Characte

Weather in the Indian monsoon region.

8. In the subequatorial region as represented by Zanzibar and the Seychelles the barometric pressure was on the whole practically normal. Winds were much below their average strength in both localities, and their direction was unusually easterly at Zanzibar. Rainfall was very irregularly distributed, having been markedly in defect at the Seychelles, and 131 per cent. in excess at Zanzibar.

Depressions and cyclonic storms.

9. The tendency to frequent unsettled weather which had characterised October and November persisted during December, three disturbances having occurred during the month. The following is a brief account of these disturbances:

Severe cyclonic storm of November 29th to December 6th over the Bay of Bengal.—According to the meagre information received from ships up to the present this storm appears to have been generated on the 29th of November over the narrow strip of sea between the Andamans and the Nicobars. From there it apparently moved in a west-north-west direcion, and by the morning of the 3rd December the centre had reached a position about two hundred miles east of Nellore. Winds of force 6 or 7 prevailed on that day in the eastern quadrant at a considerable distance from the centre, a circumstance which, coupled with the roughness of the seas on the Madras coast, would indicate that even at this stage it was a well developed disturbance. There was no inflow of humid air into southern India from the Arabian Sea, and it was perhaps owing chiefly to this circumstance that the storm turned round abruptly to north or northeast during the day. At 8 hrs. of the 4th the centre was within 100 miles of Waltair and Calingapatam, where the barometer stood about four-tenths of an inch below the normal height and very rough seas prevailed. The storm travelled in a northeasterly direction during the next two days, and by the morning of the 6th had reached the Chittagong coast. It passed inland probably between Chittagong and Cox's Bazar, and was speedily broken up by the obstructive action of the Chittagong hills.

So far as can be ascertained from the available information it is almost certain that pressure at the centre was at least half an inch in defect throughout the 5th and on the morning of the 6th. According to a letter received from the Commander of the F. L. V. *Comet*, although the greatest intensity attained by the wind there was equivalent to force 8 of the Beaufort scale, winds of hurricane violence were experienced at the Mutla station which is only 60 miles to the southeast; this is an indication that the inner area of the storm was of small extent. Th storm was noteworthy in several respects, but mo especially for the very heavy rain it gave in Oriss and the Andamans, and for the direction of its line advance during the last three days of its existence. Th northeasterly course followed in the present instance wa unique, for storms formed over the Bay in Decembe ordinarily travel either due north or between west an north.

The second and third disturbances were of an entirel different type from that of the first, the former showed itsel on the 9th over Persia and was thence transmitted east wards. Its entry into northwest India on the 12t synchronised with the appearance of a depression ove Gujarat. Like most of the Persian depressions it wa indistinctly marked, and it is therefore not possible to trac it further with certainty. The pressure changes and depar tures would indicate, however, that it was absorbed on th 13th by the Gujarat depression which was then movin northwards across Rajputana into the Punjab. The com bined disturbance was situated on the 14th over the west c upper India between Bikaner and Montgomery and wa fairly deep, pressure within it being then more than a quarte of an inch below the normal. A rapid recovery occurre over the north-west during the day and filled up th depression. General and in places heavy precipitatio resulted on the 14th and 15th from these conditions.

The third or last disturbance resembled the previou one closely in its chief features. It originated over Persi on the 22nd, and during the next three days was transmitte to northwest India where its activity was supplemente largely by a depression formed locally over Berar on th 24th. Both depressions were very feebly marked, an filled up on the 27th while passing through northeas India. Although barometrically less important than it predecessor it produced widespread rain over the Unite Provinces, the Central Provinces, the east of Central India of Rajputana and of the Punjab, and local showers i northeast India.

Pressure.

10. The geographical mean of 8 hrs. pressure over India was ·008″ below the normal value. The general pressure conditions were thus much less abnormal than in November when the monthly value of pressure was as much as —·018 in defect of the corresponding mean.

Relatively to the general condition, pressure was markedly low over the Circars, the whole of the Deccan and the Konkan, and was rather high in Burma, Assam, most parts of Eastern Bengal, Chota Nagpur, the Punjab and the greater part of the United Provinces. The relative distribution was thus almost the opposite of that obtaining in October and November, when pressure tended to be low in Burma and north-east India relatively to the peninsula.

TABLE 9.

DIVISION.	Departure from normal of mean 8 hrs. pressure.
	"
Burma	+·003
Eastern Bengal and Assam	—·001

Bombay	—·025
Central India	—·017
Central Provinces	—·019
Hyderabad	—·037
Mysore	—·016
Madras	—·015

The excess of pressure in the plains of upper India did not extend upwards to any great height, for at the level of about 4,000 feet, and above it, pressure was more or less below the normal. The vertical pressure gradients were thus steeper than usual there as well as in southern India. In the Central Provinces and north-east India, on the other hand, pressure was somewhat in excess at the level of the observing hill stations relatively to the adjacent plains.

Temperature.

11. In the plains day temperature was from 2° to 6° in defect in north-west India, and in excess by about 3° in Mysore and 2° in Madras, but elsewhere the departures from the normal were small, not exceeding 1½° in amount at the great majority of stations. Minimum or night temperature was inclined to be high in most parts of the country The excess was however less than 2° in amount except in Orissa, the Central Provinces, the east of Central India, north Madras and the Deccan, where it ranged up to 7°.

In Baluchistan both day and night temperatures were lower than usual by about 2½°, but elsewhere in the hills the deviations from the normal were not strongly marked.

Winds.

12. (*a*) Except in the United Provinces and the North-West Frontier Province where wind velocity was decidedly low, and in Rajputana and the Central Provinces where it was appreciably high, the rate of air movement did not depart to any extent from the normal.

(*b*) Steadiness was much greater than usual in Rajputana and Sind, well below the normal in the United Provinces, the North-West Frontier Province and Mysore, and about the average elsewhere.

(*c*) The deviations from the normal of the direction of motion were local rather than general, and were consequently of no great significance.

Humidity and cloud.

13. The air was damper than usual on the mean of the month in all parts of the country with the exception of Kashmir, Eastern Bengal, Assam, and central and southeast Madras.

Cloud proportion also was in excess in most places, the only important exceptions being the coast districts around the Andaman Sea, the Bombay Deccan, Mysore, and central and southeast Madras.

The departures of humidity and cloud were thus roughly parallel to those of rainfall.

Rainfall.

14. As described in a previous section, three disturbances affected the weather during the month. The precipitation due to the first disturbance was almost restricted to the coast districts round the Bay from the Circars to the Andamans, while that due to the other two extended over practically the whole of northern and central India. The total rainfall measurements of the month accordingly exceeded their normal values in the Bay Islands, the Madras Coast North, Hyderabad North, the Central Provinces, Central India, and the whole tract of country extending from Eastern Bengal to Baluchistan, and were equal to or short of the average in Lower Burma, Assam, Bombay excluding Gujarat, Mysore, south Hyderabad and the whole of Madras excepting the northern coast districts. The excess varied between half an inch and two inches in most parts of the region of abundant rainfall in northern and central India, whereas the normal fall there is less than half an inch: it was absolutely greatest in Berar which obtained 2·92 inches, the normal being 0·30 inch. In the region of scanty rainfall the defect was most marked in Madras Southeast where it amounted to 3·27 or 79 per cent.

On the mean of the whole Indian region there was an excess of 0·46 or 92 per cent.: in this respect the month contrasts very favourably with the corresponding period of 1908 in which a defect of 80 per cent. was recorded. In fact it was the wettest December since 1902.

Snowfall.

I.—BALUCHISTAN.

15. On the hills near Quetta slight falls occurred on the 11th, 13th, 21st and 27th, and heavy falls on the 23rd and 24th.

II.—AFGHANISTAN.

Kabul.—Snow fell in Kabul on 4 days to a total depth of about 2″. By the end of the month the plain of Kabul had become quite bare of the snow covering, and the high adjoining hills almost so.

III.—THE NORTH-WEST FRONTIER PROVINCE.

Wano.—Snowstorms occurred on the 12th, 14th and 24th down to a level of about 8,000 feet, but the total fall was small in amount, not exceeding 8″ in depth even on the highest points. Weather was unusually cold during the month.

Kurram.—There were in all seven falls on the Sufed Koh and two of these extended to Parachinar, where the total depth of snow was estimated at 9″. At the end of the month all the passes were bare of snow.

Kohat.—There were two falls on the hills bordering this district. The statement below gives the measurements made in the various localities :—

TABLE 17.

Locality.	Amount of snowfall recorded during the month.	
	Feet.	Inches.
Mullaghar	1	0
Bilandar	0	4

Muzioghar	0	1½
Landoku	1	0
Krumb Ustari Khel	0	6
Tanga Ustari Khel	0	6
Moulaghar Sepoja	0	6

Chitral.—Snow fell on the surrounding mountains on the 12th, 13th, 14th and 24th. The fall of the 13th and 14th was heavy and descended to the level of the observatory where it measured 7″ in depth. At the end of the month the accumulated snow measured 1 foot in depth on t adjoining hills and 15 feet on the Lorai pass.

IV.—KASHMIR.

Snowfall was irregular both in occurrence and dist bution. In Srinagar there were six snowstorms resulti in about half a foot of snow. At Sonemarg the aggrega fall of the month was estimated at about ten feet, wh nearly three feet were recorded at Kargil and about dout that amount on the neighbouring hills. At Dras a total about two feet fell on twelve days. The snow accumu tions at the end of the month measured about 4½ feet depth at Sonemarg, and about 3 feet on the passes ne Dras. In Leh the first snowfall of the winter season d not occur before the 24th and the pass to Nubra remain open.

V.—THE PUNJAB.

Chamba.—Snowstorms occurred on the Dalhous Chamba, Bhandal and Tisa ranges from the 14th to t 16th and again on the 24th and 25th, those of the 14th a 15th being severe. The lowest level reached by the sno line was 4,500 feet.

Pangi.—Snowstorms occurred daily at Kilar (elevati 8,450 feet) from the 12th to the 16th, and there was a slig fall also on the 23rd; the total quantity received was feet.

The statement below shows the total amount of sno received during the month at the recording stations, a the actual and normal depth of accumulation on the la day of the month :—

TABLE 18.

RECORDING STATION.	Total amount of snowfall during the month.		DEPTH OF ACCUMU TION AT THE E OF THE MONTH.			
			Reported.		Normal

Barmaur	3	0	3	0	2	6
Ulansa	2	3	2	3	2	9
Chitrari	1	4	1	4	1	0
Darkund	1	7	1	7	1	5
Bakani	0	7	0	7	0	8
Bhandal	0	7	0	7	0	7
Deur	0	4	0	4	0	5
Langera	3	1	3	1	1	0
Tisa	0	6	0	6	0	8
Khangu	3	2	3	2	2	2
Chatri	2	1	2	1	2	3
Alwas	5	4	5	4	2	9

Almost all the passes were closed.

Dalhousie.—There was only one snowstorm during the month, *viz.*, on the 15th. The fall at Dalhousie was only 3″ deep, but was believed to be much heavier at Kalatop, Bakrota, Dainkund and Khajiar.

Kulu.—Snowfall was confined to the passes above 8,000 feet in height and occurred on four days. The Rohtang and Hamta passes were blocked. At the end of the month snow to a depth of about 1 foot was reported to be lying at an elevation of 10,000 feet on the southern slopes.

Kilba.—Snowstorms occurred on the 13th, 14th, 15th, 24th and 25th; on the last four days the snow line was at an elevation of 7,000 to 8,000 feet and here the aggregate fall was estimated at 1½ feet. At the close of the month, there was from 2 to 4 feet of snow on the Shatul, Brua and Harang passes, which were accordingly impassable. The Hindustan-Tibet road was clear of snow :—

TABLE 19.

NAME OF PASS.	DEPTH OF ACCUMULATION AT THE END OF THE MONTH.	
	Reported.	Normal.
Shatul	4 feet	5 feet.
Brua	3 "	4½ "
Harang	2 "	2½ "

VI.—THE UNITED PROVINCES.

Garhwal.—There were altogether four falls in this district The storm of the 24th to the 26th was severe, and gave snow down to about 5,000 feet.

Almora.—The total fall of the month amounted to 7 feet on the Untadhura, 6½ feet on the Lipulekh, 5 feet on the Ralamdhura and the Kaphini, and 4 feet on the Pindari.

SUMMARY.

16. So far as can be judged from the available information the snowfall was somewhat irregularly distributed, being heavier than usual in Baluchistan and the western Himalayas and deficient in Afghanistan and parts of the North-West Frontier Province. In Chamba the snowline came down as low as 4,500 feet.

Crop report.

17. *Burma.*—The condition of the standing crops was good. Sowing of miscellaneous spring crops was progressing satisfactorily.

Eastern Bengal and Assam.—Harvesting of winter rice was nearing completion, and a good outturn was expected. Prospects of tea and wheat were good, and of mustard and pulses fair.

Bengal.—Harvesting of winter rice continued. At the end of the month rain was wanted for spring crops in parts of Jessore and Patna.

United Provinces.—At the close of the month the standing crops were doing well everywhere.

Punjab.—The standing crops were generally in good condition. Sowing of spring crops continued in some districts.

North-West Frontier Province.—At the end of the month the condition of the standing crops was generally average, except on unirrigated areas in Dera Ismail Khan where it was below it. Spring crops were being sown.

Jammu and Kashmir.—The condition of the standing crops was fair in Jammu and good in Kashmir.

Rajputana.—The state of the standing crops was good. Sowing and watering of spring crops continued.

Central India.—Crops had suffered slightly in parts of Gwalior, Indore and Bundelkhand.

Central Provinces.—Prospects were generally favourable.

Bombay.—Crops were generally good, except in parts of the east Deccan where they had suffered from want of moisture.

Hyderabad.—Standing crops were fair to good, though they had in some parts been damaged by the third week's rainfall. More rain was still needed in parts of the Warangal and Medak division.

Mysore.—The condition of the standing crops was satisfactory and the seasonal prospects were good.

Coorg.—Picking of coffee and cardamom and reaping of rice continued.

Madras.—At the end of the month standing crops were generally fair but in parts of the Deccan, North Arcot, Salem, Tanjore and Madura they were in urgent need of rain; while in parts of Guntur, Cuddapah, the central Carnatic and Tanjore some crops had withered or were withering. Harvests continued generally with fair to bumper outturn.

Tabl

(2) Abstract of observations taken at 8 hrs. at 23

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

‡ Mean of 29 days. † Mean of 30

N.B.—Elevations in italics indicate barometrical determinations.

NOTE.—The barometric readings are not reduced to sea-level, in the cases of hill or plateau stations, the elevations of which exceed 3,209 feet.

B.

Stations in India, etc., in December, 1909.

Wind direction. Number of winds from Calm.	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.	Resultant direction.	Normal direction.	Wind velocity. Mean velocity, miles per hour.	Normal.	Departure from normal.	Wind steadiness. Actual percentage.	Departure from normal.	Hygrometry, 8 hrs. Mean humidity at 8 hrs.	Departure from normal.	Mean vapour tension at 8 hrs. in inches of mercury.	Departure from normal in inches of mercury.	Cloud. Mean cloud amount at 8 hrs.	Departure from normal.	Rainfall. Number of rainy days.	Normal number of rainy days.	Departure from normal.	Rainfall of month.	Normal rainfall of month.	Departure from normal.	Total rainfall from 1st to 31st December, 1909.	Normal rainfall for period, 1st to 31st December.	Departure from normal of period, 1st to 31st December, 1909.	Heaviest rainfall during month.	Station.

(a) Indeterminate.

* Uncorrected for scale error.

Ta

(2) *Abstract of observations taken at 8 hrs. at 239 stat*

Number of subdivision.	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

§ Mean of 9 days.

(a) Indeterminate.

* Uncorrected for scale error.

‡ Mean of 28 days.

Table

(2) *Abstract of observations taken at 8 hrs. at 239 stations*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches.								Temperature of air.												
			Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

* Uncorrected for scale error. (a) Indeterminate. ** Mean of 25 days.

Table

(2) *Abstract of observations taken at 8 hrs. at 239 stations*

Number of subdivision.	Station.	Elevation of bar-cistern above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° Lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.	Absolute range during month.

Tal

(2) *Abstract of observations taken at 8 h*

Number of subdivision	Station.	Elevation of barometer above sea-level, in feet.	Pressure, 8 hrs., in inches. Mean 8 hrs. pressure reduced to 32°.	Departure from normal.	Mean 8 hrs. pressure reduced to sea-level and to constant gravity, at 45° lat.	Highest pressure recorded during month.	Date.	Lowest pressure recorded during month.	Date.	Total range of pressure during month.	Temperature of air. Mean of 8 hrs. temperature.	Mean maximum.	Departure from normal.	Mean minimum.	Departure from normal.	Monthly mean of mean between maximum and minimum.	Departure from normal.	Mean daily range of temperature.	Highest temperature observed during month.	Date.	Lowest temperature observed during month.	Date.

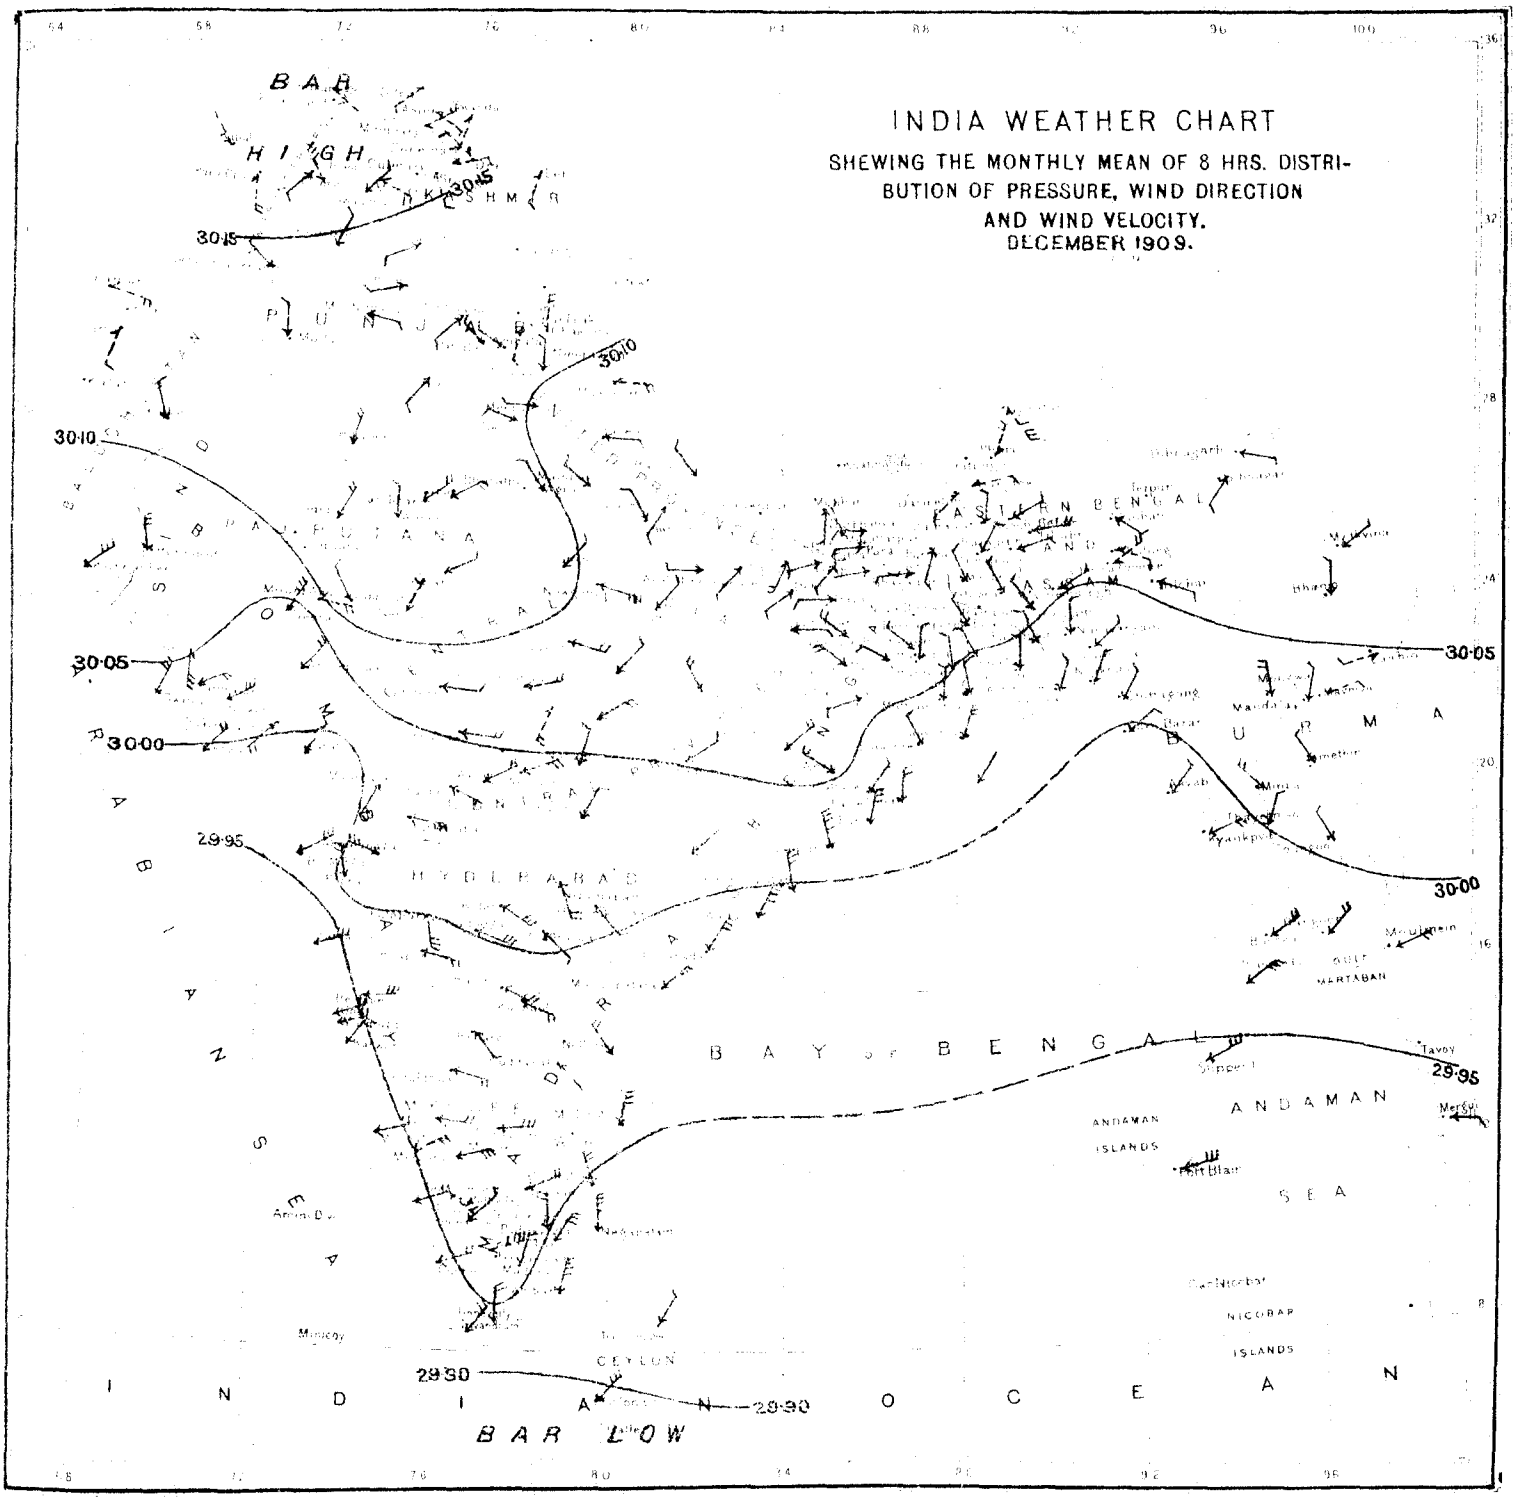
¶ Wind observations for 10 days. § Snow water with rain. ‖ Mean of 8 days.

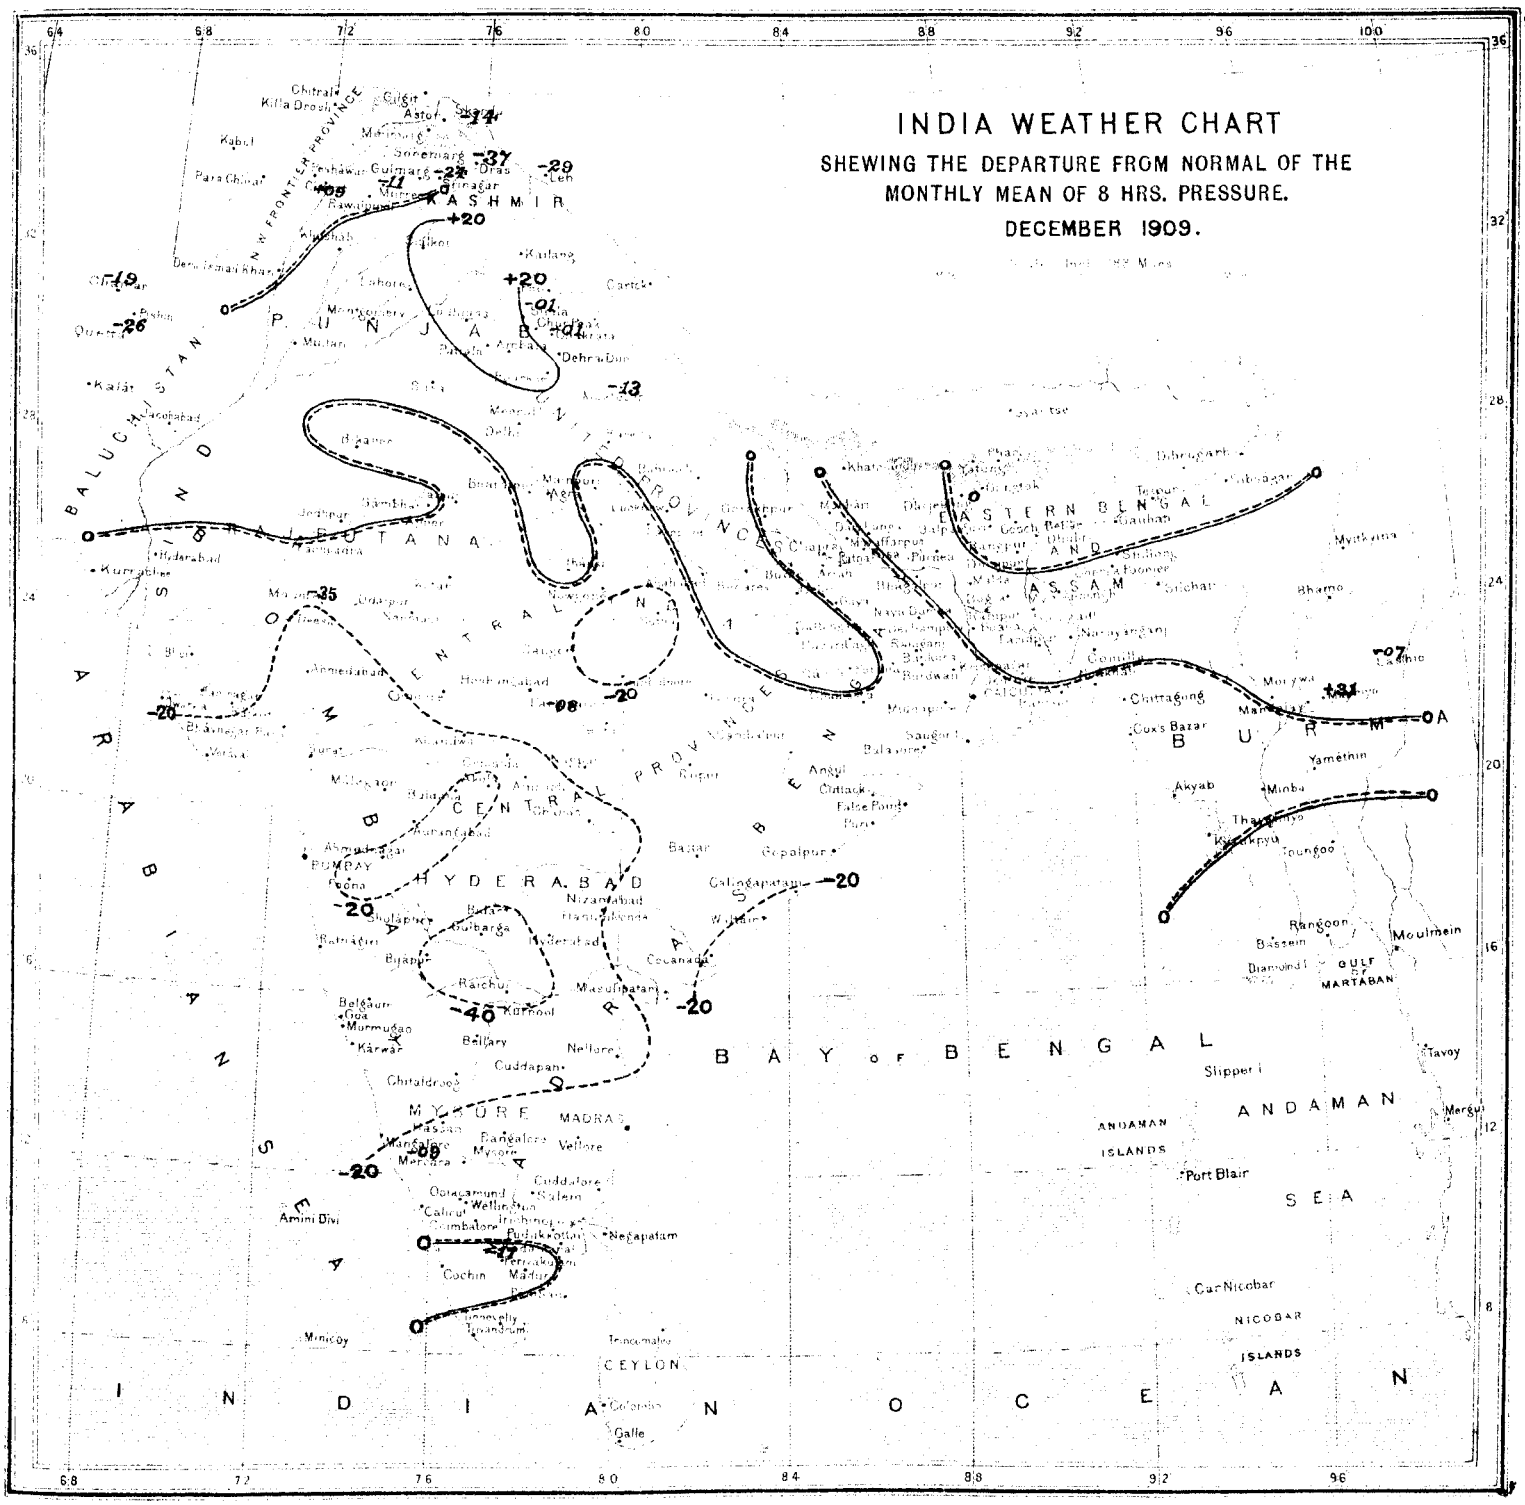


S. C. D.

The lines of the above chart represent isobars or lines of equal barometric pressure, the numbers attached indicating the barometric pressure in inches and being drawn for differences of pressure of ·05 inch. The isobars in the Bay of Bengal are filled in by means of the shore observations, and by comparison with the normal distribution of pressure.

The mean 8 hrs. wind directions of the month are shewn by means of arrows flying with the wind, and are calculated by means of Lambert's formula applied to the winds as given in Table B of the 8 hrs. observations. The mean wind directions for the hill stations are indicated by broken arrows to distinguish them from the wind arrows for the plain stations. The mean velocity of the winds during the month is shewn by the following notation:—

Velocity of	0 to 2 miles per hour	...	one feather added to the wind arrow.
,,	,, 2 to 5 ,, ,, ,,	...	two feathers ,, ,, ,, ,,
,,	,, 5 to 10 ,, ,, ,,	...	three ,, ,, ,, ,,
,,	,, 10 to 20 ,, ,, ,,	...	four ,, ,, ,, ,,
	over 20 ,, ,, ,,	...	five ,, ,, ,, ,,



Reg. No. 4,103 E., 09—1.—5,500.

The chart shows the departure from normal of the mean during the month of 8 hrs. pressure by means of lines drawn for equal amounts of departure. The numbers are given in thousandths of an inch, 20 representing ·020′ or two hundredths of an inch, &c. Continuous lines indicate that the pressure was in excess by amounts indicated by the numbers attached to the lines, and broken or dotted lines that it was in defect by amounts indicated by the numbers attached to the lines. Two parallel lines near to each other, one continuous and the other broken or dotted, represent the line of no departure, the dotted line facing the area of deficient pressure or negative departures.

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF DAILY MAXIMUM TEMPERATURE.

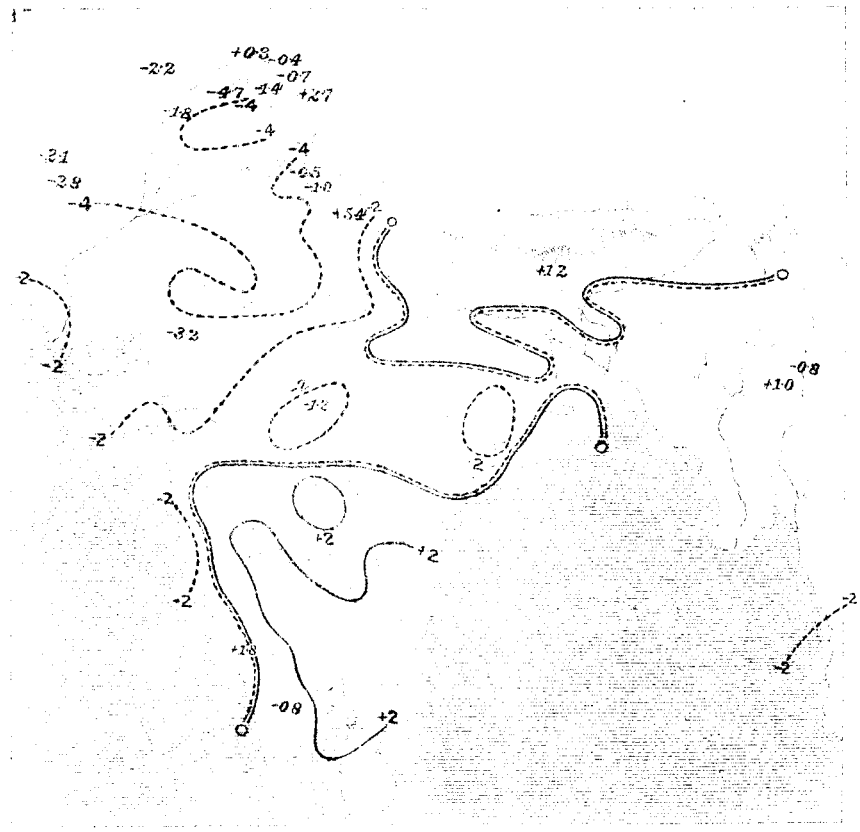


CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF DAILY MINIMUM TEMPERATURE.

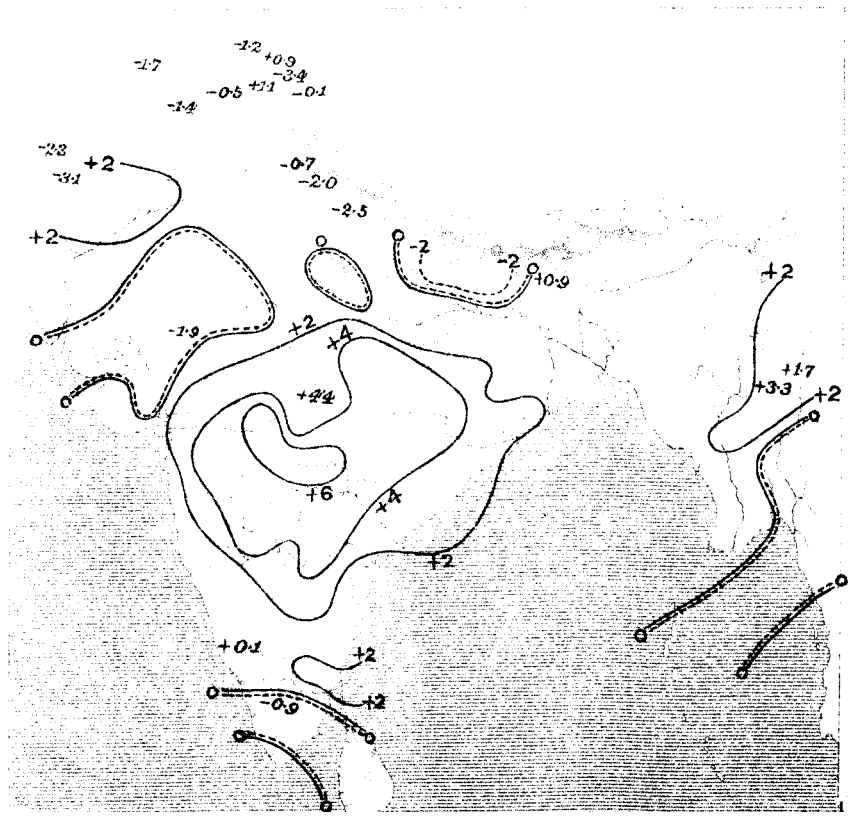

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF DAILY MEAN TEMPERATURE.

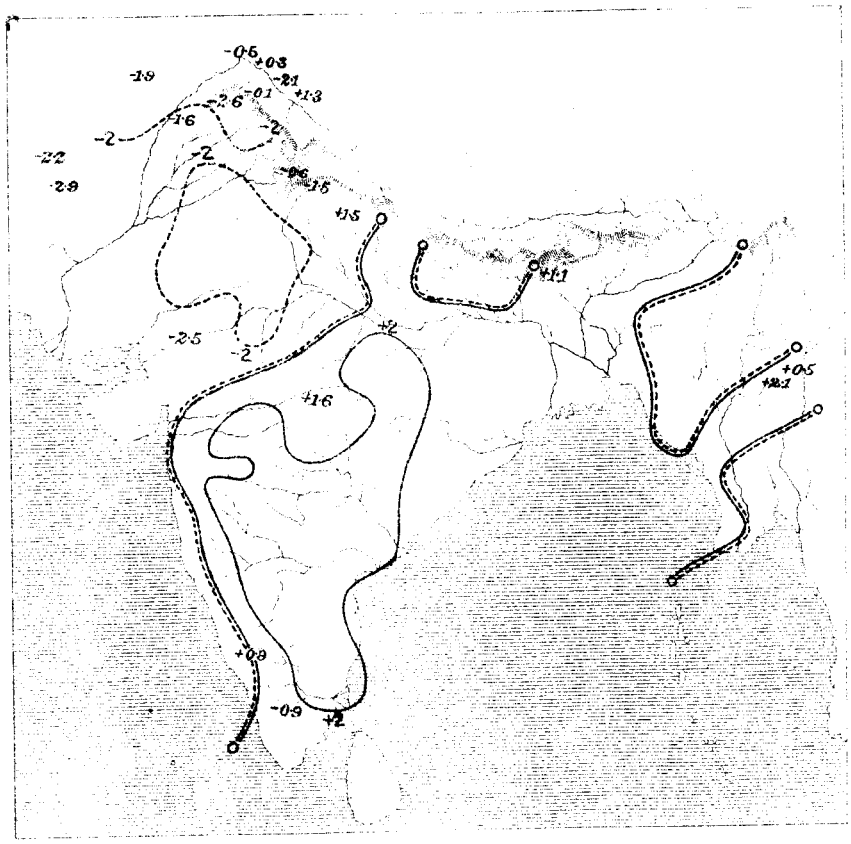

CHART SHEWING THE MONTHLY MEAN OF PRESSURE AND RESULTANT WIND DIRECTION.

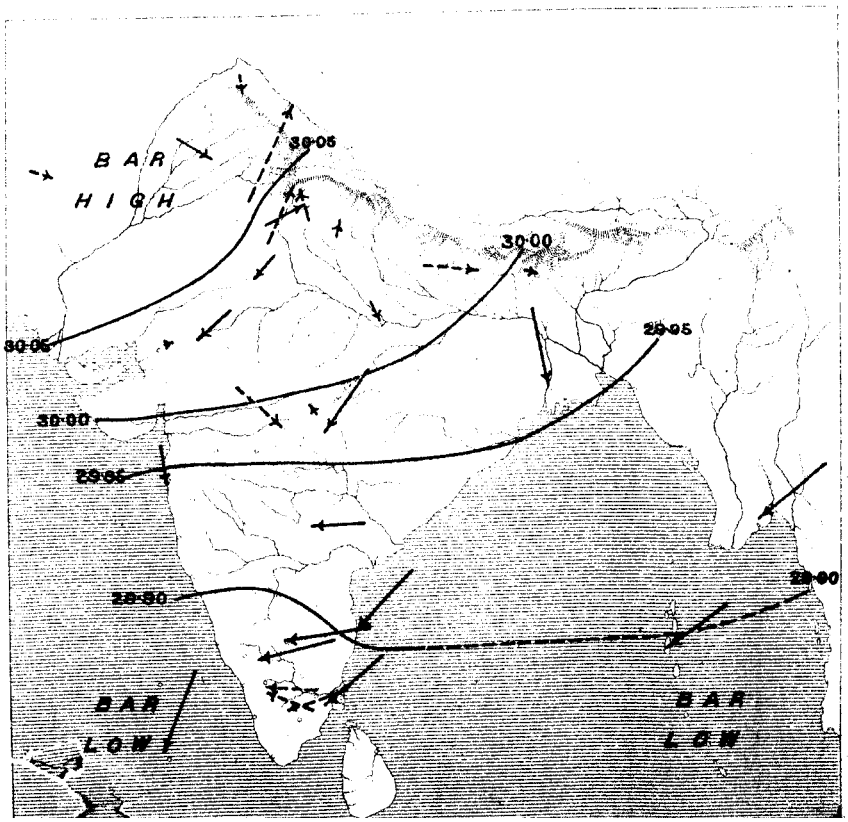

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF ABSOLUTE HUMIDITY AT 8 HRS.

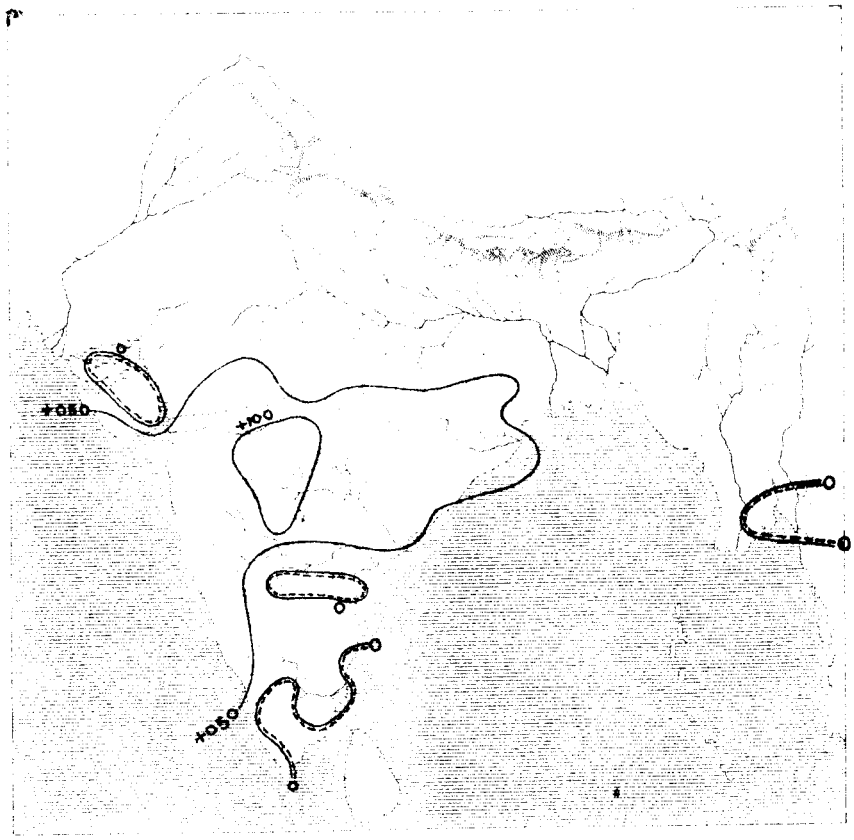

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF RELATIVE HUMIDITY AT 8 HRS.

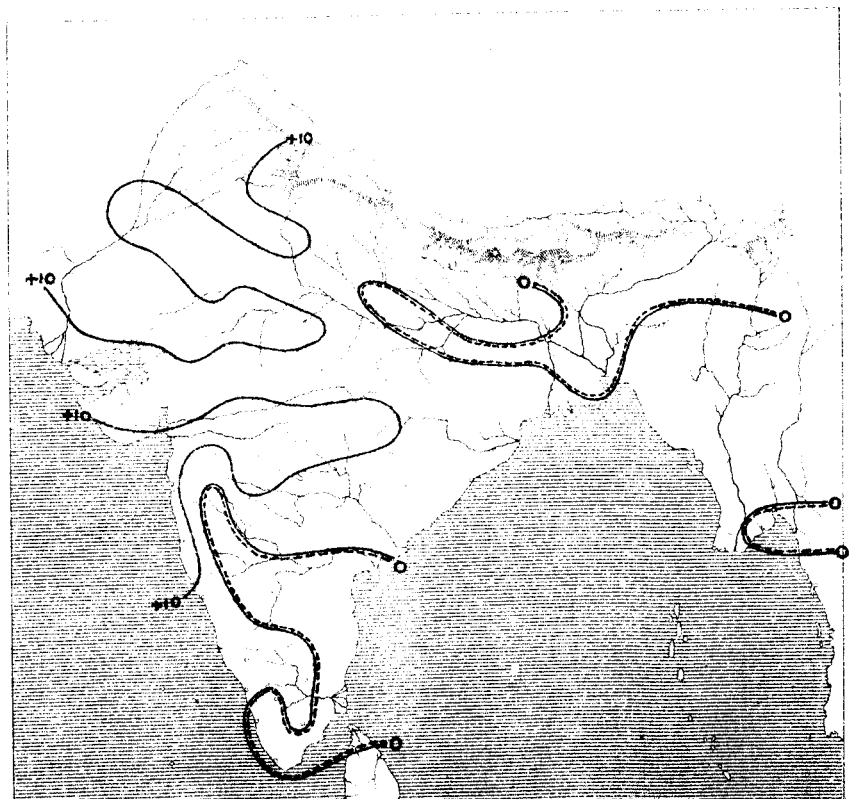

CHART SHEWING THE DEPARTURE FROM NORMAL OF THE MONTHLY MEAN OF CLOUD AMOUNT AT 8 HRS.

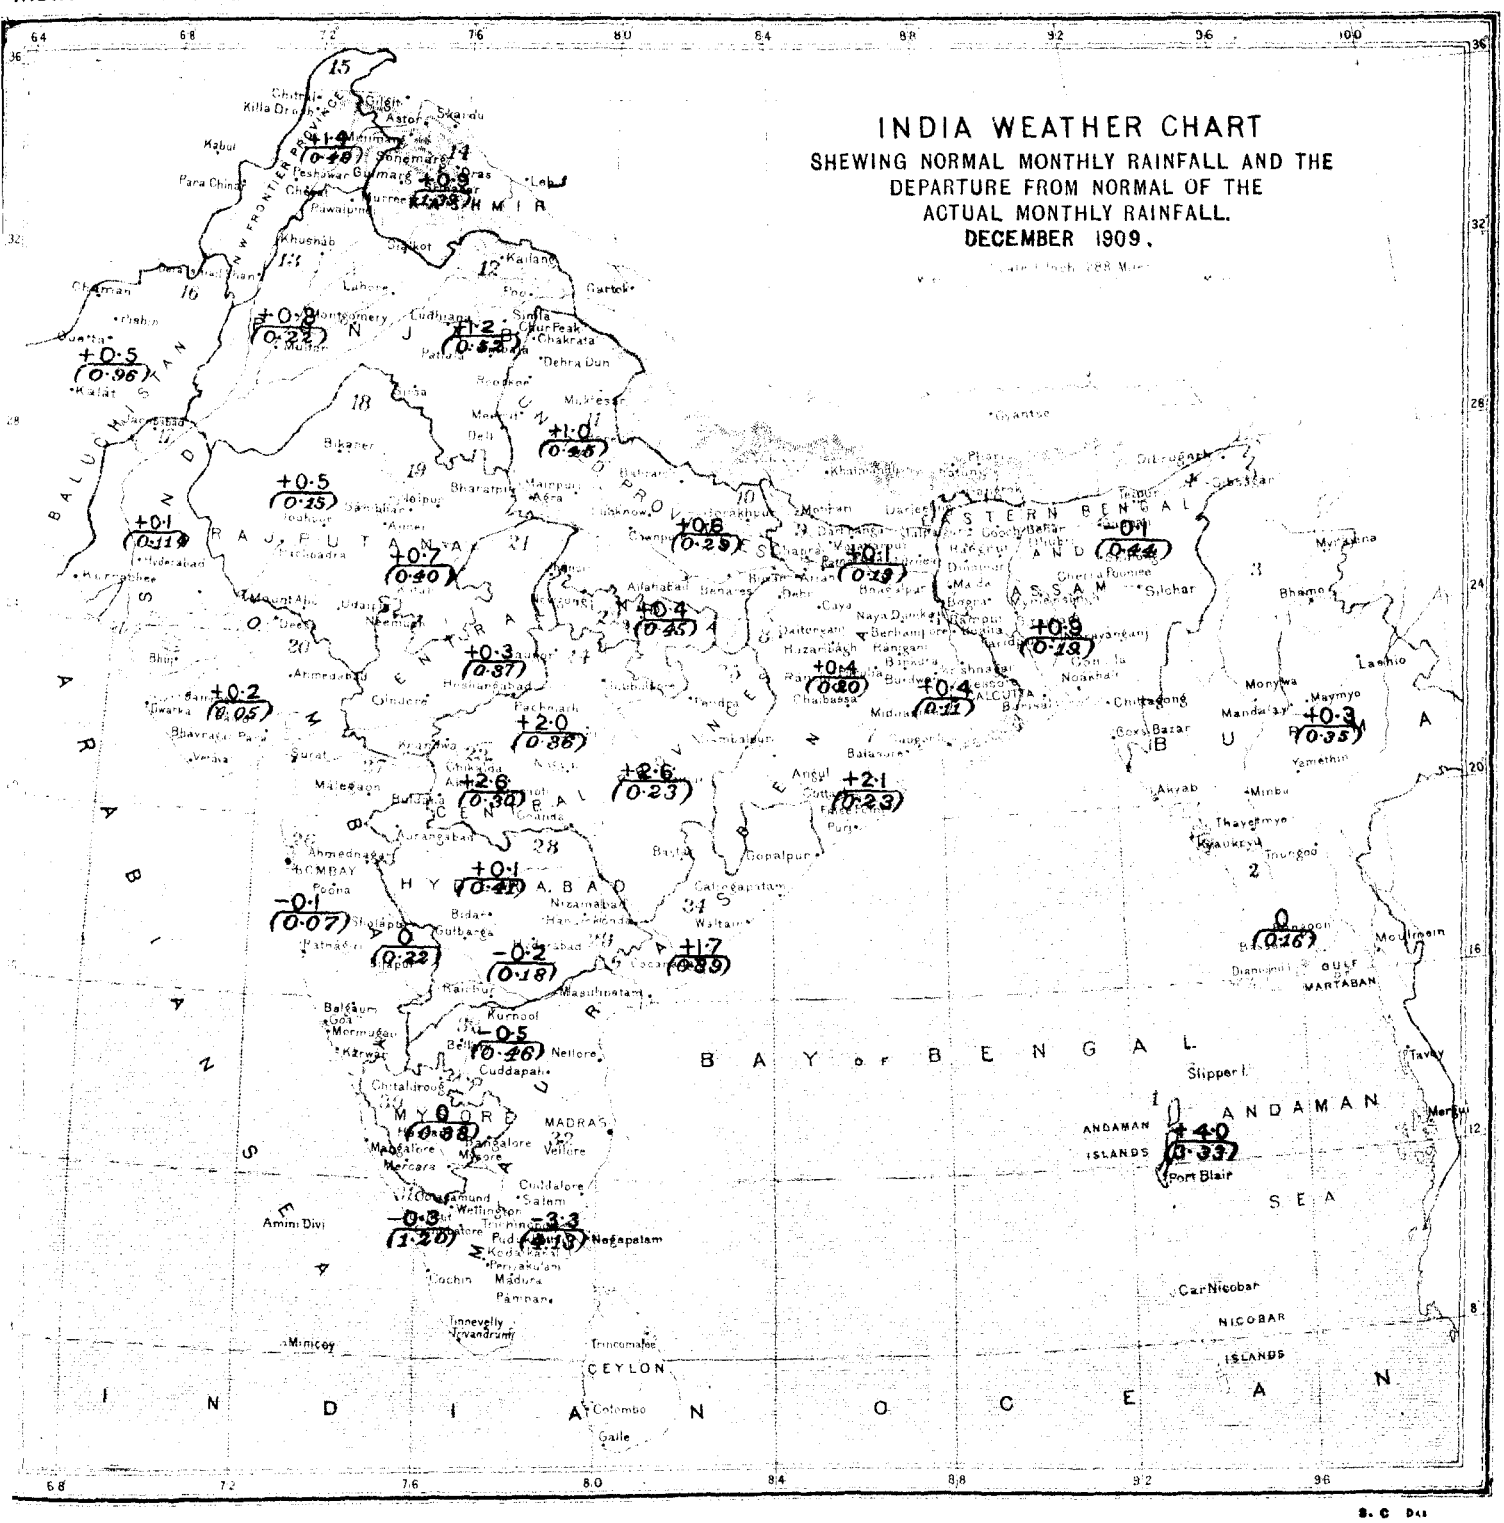
CHART SHEWING THE TOTAL NUMBER OF DAYS IN THE MONTH ON WHICH RAINFALL EQUALLED OR EXCEEDED 0·10 INCH.

(BASED ON THE RETURNS OF TABLE B.)



Reg. No. 4003 E. (9—1.—5500.)

The country is divided into 34 areas as shown in the list below. The numbers in that list correspond with the red numbers on the chart, and serve to identify the areas. The numbers in brackets on the chart give the average over the divisions of the normal monthly rainfall; the numbers above these give the departures from normal of the average actual rainfall over the divisions.
