Inhalt.

Vorwort.

I. Meteorologische Beobachtungen an zwölf Stationen in Norwegen 1886.

II. Monats- und Jahres-Resumé für das Jahr 1886.

III. Anhang I. Beobachtungen der Bewegungen der Cirruswolken 1886.

IV. Anhang II. Dynamische Windrosen 1886.

Geschencke an das meteorologische Institut. November 1886 bis October 1887.

Druckfehler und Verbesserungen.

Im Jahrbuch für 1884:

Seite 90. Hellisö. See-Temperatur für October und November ist wegen fehlerhafter Beobachtungsweise unbrauchbar.

Im Jahrbuch für 1886:

			Lies:
Seite	2.	Dovre. März 31. 8 *p* Windrichtung S ist zu streichen.

—	76.	Christiania. Länge: 10° 44′	10° 43′.
—	79.	Færder. Höhe des Regenmessers: 10.^{m}5	0.^{m}5.

Vorwort.

Das Jahrbuch für 1886 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 79 Stationen; von letzteren sind 32 Stationen solche, die mit Qvecksilberbarometer versehen sind, 7 Leuchtfeuerstationen, und 32 Regenmesserstationen.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen:

Im Sommer 1887 unternahm Hrr. J. Schroeter eine Inspectionsrejse nach den Stationen II Ordnung von Throndhjem bis Tromsø. Als Controlbarometer wurden zwei Barometer mitgeführt: Sécrétan No. 349 (Fortin) und Adie No. 674 (Kew-Station-Barometer). Durch Vergleichung mit dem Normalbarometer des Instituts Fuess No. 214 wurden die folgenden Correctionen gefunden:

Sécrétan	No. 349	vor der Reise.	20 Vergl.	+ 0.^{mm}912,	M. F. =	± 0.^{mm}021
—	„ „	nach „ „	10 „	+ 0.^{mm}905,	—	± 0.^{mm}016
		Mittel		+ 0.^{mm}908.		
Adie	No. 674	vor der Reise.	14 Vergl.	+ 0.^{mm}190,	M. F. =	± 0.^{mm}04
—	„ „	nach „ „	10 „	+ 0.^{mm}186,	—	± 0.^{mm}02
		Mittel		+ 0.^{mm}188.		

Zur Berechnung wurden die resp. Mittel + 0.91 und + 0.19 benutzt.

Bergen. Die Wind-Beobachtungen in August 1886 rühren vom Lungegaards Hospital her, da der Registrierapparat des Observatoriums unter Reparatur war.

Bodö. Bei der Inspection am 1. und 2. August 1887 fand Hrr. Schroeter aus 10 Vergleichungen die Correction des Stationsbarometers Adie No. 1479 = + 0.^{mm}31; Sécrétan gab + 0.^{mm}305, mit dem Mittelfehler einer Vergleichung M. F. = ± 0.019; Adie 674 gab + 0.^{mm}316, M. F. = ± 0.014. Die Kew-Correction war in 1875 + 0.^{mm}40. Am hiesigen Institut wurde im Mai 1875 gefunden + 0.^{mm}39, und dieselbe Correction wurde von mir bei den Inspectionen am 14. Juli 1875 und am 13. August 1877 wiedergefunden. Bei der Inspection am 4. Juli 1881 fand Hrr. A. Steen aus 3 Vergleichungen die Correction + 0.^{mm}32. Am 5. November 1884 wurde das Barometer von dem 1. nach dem 2. Stockwerk hinaufgebracht. Die Beobachtungen sind mit der Correction + 0.^{mm}39 reducirt worden. Nimmt man an, dass die Aenderung der Correction von + 0.^{mm}39 auf + 0.^{mm}31 am 5. November 1884 geschehen ist, sind die im Jahrbuche gedruckten Beobachtungen von diesem Tag an bis Ende 1886 mit —0.^{mm}08 oder rund —0.^{mm}1 zu verbessern.

Die Station hat zwei Psychrometergehäuse. Das eine wurde vom Herrn Schroeter nach einem vortheilhafteren Platz übergeführt.

Nordlicht war vom Beobachter nicht notirt worden.

Brönö. Bei der Inspection am 3., 4. u. 5. August 1887 fand Hrr. Schroeter aus 11 Vergleichungen die Correction des Stationsbarometers Adie No. 1477 = + 0.^{mm}38. Sécrétan gab + 0.^{mm}39, M. F. = ± 0.017; Adie No. 674 gab + 0.^{mm}37, M. F. = ± 0.02. Die Kew-Correction war in 1875 + 0.^{mm}05. Im Mai 1875 wurde am Institut gefunden + 0.^{mm}13, und diese Correction wurde von mir am 10. Juli 1875 in Brönö wiedergefunden. Bei der Inspection am 30. Juni 1881 fand Hrr. Steen + 0.^{mm}17. Die im Jahrbuch gedruckten Beobachtungen sind sämtlich bis Ende 1886 mit der Correction + 0.^{mm}13 reducirt worden. Seit dem 1. Januar 1883 hat zweimal Wechsel des Beobachters statt gefunden. Der Beobachter, welcher vom 1. Januar bis 1. October 1883 fungirte, hat das Barometer schlecht behandelt, und es einen neuen Platz gegeben. Vorausgesetzt, das dabei die Aenderung der Correction von + 0.^{mm}13 auf + 0.^{mm}38 eingetreten ist, sind alle publicirten Beobachtungen von 1. Januar 1883 bis Ende 1886 mit + 0.^{mm}25 oder rund + 0.^{mm}3 zu verbessern.

Eg. Irrenanstalt, etwa 3 Kilometer nordlich von Christianssand. Thermometerstation. Gute Lage. Die Station wurde von mir am 1. Mai 1885 inspicirt.

Eidfjord. Regenmesserstation am innersten Theil des Hardangerfjords.

Fagernes. Bei der Inspection am 27. bis 30. Juli 1887 fand Hr. Schroeter aus 13 Vergleichungen die Correction des Stationsbarometers Adie No. 1481 = + 0.^{mm}025. Sécrétan gab + 0.^{mm}018, M F. = ± 0.018, und Adie No. 674 gab + 0.^{mm}032, M. F. = ± 0.025. Die Kew-Correction war in 1887 + 0.^{mm}05. Am Institut wurde im Mai 1875 gefunden —0.^{mm}02, und dieselbe Correction von mir bei der Aufstellung am 16. Juli 1875 in Fagernes. Das Barometer ist somit als richtig anzusehen. Indessen zeigte es sich, dass der Beobachter wegen Weitsichtigkeit immer um etwa 0.2 Millimeter zu hoch einstellt. Die Beobachtungen von Fagernes sind also von Juli 1875 bis Ende 1886 mit —0.^{mm}2 zu corrigiren.

Die älteren Beobachtungen des Minimumthermometers, bis Ende Juli 1887, sind zu verwerfen, da der Beobachter schon am 6 Uhr Morgens sowohl Index als Ende der Spiritussäule notirte.

Fjelberg. Regenmesserstation in Hol in Hallingdal.

Flesje. Die Station wurde am 31. October 1886 nach dem naheliegenden Balestrand übergeführt. Br. 61° 13′, Lg. 6° 34′ E. Seehöhe 14.^{m}7. Höhe des Therm. 1.^{m}2, des Regenmessers 0.^{m}4. Die Barometerbeobachtungen für October bis December sind auf die Seehöhe von Flesje reducirt worden.

Granheim. Die Beobachtungen fehlen vom 8. bis 13. September. Die Lücke ist durch Vergleichung mit Tonsaasen und Leirdal ausgefüllt worden.

Graven. Regenmesserstation am inneren Theil des Hardangerfjords.

Kistrand. Die Beobachtungen für Mai 1886 fehlen.

Löveid. Thermometerstation unweit der Stadt Skien.

Ranen. Bei der Inspection am 6., 7. und 8. August fand Hrr. Schroeter aus 8 Vergleichungen die Correction des Stationsbarometers Adie No. 1480 = + 0.^{mm}28. Sécrétan gab + 0.^{mm}286, M. F. = ± 0.014, Adie No. 674 + 0.^{mm}270, M. F. = ± 0.^{mm}015. Die Kew-Correction war in 1875 + 0.^{mm}20. Am Institut wurde in Mai 1875 gefunden + 0.^{mm}14. Bei der Aufstellung in Ranen am 11. Juli 1875 fand ich + 0.^{mm}31. Am 3. August 1881 fand Hrr. Steen + 0.^{mm}27. Das Barometer hat sich also gut erhalten.

Die Höhen der Thermometer und des Regenmessers sind vom 3. Januar 1881 ab resp. 4.4 und 4.7 Meter gewesen.

Rundalen. Regenmesserstation östlich von Voss.

Röros. Bei der Inspection am 12. August 1887 fand Hrr. Schroeter aus 5 Vergleichungen mit Adie No. 674 die Correction des Stationsbarometers Adie No. 1561 = + 0.^{mm}32, M. F. = ± 0.02. Bei meiner letzten Inspection am 22. Mai 1885 (Siehe Jahrbuch für 1884, VIII) fand ich + 0.^{mm}36.

Röst. Die Minimumthermometerbeobachtungen sind unbrauchbar, ebenso die Nebelbeobachtungen. Beob. Min. ist nach den ordinären Beobachtungen aufgeführt. Mittel durch Vergleichung mit Bodö berechnet.

Soggendal. Regenmesserstation an der Südwestküste.

Südvaranger. Die Feuchtigkeitsbeobachtungen für October 1886 sind unbrauchbar.

Svolvær. Telegraphenstation in Ost-Lofoten. Die Station hat dieselben Instrumente, welche früher in Lödingen sich befanden. Bei der Inspection am 21. Juli 1887 fand Hrr. Schroeter aus 7 Vergleichungen die Correction des Stationsbarometer Adie No. 1483 = + 0.^{mm}22. Sécrétan gab + 0.^{mm}217, M. F. = ± 0.026; Adie No. 674 gab + 0.^{mm}233, M. F. = ± 0.017. Die Kew-Correction war in 1875 + 0.^{mm}15. Im Juli 1875 fand ich in Lödingen + 0.^{mm}18, und am 18. Juli 1881 fand Hrr. Steen + 0.^{mm}17. Die Beobachtungen in Svolvær sind mit + 0.^{mm}22 reducirt worden. Die übrigen Instrumente haben eine gute Aufstellung.

Throndhjem. Thermometerstation. Gute Lage in der Vorstadt Ihlen. Seit 1. Januar 1887 vollständige Station II Ordnung.

Tromsø. Bei der Inspection am 23., 24. und 25. Juli 1887 fand Hrr. Schroeter aus 7 Vergleichungen die Correction des Stationsbarometers Adie No. 1484 = + 0.^{mm}21. Sécrétan gab 0.^{mm}211, M. F. = ± 0.02 und Adie No. 674 gab + 0.^{mm}217, M. F. = ± 0.01. Am 21. Juli 1883 fand ich + 0.^{mm}18. Die Nebel-Beobachtungen gaben zu viel Nebel.

Udsire. Für November und December 1886 sind die Beobachtungen am Minimumthermometer unbrauchbar; Mittel und Minimum der Temperatur berechnet durch Vergleichung mit Skudesnes. Beob. Min. ist aus den ordinären Beobachtungen herausgenommen.

Ullensaker. Regenmesserstation zwischen Christiania und Eidsvold.

Ullensvang. Die Beobachtungen fehlen vom 7. bis 11. Juli und vom 6. bis 11. September. Die Lücken sind durch Vergleichung mit Bergen ausgefüllt worden.

Voss. Eisenbahnstation östlich von Bergen. Gute Lage. Die Station wurde von mir am 10. August 1886 inspicirt.

Varhaug. Regenmesserstation auf Jäderen, südlich von Stavanger.

In Bezug auf die Schwerecorrection ist auf das Jahrbuch für 1882, Vorwort, Seite III und IV zu verweisen.

Die Tabelle auf Seite VIII giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchtthürmen werden die Beobachtungen vom betreffenden Leuchtfeuerverwalter ausgeführt.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III dritter —
R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens, kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, inclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[2]).

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

● Regen.	n Nacht	Als Exponent
✱ Schnee.	a Vormittag	
△ Graupeln.	p Nachmittag	
≡ Nebel.	o Schwach	
⌴ Reif.	2 Stark	
∞ Höhenrauch.	1 Erste Beobachtungsstunde.	
↗ Starker Wind.	2 Zweite —	
⊼ Gewitter.	3 Dritte —	
< Blitz ohne Donner.		
⋔ Nordlicht.		
⊕ Sonnenring.		
⦶ Sonnenhof.		
⦷ Mondring.		
⦸ Mondhof.		

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ●1, Regen 8^h Morgens; ✱3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II.

beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolirte Werthe sind mit Cursiv gedruckt.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und das Normalbarometer (wahre Barometerhöhe), aber nicht auf die Meeresfläche und nicht auf die Normalschwere reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind für alle Stationen des südlichen Norwegens bis an die Breite von Trondhjem ($63^1/_2$ Grad) als Mittel der drei täglichen festen Beobachtungen und der Minimumtemperatur bestimmt. Für die Stationen, welche eine nördlichere Lage haben, ist die im Jahrbuch für 1884, Vorwort S. XII—XIII angegebene Berechnungsweisse angewendet worden.

Für Christiania und Aas sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt wurden.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet. Für Dovre, Röros und Tönset ist Correction wegen des Luftdrucks an den Mitteln angebracht worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Als Anhang I folgen Beobachtungen über die Bewegung der Cirruswolken.

Als Anhang II sind dynamische Windrosen für 24 Stationen beigegeben. Wenn eine Windrichtung während eines Monats nicht notirt worden ist, so wird dies durch einen Strich bezeichnet. Bei der Berechnung des Jahresmittels sind die für jeden Monat und für jede Windrichtung gefundenen Summen der Windstärke zusammenaddirt, und als Divisor die Anzahl der sämtlichen für das Jahr notirten respectiven Windrichtungen benutzt, welche letztere aus dem 2. Theil des Jahrbuches „Windvertheilung: Jahr" entnommen ist.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *J. Schroeter*, *C. Krafft* und *H. Chr. Löcken* ausgeführt.

Christiania, November 1887.

H. Mohn.
