Inhalt.

Vorwort.

I. Meteorologische Beobachtungen an zwölf Stationen in Norwegen 1892.

II. Monats- und Jahres-Resumé für das Jahr 1892.

III. Anhang. Beobachtungen der Bewegung der Cirruswolken 1892.

Druckfehler und Verbesserungen.

Im Jahrbuch für 1892:

In früheren Jahrbüchern:

Länge und Breite für Egeland, Soggendal und Sveingaard. Die richtigen Werthe findet man im Jahrbuch für 1892.

Vorwort.

Das Jahrbuch für 1892 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 89 Stationen: von letzteren sind 40 solche, die mit Quecksilberbarometern versehen sind, 8 Stationen mit Psychrometern, 6 Leuchtfeuerstationen, und 35 Regenmesserstationen.

Im Sommer 1893 unternahm ich eine Inspectionsreise nach den Stationen im Glommenthale, am Trondhjemsfjord, in Nordland und in Finmarken. Als Reise-Control-Barometer diente zuerst das Barometer Fuess No. 270. Nachdem dies Instrument in Sydvaranger zerschlagen worden war, nahm ich das Barometer dieser Station, Adie No. 1489, als Control-Barometer für die Stationen Vardö, Kistrand und Gjesvær. In Alten bekam ich das Barometer Fuess No. 361 aus Christiania durch die Post hinauf geschickt, und mit diesem wurde daselbst Adie No. 1489 verglichen. Auf der Rückreise verglich ich Fuess No. 361 mit dem Stationsbarometer in Trondhjem, und fand dieselbe Correction für dieses wie nach den Vergleichungen auf der Ausreise mit Fuess No. 270. Bei allen Vergleichungen der Barometer, sowohl am Institut wie an den Stationen, ist die Wirkung von Luft im Vacuum durch Beobachtungen mit verschiedener Grösse des Vacuums bestimmt und berücksichtigt worden. Das Normalbarometer Wild-Fuess No. 214 des Instituts zeigte sich frei von Luft.

1893. Juni 2.—19. ergaben 22 Vergleichungen der Reise-Controlbarometer mit dem Normalbarometer Fuess No. 214 die folgenden Correctionen c_0 der Reisebarometer, für Luft im Vacuum reduciert, auf Fuess No. 214 + 0.12 mm.:

für Fuess No. 270 $c_0 = +0.09$ mm. M. F. $= \pm 0.026$ mm.
„ Fuess No. 361 $c_0 = 0.00$ „ — $= \pm 0.024$ mm.

1893. September 7.—11. ergaben 12 Vergleichungen am Institut mit dem Normalbarometer für Fuess No. 361

$c_0 = -0.05$ mm. M. F. $= \pm 0.033$ mm.

Die Beobachtungen auf der Reise mit Fuess No. 361 sind mit dem Mittel $\frac{1}{2}(0.00 - 0.05) = -0.03$ mm. für c_0 berechnet worden.

Das Stationsbarometer in Trondhjem, Adie No. 1568, wurde am 24. und 25. Juni 1893 mit Fuess No. 270 und am 25. August mit Fuess No. 361 verglichen mit dem folgenden Resultat:

24. u. 25. Juni: Fuess No. 270 ($c_0 = +0.09$ mm.) = Adie No. 1568 + 0.18 mm. M. F. $= \pm 0.053$ mm. 10 Vergl.
25. August: Fuess No. 361 ($c_0 = -0.03$ „) = — „ — + 0.15 „ — $= \pm 0.057$ „ 7 —

Der Unterschied ist nur 0.03 mm., und die Uebereinstimmung der beiden Reise-Controlbarometer befriedigend.

Das Stationsbarometer von Südvaranger, Adie No. 1489, welches als Controlbarometer für die Stationen Vardö, Kistrand und Gjesvär diente, wurde in Alten (Bossekop) mit Fuess No. 361 verglichen. Vom 5. bis 16. August ergaben 26 Vergleichungen, Fuess mit $c_0 = -0.03$ mm. reduciert. die Correction (aufs Normalbarometer + 0.12 mm.) = + 0.43 mm. (M. F = ± 0.037 mm.). In 1875 wurde am Institut die Correction zu + 0.42 mm. gefunden. In 1883 fand ich in Südvaranger die Correction + 0.37 mm., durch eine ganz kurze Vergleichungsreihe von nur einigen Stunden. Das Barometer Adie No. 1489 hat sich also als Controlbarometer für die genannten Stationen auf der Reise von Südvaranger bis Alten gut bewährt, wovon auch die unten mitgetheilten Vergleichungen in Gjesvär zeugen. Auf der späteren Reise von Alten nach Trondhjem hat es sich geändert, indem Vergleichungen in Tromsö, Bodö und Trondhjem die Correction resp. + 0.61, + 0.57 und + 0.61 ergaben. Die Ursache dieser Aenderung ist unaufgeklärt geblieben.

Auf der Reise wurden sämmtliche Quecksilberthermometer der Stationen mit einem in Fünftelgraden getheilten Thermometer Ådermann No. 219 in Wasser verglichen. Die Correctionen des No. 219 auf das Luftthermometer waren genau bekannt nach Vergleichungen mit einem vom Bureau international des Poids et Mesures verificierten Thermometer von Tonnelot.

Auf der Reise wurde auch ein Assmann'sches Aspirationspsychrometer mitgenommen, mit welchem ich die Thermometer und Psychrometer der meisten Stationen zu vergleichen Gelegenheit hatte.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen.

Alten. Durch 26 Vergleichungen mit Fuess No. 361 ($c_0 = -0.03$ mm.) fand ich am 5.—16. August 1893 die Correction des Stationsbarometers Adie No. 1485 = + 0.175 mm (M. F. = ± 0.046 mm.). In 1881 fand Hrr. Steen + 0.14 mm., in 1883 fand ich + 0.12 und in 1888 + 0.32 mm. Diese letztere ist zweifelhaft, da das Controlbarometer in 1888 auch für das Vardöbarometer eine zu hohe Correction gab, und in 1889 seine Correction auf der Reise änderte. Die Beobachtungen in diesem Jahrbuche sind mit der Correction + 0.175 mm. bei der Barometerhöhe 757 mm. reduciert worden.

Die Barometerhöhen in den Jahrbüchern für 1888, 1889, 1890 sind mit —0.1 mm., die Luftdruckwerthe im Jahrbuche für 1891 mit —0.2 mm. zu verbessern.

Andenes. Viele unsichere Angaben des Minimumthermometers.

Bodö. Durch 21 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 4.—6. Juli 1893 die Correction des Stationsbarometers Adie No. 1479 = + 0.32 mm. (M. F. = ± 0.037 mm.). In 1881 fand Hrr. Steen + 0.32 mm., in 1887 Hrr. Schroeter + 0.31 mm.

Brönö. Durch 17 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 30. Juni—2. Juli 1893 die Correction des Stationsbarometers Adie No. 1477 = + 0.30 mm. (M. F. = ± 0.10mm.). In 1887 fand Hrr. Schroeter + 0.38 mm. Früher ist die Correction dieses Barometers auch etwas schwankend gefunden. Die Luftdruckswerthe in der Abtheilung I sind mit + 0.38 mm., diejenigen in Abtheilung II mit + 0.30 mm. reduciert worden. Die Barometerhöhen in den früheren Jahrbüchern vom November 1889 ab bis Ende 1891 und in diesem Jahrbuch Abth. I sind mit —0.1 mm. zu verbessern.

Dovre. Die Meereshöhe dieser Station, deren Bestimmung bisher auf einer Combination von Wegbaunivellements mit barometrischer Controle beruhte, ist im Sommer 1893 durch die Güte der Eisenbahnbauverwaltung durch geometrisches Nivellement genau bestimmt worden. Die neue exacte Meereshöhe ist 648.9 Meter, und übersteigt die ältere (643.2) mit 5.7 Metern. In der Abtheilung I ist die ältere Höhe sowie das Argument für die Schwerecorrection stehen geblieben. In der Abtheilung II und in der Uebersichtstabelle der Stationen findet man die richtige Höhe so wie das richtige Argument für die Schwerecorrection.

Eidsvold. Am 19. Juli 1892 wurde die Station von dem Gehöfte „Dokken“ nach dem ganz nahe liegenden Gehöfte „Bakken“ verlegen. Die Meereshöhe des neuen Orts des Barometers ist sehr nahe dieselbe wie die ältere. Die Thermometer haben am neuen Orte einen viel günstigeren Platz erhalten wie früher. Sie stehen an der NW Ecke des Hauses ausserhalb dieses, die Thermometerbeschirmung gut gegen die Sonne geschützt. Regenmesser und Windfahne stehen sehr gut.

Fagernes. Durch 5 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 10. Juli 1893 die Correction des Stationsbarometers Adie No. 1481 = + 0.10 mm. In 1887 fand Hrr. Schroeter + 0.02 mm. Die Beobachtungen in diesem Jahrbuch sind mit + 0.10 mm. berechnet worden. In den Jahrbüchern für 1890 und 1891 sind die Barometerhöhen mit + 0.1 mm. zu verbessern. Viele unsichere Angaben des Minimumthermometers.

Gjesvär. Durch 13 Vergleichungen am 30. Juli—1. August 1893 mit Adie No. 1489 (c = + 0.43 mm.) fand ich die Correction des Stationsbarometers Adie No. 1487 = + 0.06 mm. (M. F. = ± 0.041 mm.). In 1875 wurde am Institut gefunden + 0.06, in 1881 vom Hrrn. Steen in Gjesvär + 0.08, in 1888 von mir + 0.07 mm. Diese Uebereinstimmung giebt ein gutes Zeugniss für die Richtigkeit der angewandten Correction des Controlbarometers Adie No. 1489. Das Minimumthermometer ist bisweilen zu hoch notiert worden (vom Winde erschüttert). Die Bemerkungen über Niederschlag sind etwas unvollständig.

Jerkin. Durch die neue Bestimmung der Meereshöhe des Barometers an der Station Dovre ändert sich die barometrisch bestimmte Höhe von Jerkin auf 963.1 Metern.

Karasjok. Eine Anfangs 1894 durchgeführte Berechnung von Normalwerthen für den Luftdruck an den norwegischen Barometerstationen, auf die 25 jährige Periode 1866 – 1890 reduciert, führt zu der barometrisch bestimmten Höhe von Karasjok von 128.7 Metern, welche in diesem Jahrbuch benutzt worden ist.

Kistrand. Durch 4 Vergleichungen des Controlbarometers Adie No. 1489 (c = + 0.43 mm.) mit dem Stationsbarometer Adie No. 1562 fand ich am Abend des 29. Juli 1893 die Correction des letzteren = —0.015 mm. (M. F. = ± 0.010 mm.). In 1880 wurde das Instrument am Institut mit dem Normalbarometer verglichen, und daraus die Correction —0.09 mm. gefunden. Die Beobachtungen in diesem Jahrbuch sind mit —0.02 berechnet worden. In den Jahrbüchern für 1885—1891 sind die Barometerhöhen mit + 0.1 mm. zu verbessern. Die Station ist an der Westseite des Porsangerfjords gelegen, unweit des Ufers und sehr frei. Die Umgebung ist flach. Die Station hat zwei Thermometergehäuse, eins gegen ESE und eins gegen SSW. Der Regenmesser steht gut. Das Barometer hängt im Telegraphsaal des Telegraphstationsgebäudes. Die Bemerkungen über Niederschlag sind etwas unvollständig.

Krappeto. Nach neueren Nivellements ist die Meereshöhe des Barometers zu 107.2 Metern zu setzen.

Ona. Die Beobachtungen vom Februar fehlen wegen Krankheit des Beobachters.

Rena. Durch 11 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 20. Juni 1893 die Correction des Stationsbarometers Adie No. 733 = —0.11 mm. (M. F. = ± 0.030 mm.). Die am Institute in 1890 gefundene Correction ist —0.15 mm., und mit dieser sind die Beobachtungen in diesem Jahrbuche berechnet worden.

Röros. Durch 10 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 22. und 23. Juni 1893 die Correction des Stationsbarometers Adie No. 1561 = + 0.30 mm. (M. F. = ± 0.069 mm.). In 1879 fand Hrr. Steen und in 1887 Hrr. Schroeter + 0.32 mm. Die Beobachtungen in diesem Jahrbuche sind mit + 0.30 mm. reduciert worden.

Skomvär. Bei meiner Revision der Barometerhöhen unserer Stationen habe ich einen Rechenfehler entdeckt, nach dessen Berichtigung die Correction des Barometers Adie No. 1482, welches früher auf Röst war, jetzt in Skomvär ist, + 0.50 mm. sein soll, anstatt —0.10, wie früher angenommen. Die Beobachtungen in diesem Jahrbuche sind mit + 0.50 mm. reduciert worden.

Stenkjär. Durch 10 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 26. und 27. Juni 1893 die Correction des Stationsbarometers Adie No. 1565 = + 0.07 mm. (M. F. = ± 0.049 mm.). Am Institut wurde in 1883 dieselbe Correction gefunden, und mit dieser sind die Beobachtungen in diesem Jahrbuche reduciert worden.

Südvaranger. Durch die Vergleichungen in Alten von Fuess No. 361 mit dem Stationsbarometer Adie No. 1489 wurde, wie oben erwähnt, die Correction des letzteren = ± 0.43 mm (M. F. = ± 0.037 mm.) gefunden. Mit dieser sind die Beobachtungen in diesem Jahrbuche reduciert worden. In den Jahrbüchern für 1885 bis 1891 sind die Barometerhöhen mit + 0.1 mm. zu verbessern. Die psychrometrische Differenz findet sich im Winter bisweilen alzu gross angegeben. Die Bemerkungen über Niederschlag sind etwas unvollständig.

Svolvär. Durch 16 Vergleichungen mit Fuess No. 270 ($c_0 = +0.09$ mm.) fand ich am 7.—9. Juli 1893 die Correction des Stationsbarometers Adie No. 1480 = + 0.21 mm. (M. F. = ± 0.044). Die zur Reduction der Beobachtungen angewandte Correction ist + 0.19 mm., also unwesentlich von der gefundenen verschieden.

Die Thermometer stehen ausserhalb der NNE-Wand des Telegraphengebäudes. Im Hochsommer hat man für die Abendbeobachtungen ein Reservethermometer an einer gen E wendenden Hauswand. Der Regen- und Schneemesser steht gut. Der Wind wird nach der Wirkung desselben auf das Wasser im Sunde beobachtet. Hohe Berge im Norden der Station machen die Beobachtung der Winde aus dieser Gegend unzuverlässig. Im Süden hat man den offenen Westtjord.

Tromsö. Durch 6 Vergleichungen mit Fuess No. 361 ($c_0 = -0.03$ mm.) am 19. August fand ich die Correction des Stationsbarometers Adie No. 1484 = + 0.20 mm. (M. F. = ± 0.065 mm.). In 1885 fand ich + 0.18 mm., in 1887 fand Hrr. Schroeter + 0.21 mm., womit die Beobachtungen reduciert worden sind.

Trondhjem. Wie oben gesagt, fand ich auf der Hinreise die Correction des Stationsbarometers Adie No. 1568 = + 0.18 mm., auf der Rückreise = + 0.15 mm. Das Mittel, + 0.17 mm., stimmt sehr wohl mit der früher bestimmte und benutzte Correction + 0.18, mit welcher die Beobachtungen reduciert worden sind.

Tönset. Durch 4 Vergleichungen mit Fuess No. 270 fand ich am Vormittag des 21. Juni 1893 die Correction des Stationsbarometers Adie No. 732 = + 0.28 mm. (M. F. = ± 0.038 mm). Da diese Correction merklich grösser war als die in 1890 am Institut (—0.05 mm.) und bei der ersten Aufstellung des Instruments in Tönset gefundene (—0.08 mm.), nahm ich mir vor, das Controlbarometer zu reinigen. Durch diese Operation kam etwas mehr Luft ins Vacuum hinein als früher, aber die späteren Beobachtungen mit grösserem und kleinerem Vacuum erlaubten mir die Wirkung dieser Luft bei der Reduction zu berücksichtigen. Am Nachmittage gaben 5 Vergleichungen die Correction des Stationsbarometers = + 0.30 mm., also wesentlich dieselbe wie diejenigen des Vormittags. Die Beobachtungen in diesem Jahrbuche sind mit + 0.29 mm. reduciert worden. Das Stationsbarometer befand sich vom 14. October bis 12. December 1892 in einem anderen, früher als Station benutzten Local. Sämmtliche Beobachtungen aus dieser Zeit sind auf das Niveau 497.9 m. reduciert worden. Es scheint nicht wahrscheinlich, dass die Aenderung der Correction des Barometers Adie bei der Uebertührung von dem einem nach dem anderen Local verursacht ist, vielmehr deuten monatliche Vergleichungen mit den Nachbarstationen

darauf hin, dass die neue Correction schon am Beginn der neuen Beobachtungsreihe in Tönset im Juli 1890 eingetreten ist, kurz nach der Aufstellung der Instrumente am 17. Juni. Die in den Jahrbüchern für 1890 und 1891 gedruckten Barometerhöhen für Tönset sind also mit + 0.34 mm. zu verbessern.

Vardö. Durch 14 Vergleichungen mit dem Barometer Adie No. 1489 (c = +0.43 mm.) fand ich am 23.—27. Juli 1893 die Correction des Stationsbarometers Adie No. 1488 = +0.18 mm. (M. F. = ±0.019 mm.). Die in 1888 gefundene Correction war + 0.31 mm., aber diese ist wahrscheinlich zu hoch, wie auch der Fall, wie oben bemerkt, mit dem Alten-Barometer war. Ich setze die Correction für Adie No. 1488 = + 0.20 mm., und die in den Jahrbüchern für 1888 bis 1890 gedruckten Beobachtungen dürfen mit —0.1 mm., diejenigen für 1891 mit —0.2 mm. verbessert werden. Im Jahrbuche für 1892 sind die Beobachtungen mit der Correction —0.20 mm. reduciert worden.

Die Bemerkungen über Niederschlag sind etwas unvollständig.

Voss. Die Beobachtungstermine sind nicht in allen Monaten dieselben geblieben. In allen Monaten ist um 8 a beobachtet worden. Im Januar, November und December ist um 3 p und 7 p, im Februar um 2 p und 7 p, sonst um 2 p und 8 p beobachtet worden.

In den Jahren 1892 und 1893 sind relative Schweremessungen mit dem Sterneck'schen Apparate vom Hrrn. Professor Schiötz an mehreren Orten in Norwegen gemacht worden, unter denen sich einige von unseren meteorologischen Stationen befinden. Die aus diesen Messungen berechneten Werthe der absoluten Schwere stimmen derart mit den aus der S. XI stehenden Formel berechneten, dass die entsprechenden Correctionen für die benutzten Schwerecorrectionen für die Barometerhöhe 760 mm. die folgenden werden: Christiania: + 0.06 mm.; Tromsö: + 0.04 mm.; Alten (Bossekop): + 0.02 mm.; Gjesvär: + 0.07 mm. Im Inneren des Landes (Österdalen zwischen Rena und Hamar) werden die Correctionen nur + 0.02 mm. Diese Zahlen sind von derselben Ordnung wie die grösste erreichbare Genauigkeit der Stationsbeobachtungen.

Die Vergleichungen, welche ich auf der Inspectionsreise im Sommer 1893 zwischen dem Assmann'schen Aspirationspsychrometer und den Psychrometern und Thermometern an unseren Stationen anstellte, haben die folgenden Resultate ergeben. Die Aspirationspsychrometerbeobachtungen wurden nach Sprungs Formel, die Stationsbeobachtungen, befreit von Instrumentalfehlern nach Jelineks Tafeln berechnet.

Station.	Tag.	Uhr.	Stationspsychrometer.				Aspirationspsychrometer.				Δt	Δe	Δr

Im Mittel											−0.04	+0.08	+0.5%
Mittlere Abweichung vom Mittel											±0.16	±0.19	±1.5

Die angeführten Zahlen sind Mittel von mehreren Beobachtungen, in kurzen Intervallen ausgeführt. Die Beobachtungen wurden, wie man sieht, in den meisten Fällen zu anderen Zeiten gemacht als zu den normierten Terminen. Temperaturbeobachtungen, welche offenbar unter ungünstigen Strahlungsverhältnissen litten, stehen in einer Parenthese. Bei den Terminsbeobachtungen sind die Strahlungsverhältnisse die günstigsten, welche am Orte zu finden sind. Der Luftzug war bei den Stationspsychrometern der natürliche und in keinem Fall ein besonders starker, vielmehr in den meisten Fällen ganz schwach.

Die Tabelle auf Seite X und XI giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphen-, Eisenbahn- und Leuchtfeuer-Stationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —
R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf **die Normalschwere** reduciert.[1]) Die Reduction auf die Normalschwere nach der Formel

$$\text{Schwerecorrection} = b\,(-0.00259 \cos 2q - 0.000000196\, H)$$

wo b die auf 0° und das Normalbarometer reducierte Barometerhöhe, q die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerecorrection angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerecorrection stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerecorrection, im Sinne unreducierte minus redu-

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252.

cierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraction der angegebenen Schwerecorrection, auf die uncorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Correctionen der Thermometer auf das **Luft**thermometer reduciert worden.[1]) Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben, um 8 Uhr a. m., mit dem trocknen Thermometer, corrigiert worden. Das Minimumthermometer wird um 8 Uhr p. m. eingestellt. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr p. m. und 8 Uhr a. m., kein Minimum nachweist, ist die Temperatur für 2 Uhr a. m interpolirt und mit Cursiv gedruckt worden. Bei der unten beschriebenen Methode der Berechnung des Tagesmittels ist hierauf Rücksicht genommen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung: Scala 0 = Still bis 6 = Orkan[2]).

7. Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

● Regen.	*n* Nacht	Als Exponent
✱ Schnee.	*a* Vormittag	
△ Graupeln	*p* Nachmittag	
≡ Nebel	*o* Schwach	
⊔ Reif.	2 Stark	
∞ Höhenrauch.	1 Erste Beobachtungsstunde.	
⚡ Starker Wind.	2 Zweite —	
⊼ Gewitter.	3 Dritte —	
< Blitz ohne Donner.		
♕ Nordlicht.		
⊕ Sonnenring.		
⦶ Sonnenhof.		
⦶ Mondring.		
⦶ Mondhof.		

[1]) Dies ist durch den glücklichen Umstand erreicht, dass die Correctionen des Normalthermometers auf das Luftthermometer weniger als 0°.05 betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II., sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ● 1, Regen 8^h Morgens; ✱ 3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolierte Werthe sind mit Cursiv gedruckt.

Die Uebersichtstabellen der zweiten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobactungen plus eine Correction. Diese Correctionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christianssand, Bergen und Bossekop abgeleitet worden.[1] Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Correctionsgrössen, welche für 1892 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Factor ist, der mit der Station und dem Monate wechselt wie die Tabelle auf Seite XIII des Jahrbuchs für 1891 zeigt. Siehe auch die Bemerkungen in demselben Jahrbuche Seite XIV.

Für Christiania, Aas, Bjelland und Trondhjem sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Correction. Die Werthe dieser Correctionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Jerkin, Dovre und Tonsaasen ist Correction wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Factors c. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

---

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den ersten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *N. J. Nielsen*, *Aa. Grårud*, *K. Irgens*, *P. S. Nissen*, *H. H. Alme* und *H. Chr. Löcken* ausgeführt.

Chrsistiania, März 1894.

H. Mohn.
