Dans le supplément aux Annales de l'Observatoire Physique Central Nicolas sont publiés, sans aucune modification par rapport aux publications précédentes, les observations de l'Observatoire à Irkoutsk par chaques trois heures, de même que les résumés mensuels des observations horaires.

En outre dans la seconde partie de la même livraison sont inclues les observations detaillées des stations du 2-de ordre du réseau de l'Observatoire bien fonctionnantes et plus interessantes au point de vue météorologique, et notamment celles de:

| | | |
|---|---|---|
| Bolchoï Ouchkaniï île. | Kirensk. | Pestchanaïa Boukhta. |
| Verkhoïansk. | Krasnoïarsk. | Stretensk. |
| Viliouïsk. | Mysovaïa | Troïtskosavsk. |

Les résumés mensuels et annuels des stations indiquées ci-dessus sont déjà imprimées dans la 2-de partie des Annales de l'Observatoire Physique Central Nicolas pour 1908.

La direction immediate de l'elaboration et de l'impression des travaux de l'Observatoire pour 1908 appartenait à mon directeur—adjoint M-r I. V. Figourovsky, tandis que les observations du réseau des stations ont été élaborées par M-r V. B. Chostakovitch.

Directeur de l'Observatoire
Magnétique et Météorologique

**A. V. Voznessensky.**

Irkoutsk,
mars 1914.

# OBSERVATIONS

## DE L'OBSERVATOIRE MAGNÉTIQUE ET MÉTÉOROLOGIQUE

## à IRKOUTSK

## en 1908.

# Observations de l'Observatoire Magnétique et Météorologique à Irkoutsk en 1908.

Les méthodes et les programmes des travaux de l'Observatoire n'ont été modifiés en 1908 par rapport aux precédents. Les compléments partiels sont indiqués plus loin en détail. Toutes les observations en 1908 de même que leur élaboration se produisaient sous la surveillance du directeur-adjoint, M-r J. V. Figourovsky, à l'exception des periodes depuis le 7 jusqu'au 17 septembre et depuis le 22 septembre jusqu'au 3 octobre, quand j'étais chargé de fonctions de M-r Figourovsky, moi-même, ce dernier étant en voyage d'office.

**A. V. Voznessensky.**

---

## I. Observations astronomiques.

Les détérminations astronomiques du temps se faisaient en 1908 suivant la possibilité chaque huitaine, à l'aide de l'instrument universel de Breithaupt selon le soleil. A nos chronomètres et pendules était ajoutée encore une pendule astronomique de Strasser et Rhode n°304 avec un pendule d'acier-nickel à compensation, fabriqué par Riefler. Afin de garantir la constance de sa marche elle était installée dans le souterrain sismologique, où la température peut être rendue beaucoup plus stable, que dans l'édifice principal, qui est en bois.

Les marches diurnes des chronomètres et des pendules, en moyennes mensuelles, sont indiquées dans la table suivante:

| Mois. | Température dans la boite aux chronom. | Chronomètres marins de Wirén. | | | Chr. à poche d'Ericsson. | | Pendules de | |
|---|---|---|---|---|---|---|---|---|
| | | n° 73. | n° 135. | n° 171. | n° 105. | n° 451. | Löbner. | Strasser et Rhode. |
| Janvier | 17.°2 | —2.°9 | 0.°9 | 1.°9 | — | 0.°8 | —0.°2 | -0.°6 |
| Février | 17.0 | —2.9 | 0.3 | 1.4 | — | 1.4 | 0.0 | —0.6 |
| Mars | 17.0 | —3.5 | 0.2 | 1.1 | 0.°5 | 1.9 | 0.0 | —0.1 |
| Avril | 19.0 | —2.7 | 1.2 | 0.0 | —0.3 | 1.3 | —0.4 | —0.8 |
| Mai | 18.1 | —3.0 | 0.9 | 1.8 | —0.4 | 0.9 | —0.9 | —1.2 |
| Juin | 19.8 | 0.1 | 4.0 | 2.1 | 0.9 | 1.2 | 0.3 | 0.9 |
| Juillet | 22.7 | 1.1 | 5.4 | —1.0 | 1.1 | 1.0 | —1.0 | —0.6 |
| Août | 21.0 | 1.4 | 6.3 | 0.3 | 1.1 | 0.1 | —0.7 | 0.0 |
| Septembre | 16.0 | 0.0 | 4.0 | 0.7 | 0.4 | 0.0 | 0.1 | —0.3 |
| Octobre | 16.9 | 0.6 | 3.7 | —0.1 | 0.8 | 0.6 | 0.0 | —0.5 |
| Novembre | 16.7 | —1.7 | 2.4 | 1.6 | 1.2 | 0.6 | 0.2 | —0.4 |
| Décembre | 16.6 | —1.8 | 2.4 | 1.4 | 1.0 | 0.4 | 0.0 | —0.4 |

Pour nous rendre compte de la stabilité de l'installation de notre instrument universel, qui nous sert aussi pour la détérmination de la déclinaison magnétique absolue, nous avons fait le 25 décembre 1908 des détérminations des azimuths de nos deux mires, qui ont fourni pour l'azimuth de notre mire principale—la croix sur l'église d'Assomption—la valeur de 16°03′35″.7 ce qui ne se distingue à peu près guere de la moyenne pluriannuelle qui est 16°03′37″.

La divergence entre la valeur nouvelle de 14°29′42″.8 de l'azimuth de la croix de Notre-Dame de Kazan et celle observée anterieurement, est de même très faible.

## II. Observations météorologiques.

**Pression atmosphérique.** Les premièrs jours du mois de juin le baromètre normal de Turettini n°5 était comparé avec les baromètres à siphon nos 547 et 310 transportés par M. S. I. Savinoff de l'Observatoire M. M. Constantin à Pavlovsk. Les corrections de ces deux baromètre de contrôle étaient déterminées à Pavlovsk avant le depart et après le retour.

| | mm | mm |
|---|---|---|
| Avant le voyage le 4 juin 1908 . . . . . | n°547 +0.11 | n°310 +0.24 |
| Après le voyage le 4 août 1908 . . . . . | +0.07 | +0.25 |
| En moyen . . . . | +0.09 | +0.24 |

La différence des valeurs moyennes est égale à 0.15 mm, tandis que suivant nos comparaisons elle était égale à 0.18 mm., donc la même que celle obtenue à Pavlovsk après le voyage.

En considerant les corrections des baromètres de contrôle nous aurons les corrections moyennes du baromètre du Turettini n°5 selon tous les baromètres, lus simultannement; elles sont: d'après M. A. V. Voznessensky +0.74 mm.
d'après M. J. V. Figourovsky . . +0.75

La moyenne des corrections de n°5 est donc en 1908 +0.74 mm.

En 1900 elle était égale à +0.80 mm. Dans la publication présente des observations la correction du baromètre normal de Turettini n°5 est prise comme égale à +0.80 mm. lors ses comparaisons aux autres baromètres ouvriers.

Les valeurs horaires de la pression atmosphérique sont prises des diagrammes du baromètre enregistreur à mercure de Wild-Hasler.

**L'altitude absolue** du point de zéro du baromètre de l'Observatoire est prise cette fois égale à 474.4 m. suivant les remarques de M. A. A. Kaminski, publiées dans la 2-e partie de la 1-re livraison des Annales de l'Observatoire Physique Central Nicolas pour l'an 1907.

**Température de l'air.** L'installation des appareils thermométriques correspondants n'a pas éprouvé aucune modification essentielle. Seulement le psychromètre-aspirateur d'Assmann qui était anterieurement dans l'abri de sud, est accroché depuis le 1 janvier à un poteau au milieu de la plate-forme météorologique, à l'hauteur de 1.2 m. Il est lu pendant les observations de trois termes.

Le thermomètre enregistreur de Fuess, dont les diagrammes nous fournissaient les températures horaires, fonctionnait incorrectement depuis le 29 juin jusqu'au 4 juillet, à cause de quoi les valeurs de ces jours de relâche de même que pour des autres lacunes de courte durée sont prises des diagrammes de l'appareil-enregistreur de Richard.

**Humidité de l'air.** L'humidité de l'air horaire est calculée suivant les diagrammes des hygrographes de Richard et de Fuess, dont le second faisait de réserve. Il est à observer que lors la pluie ou la neige, les cheveux de deux instruments, qui étaient installés dans l'abri ouvert vers le nord, se couvraient de l'eau ou de la neige, d'où la defiguration temporaire de leurs diagrammes.

**Vent.** Depuis le 21 jusqu'au 27 octobre l'anémographe de Munro était hors de travail, et les données horaires ont été fournies par l'anémographe de réserve de Freiberg.

**Précipitations.** Les données horaires des précipitations ont été enlevées des diagrammes du chionographe de Hellmann. Des rares relâches, de celui-ci on a pris les diagrammes de l'ombrographe de Hellmann. La comparaison de ces deux appareils donne:

| | Mai. | Juin. | Juillet. | Août. | Septembre. |
|---|---|---|---|---|---|
| Chionographe . . . . . | 31.8 | 78.5 | 62.1 | 53.3 | 58.4 |
| Ombrographe . . . . . | 31.0 | 78.4 | 62.7 | 56.9 | 60.0 |

**Couche de neige.** En complément des observations de l'épaisseur de la couche de neige, on faisait aussi dès la moitié du mois de janvier la détermination de la densité de la neige. Ces observations sont aussi imprimées ci-dessous.

## III. Observations magnétiques.

**Observations absolues.** Parmi les remarques se rapportant aux observations magnétiques absolues il faut noter que le moment magnétique du barreau d'oscillations n°1 a changé sa grandeur (peut être vers 2 pour cent à peu près) après le 25 juin après avoir été mis en contact avec un pinceau, dont le portepinceau contenait du fer. Le 15 août le fil de soie double du théodolite de Döhring, servant aux oscillations du barreau, était rompu; il était remplacé en suite par un autre fil ordinaire, grace à quoi la torsion est devenue 16′ au lieu de 36′.

Quant à la déclinaison magnétique absolue il faut rappeler, que le 25 décembre 1908 une nouvelle détérmination de l'azimuth de la mire principale, clocher d'église d'Assomption, a donné la valeur de 16°03′36″, très rapprochée à celle d'autrefois : 16°03′37″.

**Observations de variation.** Elles étaient faites avec les instruments anciens. La détérmination de leurs constantes a eu lieu au mois de novembre 1908. L'angle de torsion de l'unifilaire à lecture directe est été trouvé égal à 21′.28 au lieu de 20′.15 obtenu en 1901 L'angle de torsion de l'unifilaire—enregistreur, suivant les données de 1905 était égal à 176′.72, la valeur trop grande de ce dernier s'expliquant par cette raison, que l'unifilaire enregistreur est muni d'un fil metallique et non en soie.

La réduction des divisions lues directement ou enlevées des diagrammes en valeurs absolues se faisaient suivant les formules de réduction, et notamment.

Pour l'unifilaire à lecture directe . . . . . $D = D_0 + 0.99862\ (n - n_0)$

Pour l'unifilaire enregistreur . . . . . $D' = D'_0 + 1.00580\ (n' - n'_0)$

Les positions normales sont donné dans la table I de la publication présente. Les différences mensuelles moyennes de la déclinaison selon ces deux appareils unifilaires lors les observations de trois termes sont indiquées dans la table 2.

**Composante horizontale.** La sensibilité du bifilaire d'Edelmann à lecture directe, selon les détérmination du 29 octobre était la suivante:

$dH = 0.0002413$ en 1 cas.
$0.0002411$ en 2 cas.
$0.0002414$ en 3 cas.

donc 0.0002413 en moyen. Ainsi pour toute l'année a été pris la formule de réduction suivante:

$$H = H_0 + 0.000241\ [(h - 300) + 2.575\ (t - 17.°0)]$$

Quant au bifilaire d'Edelmann à l'enregistrement photographique, la formule de réduction de ses indications en valeurs absolues avait la forme anterieure:

$$H' = H'_0 - 0.000442\ (h' - h'_0) - 0.00022\ (t - 17.°0)$$

La détérmination de la sensibilité de ce dernier instrument, qui a eu lieu le 16 novembre a donné pour dH la valeur trés rapprochée de celle appliquée jusque là, et notamment $dH = 0.000444$.

**Composante verticale.** Elle était mesurée par les mêmes instruments que d'auparavant. La sensibilité des deux balances de Lloyd était de nouveau determinée en 1908. La balance de Lloyd à lecture directe lors la détérmination du 2 novembre a eu des sensibilités égales à 0.0002759 et à 0.0002780, donc la formule de réduction, qui est appliquée pour toute l'année, a eu la forme suivante:

$$V = V_0 + 0.000277\ [(v - 400) - 0.57\ (t - 17.°0)]$$

Pour la balance de Lloyd à l'enregistrement photographique la détérmination du 16 novembre a donné pour la sensibilité la valeur de $dV = 0.0005077$, qui est égale à l'ancienne. Donc, la formule de réduction est aussi conservé la même:

$$V' = V'_0 + 0.000508\ (v - 50) - 0.000051\ (t - 17.°0).$$

Les tables mentionnées I et II, qui contiennent les positions normales des unifilaires et leur comparaison, contiennent également les mêmes indications rélatives aux bifilaires et aux balances de Lloyd. Il est encore à noter que les variations de la température à l'interieur de la salle, où sont installés les appareils à variation, étaient bien considerables, et la temperature oscillait le long de l'année depuis 15.3° jusqu'à 23.°2.

La seconde serie des appareils enregistreurs d'Eschenhagen fonctionnait pendant toute l'année en bon ordre. Leurs diagrammes nous servaient de contrôle et partiellement pour réstituer les données, qui manquaient aux enregistreurs d'Edelmann.

**J. V. Figourovsky.**

# OBSERVATIONS DETAILLÉES

## DES STATIONS DE 2-DE ORDRE

## en 1908.

# Remarque sur les observations des différentes stations.

## Doudinka.

Le 11 avril la girouette de Wild s'était brisée. Le lendemain elle était deja reparée.

## Viliouïsk.

**Vent.** Jusqu'au 1 juillet par cause de mauvais état de la girouette, la direction du vent était determinée à l'aide de la boussole, et sa force—à l'aide du toucher. Dès le 1 juillet la girouette est reparée.

## Kirensk.

**Abri psychromètrique.** Le 24 juin les instrument ont été transportés à l'abri nouveau de l'ancien. La température minima est indiquée selon le thermomètre-enregistreur pour le mois d'octobre.

## Krasnoïarsk.

Dès le 2 septembre 1908 la station est transportée de la cour de l'hôpital militaire à la cour de M. le D-r P. N. Konovaloff; les hauteurs des thermomètres et de la girouette sont changées, celle du pluviomètre reste la même que d'auparavant. Depuis le 4 jusqu'au 15 août le baromètre était installé dans une autre chambre de l'hôpital à la même hauteur au dessus du plancher. Le 2 septembre il est transporté dans la maison de M. le D-r Konovaloff. Sa nouvelle hauteur absolue ne reste jusqu'ici que peu exacte. Donc nous avons adopté en attendant l'altitude anterieure.

## Bolchoï Ouchkaniï.

La pression atmosphérique est observée depuis le mois de septembre à l'aide du baromètre aneroïde n° 317, auquel à 720 mm. et à 0° est à ajouter une correction—1.0 mm.

## Tchita.

L'inspection de la station a eu lieu le 5 et le 6 juin 1909. Elle était faite par M. Chostakovitch.

**Baromètre.** La correction du baromètre a eu en juin 1909 la valeur de —1.06 mm., qui était appliquée également en 1908 aux indications de cet instrument.

L'altitude du baromètre suivant le nivellement de M. Chostakovitch est égale, depuis le 17 novembre 1907, à 679.2 m. Les appareils d'exterieur sont transportés de la cour du gymnase de filles à la cour de la maison de l'observateur le 18 novembre 1907. Le cage psychrométrique à ventilation et les instrument y installés ont été transportés depuis le mois de novembre 1907 à l'abri modèle normal, qui n'est pas peinturé et dont la position dans la cour de l'observateur n'est pas tout à fait favorable: il y a dans l'approximité de l'abri des sapin et de bouleaux; vers le nord l'espace est libre.

La girouette est installée depuis le novembre 1907 sur le toit d'un hangar où elle est exposée aux vents de toutes direction.

**Pluviomètre.** Le pluviomètre se trouve près de l'abri nouveau, mais il n'a plus la defense de Nipher, cétte dernière n'etant pas transportée avec lui. Donc depuis le mois de novembre 1907 il n'en avait plus.

## Perevalnaïa.

**Baromètre.** M. V. B. Chostakovitch a inspecté la station le 14 juin 1909; lors cette inspection il a déterminé la correction du baromètre de Turettini n°7, qui est égale à +0.16 mm. La correction precédente etant égale à +0.15 mm. la deviation reste négligeable. Les indications du baromètre pour 1908 sont corrigé par +0.16 mm.

**V. B. Chostakovitch.**
