HURRICANES - 1945

During 1945 there were ten tropical disturbances of which four attained full hurricane force.

I TROPICAL DISTURBANCE JUNE 19-28.

On the 19th of June a small tropical low developed in the general region of San Andres Island southeast of Puerto Cabezas, Nicaragua, with evidence showing on the surface map of a circular isobaric pattern. The 0030 GMT map of the 20th showed a closed isobaric low for the first time, and during the first 12 hours of the storm's existence it moved 13 to 16 knots. During this time it was causing weather over an area of 200 to 300 miles in diameter. By 1230 GMT of the 20th it was located at lat.- 18N long.-86W. The storm began a definite change of direction for the first time west of Swan Island where it began moving toward the north, having slowed down to approximately 8 knots. The trajectory of the storm continued northward for the next three days, during which time it was of weak intensity and causing widespread intermittent rain and squall areas.

While the storm was moving northward through the Yucatan Channel and into the Gulf of Mexico there existed a weak frontal trough over the eastern seaboard with a high cell situated over the Appalachian Mountains and one east of Bermuda. The trough was laying northeast-southwest, and it seemed that the path would continue northward with a slow swinging into the north-northeast due to the presence of the trough and its expected movement.

However, by the 23rd, when the storm had been located at lat.- 27.8N long.-86.3W, on the 1230 GMT map, it began re-curving to the east-northeast. The frontal trough had entirely dissipated by this time, and the winds aloft, during its northward movement, were light variable over the southeastern states. Re-curvature may have been due to the intensifying and building up of the disturbance, bringing it under the influence of the prevailing westerly winds aloft.

The storm crossed the coastline of Florida approximately 0900 GMT of the 24th in the vicinity of Cedar Keys. On the afternoon of the same day it moved into the Atlantic Ocean some distance north of Daytona Beach, and it wasn't until the storm was centered over water north of lat.- 30N that it reached moderate intensity with an increase to 10-15 knots translational speed.

A northeastward movement continued to be the general path of the storm for the next four days with the lowest pressure reported at Cape Hatteras, North Carolina, and a maximum wind of 47-54 knots being reported from a ship located at lat. - 38.2N long. - 69.5W. In the early stages of development before hurricane intensity was reached, wind aloft data showed the cyclonic circulation as high as 16000 feet.

II TROPICAL DISTURBANCE JULY 18-22.

As early as the fifteenth of July, a trough in its first stages was noticeable over the Yucatan Peninsula in the winds aloft data up to 8000 ft. Sufficient heating and convergence took place for the formation of showers and scattered thunderstorms to occur along this trough line late in the evening of the same day. The trough stagnated for the following 24 hours, giving rise to light shower areas over land, and on the 17th a curvature of the isobars across the trough could be detected on the 1230 GMT map, probably indicating an increase in activity. During the next 36 hours the trough moved westward and by the evening of the 18th it was laying approximately north-south from the Tehuantepec Pass northward through the Gulf of Mexico into Louisiana. A first advisory was issued concerning a slight tropical disturbance which was believed to be forming along the trough line on the 18th, although there were no definite indications either on the surface or winds aloft maps that a closed cyclonic circulation existed at any level. However, on the 19th winds up to 6000 ft. along the Mexican coastline showed a return westerly circulation.

The movement of the storm area fluctuated from north-northwest to north-northeast until the 20th when it was located in the vicinity of lat. 28.4N long.-93W. The direction of movement was quite erratic at times, very slow and indeterminate, probably due to the slight intensity of the disturbance, and also due to the existence of a high cell northeast of Bermuda which was affecting the circulation over the eastern half of the United States. After 1230 GMT on the 20th the storm curved toward the west and continued in a westward direction until it began dissipating on July 22nd off the coast of Texas near Corpus Christi. At no time did this storm cause winds of over 35 knots near the center. The storm area, during its greatest intensity, covered an area of 150 to 200 miles consisting mostly of rain and showers of slight to moderate intensity to the north and east of the center.

III TROPICAL DISTURBANCE AUGUST 1-4.

On the first of the month there were signs evident both on the surface and winds aloft maps that a disturbance might be forming in a general easterly direction from Barbados in the vicinity of lat. -12.5N long.- 56W. On the 1230 GMT map of the 2nd the center of the low pressure area was located at lat.- 13.2N long. 58.8W or about 60 miles east-northeast of Barbados. By this time the storm was showing signs of slight intensity, and a closed low circulation became apparent in the winds aloft flow and on the surface isobars. During the first 36 hours of the storm's existence it moved northwestward 10 to 12 knots.

The Bermuda High was prevailing over the West Indies preventing the storm from moving further in a northwestward direction, and it is believed that the position of this high actually caused the storm to begin turning into the west on the 3rd. At this time both winds aloft and surface winds began increasing with a maximum wind reported of 45 knots, and along with a spreading of the area of bad weather, indicated that the intensity of the storm had increased from slight to moderate. Weather consisted of moderate to occasionally heavy squalls 50 to 100 miles north and east of the center.

By 1230 GMT of the third the disturbance was located at lat. - 16.5N long. - 64W, moving in a westward direction at 12 knots, and winds were reported between 45 and 50 knots at the center. As the storm approached Ciudad Trujillo, the stronger winds from the north were cut off by the mountainous terrain of Hispanola, and the disturbance became more like a wave on an "Easterly Wave" which was moving westward. Weather conditions in a 150 mile band to the rear of the wave consisted of scattered towering cumulus and cumulonimbus clouds along with overcast altostratus and light to moderate rain.

The storm slowly swung toward the northwest again, and on the 4th maximum winds estimated as high as 52 knots were reported three to five hours before the storm moved inland. At approximately 1500 GMT the low pressure area moved inland about 60 miles west of Ciudad Trujillo. Movement over land caused the storm to dissipate; however, reports showed that heavy cloudiness and shower areas continued to exist over the island during the remainder of the day.

IV TROPICAL DISTURBANCE AUGUST 18-21.

The disturbance seems to have developed from an easterly wave which was first located near Parimaribo, Dutch Guiana on the 16th of the month. The wave was oriented north-northeast to south-southwest and moved northwestward at 10 knots, reaching the area of Fort de France on the 18th. During early stages of the wave development, a tropical low pressure area formed on the wave, and it was first located in the vicinity of lat.-18N long. - 56W on the 18th.

During the first two days of the storm's existence, it moved 12 to 14 knots in a general west-northwestward direction to a point north of Puerto Rico, where it was located at lat. - 20.2N long.-67W on the 20th at 0030 GMT. Weather consisting of light to moderate squalls and occasional thunderstorms occurred over an area of 60 to 100 miles radius from the storm center. Much stronger winds and the majority of the bad weather encountered were found in the northeast quadrant, while comparatively light winds were found to the southwest of the center. Throughout the entire history of the storm, there were only slight indications of a closed circulation in the lower levels, with a wind shift typical of that across an easterly wave evident in the upper levels.

This tropical disturbance never developed into a full hurricane, for, similar to the disturbance of July, the air aloft and to the west of the disturbed area was very dry. This, together with the dry air preceeding the storm, and the cutting off of the southerly winds as the disturbance passed to the north of the islands, probably accounted for the breaking down of the storm before full hurricane intensity could be reached.

During the 20th, the movement of the storm increased to 14 to 18 knots and it continued moving in a west-northwestward direction. Winds as high as 50 knots were reported by reconnaisance flights, but on the average reported winds were 30 to 40 knots. After dissipation began on the 21st, a wind shift line was still evident, being attended by light squalls and isolated thunderstorms, even though it was no longer possible to locate an exact center. After several hours of this, the disturbance finally dissipated southwest of Great Exuma, or approximately 270 miles southeast of Miami early on the 21st.

V TROPICAL DISTURBANCE AUGUST 24-27.

This disturbance developed along a trough line which was first oriented north-northeast to south-southwest, located to the west of the Tehuantepec Pass and extending into the Gulf of Mexico. By the 20th the trough line had moved into the pass, oriented as before, and was causing scattered shower areas at the coastal stations between Tuxpan and Campeche, Mexico, along with a definite wind shift as high as 7000 feet. During the 20th the winds above 6000 feet began shifting around to the north on the west side of the trough as far north as Texas with southeasterly winds over the entire area from Salvador to Tehuantepec and Minstitlan. Movement of the trough was very slow westward and during the next 24 hours it had moved west of Vere Cruz and Tehuantepec, showing signs of a completed low circulation above 12000 feet along the southern Gulf coast. This west and southwest flow from Vere Cruz to Merida slowly worked into the lower levels and by the 23rd the westerly circulation existed as low as 6000 feet.

At 1230 GMT on the 24th the storm was central at lat. - 21.5N long.- 94.5W, moving northward 8 to 10 knots. Winds of 43-65 knots were reported near the center which was located 150 to 200 miles east of Tampico. Early on the 25th the storm began moving slowly toward the west-northwest; movement of the center accelerated to approximately 20 knots until the storm was central at lat. - 26.3N long. - 96W on the 0030 GMT map of the 26th.

The gradual shifting of the storm toward the north-northwest was due to the influence of a high cell located over the central United States, causing the storm area to move with the westward flow around the southern portion of the high pressure area. However, the high slowly subsided and eventually broke down into two separate cells, and the direction of the path of the storm, just before it moved inland on the 27th, changed toward the north-northeast.

The storm, having greatly intensified during the 25th and 26th of the month, was probably of hurricane intensity by the time it approached the Texas coastline on the 26th. Winds of 117 knots were reported near the center with 65 knot winds over a large area. On August 27th the tropical disturbance entered the continent near Port Lavaca, Texas.

It's trajectory, after moving inland, continued in a north-northeastward direction, having slowed down to 5-10 knots. No flights in the Eastern sector were affected; no cancellations or delays took place at Brownsville despite the extreme nearness of the center. Ceilings and visibilities remained above minimums except for very brief periods in rain squalls. Surface winds did not exceed 35 knots except during gusts. Gulf Coast stations in the sector south of Brownsville were not adversely affected by this storm due to subsidence to the south and west of the center. In the earlier stages, however, while to the south of Vere Cruz, extensive areas of stratus and rain were encountered by pilots, but there was little turbulence reported. The low slowly filled and dissipated south of Navasota, Texas, on the morning of August 28th.

VI TROPICAL DISTURBANCE AUGUST 31.

On the 30th of August 2 wave on the Intertropical Front, which was lying north of the Canal Zone, moved westnorth-westward into the Caribbean Sea above the 17th parallel. On the 31st about 0600 GMT signs of a tropical disturbance were reported by a ship in the vicinity. It is believed that the disturbance did not develop into closed system until the wave had passed to about 100 miles northwest of Swan Island. During this time considerable squalliness existed over a moderate area throughout the northeast quadrant.

At 1200 GMT on the 31st a definite location of the center was established at lat. - 17-30N long. - 86-30W and thereafter this disturbance moved westward at approximately 12 knots and entered the coast of British Honduras in the immediate vicinity of Belize at about 1800 GMT.

Maximum winds near the center were estimated at 60-70 knots. After entering over the land the disturbance began to dissipate and did not re-generate. Convection, convergence and the advection of moisture in connection with the easterly component of motion during the dissipating stages of the storm caused abnormal CB activity along the lower Gulf coast for sometime thereafter.

VII TROPICAL DISTURBANCE SEPTEMBER 3-6

On September 1st a trough line, which had been moving westward across Haiti and Cuba, had developed to the extent of becoming a surface front. This trough-frontal system was gradually becoming coincident with a weak polar front which had been moving eastward across the Gulf of Mexico at this time.

On the 4th of September there were evidences of a cyclonic circulation developing along the front which now lay in a NNE-SSW line through Miami. This circulation located in the vicinity of lat. - 23-30N and long. - 82-45W at about 1200 GMT was traveling in the wind flow stream of a High pressure cell whose center was to the east of Miami. Squally weather in the northeast became more pronounced as evidences of the circulation intensified. About 2000 GMT September 4, Miami was experiencing very squally weather with surface wind gusts to 41 knots as the center of activity moved northward along the 82W meridian. At 2000 GMT September 4, the disturbance was central lat. 25-35N long. - 82W and moving north or north-northwestward at 14 knots.

The disturbance began to break down as it commenced to move northwestward to west-northwestward, becoming a squall area. At this time there was little indication of a cyclonic circulation. From all facts present only an area of squally weather was present which moved in the wind flow pattern more probably as an open wave or perturbation of the frontal-trough. At 1200 GMT on the 5th the disturbed area was located at lat. 29-15N long. - 86-30W and at 0600 GMT on the 6th it had moved inland slightly to the east and north of New Orleans with gradually improving conditions along the Gulf coast thereafter.

VIII TROPICAL DISTURBANCE SEPTEMBER 9-11

On the 9th of September military reconnaissance planes encountered signs of a tropical disturbance northeast of Guadeloupe in the vicinity of lat. - 18N long.-59W at 1700 GMT. The disturbance was reported of moderate intensity, moving north-northwestward to northwestward at about 14 knots with winds of force 9 in eastern semi-circle and passing 160 miles to the north of St. Johns. The disturbance was embedded in the wind flow of the High pressure system centered to the northeast of St. Johns and its northwestward to north-northwestward movement persisted.

On the 10th the disturbance was situated at lat. 19-50N long. - 61-50W with winds of 50 knots near center and 35 to 40 knots within 100 miles in eastern semi-circle. It continued moving northwestward and reconnaissance flights estimated the storm center at lat. - 21-40N long. - 63-30W at 2000GMT September 9. Subsequent reconnaissance flights on September 11, estimated the storm center at lat.-26N long. - 66W at 1200 GMT.

No further advices were issued concerning this storm as it moved northward and then recurving to the north-northeastward to pass to the east of Bermuda. Study of the constant pressure charts indicated dry air being drawn into the vortex in the western semi-circle aloft. This dry air prevented the storm from deepening and intensifying into a full Hurricane before recurvature and it passed off into the central Atlantic as an extra-tropical storm.

IX TROPICAL DISTURBANCE SEPTEMBER 11-17

The Florida Hurricane that passed near and to the west of Miami on the 15th of September, was first indicated as a disturbed area to the east-northeast of St. Johns. Late on September 11th northerly and northwesterly circulation and isallobaric evidences indicated a cyclonic formation along an active easterly wave about 300 miles east of the Windward Islands. Pilot reports soon substantiated previous evidence of the existence of the disturbance which moved northwestward to the vicinity of lat.-20N after which a more westerly direction was observed. Military reconnaissance flights in the late afternoon of the 12th indicated a well developed disturbance with its center near lat. - 19N long.-60.5N with reported surface winds 40 to 60 miles from center of 60 to 65 knots.

By early morning September 13 it was recognized that the storm was approaching hurricane intensity, although still covering a small area. It continued to intensify and passed about 70 to 80 miles north of San Juan about mid-day of the 13th. Winds at San Juan did not reach hurricane force and flights over the JUA-PCO sector were not restricted. At San Juan there were frequent showers and occassional moderate to heavy thunderstorms throughout the day of the 13th. The surface winds backed gradually from WSW to SSW during the day and were moderately gusty in character. The maximum wind at the airport was about 40 knots, although stronger wind velocities might have been expected from the prevailing pressure gradient. No showers occurred for two days after passage of the storm center.

From this position the storm moved in a west-northwestward direction at 16 knots increasing in intensity and passing close to Turks Island about 0700 GMT on the 14th. This storm of Hurricane intensity continued its west-northwestward movement at about 16 knots until early on the morning of the 15th when it slowly

curved to the northward, passing close to Carysfort Reef shortly after noon.

The center passed inland over Florida and over the Army Air Base at Homestead, Florida, with that station reporting the calm center from 2125 G.T to 2215 G.T and winds maximum from the SSW at 109-113 knots after 2215 G.T. The center passed about 30 miles west of Miami moving north-northwestward and continued a slow turn to the north-northeastward passing off the Florida coast southeast of Jacksonville on the morning of the 17th about 0400 G.T. The storm continued its north-northeastward path and entered over land again between Savannah and Charleston. The storm gradually lost its intensity as it moved northward over the East coast States.

This storm of Hurricane intensity followed the general wind flow pattern at 16000 to 20000 ft throughout its entire observed path, recurving with the southerly winds in advance of a cold front moving eastward across the Gulfstream.

Additional Data is as follows:

Turks Island about 0700 G.T September 14th reported conservatively estimated wind velocity 130 knots, barometer 976.4 millibars.

Carysfort Reef (lat.- 22.3N long. - 80-10W) shortly afternoon September 15th reported lowest barometer 985.8 millibars, wind 124 knots.

Miami record: September 15th, 1945.

5:45 PM EWT	WeaBu Downtown	63 knots-sustained gust to 77 knots ENE
6:35 PM "	PAFLD	Gusts-to 83 knots SE.
6:35 PM "	WeaBu Downtown	1 minute gust 86 knots from SE
7:00 PM "	" "	1 minute gust 84 knots from SE
7:04 PM "	PAFLD	Instantaneous gust to 93 knots ESE
7:05 PM "	"	Lowest barometer 988.5 millibars

PRELIMINARY REPORT FROM THE USNB MIAMI

Maximum wind velocity five min. period 75 knots from SE at 6:36 PM
Extreme velocity 93 knots from SE at 6:36 PM. Lowest barometer 988.5 millibars at sea level at 6:14 PM.

Following from Homestead Army Air Base quote

> "Lowest barometer 951.2 millibars at sea level at 5:55 PM.
> Wind est. maximum 109-113 knots from SSW from 6:15 PM to 7:00 PM.
> Gusts considerably higher. In calm center from 5:25 PM to 6:15PM."
> unquote.

X TROPICAL DISTURBANCE OCTOBER 2-4

On the 1st of October, the Inter-tropical Front moved northward over the Canal Zone to approximately the 15th parallel with a wave forming on the front which by the 2nd had become a slight tropical disturbance central at 2000 GMT lat.- 16N long.- 82-15W.

From this position the disturbance intensified rapidly to full hurricane force over a small area and moved west-northwestward through the 3rd of October and gradually curved slowly west-southwestward through the 4th of the month. At 1800 GMT this small Hurricane passed inland over British Honduras about 60 miles south of Belize.

After passing inland the storm disintegrated while passing over the mountains of eastern Guatemala. The intense high pressure system extending over Florida and the Gulf of Mexico at this time prevented the storm from moving in a northerly direction after the early hours on the 4th. While over water winds of 75 knots prevailed over a small area around the center which had increased to 85 to 90 knots by 1200 GMT on the 4th.

SUMMARY OF TROPICAL DISTURBANCES -- 1945

(Number of storm on table corresponds with number of track on Chart)

STORM	DATES	MAXIMUM REPORTED SURFACE WIND*	LOWEST REPORTED SURFACE PRESSURE*	INTENSITY
I.	JUNE 19-28	47-54 KNOTS (SHIP REPORT)	989.2 MLBS. OR 29.21 INCHES CAPE HATTERAS, NC	MODERATE

CLASSIFICATION

Weak	29 KTS (34 MPH) or lower
Slight	30-41 KTS (35-47 MPH)
Moderate	42-56 KTS (48-65 MPH)
Hurricane	Above 56 KNOTS (65 MPH) or higher. Or 982 MB or lower, or both.

During 1945 there were ten tropical disturbances of which four attained full hurricane force.

I TROPICAL DISTURBANCE JUNE 19-28.

On the 19th of June a small tropical low developed in the general region of San Andres Island southeast of Puerto Cabezas, Nicaragua, with evidence showing on the surface map of a circular isobaric pattern. The 0030 GMT map of the 20th showed a closed isobaric low for the first time, and during the first 12 hours of the storm's existence it moved 13 to 16 knots. During this time it was causing weather over an area of 200 to 300 miles in diameter. By 1230 GMT of the 20th it was located at lat.- 18N long.-86W. The storm began a definite change of direction for the first time west of Swan Island where it began moving toward the north, having slowed down to approximately 8 knots. The trajectory of the storm continued northward for the next three days, during which time it was of weak intensity and causing widespread intermittent rain and squall areas.

While the storm was moving northward through the Yucatan Channel and into the Gulf of Mexico there existed a weak frontal trough over the eastern seaboard with a high cell situated over the Appalachian Mountains and one east of Bermuda. The trough was laying northeast-southwest, and it seemed that the path would continue northward with a slow swinging into the north-northeast due to the presence of the trough and its expected movement.

However, by the 23rd, when the storm had been located at lat.- 27.8N long.-86.3W, on the 1230 GMT map, it began re-curving to the east-northeast. The frontal trough had entirely dissipated by this time, and the winds aloft, during its northward movement, were light variable over the southeastern states. Re-curvature may have been due to the intensifying and building up of the disturbance, bringing it under the influence of the prevailing westerly winds aloft.

The storm crossed the coastline of Florida approximately 0900 GMT of the 24th in the vicinity of Cedar Keys. On the afternoon of the same day it moved into the Atlantic Ocean some distance north of Daytona Beach, and it wasn't until the storm was centered over water north of lat.- 30N that it reached moderate intensity with an increase to 10-15 knots translational speed.

A northeastward movement continued to be the general path of the storm for the next four days with the lowest pressure reported at Cape Hatteras, North Carolina, and a maximum wind of 47-54 knots being reported from a ship located at lat. - 38.2N long. - 69.5W. In the early stages of development before hurricane intensity was reached, wind aloft data showed the cyclonic circulation as high as 16000 feet.

II TROPICAL DISTURBANCE JULY 18-22.

As early as the fifteenth of July, a trough in its first stages was noticeable over the Yucatan Peninsula in the winds aloft data up to 8000 ft. Sufficient heating and convergence took place for the formation of showers and scattered thunderstorms to occur along this trough line late in the evening of the same day. The trough stagnated for the following 24 hours, giving rise to light shower areas over land, and on the 17th a curvature of the isobars across the trough could be detected on the 1230 GMT map, probably indicating an increase in activity. During the next 36 hours the trough moved westward and by the evening of the 18th it was laying approximately north-south from the Tehuantepec Pass northward through the Gulf of Mexico into Louisiana. A first advisory was issued concerning a slight tropical disturbance which was believed to be forming along the trough line on the 18th, although there were no definite indications either on the surface or winds aloft maps that a closed cyclonic circulation existed at any level. However, on the 19th winds up to 6000 ft. along the Mexican coastline showed a return westerly circulation.

The movement of the storm area fluctuated from north-northwest to north-northeast until the 20th when it was located in the vicinity of lat. 28.4N long.-93W. The direction of movement was quite erratic at times, very slow and indeterminate, probably due to the slight intensity of the disturbance, and also due to the existence of a high cell northeast of Bermuda which was affecting the circulation over the eastern half of the United States. After 1230 GMT on the 20th the storm curved toward the west and continued in a westward direction until it began dissipating on July 22nd off the coast of Texas near Corpus Christi. At no time did this storm cause winds of over 35 knots near the center. The storm area, during its greatest intensity, covered an area of 150 to 200 miles consisting mostly of rain and showers of slight to moderate intensity to the north and east of the center.

III TROPICAL DISTURBANCE AUGUST 1-4.

On the first of the month there were signs evident both on the surface and winds aloft maps that a disturbance might be forming in a general easterly direction from Barbados in the vicinity of lat. -12.5N long.- 56W. On the 1230 GMT map of the 2nd the center of the low pressure area was located at lat.- 13.2N long. 58.8W or about 60 miles east-northeast of Barbados. By this time the storm was showing signs of slight intensity, and a closed low circulation became apparent in the winds aloft flow and on the surface isobars. During the first 36 hours of the storm's existence it moved northwestward 10 to 12 knots.

The Bermuda High was prevailing over the West Indies preventing the storm from moving further in a northwestward direction, and it is believed that the position of this high actually caused the storm to begin turning into the west on the 3rd. At this time both winds aloft and surface winds began increasing with a maximum wind reported of 45 knots, and along with a spreading of the area of bad weather, indicated that the intensity of the storm had increased from slight to moderate. Weather consisted of moderate to occasionally heavy squalls 50 to 100 miles north and east of the center.

By 1230 GMT of the third the disturbance was located at lat. - 16.5N long. - 64W, moving in a westward direction at 12 knots, and winds were reported between 45 and 50 knots at the center. As the storm approached Ciudad Trujillo, the stronger winds from the north were cut off by the mountainous terrain of Hispanola, and the disturbance became more like a wave on an "Easterly Wave" which was moving westward. Weather conditions in a 150 mile band to the rear of the wave consisted of scattered towering cumulus and cumulonimbus clouds along with overcast altostratus and light to moderate rain.

The storm slowly swung toward the northwest again, and on the 4th maximum winds estimated as high as 52 knots were reported three to five hours before the storm moved inland. At approximately 1500 GMT the low pressure area moved inland about 60 miles west of Ciudad Trujillo. Movement over land caused the storm to dissipate; however, reports showed that heavy cloudiness and shower areas continued to exist over the island during the remainder of the day.

IV TROPICAL DISTURBANCE AUGUST 18-21.

The disturbance seems to have developed from an easterly wave which was first located near Parimaribo, Dutch Guiana on the 16th of the month. The wave was oriented north-northeast to south-southwest and moved northwestward at 10 knots, reaching the area of Fort de France on the 18th. During early stages of the wave development, a tropical low pressure area formed on the wave, and it was first located in the vicinity of lat.-18N long. - 56W on the 18th.

During the first two days of the storm's existence, it moved 12 to 14 knots in a general west-northwestward direction to a point north of Puerto Rico, where it was located at lat. - 20.2N long.-67W on the 20th at 0030 GMT. Weather consisting of light to moderate squalls and occasional thunderstorms occurred over an area of 60 to 100 miles radius from the storm center. Much stronger winds and the majority of the bad weather encountered were found in the northeast quadrant, while comparatively light winds were found to the southwest of the center. Throughout the entire history of the storm, there were only slight indications of a closed circulation in the lower levels, with a wind shift typical of that across an easterly wave evident in the upper levels.

This tropical disturbance never developed into a full hurricane, for, similar to the disturbance of July, the air aloft and to the west of the disturbed area was very dry. This, together with the dry air preceeding the storm, and the cutting off of the southerly winds as the disturbance passed to the north of the islands, probably accounted for the breaking down of the storm before full hurricane intensity could be reached.

During the 20th, the movement of the storm increased to 14 to 18 knots and it continued moving in a west-northwestward direction. Winds as high as 50 knots were reported by reconnaisance flights, but on the average reported winds were 30 to 40 knots. After dissipation began on the 21st, a wind shift line was still evident, being attended by light squalls and isolated thunderstorms, even though it was no longer possible to locate an exact center. After several hours of this, the disturbance finally dissipated southwest of Great Exuma, or approximately 270 miles southeast of Miami early on the 21st.

V TROPICAL DISTURBANCE AUGUST 24-27.

This disturbance developed along a trough line which was first oriented north-northeast to south-southwest, located to the west of the Tehuantepec Pass and extending into the Gulf of Mexico. By the 20th the trough line had moved into the pass, oriented as before, and was causing scattered shower areas at the coastal stations between Tuxpan and Campeche, Mexico, along with a definite wind shift as high as 7000 feet. During the 20th the winds above 6000 feet began shifting around to the north on the west side of the trough as far north as Texas with southeasterly winds over the entire area from Salvador to Tehuantepec and Minatitlan. Movement of the trough was very slow westward and during the next 24 hours it had moved west of Vera Cruz and Tehuantepec, showing signs of a completed low circulation above 12000 feet along the southern Gulf coast. This west and southwest flow from Vera Cruz to Meride slowly worked into the lower levels and by the 23rd the westerly circulation existed as low as 6000 feet.

At 1230 GMT on the 24th the storm was central at lat. - 21.5N long.- 94.5W, moving northward 8 to 10 knots. Winds of 43-65 knots were reported near the center which was located 150 to 200 miles east of Tampico. Early on the 25th the storm began moving slowly toward the west-northwest; movement of the center accelerated to approximately 20 knots until the storm was central at lat. - 26.3N long. - 96W on the 0030 GMT map of the 26th.

The gradual shifting of the storm toward the north-northwest was due to the influence of a high cell located over the central United States, causing the storm area to move with the westward flow around the southern portion of the high pressure area. However, the high slowly subsided and eventually broke down into two separate cells, and the direction of the path of the storm, just before it moved inland on the 27th, changed toward the north-northeast.

The storm, having greatly intensified during the 25th and 26th of the month, was probably of hurricane intensity by the time it approached the Texas coastline on the 26th. Winds of 117 knots were reported near the center with 65 knot winds over a large area. On August 27th the tropical disturbance entered the continent near Port Lavaca, Texas.

It's trajectory, after moving inland, continued in a north-northeastward direction, having slowed down to 5-10 knots. No flights in the Eastern sector were affected; no cancellations or delays took place at Brownsville despite the extreme nearness of the center. Ceilings and visibilities remained above minimums except for very brief periods in rain squalls. Surface winds did not exceed 35 knots except during gusts. Gulf Coast stations in the sector south of Brownsville were not adversely affected by this storm due to subsidence to the south and west of the center. In the earlier stages, however, while to the south of Vera Cruz, extensive areas of stratus and rain were encountered by pilots, but there was little turbulence reported. The low slowly filled and dissipated south of Navasota, Texas, on the morning of August 28th.

VI TROPICAL DISTURBANCE AUGUST 31.

On the 30th of August a wave on the Intertropical Front, which was lying north of the Canal Zone, moved westnorth-westward into the Caribbean Sea above the 17th parallel. On the 31st about 0600 GMT signs of a tropical disturbance were reported by a ship in the vicinity. It is believed that the disturbance did not develop into closed system until the wave had passed to about 100 miles northwest of Swan Island. During this time considerable squalliness existed over a moderate area throughout the northeast quadrant.

At 1200 GMT on the 31st a definite location of the center was established at lat. - 17-30N long. - 86-30W and thereafter this disturbance moved westward at approximately 12 knots and entered the coast of British Honduras in the immediate vicinity of Belize at about 1800 GMT.

Maximum winds near the center were estimated at 60-70 knots. After entering over the land the disturbance began to dissipate and did not re-generate. Convection, convergence and the advection of moisture in connection with the easterly component of motion during the dissipating stages of the storm caused abnormal CB activity along the lower Gulf coast for sometime thereafter.

VII TROPICAL DISTURBANCE SEPTEMBER 3-6

On September 1st a trough line, which had been moving westward across Haiti and Cuba, had developed to the extent of becoming a surface front. This trough-frontal system was gradually becoming coincident with a weak polar front which had been moving eastward across the Gulf of Mexico at this time.

On the 4th of September there were evidences of a cyclonic circulation developing along the front which now lay in a NNE-SSW line through Miami. This circulation located in the vicinity of lat. - 23-30N and long. - 82-45W at about 1200 GMT was traveling in the wind flow stream of a High pressure cell whose center was to the east of Miami. Squally weather in the northeast became more pronounced as evidences of the circulation intensified. About 2000 GMT September 4, Miami was experiencing very squally weather with surface wind gusts to 41 knots as the center of activity moved northward along the 82W meridian. At 2000 GMT September 4, the disturbance was central lat. 25-35N long. - 82W and moving north or north-northwestward at 14 knots.

The disturbance began to break down as it commenced to move northwestward to west-northwestward, becoming a squall area. At this time there was little indication of a cyclonic circulation. From all facts present only an area of squally weather was present which moved in the wind flow pattern more probably as an open wave or perturbation of the frontal-trough. At 1200 GMT on the 5th the disturbed area was located at lat. 29-15N long. - 86-30W and at 0600 GMT on the 6th it had moved inland slightly to the east and north of New Orleans with gradually improving conditions along the Gulf coast thereafter.

VIII TROPICAL DISTURBANCE SEPTEMBER 9-11

On the 9th of September military reconnaissance planes encountered signs of a tropical disturbance northeast of Guadeloupe in the vicinity of lat. - 18N long.-59W at 1700 GMT. The disturbance was reported of moderate intensity, moving north-northwestward to northwestward at about 14 knots with winds of force 9 in eastern semi-circle and passing 160 miles to the north of St. Johns. The disturbance was embedded in the wind flow of the High pressure system centered to the northeast of St. Johns and its northwestward to north-northwestward movement persisted.

On the 10th the disturbance was situated at lat. 19-50N long. - 61-50W with winds of 50 knots near center and 35 to 40 knots within 100 miles in eastern semi-circle. It continued moving northwestward and reconnaissance flights estimated the storm center at lat. - 21-40N long. - 63-30W at 2000GMT September 9. Subsequent reconnaissance flights on September 11, estimated the storm center at lat.-26N long. - 66W at 1200 GMT.

No further advices were issued concerning this storm as it moved northward and then recurving to the north-northeastward to pass to the east of Bermuda. Study of the constant pressure charts indicated dry air being drawn into the vortex in the western semi-circle aloft. This dry air prevented the storm from deepening and intensifying into a full Hurricane before recurvature and it passed off into the central Atlantic as an extra-tropical storm.

IX TROPICAL DISTURBANCE SEPTEMBER 11-17

The Florida Hurricane that passed near and to the west of Miami on the 15th of September, was first indicated as a disturbed area to the east-northeast of St. Johns. Late on September 11th northerly and northwesterly circulation and isallobaric evidences indicated a cyclonic formation along an active easterly wave about 300 miles east of the Windward Islands. Pilot reports soon substantiated previous evidence of the existence of the disturbance which moved northwestward to the vicinity of lat.-20N after which a more westerly direction was observed. Military reconnaissance flights in the late afternoon of the 12th indicated a well developed disturbance with its center near lat. - 19N long.-60.5N with reported surface winds 40 to 60 miles from center of 60 to 65 knots.

By early morning September 13 it was recognized that the storm was approaching hurricane intensity, although still covering a small area. It continued to intensify and passed about 70 to 80 miles north of San Juan about mid-day of the 13th. Winds at San Juan did not reach hurricane force and flights over the JUA-PCO sector were not restricted. At San Juan there were frequent showers and occassional moderate to heavy thunderstorms throughout the day of the 13th. The surface winds backed gradually from WSW to SSW during the day and were moderately gusty in character. The maximum wind at the airport was about 40 knots, although stronger wind velocities might have been expected from the prevailing pressure gradient. No showers occurred for two days after passage of the storm center.

From this position the storm moved in a west-northwestward direction at 16 knots increasing in intensity and passing close to Turks Island about 0700 GMT on the 14th. This storm of Hurricane intensity continued its west-northwestward movement at about 16 knots until early on the morning of the 15th when it slowly

curved to the northward, passing close to Carysfort Reef shortly after noon.

The center passed inland over Florida and over the Army Air Base at Homestead, Florida, with that station reporting the calm center from 2125 GMT to 2215 GMT and winds maximum from the SSW at 109-113 knots after 2215 GMT. The center passed about 30 miles west of Miami moving north-northwestward and continued a slow turn to the north-northeastward passing off the Florida coast southeast of Jacksonville on the morning of the 17th about 0400 GMT. The storm continued its north-northeastward path and entered over land again between Savannah and Charleston. The storm gradually lost its intensity as it moved northward over the East coast States.

This storm of hurricane intensity followed the general wind flow pattern at 16000 to 20000 ft throughout its entire observed path, recurving with the southerly winds in advance of a cold front moving eastward across the Gulfstream.

Additional Data is as follows:

Turks Island about 0700 GMT September 14th reported conservatively estimated wind velocity 130 knots, barometer 976.4 millibars.

Carysfort Reef (lat.- 22.3N long. - 80-10W) shortly afternoon September 15th reported lowest barometer 985.8 millibars, wind 124 knots.

Miami record: September 15th, 1945.

5:45 PM	EWT	WeaBu Downtown	63 knots-sustained gust to 77 knots ENE
6:35 PM	"	PAFLD	Gusts-to 83 knots SE.
6:35 PM	"	WeaBu Downtown	1 minute gust 86 knots from SE
7:00 PM	"	" "	1 minute gust 84 knots from SE
7:04 PM	"	PAFLD	Instantanous gust to 93 knots ESE
7:05 PM	"	"	Lowest barometer 988.5 millibars

PRELIMINARY REPORT FROM THE USWB MIAMI

Maximum wind velocity five min. period 75 knots from SE at 6:36 PM
Extreme velocity 93 knots from SE at 6:36 PM. Lowest barometer 988.5 millibars at sea level at 6:14 PM.

Following from Homestead Army Air Base quote

> "Lowest barometer 951.2 millibars at sea level at 5:55 PM.
> Wind est. maximum 109-113 knots from SSW from 6:15 PM to 7:00 PM.
> Gusts considerably higher. In calm center from 5:25 PM to 6:15PM."
> unquote.

X TROPICAL DISTURBANCE OCTOBER 2-4

On the 1st of October, the Inter-tropical Front moved northward over the Canal Zone to approximately the 15th parallel with a wave forming on the front which by the 2nd had become a slight tropical disturbance central at 2000 GMT lat.- 16N long.- 82-15W.

From this position the disturbance intensified rapidly to full hurricane force over a small area and moved west-northwestward through the 3rd of October and gradually curved slowly west-southwestward through the 4th of the month. At 1800 GMT this small Hurricane passed inland over British Honduras about 60 miles south of Belize.

After passing inland the storm disintegrated while passing over the mountains of eastern Guatemala. The intense high pressure system extending over Florida and the Gulf of Mexico at this time prevented the storm from moving in a northerly direction after the early hours on the 4th. While over water winds of 75 knots prevailed over a small area around the center which had increased to 85 to 90 knots by 1200 GMT on the 4th.

SUMMARY OF TROPICAL DISTURBANCES -- 1945

(Number of storm on table corresponds with number of track on Chart)

STORM	DATES	MAXIMUM REPORTED SURFACE WIND*	LOWEST REPORTED SURFACE PRESSURE*	INTENSITY
I.	JUNE 19-28	47-54 KNOTS (SHIP REPORT)	989.2 MLBS. OR 29.21 INCHES CAPE HATTERAS, NC	MODERATE
