Introduction

Ce volume fait suite aux trois volumes d'observations météorologiques précédents (1921, 1922, 1923) et il est composé suivant le même plan.

Les observations absolues ont continué à être faites trois fois par jour à 7h., à 13h. et à 18h. (Temps civil du 2e fuseau).

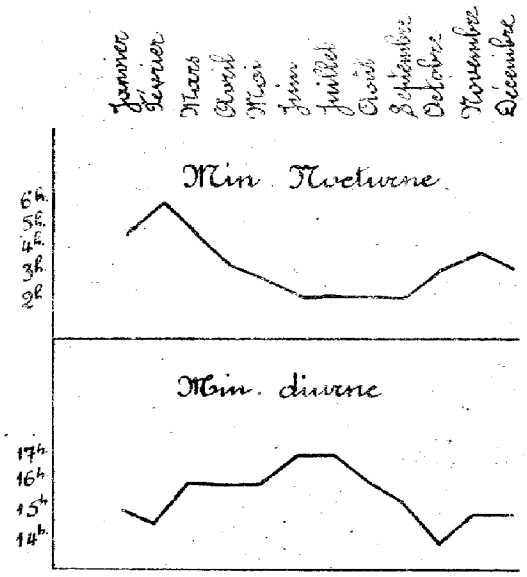
Les tableaux relatifs à la pression atmosphérique, aux températures sous abri et près du sol, et à l'humidité relative contiennent les relevés des phénomènes pour chacune des 24 heures de la journée (minuit exclus à minuit inclus), leurs moyennes diurnes et les moyennes relatives à chaque heure de la journée, les maxima et minima quotidiens, avec l'excès du maximum sur le minimum sous le nom d'oscillation.

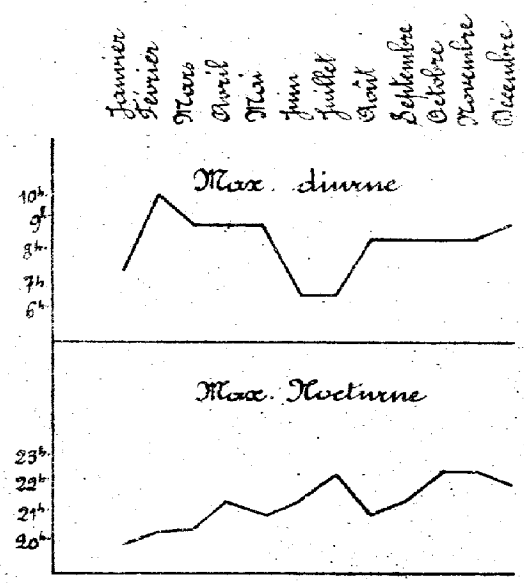
Pression atmosphérique.

Les observations absolues ont été faites au 0mm,01 sur un baromètre Fortin (grand modèle Tonnelot), réduites à zéro et corrigées de la gravité, mais non rapportées au niveau de la mer. L'altitude de la cuvette barométrique au dessus du niveau moyen de la Méditerranée à Beyrouth est de 918m,45 : hauteur déduite de l'altitude de la console placée à l'entrée du pavillon météorologique par les soins du nivellement géodesique exécutée en 1921.

Altitude de la cuvette barométrique et valeurs de la gravité à Ksara sont rappelées à la p. 1

Les tableaux relatifs à la pression atmosphérique résultent des relevés horaires faits sur un baromètre enregistreur à poids (petit modèle Richard, développant 3mm par millimètre de pression). — Les valeurs lues ont été corrigées par comparaison avec les observations absolues.





Les graphiques des pp. 26 et 27 mettent en évidence les marées diurnes de la pression. On peut y lire facilement qu'elle a été, cette année, la situation moyenne horaire des minima et maxima diurnes et nocturnes de la pression atmosphérique et par suite quelle a été sa variation au cours de l'année, c'est ce que représentent les nouveaux graphiques ci dessus.

Températures.

Toutes les températures sont évaluées en degrés centigrades.

1° Température de l'air. Les thermomètres sont placés à 1m,50 du sol, sous un abri, genre anglais, très aéré, qu'une triple toiture protège contre les rayons du soleil.

Les valeurs horaires sont lues sur un thermographe (grand modèle Richard) et corrigées par comparaison avec un thermomètre à mercure. Les maxima et minima sont lus sur un thermomètre à mercure (maxima) et un thermomètre à alcool (minima), ou sur l'enregistreur dans les cas exceptionnels; leur heure est déterminée par la lecture de l'enregistreur.

Les courbes des températures maxima (a), minima (c) et moyennes diurnes (b) sont mises en regard et renvoyées à la fin du volume.

Il en est de même des courbes relatives aux températures près du sol.

2° - Température près du sol. - On a relevé sans corrections, heure par heure, les températures marquées par un thermographe Richard (modèle du B.C.M) placé directement sur le sol.

Sous le titre : Distribution de la température près du sol on indique le nombre d'heures que la température près du sol est restée comprise dans des intervalles variant de 5° en 5°.

Suivent des graphiques où sont comparées les moyennes horaires des températures sous abri et près du sol.

Humidité relative - Les lectures ont été faites sur un hygromètre enregistreur Richard et corrigées par comparaison avec les indications du psychromètre.

Evaporation - Les valeurs quotidiennes de l'évaporation ont été lues sur des évaporomètres Piche.

Précipitations - La lettre g dans le tableau relatif aux précipitations signifie : gouttes de pluie.

Les quantités d'eau tombée et de celle évaporée sont comparées dans un graphique.

Condensation occulte - Les observations commencées en 1923 ont été continuées avec le même appareil. Celui-ci est placé à 1m35 au dessus du sol.

L'observation consiste à comparer le poids de l'appareil mesuré dès que le soleil a disparu au poids qu'on lui trouve le lendemain un peu avant le lever du soleil.

Insolation. - Les températures des thermomètres de l'actinomètre Arago, et leurs différences sont données pour chaque jour à 7h, 13h, et 18h. La durée de la présence du soleil a été relevée d'après les indications d'un héliographe Campbell.

<u>Vents</u> - Les tableaux relatifs aux vents sont expliqués aux pp. 132, 133 et 137. Les graphiques donnant les vitesses moyennes horaires par mois et ceux représentant les fréquences respectives des différents vents ainsi que les calmes s'expliquent d'eux mêmes.

A la suite des données relatives aux vents on a noté quelques détails sur trois périodes orageuses.

La transcription du manuscrit a été faite par Tonfik Zanati

– Evaporation : Dans le calcul des moyennes on a tenu compte des lacunes indiquées par le tableau de la page 113 –
On a compté comme jours de pluie ou neige, ceux-là seulement où la précipitation a été mesurable. De la neige est tombée les 2, 3 et 6 Février –

Comparaison des pluies et de l'évaporation { pluie : - - - - - - - -

Remarques sur les tableaux précédents

Pour préparer les tableaux précédents on a relevé heure par heure sur le totalisateur d'un moulinet Richard le nombre de kilomètres de vent passés pendant l'heure qui s'achevait. Lorsque l'enregistrement du moulinet Richard a fait défaut, on y a suppléé par les indications d'un moulinet Robinson, en les réduisant au moyen d'un coefficient convenable à celles qui eût données le moulinet Richard. Enfin dans les rares cas où ces deux instruments ont été inutilisables à la fois, on a recouru à l'anémocinémographe suit les indications d'un moulinet Richard.

Il y a des lacunes le 22 janvier de 16^h à 24^h ; le 23 de 1^h à 15^h. Le 16 février de 1^h à 7^h ; le 24 de 17^h à 18^h — Le 4 avril de 17^h à 18^h ; le 5 de 22^h à 23^h ; le 15 de 3^h à 8^h — Nombreuses lacunes au mois de juin : le 7 de 15^h à 16^h — le 9 de 9^h à 10^h — le 12, 14^h — le 13 de 13^h à 18^h — le 14 de 9^h à 11^h — le 17 de 18^h à 20^h — le 22 de 5^h à 6^h — le 23 de 7^h à 8^h — le 24 de 13^h à 16^h — Le 27 Septembre de 10^h à 13^h.

On a tenu compte dans les moyennes.

Deuxième tableau : Il contient les moyennes pour chaque mois relatives à une même heure de la journée (Moy. hor.) L'avant dernière colonne donnant les moyennes horaires annuelles indique l'allure générale des vents à Ksara en cours de la journée — Comme pour le 1e tableau, on a souligné les maximum et minimum de chaque mois. Les maximum sont localisés entre 13^h et 16^h les minimum le sont de 7^h à 9^h à trois exceptions près, celles-ci toutefois sont peut-être accidentelles, à en juger par la suite des nombres inscrits aux heures 6^h, 7^h, 8^h, en janvier mai et juin —

La dernière colonne du tableau contient le nombre des calmes relatifs à chaque heure. Ici on entend par "Calme", que le nombre de mètres de vent passés dans le moulinet pendant l'heure qui se termine n'a pas atteint 1000 —

Calmes	78	47	51	64	61	59	77	76	86	65	116	113

Pour former le tableau ci-dessus, on a relevé le nombre de fois que chaque vent de direction donnée a soufflé à chaque heure ronde de la journée, on en fait la somme pour chacune des directions, et l'on a inscrit ces sommes au tableau précédent.

Le mot "Calme" prend ici un sens différent de celui qu'il avait dans le tableau de la page 131 et qui a été défini à la page 132. Le mot "Calme" veut dire ici : à l'heure ronde considérée, la vitesse du vent n'atteignait pas 1m par seconde –

Les graphiques qui suivent sont l'expression du tableau ci-dessus.

Les nombres soulignés correspondent aux heures du maximum de fréquence de chaque direction.

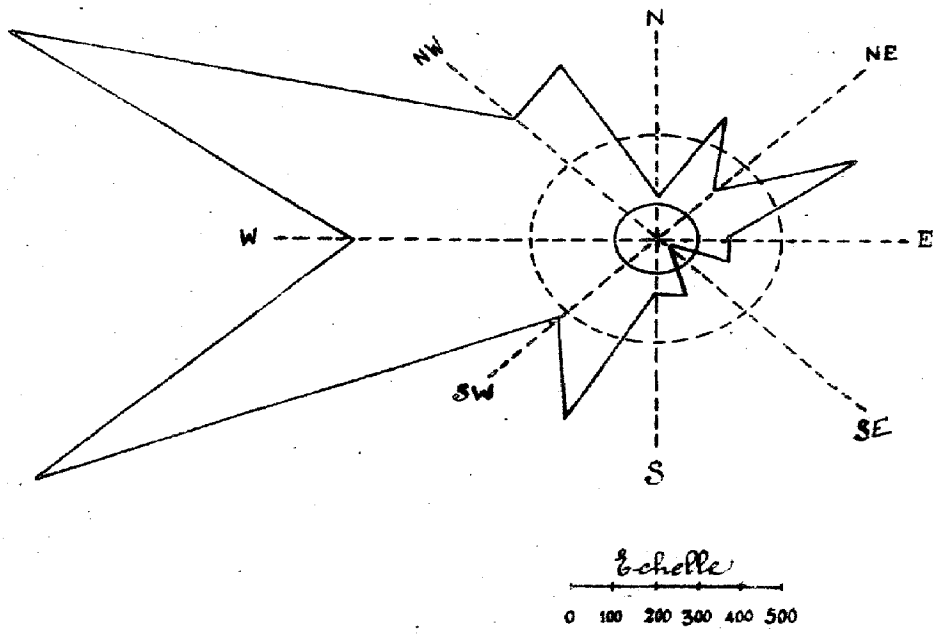
Vents fréquents : NNE, ENE, SSW, SW, WSW, W, WNW, NW, NNW.
(fréquence annuelle supérieure à 300)

Moins fréquents : N, NE, E, ESE, SSE, S.
(fréquence supérieure à 100, inférieure à 300)

Peu fréquents : SE. (fréquence inférieure à 100)

Dans la représentation graphique suivante les cercles ponctués délimitent les régions de fréquence.

Fréquence annuelle des vents de chaque direction



B . 10

— Périodes orageuses —

Trois périodes orageuses sont à signaler, la première et la principale entre le 1er et le 10 Février, la seconde du 25 au 27 du même mois, et la dernière le 24 Novembre.

La seconde période 25 au 27 Février commence vers 22h le 25, atteint son paroxysme le 26 et se calme peu à peu le 27. Des bourrasques de neige et de grêle accompagnées d'éclairs et de tonnerre à plusieurs reprises se manifestent dès 22h30 le 25 et rendent très mauvaises la fin de la nuit et toute la journée du 26. Le baromètre est descendu jusqu'à 673 et la vitesse du vent a dépassé plusieurs fois 20m/s entre 0h et 16h et elle atteint près de 25m/s vers 6h½.

La tempête du 1er au 10 Février est plus importante tant par sa durée que par les dégâts qu'elle a causés.

<u>A Koara</u> — Le vent W de 8h à 12h le 2 saute au nord le 3 de 1h à 2h½; très variable de 8h à 20h le 3, il effectue plusieurs fois un tour complet d'horizon, se stabilise à l'W de 9h le 4 à 0h le 5, une accalmie survient par NW et dure de 0h à 6h; le SW reprend le même jour à partir de 16h.

La vitesse du vent entre 9h du 4 Février et 5h du 5 est de 20m8/s en moyenne. Le maximum de vitesse a eu lieu le 2 entre 9h et 23h, durée pendant laquelle la vitesse a fréquemment dépassé 22m/s.

La petite antenne télégraphique a été renversée et la grande a eu plusieurs fils rompus.

<u>Dans la montagne au col de Sofar à Beidar</u> — Ce col de 2 à 3 Km de longueur traverse le Liban au Sud-Ouest de Koara par une ouverture profonde entre le Djebel Kneysseh (2091m.) et le Djebel Baroub (1950m.). La ligne de chemin fer du D.H.P. le franchit en général à flanc de côteau toutefois avec un tunnel, entre les Kil. 37,887 et 38,237 au sortir de la station de Beidar du côté de Damas.

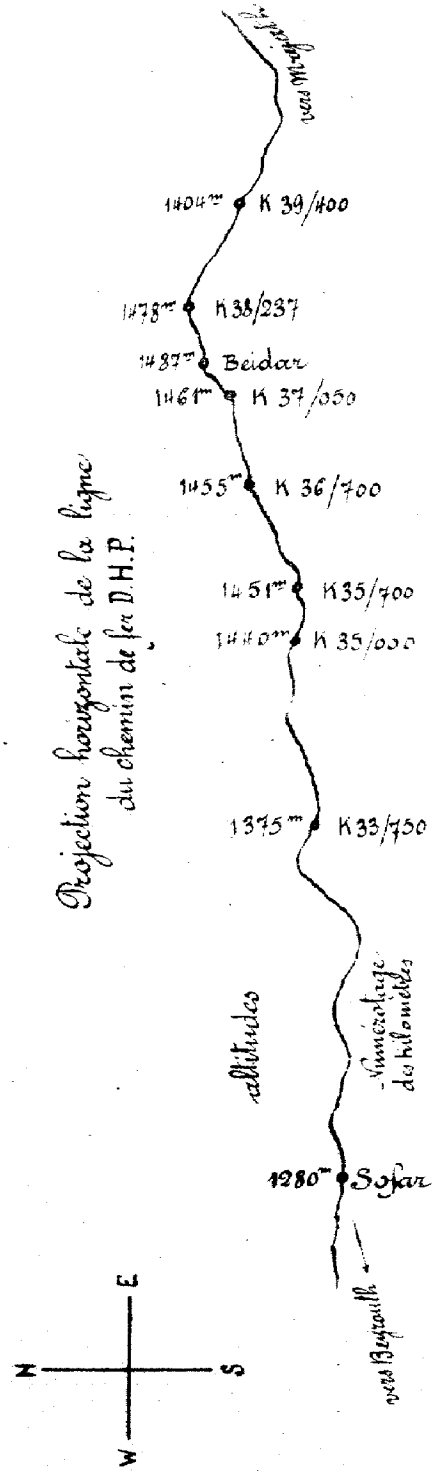
On peut se rendre compte de l'intensité de la tempête par les renseignements suivants extraits d'une note que Mr Stivanin de la compagnie du chemin de fer D.H.P. a eu l'obligeance de nous communiquer:

1er Février. — Début pendant la journée, vent dominant SW assez violent.

Le 2 — Vers 22h., vent violent NW jusqu'au

3 — Vers 10h., saute brusque au sud ouest, temps très mauvais, glace formée autour des rails: circulation dangereuse — Train venant d'Alep bloqué par les neiges au Km 38/850.—

~ Suite des périodes orageuses ~.



4 – . Interruption de la circulation annoncée vers 9h.
5 – . Accalmie, vent léger NW.
6 – . Temps très mauvais, vent violent SW jusque vers 24h.
7 – . Vent N léger. – Circulation rétablie à 17h.30.
9 – . Pendant la matinée vent violent NW. – Neige entraînée sur la voie surtout entre les Km 36/000 et 36/300, puis entre Km 38/237 et 39/400. Vers 21h. vent franchement du N. acquiert sa plus grande violence jusque vers 5h. du 10 – Circulation très difficile, retards de tous les trains par suite de la neige.

Accumulations de neige les plus importantes entre les Km. :
33/750 à 34/250 – hauteur sur rails de 1m,50 à 2m,00
35/700 à 36/600 – " de 2,00 à 2,75
37/050 à 37/887 (entrée du tunnel de Beidar côté Beyrouth)
hauteur sur rails 1m,00 à 3m,00
38/237 (sortie du tunnel côté de Damas) à 39/450 hauteur sur rails 2m,50 à 3m,50.

. . . . . .

12 poteaux télégraphiques déracinés ou brisés entre Km 46/000 (Jdita) et 51/000 (Saâd-Naïl).

La foudre tombée sur la ligne aérienne au Km 19/000 (Aley), fissure 7 poteaux, brise plusieurs isolateurs, brule tous les postes entre Aley et Beyrouth.

Suite des périodes orageuses

Le 24 Novembre de 17h,30 à 22h. un violent orage accompagné de pluies diluviennes a sévi dans la Syrie Nord. Sur la ligne d'Adana, l'orage surprenant un train entre Alep et Mouslimieh a causé un déraillement où une vingtaine de personnes ont été blessées.

Près de la gare de Hamidié sur la ligne Alep-Rayak (30 Km d'Alep, 302 de Rayak) la ligne a été coupée par les inondations. L'eau est montée à 50cm au dessus du rail. La circulation des trains a été empêchée jusqu'au 27 Novembre.

A Alep même la riviere (le Kweik) a débordé. Le camp du Lieutenant Bazerques de la mission Géodesique operant du côté d'Antioche, a été surpris par les eaux. Bagages et mulets ont été emportés, et 5 soldats ont été noyés.

Résumé annuel - 1924 -

Mois	Pression	Température sous abri	Température près du sol	Humidité relative	Nombre moyen de Kil. de vent par jour	Nombre moyen de Kil. de vent par heure

Dates	Impression générale	Notes
1	Nuit chaude, journée froide, vent aigre le soir. Temps couvert.	Le 5, plusieurs passages de cigognes nombreuses.
2	Très vilain temps, tempête et grêle tout le jour.	Le 16, on remarque la floraison des anémones sauvages, des ormeaux, de quelques saules pleureurs devenus verdoyants, des frênes. Quelques bourgeons des peupliers de caroline se sont ouverts.
3	Couvert avec trous, AB, humide et froid après midi.	
4	B., clair, frais.	
5	Calme, doux.	
6	B., couvert, très doux.	
7	Très variable : TB, couvert, pluie, B, couvert, pluie frais.	
8	Temps mou, couvert, plutôt frais.	
9	Humide, temps très mauvais.	
10	Temps aigre, menaçant.	
11	Couvert, assez frais.	Dans les prairies les premiers coquelicots fleurissent. Les buissons prennent leurs premières feuilles.
12	TB., doux.	
13	Couvert, tempéré.	
14	Plus frais, averses légères.	
15	Couvert le matin, soir clair, frais.	
16	A-B., chaud ; se couvre peu à peu.	Le 21, retour des hirondelles.
17	Chaud.	
18	Couvert, froid.	Le 21 à 6h des nuages blancs défilent rapidement vers le SW le long de l'Anti-Liban tandis que des nuages plus haut que les montagnes se meuvent lentement en sens contraire.
19	B., doux.	
20	Doux, B, se couvre peu à peu.	
21	Demi-couvert, doux.	
22	B., doux.	
23	TB., chaud.	
24	Couvert, chaud.	
25	Chaud, avec vent après midi.	Le 22, la journée très belle débute entre 5h et 6h½ par un brouillard universel et intense, on n'y voit pas à 100m.
26	Tempéré, calme.	
27	B., tempéré, vent fort après midi.	
28	B., tempéré.	
29	B., clair, chaud.	
30	B., clair, vent.	Le 28, nombreux passages d'oies sauvages, très haut.
31	Vents violents, clair.	Le 31, Les bourgeons des figuiers s'ouvrent.
