PRELIMINARY REPORT ON HURRICANE "CINDY".

September 16-18, 1963

Hurricane "Cindy", the first in the Gulf of Mexico in two years, formed in the northwestern Gulf about 150-200 miles off the Texas coast on September 16. A bulletin issued at 9:00 a.m. by the Weather Bureau hurricane warning center at New Orleans advised of the developing storm. At 1:00 p.m. gale warnings were hoisted from Freeport, Texas to Grand Isle, Louisiana. At 2 p.m. the SS Sabine reported hurricane force winds and gave the location of the center about 200 miles east of Corpus Christi. Hurricane warnings were ordered from Galveston to Vermilion Bay at 4 p.m. The storm moved northward at an average speed of 8 miles per hour. It remained small in area and stopped intensifying after barely reaching hurricane force.

The hurricane crossed the Texas coast in the Galveston - Port Arthur area on September 17 then became nearly stationary and produced persistent heavy rains in the Beaumont - Port Arthur - Orange area. It gradually diminished in strength, and on the 19th the remnants drifted southwestward and southward over Texas

More than 15 inches of rain fell in some places near the upper Texas coast and in extreme southwest Louisiana. Early reports estimate flood damage as high as \$11.5 million. There was little damage from wind or tide.

About 3600 persons in the Texas coastal area and 6,000 in southwestern Louisiana are reported to have evacuated in response to the Weather Bureau's hurricane warnings. No loss of life was reported.

Following are preliminary storm data from Weather Bureau Offices at Galveston and Port Arthur, Texas:

	<u>Galveston</u>	<u>Port Arthur*</u>	<u>Remarks</u>
Wind	Peak gust NE 74 mph at 0216C, 17th Fastest mile NE 54 mph at 0232C, 17th	NE 42 mph 0500C, 17th	SE 75 mph (estimated) 0500C, 17th at Sabine Coast Guard Station
Lowest barometric pressure	29.54 inches at 0529C, 17th	29.69 in. 1700- 1800C, 17th	
Rainfall	3.64 inches	15.17 inches	22.72 in at Deweyville, Texas in 24 hours
Tide	4.6 ft MSL at 0310C Pier 21 Galveston Channel; 4.0 ft MSL at 0300C Pleasure Pier on Gulf side	3.8 ft MSL at Sabine 0345- 0525C, 17th	
Losses	No known deaths or injuries or major damage.	No casualties; flood damage estimated \$11.5 million in 4 counties.	

*Jefferson County Airport

Surface ships, the Weather Bureau radar stations at Galveston, Lake Charles, and New Orleans, and Navy reconnaissance aircraft assisted in the tracking of the hurricane. Because the storm was rather poorly developed and its eye or center ill-defined, however, radar tracking was difficult. This is in contrast to tracking of a well-developed hurricane, such as "Carla" in 1961, which presents a clear-cut pattern on the radarscope.

ADVISORIES AND BULLETINS

NEW ORLEANS WEATHER BUREAU BULLETIN 9 AM CST SEPTEMBER 16 1963

A LOW PRESSURE AREA APPEARS TO BE DEVELOPING IN THE NORTHWEST GULF OF MEXICO 150 TO 200 MILES EAST OF BROWNSVILLE TEXAS. GALVESTON WEATHER BUREAU LOCAL STATEMENT 2:45 PM CST SEPTEMBER 16 1963

SEE LATEST ADVISORY ON TROPICAL STORM CINDY.

GALE WARNINGS AND A HURRICANE WATCH ARE IN EFFECT FOR THE FREEPORT-GALVESTON-GALVESTON BAY-BOLIVAR PENINSULA AREA.

SINCE PRESENT INDICATIONS ARE THAT CINDY MAY REACH HURRICANE FORCE BEFORE MOVING INLAND LATE TONIGHT ALL STORM PREPARATIONS AND EVACUATIONS SHOULD BE COMPLETED BEFORE DARK TONIGHT.

TIDES OF 3 TO 5 FEET ABOVE NORMAL ARE ANTICIPATED ALONG THE UPPER TEXAS COAST AS THE STORM CENTER MOVES INLAND WITH POSSIBLY AN ADDITIONAL 2 FEET NEAR THE HEADS OF BAYS. TIDES OF 3 TO 5 FEET ABOVE NORMAL WILL FLOOD ALL BEACHES AND ADJACENT LOW-LYING AREAS. THIS INCLUDES MUCH OF THE AREA NEAR OFFATTS BAYOU IN GALVESTON. WITH THESE ANTICIPATED TIDE HEIGHTS THE GALVESTON CAUSEWAY APPROACHES SHOULD NOT BE FLOODED. HOWEVER LOCALIZED FLOODING THROUGHOUT THE AREA IS POSSIBLE DUE TO THE COMBINATION OF HIGH TIDES AND HEAVY RAINFALL. THIS IS ESPECIALLY TRUE ALONG BAYOUS SUCH AS HIGHLAND AND DICKINSON BAYOU AND THE CLEAR CREEK AREA.

TIDES OF 5 FEET WOULD ISOLATE BOLIVAR PENINSULA SO RESIDENTS AND CAMPERS ON BOLIVAR PENINSULA SHOULD EITHER SEEK SAFE SHELTER OR EVACUATE BEFORE DARK TONIGHT.

SEAS ARE BECOMING INCREASINGLY ROUGH WITH TIDES RISING VERY SLOWLY. THE PRESENT GALVESTON TIDE HEIGHT IS 1.9 FEET ABOVE MEAN SEA LEVEL WHICH IS 1.2 FEET ABOVE NORMAL.

LISTEN FOR ADDITIONAL ADVISORIES AND LOCAL STATEMENTS.
