Preliminary Report with Advisories and Bulletins Issued.

HURRICANE DAISY SEPTEMBER 30 - OCTOBER 7, 1962
PRELIMINARY REPORT

On September 28, 1962 the attention of tropical meteorologists was focused on an easterly wave, which was located about 700 miles east of the Lesser Antilles. The following day cloud photographs from TIROS VI and reports from reconnaissance aircraft indicated the development of a weak, poorly defined circulation; however, on the 30th, a definite circulation was observed by reconnaissance aircraft. As a result of this information, gale warnings and a hurricane watch for the Leeward Islands were put into effect by the San Juan Weather Bureau office at 3:30 p.m. AST.

Lacking the necessary upper air conditions for continued development, DAISY remained a relatively weak storm as it passed northeast of the island of Antigua on October 1st. Gale warnings and the hurricane watch were discontinued at noon. As the storm passed a short distance to the northeast of Antigua the lowest pressure observed was 1008.3 mbs. or 29.76 inches.

During October 1st and 2nd, DAISY moved slowly northward and remained weak. On October 3rd, however, upper air conditions were becoming favorable for intensification, and early morning aircraft reports on the 4th indicated the first hurricane force winds. DAISY was then centered about 775 miles east of Miami and the central pressure had fallen to 986 mbs. or 29.12 inches.

Early on October 5th, DAISY recurved to the north and offered a threat to Bermuda. Hurricane force winds extended outward 80 miles from the center with gale force winds out another 350 miles to the east and north; lowest pressure was 969 mbs. or 28.62 inches. Verifying the predicted northward movement, the center of Hurricane DAISY passed about 200 miles to the west of Bermuda. Aircraft and land-based radar kept the storm under surveillance as winds up to 67 mph in gusts were recorded on Bermuda. The familiar spiral bands and an eye were visible on tracking radars.

Increasing its forward movement to 20 to 25 mph after passing west of Bermuda, DAISY next became a threat to the New England area, which had been soaked by heavy rains from a previous northeast storm. Whole gale warnings were issued at 5 p.m. EST October 6, for coastal waters from Block Island, Rhode Island to Eastport, Maine while a hurricane watch was put into effect for the Maine coast. As is usually the case with tropical cyclones that move over colder waters, DAISY gradually began to decrease in intensity. Heading for the Bay of Fundy on the 7th, DAISY lost all tropical characteristics.

Preliminary estimates show property damage from winds and seas along the coast of Maine totaling several million dollars. Two persons died in New England from direct effects of the hurricane. One was hit by a falling tree and the other swept out to sea by a large wave.

The preceding northeast storm contributed more to losses elsewhere over eastern New England than did DAISY. Heavy rains totaling up to 12 inches most of which fell in the first storm caused considerable flooding, several millions of dollars in damage, and evacuation of numerous residents from low area. The heavy rainfall interrupted transportation and is blamed for some 22 traffic deaths.
