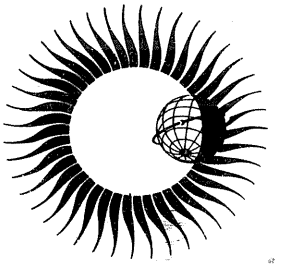
WORLD DATA CENTER A
for
Solar-Terrestrial Physics

PRELIMINARY COMPILATION OF DATA FOR RETROSPECTIVE WORLD INTERVAL JULY 26 - AUGUST 14, 1972



November 1972

WORLD DATA CENTER A

National Academy of Sciences
2101 Constitution Avenue, N. W. Washington, D. C. U.S.A., 20418

World Data Center A consists of the Coordination Office

and eight subcenters:

World Data Center A
Coordination Office
National Academy of Sciences
2101 Constitution Avenue, N.W.
Washington, D. C., U.S.A. 20418
Telephone (202) 961-1478

Solar and Interplanetary Phenomena, Ionospheric Phenomena, Flare-Associated Events, Geomagnetic Variations, Magnetospheric and Interplanetary Magnetic Phenomena, Aurora, Cosmic Rays, Airglow:
World Data Center A
for Solar-Terrestrial Physics
National Oceanic and Atmospheric Administration
Boulder, Colorado, U.S.A. 80302
Telephone (303) 499-1000 Ext. 6467

Geomagnetism, Seismology, Gravity (and Upper Mantle Project Archives):
World Data Center A:
Geomagnetism, Seismology and Gravity
Environmental Data Service, NOAA
Boulder, Colorado, U.S.A. 80302
Telephone (303) 499-1000 Ext. 6311

Glaciology:
World Data Center A:
Glaciology
U. S. Geological Survey
1305 Tacoma Avenue South
Tacoma, Washington, U.S.A. 98402
Telephone (206) 383-2861 Ext. 318

Longitude and Latitude:
World Data Center A:
Longitude and Latitude
U. S. Naval Observatory
Washington, D. C., U.S.A. 20390
Telephone (202) 698-8422

Meteorology (and Nuclear Radiation):
World Data Center A:
Meteorology
National Climatic Center
Federal Building
Asheville, North Carolina, U.S.A. 28801
Telephone (704) 254-0961

Oceanography:
World Data Center A:
Oceanography
National Oceanic and Atmospheric Administration
Rockville, Maryland, U.S.A. 20852
Telephone (202) 426-9052

Rockets and Satellites:
World Data Center A:
Rockets and Satellites
Goddard Space Flight Center
Code 601
Greenbelt, Maryland, U.S.A. 20771
Telephone (301) 982-6695

Tsunami:
World Data Center A:
Tsunami
National Oceanic and Atmospheric Administration
P.O. Box 3887
Honolulu, Hawaii, U.S.A. 96812
Telephone (808) 546-5698

Notes:

(1) World Data Centers conduct international exchange of geophysical observations in accordance with the principles set forth by the International Council of Scientific Unions. WDC-A is established in the United States under the auspices of the National Academy of Sciences.
(2) Communications regarding data interchange matters in general and World Data Center A as a whole should be addressed to: World Data Center A, Coordination Office (see address above).
(3) Inquiries and communications concerning data in specific disciplines should be addressed to the appropriate subcenter listed above.

REPORT UAG - 21

PRELIMINARY COMPILATION OF DATA FOR RETROSPECTIVE WORLD INTERVAL JULY 26 - AUGUST 14, 1972

compiled by

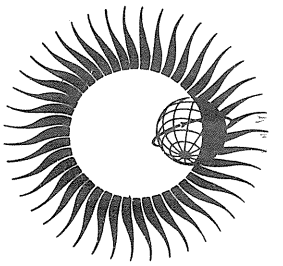
J. Virginia Lincoln and Hope I. Leighton

WDC-A for Solar - Terrestrial Physics

Prepared by World Data Center A for
Solar-Terrestrial Physics, NOAA, Boulder, Colorado
and published by

U.S. DEPARTMENT OF COMMERCE
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

ENVIRONMENTAL DATA SERVICE
Asheville, North Carolina, USA 28801



November 1972

SUBSCRIPTION PRICE: $9.00 a year; $2.50 additional for foreign mailing; single copy price varies.* Checks and money orders should be made payable to the Department of Commerce, NOAA. Remittance and correspondence regarding subscriptions should be sent to the National Climatic Center, Federal Building, Asheville, NC 28801, Attn: Publications.

* PRICE THIS ISSUE $0.70

FOREWORD

This report was initiated by the Supplemental Call for Papers in the Solar-Planetary Relationships Section at the Fall Annual Meeting of the American Geophysical Union at San Francisco, California, December 4-7, 1972. Furthermore at the XVII General Assembly of the International Union of Radio Science (URSI), Warsaw, Poland, August 20-29, 1972, Commission III passed Recommendation III.5 which designated July 26 - August 14, 1972, as a Retrospective World Interval. Finally, Commission V of the International Association of Geomagnetism and Aeronomy (IAGA) is scheduling a Symposium on this time period as well as at the September 1973 meeting of IAGA in Kyoto, Japan.

INTRODUCTION

by

J. Virginia Lincoln and Hope I. Leighton
World Data Center A for Solar-Terrestrial Physics
Environmental Data Service
National Oceanic and Atmospheric Administration
Boulder, Colorado 80302

In this report are presented the solar-terrestrial physics data available in early October 1972 for the period of unusual solar activity July 26 - August 14, 1972, associated with the transit of McMath Plage Region 11976. Much of the data has appeared or will appear in the monthly "Solar-Geophysical Data" reports. Because of the promptness of this report some of the data will be more complete at the time of the Comprehensive Reports, January through March 1973 issues, of "Solar-Geophysical Data".

The advantage of this report is that the data are collected in one place rather than distributed through several issues. In addition, data not routinely published are included. The data come from worldwide sources and are part of the archives of World Data Center A for Solar-Terrestrial Physics.

Since this period is of such interest containing the greatest geomagnetic storm to date of the current solar cycle, together with many associated terrestrial effects, we plan to issue at a later date a special catalog of all the data for this period submitted to the World Data Center. We also plan to request contributions for a more complete data compilation from the worldwide community including interpretations of their data. This too will be a UAG-Report in this series and will be planned for distribution before the September 1973 Kyoto meeting of IAGA.

This data compilation is ordered roughly as is "Solar-Geophysical Data". Most of the data are self-explanatory, but for more details as to interpretation, instrumentation used, etc., reference should be made to the "Solar-Geophysical Data" Descriptive Text, No. 330 (Supplement), issued February 1972.

The daily solar maps are as indicated in the Descriptive Text with the FeXV maps described in "Solar-Geophysical Data" No. 335, Part I, Prompt Reports, July 1972. They are from the Goddard EUV Spectroheliograph on OSO-7 recording radiation from a small element of the solar disk at extreme ultraviolet wavelengths between 120A and 400A.

A table presents the λ 5303 green coronal line intensities associated with the west limb passage of McMath Region 11976. There were insufficient data to prepare a similar table of east limb data.

Though all of the solar flare data which will eventually be received are not available at this time, it was considered worthwhile to prepare a preliminary listing of confirmed grouped flare reports. In the margin the flares of importance 2B or greater are highlighted. They occurred at 1958 UT August 2, at 0530 UT August 4, at 1455 UT August 7 and at 1227 UT August 11, 1972.

From the archives of the World Data Center a table of the outstanding surge and prominence reports was prepared from the data available.

The most outstanding solar radio emission bursts for fixed frequency have been highlighted in the margin in a manner similar to the flares. These are at 0305 UT August 2, at 1946 UT August 2, at 0540 UT August 4, at 1425 UT August 7, and at 1208 UT August 11, 1972. As with the flares, there will be further reports available later. The graphs of several selected bursts on August 2, 4 and 7, 1972 are presented.

The ATS-1 proton data are the only satellite data reduced in time for this publication. They are believed to be subject to large error for two reasons: 1) sensor degradation and 2) an overflow of registers used to display the fluxes in the Boulder Warning Center.

The proton events and geomagnetic disturbances are evident in the riometer records reproduced from the Alaskan chain of riometers. Caution should be exercised in their interpretation since the equipment was not operating in such a manner as to make it possible to prepare a reliable quiet day curve against which the raw riometer data could be compared.

The McMurdo riometer data are thanks to W. I. Axford and H.J.A. Chivers of the University of California, San Diego. The McMurdo instrument transmits the data via satellite to California where they are reduced in the usual way by comparing the observed intensities with the derived quiet day curve. The graphs indicate, as Axford and Chivers state, major activity beginning about 0000 UT August 3, 1972, reaching maxima at 2200 UT August 4 and 0100 UT August 9, 1972, of greater than 12.6 dB and $\sim$5.6 dB, respectively. These peaks are close to local noon for McMurdo although the station was not sunlit at all during the events.

S. M. Ostrow prepared the ionospheric f-plots presented on pages 112-113. The two graphs are preceded by a description of the data and their significance.

In the "Geomagnetic Activity" section the reduced magnetograms are thanks to K. Kawasaki, CIRES Fellow and Guest Worker with the National Geophysical and Solar-Terrestrial Data Center of the Environmental Data Service in Boulder, and S. -I. Akasofu, Geophysical Institute, College, Alaska. Only a few magnetograms were available for prompt reduction. The four selected cover latitudes from the auroral zone to near the equator. Leirvogur and College are reduced to the same 500 γ range. San Juan and Honolulu are reduced to the same 50 γ range. Dr. M. Sugiura and D. M. Poros of NASA, Goddard Space Flight Center, submitted the provisional equatorial Dst calculations.

Unfortunately the Alert and Deep River Charts for August have not been received in time for this publication. Calgary and Sulphur Mountain indicate the Forbush decreases at the time of the geomagnetic storms.

The final table lists auroral reports received from visual observers at the times of the geomagnetic activity.

It is to be hoped that this data collection will assist the many research workers in their detailed analysis of their observations during this most exciting period of solar-terrestrial activity.

Note: This coverage was obtained on an emergency basis in an attempt to follow the 3B flare @ N14 W38 on 07/1520 UT. The pass was on the 64 meter antenna at Goldstone and not long enough to obtain a satisfactory solar wind signature. However, one of the highest (if not the highest) counting rates on record was obtained from Simpson's Cosmic Ray 0.6 - 13 Mev energy range.

[1] Wolfe - NASA/ARC
[2] Simpson - University of Chicago

* Includes He 0.6-13 Mev/nucleons and electrons ∿0.5 Mev - see J. Retzler and J. A. Simpson, J. Geophys. Res., 74, 9, 2149-2160, 1969 for discussion of the electron response of Pioneer VII.
** Includes He >13 Mev/nucleons.
Q used to indicate that a rate is at its quiescent level.

Note: The notes published with the March 1972 data continue to apply to the current data.

ESP = Earth-Sun Probe Angle.

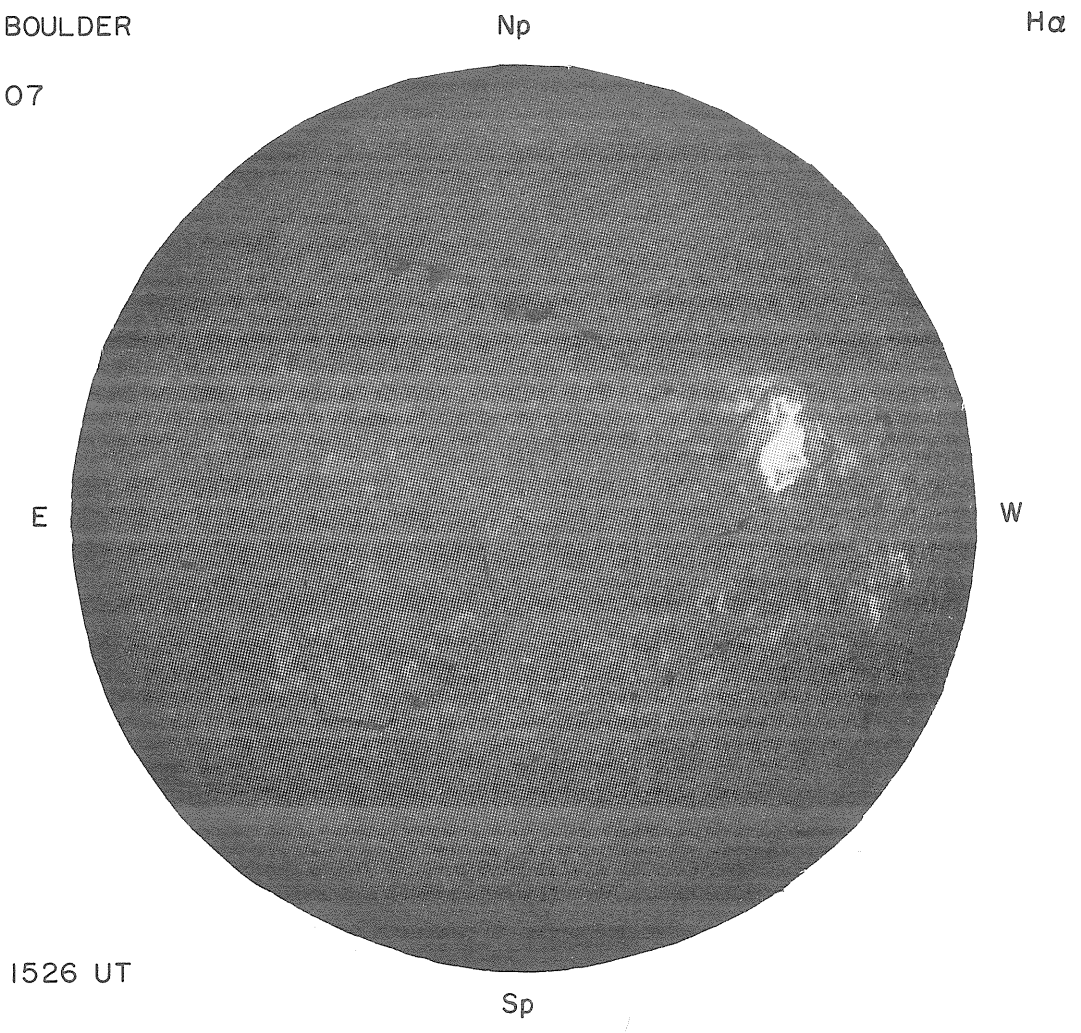
ESP = Earth-Sun Probe Angle

Notes: * Reversal in field occurred at 1056 UT
(1) 0800 thru 1535 UT 312°, 1535 thru 1820 UT 40°, returning to 321° at 1820
(2) Disturbance started ∿0400 UT
(3) U_{H+} jump at 1124 UT; E-field jump at 1128 UT; M-field jump at ∿1100 UT
(4) /B/ jumped from prior ambient of ∿20 to 84 Gamma starting at 1100 UT
(5) 1906 thru 2251 UT = 095°; 2252 thru 0303 UT = 247°; with field direction reversal at 2251 UT
(6) Several /B/ jumps of 1.5 to 2 Gamma at 1000 and 1200 UT
(7) /B/ jumped to ∿3X ambient at 2258 UT
(8) Plasma IP shock from 3B flare of 07/1520 UT seen by Pioneer 9 at 10/0700
(9) Field direction reversal at 0825 UT

Pioneer Plasma instrument recorded three interplanetary (IP) shocks as a result of the series of flares originating from McMath region #976 (N12 E28 on 2 August 1972): at 03/1124 UT U_{H+} jumped from an ambient of 350 to 585 km/sec, at 03/2215 UT U_{H+} jumped from 600 to 900 km/sec, at 05/0030 UT U_{H+} jumped from 900 to >1000 km/sec. This >1000 km/sec solar wind velocity appears to be the highest velocity recorded on the Pioneer series of spacecraft to date. Pioneer 10 plasma instrument indicated similarly these IP shocks; however, the changes noted were somewhat more subtle.

Radial Alignment of Pioneers 9 and 10 (with sun) occurred at 0940 UT on 6 August 1972 with Pioneer 9 at 1.1618×10^8 km from sun, and Pioneer 10 at 3.2894×10^8 km from sun.

FLARE OF 07 AUGUST 1972



SOLAR FLARES

Note: Only Eastern Hemisphere events are included for July 26-31. Only disk phenomena are included for August 1-8. Only Western Hemisphere events are included for August 9-14.

DSD = dark surge on disk
ADF = active dark filament
BSL = bright surge at limb
BSD = bright surge on disk
APR = active prominence region
EPL = eruptive prominence at limb
SDF = sudden disappearance of filament

The symbols used in connection with the spectral type in describing the important bursts are as follows:

B = Single burst
G = Small group (< 10) of bursts
GG = Large group (> 10) of bursts
C = Underlying continuum (particularly with type I)
S = Storm in the sense of intermittent but apparently connected activity
N = Intermittent activity in this period
U = U-shaped burst of Type III
RS = Reverse slope burst
DP = Drifting pairs
DC = Drifting Chains
H = Herringbone
W = Weak
P = Pulsations
CONT = Continuum
UNCLF = Unclassified activity

Note: Reports not received from Clark Lake Radio Observatory at time of publication.

Hourly Values of Ionospheric Data from Eight Locations for the Period July 26 through August 14, 1972

by

S. M. Ostrow
National Oceanic and Atmospheric Administration
Boulder, Colorado

In Figure 1, hourly values of foF2 and fmin from eight ionosphere stations are presented for the period July 26 through August 14, 1972. The data are plotted against Universal Time, and the time of local midnight at each station is indicated by a carat. The graphs are similar to f-plots. Vertical lines drawn from the bottom of each graph indicate values of fmin, and dots connected by a continuous line represent values of foF2. Reasons for missing data and pertinent information about some of the measurements are indicated by standard symbols (see Piggott and Rawer, 1961, "URSI Handbook of Ionogram Interpretation and Reduction", for explanation of the symbols and format of the graphs). Monthly median values are also given for purposes of comparison with the daily/hourly data.

The geographic and geomagnetic coordinates of the eight ionosphere stations are listed in Table 1, together with the computed dip and computed ground L values. With the exception of Maui, the stations are all in Greenland or North America. The stations were selected to illustrate the changes in ionospheric behavior from high to low geomagnetic latitudes. These are a representative sample of the ionospheric data available at World Data Center-A for Solar-Terrestrial Physics at Boulder, Colorado. Formats in which the data are held include ionogram film, tabulations of daily, hourly and median values of characteristics, and f-plots. Depending on the originating laboratory, ionospheric data for a given location and month may arrive at the Data Center in less than a month or take more than a year, but most of the data have been received by about six months after the month of observation.

These graphs indicate that a complex pattern of global ionospheric behavior is associated with the solar-geophysical events that occurred during this time period. The most obvious feature of these graphs is the lengthy periods of high absorption produced by particle precipitation at high latitudes, the effects of which decrease with decreasing geomagnetic latitude, becoming negligible at low latitudes. Effects shown by the foF2 data, while less striking, indicate that important F2 layer changes are associated with the events in this period. The changes in diurnal patterns of foF2 at Mexico City and Maui suggest that F2-layer effects at lower latitudes during disturbed periods may deserve more study than they have received in previous years.

Table 1

Station	Geographic		Geomagnetic		Computed	
	Lat.	Long.	Lat.	Long.	Dip	L

SUDDEN COMMENCEMENTS AND SOLAR FLARE EFFECTS

AUGUST 1972

PRELIMINARY REPORT ON RAPID MAGNETIC VARIATIONS (by Dr. A. Romana)

The meaning of the station symbols is given in the IAGA-Bulletins nr. 12 and 32. Times of ssc, si and bay-commencements are mean values. If given by ten or more stations they are underlined.

Sudden commencements followed by a magnetic storm or a period of storminess (ssc)

04 0119 A: SO DO NU SI MA VI FU LG IK TL FR PE SF KS QU TE HU TN LM; B: WN WI NI VL AQ EB CI KA PM PP GN AM (si: A: OT; C: SS)

COMMENTS FROM VISUAL AURORAL OBSERVATIONS
August 4-6, 1972

Date/Time (UT)	Observer	Observation
04/0400	Hanover, Illinois	Broad banded, brick red structure observed in the west that slowly moved eastward. The display continued for approximately two hours.
0400	Savory, Wyoming	From dusk to late evening there was a white glow between headings 340° and 30°, extending to 20° above the horizon. Between 0400 and 0430 UT a red glow was in evidence above the white up to 40° in altitude.
0400	Westcliff, Colorado	A red auroral patch was visible at the zenith for approximately 15 minutes. Before and after the zenith sighting a well developed red arc was evident to the north 15 to 20° above the horizon. Estimated intensity 10 to 12 kilorayleighs (kR). 1 kR = an apparent emission rate of 10^9 photons/cm^2(columm)/sec.
0500	Fritz Peak, (Nederland, Colorado)	Aurora observed until obscured by clouds at about 0700 UT. Cloudiness prevented observations on the 5th but aurora was again observed on the night of the 6th.
0530	Hillsboro, Oregon	A strong white, steady glow was visible to the NNE.
0600	Hillsboro, Oregon	Narrow bands appeared intermittently above the steady glow, disappearing after 15 to 60 seconds.
0800	Hillsboro, Oregon	Large white clouds formed almost overhead, lasting 15 to 30 seconds. This marked the apparent peak of this display.
0900	Hillsboro, Oregon	Steady glow visible but dimming.
1000	Hillsboro, Oregon	Display had terminated.
2100	Springfield, Vermont	Aurora was evident as dark fell and continued all night with homogeneous bands constantly present and rays up to 80° above the horizon. No intense colors and no deep reds were seen, but between 0300 and 0430 UT a full corona developed five times, each of which lasted only a few minutes. The unique feature of the display was its extreme mobility. Rays formed in a few seconds only to vanish equally fast; surfaces flickered within time intervals of less than a second, while intensity changes were often of the order of 10 magnitudes....
2310-2335	Ondrejov, Czechoslovakia	Diffuse display observed, dark red in color over the NNE horizon up to an altitude of 50°. At 2335 UT aurora weak, orange in color; maximum vertical extent: 25 to 30° above the NNE horizon.
	In addition reports were received from Thunder Bay, Canada; from Michigan, Ohio and Topeka, Kansas, and the Royal Greenwich Observatory, Herstmonceux Castle.	
05/0200-0500	Erie, Pennsylvania	Colorless display with at least two vertical plumes that fluctuated in brightness. Ended quite suddenly.
0355	Dubuque, Iowa	A white, rainbow-shaped arc was observed.
0510	Ann Arbor, Michigan (4-channel photometer)	Meridian scans of low latitude red arc aurora. Time is that of maximum intensity (300 rayleighs). Zenith angle was 52°S; breadth of arc between 36 and 58°S. 1 rayleigh = an apparent emission rate of 10^6 photons/cm^2 (column)/sec.
06/2130	Springfield, Vermont	Aurora formed homogeneous bands half an hour after dark and display was limited to rays rising usually no more than 40° along with a number of bright diffuse surfaces. Aurora still present at 4:00 am (0800 UT).
