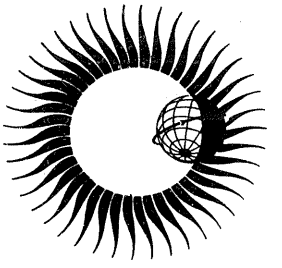
ABSORPTION DATA FOR THE IGY/IGC AND IQSY



JUNE 1974

WORLD DATA CENTER A

National Academy of Sciences

2101 Constitution Avenue, N. W. Washington, D. C., U.S.A., 20418

World Data Center A consists of the Coordination Office and eight subcenters:

World Data Center A
Coordination Office
National Academy of Sciences
2101 Constitution Avenue, N.W.
Washington, D. C., U.S.A. 20418
Telephone (202) 389-6478

Solar and Interplanetary Phenomena, Ionospheric Phenomena, Flare-Associated Events, Geomagnetic Variations, Magnetospheric and Interplanetary Magnetic Phenomena, Aurora, Cosmic Rays, Airglow:
World Data Center A
for Solar-Terrestrial Physics
National Oceanic and Atmospheric Administration
Boulder, Colorado, U.S.A. 80302
Telephone (303) 499-1000 Ext. 6467

Geomagnetism, Seismology, Gravity (and Upper Mantle Project Archives):
World Data Center A:
Geomagnetism, Seismology and Gravity
Environmental Data Service, NOAA
Boulder, Colorado, U.S.A. 80302
Telephone (303) 499-1000 Ext. 6311

Glaciology:
World Data Center A:
Glaciology
U.S. Geological Survey
1305 Tacoma Avenue South
Tacoma, Washington, U.S.A. 98402
Telephone (206) 593-6502

Longitude and Latitude:
World Data Center A:
Longitude and Latitude
U. S. Naval Observatory
Washington, D. C., U.S.A. 20390
Telephone (202) 254-4547

Meteorology (and Nuclear Radiation):
World Data Center A:
Meteorology
National Climatic Center
Federal Building
Asheville, North Carolina, U.S.A. 28801
Telephone (704) 254-0683

Oceanography:
World Data Center A:
Oceanography
National Oceanic and Atmospheric Administration
Rockville, Maryland, U.S.A. 20852
Telephone (202) 426-9052

Rockets and Satellites:
World Data Center A:
Rockets and Satellites
Goddard Space Flight Center
Code 601
Greenbelt, Maryland, U.S.A. 20771
Telephone (301) 982-6695

Tsunami:
World Data Center A:
Tsunami
National Oceanic and Atmospheric Administration
2525 Korrea Road
Honolulu, Hawaii, U.S.A. 96822
Telephone (808) 948-8083

Notes:

(1) World Data Centers conduct international exchange of geophysical observations in accordance with the principles set forth by the International Council of Scientific Unions. WDC-A is established in the United States under the auspices of the National Academy of Sciences.
(2) Communications regarding data interchange matters in general and World Data Center A as a whole should be addressed to: World Data Center A, Coordination Office (see address above).
(3) Inquiries and communications concerning data in specific disciplines should be addressed to the appropriate subcenter listed above.

Errata for Report UAG-34, "Absorption Data for the IGY/IGC and IQSY"

Due to the number of errors noted in Report UAG-34, published June 1974, we are issuing this errata sheet. Though most of the errata are probably obvious to users, recipients are encouraged to incorporate these corrections into the UAG Report for clarity of the data presentation. We acknowledge with thanks the help of Richard Smith of WDC-C1 in detailing the corrections listed here.

1. Kuhlungsborn data appearing in the Report are actually A3 CW Field-Strength data. No A1 pulse echo data are available from this station.
   These A3 data appear on pages 55, 151, 152, 153, 291, 292, 293 and 294. Also, on pages 11, 12 and 14, A1 should be deleted from the Kuhlungsborn entry.

2. On pages 11, 12 and 14, change the "A3" entry for Slough to "A1."

3. On page 98, the units for this Brisbane data table should be 1.0 dB.

4. On page 106, these DeBilt data are A-values. Units should be 1.0 dB. The corresponding entry in the Monthly Median Noon Values Tables, page 33, should read "1959 A(dB)" instead of "1959 2.+5.", and the M values (median values) listed there should be multiplied by a factor of ten.

5. On pages 139 and 141, identical (except for rounding) tables for Inverness are repeated. Delete table on page 139.

6. On pages 299 and 300, the cos chi value for these Tokyo tables is 0.5.

7. On page 317, the letters C and M are reversed in this Singapore table.

8. On page 319, the Ahmedabad diurnal table is incorrect. A corrected table appears on the reverse side of this page.

9. On pages 347, 348, 374 and 381, these 1959 Canadian diurnal tables appear in the 1964-65 diurnal variations section. The tables should appear in the 1957-59 section after pages 320, 325, 329 and 336. The following note should also be attached to these tables:

   NOTE - Upper case B in original manuscript replaced here by DB (no echoes seen).
   Lower case b in original manuscript replaced here by B (echoes too weak to measure).

All data in Report UAG-34 are now available on magnetic tape either directly from NGSDC or through the co-located World Data Center A for Solar-Terrestrial Physics. Tape-to-tape copies are $50 plus cost of blank tape.

WORLD DATA CENTERS CONDUCT INTERNATIONAL EXCHANGES OF GEOPHYSICAL OBSERVATIONS IN ACCORDANCE WITH THE PRINCIPLES SET FORTH BY THE INTERNATIONAL COUNCIL OF SCIENTIFIC UNIONS THROUGH THE ICSU PANEL ON WDC'S. INITIATED FOR THE INTERNATIONAL GEOPHYSICAL YEAR 1957-58, THE DATA EXCHANGE CONTINUES ACCORDING TO RECOMMENDATIONS OF VARIOUS ICSU SCIENTIFIC ORGANIZATIONS. WDC-A IS ESTABLISHED IN THE UNITED STATES UNDER THE AUSPICES OF THE NATIONAL ACADEMY OF SCIENCES.

ABSTRACT: The A1 absorption data from all known stations have been collected for the periods of the IGY/IGC (1957-1959) and the IQSY (1964-1965), periods of sunspot maximum and sunspot minimum, respectively, and tabulated in a uniform manner.

INTRODUCTION

Measurement of Absorption

The measurement of absorption of waves in the ionosphere gives information on the properties of the lower E- and D-regions of the ionosphere which is difficult to obtain by other means. It is also very important for predicting the field strength of radio waves reflected in the ionosphere. The technique is difficult so that the amount of data available is small compared with those for the reflecting layers of the ionosphere.

While some of the data obtained has been circulated at least to those known to be interested, the majority is only available by application to the originators of the data or by searching for it in the World Data Centers. Sometimes this involves abstracting the data from publications mainly concerned with other disciplines.

In principle, the most important data are:

(a) Results of long sequences of systematic measurements.

(b) Results from all possible stations at times when the spatial coverage was maximum.

As the main results of the long sequences have been adequately summarized in the literature, the most pressing need is (b). However, we would stress that the data from (a) should be sent to the WDCs so that it is available for more detailed studies than those already published. It amounts, in all, to many hundreds of tables.

There are three main methods of measuring ionospheric absorption:

(a) The pulse reflection technique, method A1.

(b) The absorption of cosmic noise using a riometer, method A2.

(c) The measurement of continuous wave signals at oblique incidence, method A3.

These are complementary in general although in special cases they may measure the same quantity. Nearly all measurements have conformed to the procedures given in *Annals of the IGY* Vol. III, part II 'The Measurement of Ionospheric Absorption' (1957), supplemented, for other later data, by the *IQSY Instruction Manual No. 4* 'The Ionosphere' part II, "Absorption Measurements" (1963). The basis of the pulse method, as used to date, was summarized by W. R. Piggott in *Proc. IEE, 100*, part III, p. 61-72, No. 64, 'The Reflection and Absorption of Radio Waves in the Ionosphere' (March 1953).

The riometer method A2 is not easily usable to measure the normal D- and E-region absorption in the ionosphere though it is invaluable for studying short-lived events. Usually the accuracy of calibration is too poor, e.g. the maximum absorption at noon may be less than 0.5 dB, while the calibration accuracy is about 0.5 dB at frequencies near 30 MHz. In general it is also sensitive to absorption in the F-region which, for the frequency used, can exceed that at lower levels. Thus it is controversial whether the data are ever comparable with those obtained by the other two techniques. Apart from giving some references to sources of A2 data we do not list any A2 data.

In practice the A3 method used at HF gives data which appear to be consistent with A1 data obtained at the equivalent vertical incidence frequency, but it can also be used at lower frequencies where pulse methods are less suitable. The most detailed exposition of this method has been given by Schwentek.

Theory and Use of Absorption Data

The relation between the absorption measured at a station and the physical properties of the lower ionosphere is more complex than for most ionospheric parameters. The absorption L in decibels is related to the absorption coefficient κ integrated over the path of the wave in the ionosphere by the equations:

$$\kappa ds = - \ln \rho \tag{1}$$

$$L = - 20 \log_{10} \rho \simeq 8.7 \int \kappa \, ds \tag{2}$$

where ρ is the apparent reflection coefficient of the ionosphere, i.e. the ratio of the signal amplitude actually found to that which would have been obtained with no absorption.

For an actual electron density N(h) and collision frequency $\nu(h)$ model, the absorption for any frequency can be calculated using a computer and the magneto-ionic equation. The reverse procedure is also possible in principle, though the accuracy attained depends on the frequency band available, the accuracy of the virtual height and absorption measurements and of the data used to estimate $\nu(h)$. The main features of the phenomenon may be deduced from the approximate form of κ:

$$\kappa = \frac{2\pi e^2}{mc} \frac{1}{\mu} \frac{N\nu}{\nu^2 + (\omega \pm \omega_L)^2} \tag{3}$$

where e, m are the electron charge and mass, c the velocity of light, μ the phase refractive index of the medium for the mode in use, ω the angular radio frequency ($\omega = 2\pi f$), and ω_L the gyrofrequency about the component of magnetic field along the wave path. The expression changes near the level of reflection where μ varies rapidly with frequency.

In practice absorption is almost always measured using the ordinary wave, effective angular frequency $(\omega + \omega_L)$, and the contribution to $\int \kappa ds$ from levels where ν^2 is significant compared with the usually negligible quantity $(\omega + \omega_L)^2$, so that we obtain:

$$L \propto \int \kappa ds \propto \frac{1}{(\omega + \omega_L)^2} \int \frac{N\nu}{\mu} ds \tag{4}$$

Near the reflection point, $\int N\nu/\mu \, ds$ depends mainly on the local value of $\nu/(dN/dh)$, i.e. on the height and shape of the reflecting layer. Elsewhere L depends essentially on $\int N\nu ds$. Thus a change in L with position or time can be due to a change in either term. However in most cases $\nu/(dN/dh)$ is relatively stable so that changes in L are often measures of changes in $\int N\nu ds$. Where measurements are available on several frequencies it is often possible to identify the cause of the change in the measured absorption L; an elementary example is shown in Table 1 in which L values are compared for high and low absorption days in winter at Slough. The line marked 'theory' shows how the difference should vary with frequency if the reflecting layer were unaltered and the whole of the difference was due to an increase in $\int N\nu ds$ below the reflecting layer.

Table 1

Differences in Absorption - Winter 1948-9 at Slough

Day Type	Sounding Frequency MHz 2.0	2.4	2.8	3.2	4.0	4.8	Count	AdB (mean)
High H	63	51	47	42	27	23	17	680
Low L	33	27	27	20	18	15	16	355
H-L	30	24	20	22	9	8		325
Theory	29	22	18	15	11	8		335

Except at 3.2 MHz, which was too close to foE to be reliable, it is clear that the hypothesis is correct for these days. Occasions can also be found where the difference is consistent with a change in shape of the reflecting layer.

The distinctions between deviative ($\mu \to 0$) or nondeviative ($\mu = 1$) absorption or between E- and D-region absorptions are essentially arbitrary and have caused much controversy. If the variations of N(h) and ν(h) are both known in the reflecting layer, it is possible to compute the absorption in the layer and the absorption the layer would cause if the refractive index were unity, i.e. $\int N\nu ds$ through the layer. The corrections depend on the shape of the functions N(h), ν(h); foE and the working frequency, and the deductions of the relative magnitude of the E- and D-region absorption are critically dependent on the reliability of the model. However, the deduced value of $\int N\nu ds$ through both regions is relatively insensitive to errors in N(h) ν(h) and is a valuable parameter. For this reason some stations produce an absorption index A in decibels which is an approximate measure of this quantity.

Formally, $A(f) = (f + f_L)^2 L(f)$ where A(f) is independent of frequency when L contains no deviative terms or when the observed value of L has been corrected using a model (see W. R. Piggott, 1953, loc. cit., for the method used by the U.K. group of stations). The average of A(f) weighted according to reliability is a convenient index when multifrequency observations are available and enables all the data to be used, reducing the effects of changes in the E-layer shape.

Clearly the value of making absorption measurements depends on whether they can give information on either or both of the two factors which determine L. This was tested before the start of the IGY by comparing data taken at seven European stations spread over a distance up to 1500 km apart and a latitude range of N48 to N70. Data taken at two frequencies showed strong day-to-day correlations with each other and with the data from the other stations. Thus, while it is clear that the data need not measure changes in $\int N\nu ds$ exactly, there is sufficient regularity to suggest that changes in $\int N\nu ds$ or in the shape of the layer or both should be available. The advent of the computer has made it possible to interpret the data with far more accuracy than was possible in the IGY or before, and it is found that data from different zones are remarkably consistent when due allowance is made for changes in the ratio f/foE with time and position. Changes in the earth's magnetic field with position also affect the significance of the L values, partly by changing the effective frequency, $(f + f_L)$, and partly because the deviative loss can vary with dip angle. Using computers, the effects of these factors can be estimated, and it should be possible to do useful research with the data. This report has been prepared to facilitate such research.

The earliest attempt to make synoptic measurements of the absorption of waves reflected from the ionosphere at vertical incidence using the pulse technique, method A1, was started by Prof. E. V. Appleton in 1935. This sequence was kept operating until 1959 at a station which moved from London to Cambridge and then to Slough. Singular sequences were started at Freiburg, Port Stanley (Falkland Islands) and Singapore in 1949, Kjeller/Oslo in 1950, Ibadan (Nigeria) in 1952, Delhi in 1954 and Tromsö in 1955. Systematic measurements of conversion coefficient at oblique incidence, method A3, were started at Kühlungsborn in 1952. Systematic A3 measurements were also made in Japan from 1951 using nine frequencies, but the data were never made generally available. Most of the above stations remained in operation almost until the IGY, 1957-8, providing important sequences of data from which the solar cycle changes could be deduced.

These stations were supplemented by others operating irregularly so that by the beginning of the IGY some 18 stations were producing data. The IGY provoked a rapid extension of this network to over 43 stations. Many stations, including most of those with long sequences, ceased operation after the IGY, but some were reopened for the IQSY, 1964-5. Thus the most intensive coverage is available for the IGY/IGC (1957-9) and IQSY (1964-5) periods. Prior to the IGY there was no recognized system of interchanging absorption data and many series of observations were used for local research and then lost. A few groups published data, mainly with restricted circulation, but most of this is still not easily available.

The plans for the IGY called for the formation of an absorption measuring network, for the analysis of the data in a standard form, for its circulation through the World Data Center Network, and its publication in the IGY Annals. In practice the analysis was often seriously delayed. There were instrumental and calibration troubles and the task of collecting the data and putting it into a uniform style proved more than could be managed with the manpower available. Many stations did not succeed in starting observatories until the IGY was almost over, so it was decided to try to collect both the IGY and IGC data. A new effort, but on a smaller scale, was made in the IQSY, and it became obvious that a collection of IGY/IGC and IQSY data would be very valuable. The former were collected by W. R. Piggott, the URSI Consultant for A1 Absorption in the IGY, and the latter by Prof. K. Rawer, who held this post in the IQSY. These were helped by many people, in particular the editing and checking with original data were largely due to Dr. Owen Jones and Mrs. E. Hurst. The considerable task of writing computer programs and punching the data has been done by Mr. M. E. Nason and Miss Vi Hill under the direction of A. H. Shapley, with checking by Mrs. E. Hurst — a nice piece of international cooperation.

[Editor's Note: This data compilation, obviously, has been many years in preparation, and it is not worthwhile to trace the history and the reasons for the delay. In part the text dates from the late 1960s. Repeated inquiries from potential users to WDC-C1 and WDC-A in the last year have stimulated its completion. Interestingly, during the final preparation stages, over 100 additional data tables were located by Richard Smith of WDC-C1 and Helen Coffey of WDC-A. Credit for bringing the compilation to completion goes to Helen Coffey to whom all the previous workers must be grateful. A.H.S.]

Some Characteristics of the Data

As absorption data may be used by those with no experience in the technique, it may be worthwhile giving a few precautionary comments.

The calculation of absorption involves the comparison of the observed signal with a value deduced for conditions when absorption losses are negligible. If the ionosphere were horizontally stratified and smooth, this would involve no difficulty, but in practice there are always waves and irregularities present which cause the signal to fade. There is little difficulty in reducing the effects of fast fading to negligible proportions, but slow fading often has a quasi-period of about 15 minutes and can have quasi-periods of over an hour. Thus a sample measurement, usually taking 15 minutes, can contain residual errors due to incomplete correction for long period fading. In addition, the effective roughness of the ionosphere changes from day to night and, in general, with latitude. A completely rough surface can give 3 dB more signal than a smooth surface at vertical incidence. Thus comparisons of signal strengths between night and day usually show a greater attenuation in the day than is due to absorption acting alone (the converse occurs near the geomagnetic equator where the ionosphere can be rougher in the day than at night, owing to the effect of equatorial Es type q). The presence of the extraordinary wave at night when it is not present in the day can give a similar error. Most stations attempt to correct for these phenomena.

The total absorption varies fairly regularly with solar zenith angle except when the sampling frequency is within about ±10% of the critical frequency of a reflecting layer, and it is conventional to express the diurnal and seasonal variations in the forms:

$$L = Lo(\cos \chi)^n \qquad \text{diurnal}$$

$$L = Lo(\cos \chi)^m \qquad \text{seasonal}$$

where χ is the solar zenith angle.

In general n and m are not independent of χ. This is partly due to the fact that the ion production is inversely proportional to the Chapman function $Ch(R,\chi)$ which is significantly difference from $\sec \chi$ when $\cos \chi < 0.25$, partly to finite recombination time and partly to changes in the atmosphere which often vary with season or when $\cos \chi \to 0$. Thus there is some bias possible when fitting the line of least squares fit between L and $Ch(R,\chi)$. Typical values of n are about 0.75, but bias could cause the tabulated values to range between 0.65 and 0.85. It should also be noted that a systematic error in calibration can have rather large effects on the apparent values of n or m. Thus for L = 50 dB near $\cos \chi = 1$, a systematic error of 3 dB will cause n or m to change from 0.67 to 0.91 for a true value of 0.75; for L = 20 dB, a similar error causes changes from 0.55 to 1.15! It is a remarkable fact that the values of n deduced at most temperate and low latitude stations agree within smaller ranges than those given, suggesting that the absolute accuracy is, in fact, quite good.

Studies in the winter anomaly zone and at high latitudes show that there are real changes of n and m with latitude, e.g., at Slough and Port Stanley n increases steadily with Lo up to n = 1.5 on days of very high absorption in winter and all stations near the auroral zone agree in giving very low values of n, e.g., n = 0.25.

A comparable difficulty can arise in considering solar cycle variations. In general L increases fairly regularly with sunspot number R (or 10 cm flux) up to the region R $\simeq$ 140, but at greater levels of activity the increase is slower. Similar effects are seen in foE, foF1 and foF2. Simple comparisons of L at very great and very small solar activity generally show a slower variation of L with R than that usually found and underestimate L near R = 100, the most probable solar maximum condition. Fortunately a number of stations have continued observations after the IGY and IQSY and give data from which the true variations can be deduced.

Summary of Published Absorption Data

Some published values of the variations of absorption with time of day, season, solar activity and frequency are summarized in the table below, in which:

$L = Lo(\cos \chi)^n$	diurnal
$L = Lo(\cos \chi)^m$	seasonal
$L = Lo(1+bR)$	solar cycle
$L = Lo/f^x$	frequency

Note that these parameters represent the combined effects of the E- and D-region absorption and do not directly give physical parameters. Thus as x decreases, f/foE decreases for both f $\lesssim$ foE. For f<foE the height of reflection falls and the E-layer contribution in general decreases. For f>foE the group retardation in E increases so that the E-layer contribution increases. Thus n for an E-layer reflection is less than that for the D-region taken alone, while that for an F-layer relfection may be greater. The solar cycle variation is modified in the same way — if there was no D-region absorption, the value of b would, in practice, be negative for an E-layer reflection, positive for an F-layer reflection. For oblique reflections, method A3, the relative importance of absorption near the point of reflection is usually less than for vertical incidence A1. Thus the values of n, m, and b for E-reflections, method A3, may be, in general, slightly larger than for the corresponding A1 case.

The physical interpretation of absorption parameters involves the use of models which enable the E- and D-region contributions to be separated. It is important:

(a) that the model is appropriate to the physical situation, and

(b) that the computations are adequately accurate.

While the parabolic approximation for the shape N(h) of the E-layer is often adequate, it is essential to use a variation of collision frequency with height which is a good approximation to that actually present. Relatively small errors in the scale height of the latter can cause serious errors in interpretation. This is particularly important when using graphical analysis, e.g., the spider's web method (Bibl, Paul, and Rawer, *J. Atmos. Terr. Phys.*, 16, 324-339, 1959). Systematic changes in the position of interception with change in frequency imply an incorrect model. Most models in use in this method assume $\nu = \nu_o \exp [(h - h_o)/H]$, with $y_m = 2H$ and $N = N_o [1 - (y/y_m)^2]$, whereas in practice $y_m \neq 2H$.

Description of Data Tables and Master Station Lists

A list of known pulse, A1, and CW A3 stations is given in Table 2, together with the data at which regular observations were started when this is known. In most cases irregular observations started earlier, in a few cases several years earlier. The table also shows for which years of our periods 1957-59 and 1964-65 data are available. For convenience of analysis the stations are also listed in order of geographic and geomagnetic (central dipole) latitudes.

The main sequence of data consists of measurements by the A1 pulse echo technique of absorption L in decibels near noon, mostly on a frequency near 2.2 MHz but sometimes on a series of frequencies. The monthly medians of these data are collected in Section 1 of the tables together with the monthly median noon values of the E-layer critical frequency foE and, where appropriate, F1-layer critical frequency foF1. A contents table is provided for these data.

This is followed in Section 2 by the actual daily values arranged by date and month. In both this and the first chapter values of A in decibels deduced from multifrequency observations are given where provided in the original data. The units in use are shown at the top of each table.

In the case of the Canadian data a distinction is made between echoes which were visible but too weak to measure, lower case b in the original tables, and total blackout, capital B. This difference is reproduced in the computer tables by the symbols B and DB, respectively. B implies losses about 10 dB greater than the highest numerical value, DB much greater absorption.

A few stations also provided data for other time of day, e.g., measurements at constant solar zenith angle χ, measurements at fixed times well away from noon, or diurnal variations. These are collected in Section 3 of the tables. In the case of diurnal variations only monthly median data are reproduced; the day-to-day changes are adequately represented by the noon data for most purposes.

In all cases an attempt has been made to make the data from different stations as uniform as possible. We have therefore rounded the data to the nearest dB (in a few cases nearest 0.5 dB). We do not believe that there is any loss in accuracy in this, in fact the errors remaining may be several dB, at least on some days.

In some cases the frequencies used did not remain constant throughout the sequence. In such situations we have collected together in one table data which should be reasonably compatible, noting the actual frequency in use in each month on the table so that the user can apply corrections if desired. In general, for the small frequency changes involved, the absorption decreases almost linearly with increase in frequency. An examination of multifrequency data, taken when foE was the same as in the table, will give a good guide of the possible errors. The percentage change of L in decibels over small frequency ranges is almost independent of position when foE is held constant.

Table 2a

UAG Series of Reports

Prepared by World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, Colorado, U.S.A.

These reports are for sale through the National Climatic Center, Federal Building, Asheville, NC 28801, Attn: Publications. Subscription price: $9.00 a year; $2.50 additional for foreign mailing; single copy price varies. These reports are issued on an irregular basis with 6 to 12 reports being issued each year. Therefore, in some years the single copy rate will be less than the subscription price, and in some years the single copy rate will be more than the subscription price. Make check or money order payable to: Department of Commerce, NOAA.

Some issues are now out of print and are available only on microfiche as indicated. Requests for microfiche should be sent to World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, Co 80302, with check or money order made payable to Department of Commerce, NOAA.

UAG-1 "IQSY Night Airglow Data", by L. L. Smith, F. E. Roach and J. M. McKennan of Aeronomy Laboratory, ESSA Research Laboratories, July 1968, 305 pages, price $1.75.

UAG-2 "A Reevaluation of Solar Flares, 1964-1966", by Helen W. Dodson and E. Ruth Hedeman of McMath-Hulbert Observatory, The University of Michigan, August 1968, 28 pages, microfiche only, price 45 cents.

UAG-3 "Observations of Jupiter's Sporadic Radio Emission in the Range 7.6-41 MHz, 6 July 1966 through 8 September 1968", by James W. Warwick and George A. Dulk, Department of Astro-Geophysics, University of Colorado, October 1968, 35 pages, microfiche only, price 45 cents.

UAG-4 "Abbreviated Calendar Record 1966-1967", by J. Virginia Lincoln, Hope I. Leighton and Dorothy K. Kropp of Aeronomy and Space Data Center, Space Disturbances Laboratory, ESSA Research Laboratories, January 1969, 170 pages, price $1.25.

UAG-5 "Data on Solar Event of May 23, 1967 and its Geophysical Effects", compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA, February 1969, 120 pages, microfiche only, price 90 cents.

UAG-6 "International Geophysical Calendars 1957-1969", by A. H. Shapley and J. Virginia Lincoln, ESSA Research Laboratories, March 1969, 25 pages, microfiche only, price 45 cents.

UAG-7 "Observations of the Solar Electron Corona: February 1964-January 1968", by Richard T. Hansen, High Altitude Observatory, Boulder, Colorado and Kamuela, Hawaii, October 1969, 12 pages, price 15 cents.

UAG-8 "Data on Solar-Geophysical Activity October 24-November 6, 1968", Parts 1 and 2, compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA, March 1970, 312 pages, price (includes Parts 1 and 2) $1.75.

UAG-9 "Data on Cosmic Ray Event of November 18, 1968 and Associated Phenomena", compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA, April 1970, 109 pages, price 55 cents.

UAG-10 "Atlas of Ionograms", edited by A. H. Shapley, ESSA Research Laboratories, May 1970, 243 pages, price $1.50.

UAG-11 "Catalogue of Data on Solar-Terrestrial Physics", June 1970. (now obsolete).

UAG-12 "Solar-Geophysical Activity Associated with the Major Geomagnetic Storm of March 8, 1970", Parts 1, 2 and 3, compiled by J. Virginia Lincoln and Dale B. Bucknam, World Data Center A, Upper Atmosphere Geophysics, NOAA, April 1971, 466 pages, price (includes Parts 1-3) $3.00.

UAG-13 "Data on the Solar Proton Event of November 2, 1969 through the Geomagnetic Storm of November 8-10, 1969", compiled by Dale B. Bucknam and J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, NOAA, May 1971, 76 pages, microfiche only, price 90 cents.

UAG-14 "An Experimental, Comprehensive Flare Index and Its Derivation for 'Major' Flares, 1955-1969", compiled by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, The University of Michigan, July 1971, 25 pages, price 30 cents.

UAG-15 "Catalogue of Data on Solar-Terrestrial Physics", July 1971. (now obsolete).

UAG-16 "Temporal Development of the Geographical Distribution of Auroral Absorption for 30 Substorm Events in each of IQSY (1964-65) and IASY (1969)", by F. T. Berkey, V. M. Driatskiy, K. Henriksen, D. H. Jelly, T. I. Shchuka, A. Theander and J. Yliniemi, September 1971, 131 pages, price 70 cents.

UAG-17 "Ionospheric Drift Velocity Measurements at Jicamarca, Peru (July 1967-March 1970)", by Ben B. Balsley, Aeronomy Laboratory, National Oceanic and Atmospheric Administration, Boulder, Colorado, and Ronald F. Woodman, Jicamarca Radar Observatory, Instituto Geofisico del Perú, Lima, Peru, October 1971, 45 pages, microfiche only, price 45 cents.

UAG-18 "A Study of Polar Cap and Auroral Zone Magnetic Variations", by K. Kawasaki and S. -I. Akasofu, Geophysical Institute, University of Alaska, June 1972, 21 pages, price 20 cents.

UAG-19 "Reevaluation of Solar Flares 1967", by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, The University of Michigan, and Marta Rovira de Miceli, San Miguel Observatory, Argentina, June 1972, 15 pages, price 15 cents.

UAG-20 "Catalogue of Data on Solar-Terrestrial Physics", October 1972. (now obsolete).

UAG-21 "Preliminary Compilation of Data for Retrospective World Interval July 26 - August 14, 1972", compiled by J. Virginia Lincoln and Hope I. Leighton, World Data Center A for Solar-Terrestrial Physics, November 1972, 128 pages, price 70 cents.

UAG-22 "Auroral Electrojet Magnetic Activity indices (AE) for 1970", by Joe Haskell Allen, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, November 1972, 146 pages, price 75 cents.

UAG-23 "U.R.S.I. Handbook of Ionogram Interpretation and Reduction", Second Edition, November 1972, edited by W. R. Piggott, Radio and Space Research Station, Slough, U.K., and K. Rawer, Arbeitsgruppe für Physikalische Weltraumforschung, Freiburg, G.F.R., November 1972, 324 pages, price $1.75.

UAG-24 "Data on Solar-Geophysical Activity Associated with the Major Ground Level Cosmic Ray Events of 24 January and 1 September 1971", Parts 1 and 2, compiled by Helen E. Coffey and J. Virginia Lincoln, World Data Center A for Solar-Terrestrial Physics, December 1972, 462 pages, price (includes Parts 1 and 2) $2.00.

UAG-25 "Observations of Jupiter's Sporadic Radio Emission in the Range 7.6-41 MHz, 9 September 1968 through 9 December 1971", by James W. Warwick, George A. Dulk and David G. Swann, Department of Astro-Geophysics, University of Colorado, February 1973, 35 pages, price 35 cents.

UAG-26 "Data Compilation for the Magnetospherically Quiet Periods February 19-23 and November 29 - December 3, 1970", compiled by Helen E. Coffey and J. Virginia Lincoln, World Data Center A for Solar-Terrestrial Physics, May 1973, 129 pages, price 70 cents.

UAG-27 "High Speed Streams in the Solar Wind", by D. S. Intriligator, University of Southern California, Department of Physics, Los Angeles, California, 90007, June 1973, 16 pages, price 15 cents.

UAG-28 "Collected Data Reports on August 1972 Solar-Terrestrial Events", Parts 1, 2 and 3, edited by Helen E. Coffey, World Data Center A for Solar-Terrestrial Physics, July 1973, 932 pages, price (includes Parts 1-3) $4.50.

UAG-29 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1968", by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, October 1973, 148 pages, price 75 cents.

UAG-30 "Catalog of Data on Solar-Terrestrial Physics", prepared by Environmental Data Service, NOAA, Boulder, Colorado, October 1973, 317 pages, price $1.75.

UAG-31 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1969", by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, February 1974, 142 pages, price 75 cents.

UAG-32 "Synoptic Radio Maps of the Sun at 3.3 mm for the Years 1967-1969", by Earle B. Mayfield and Kennon P. White III, San Fernando Observatory, Space Physics Laboratory and Fred I. Shimabukuro, Electronics Research Laboratory, Laboratory Operations, The Aerospace Corporation, El Segundo, California, 90245, April 1974, 26 pages, price 35 cents.
