Abstract

In support of marine monitoring measurement programs, the National Institute of Standards and Technology (NIST), in cooperation with the National Oceanic and Atmospheric Administration (NOAA) National Status and Trends Program (NS&T), conducts yearly interlaboratory comparison exercises to provide one mechanism for participating laboratories/monitoring programs to evaluate the quality and comparability of their performance in measuring selected organic contaminants in environmental samples. In this report, results of the 1999 exercises of the NIST/NOAA NS&T Intercomparison Exercise Program for Organic Contaminants in the Marine Environment are described in which selected polychlorinated biphenyl (PCB) congeners and chlorinated pesticides were determined in Fish Homogenate IV and selected PCB congeners, chlorinated pesticides, and polycyclic aromatic hydrocarbons (PAHs) were determined in Marine Sediment IX exercise materials. The analytical methods used by each participating laboratory in this performance-based program are summarized.

Introduction

The preparation and distribution of two materials, Fish Homogenate IV (QA99FSH4) and Marine Sediment IX (QA99SED9), used in interlaboratory comparison exercises of 1999 for the National Institute of Standards and Technology (NIST)/ National Oceanic and Atmospheric Administration (NOAA) National Status and Trends (NS&T) Organics Quality Assurance Program and the NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment and the results of these exercises are described in this report. The analytical methods used by each participating laboratory are summarized.

Tools and mechanisms for the assessment of data produced by laboratories providing environmental analyses are critical because decision-making based on inaccurate results or data of unknown quality can have significant economic and health consequences. NIST provides a variety of activities in support of environmental monitoring programs for organic contaminants. The largest of these programs was initiated and funded in part for the past twelve years by the NOAA NS&T Marine Monitoring Program [1,2,3]. The EPA Environmental Monitoring and Assessment Program (EMAP) participated in the existing NIST/NOAA NS&T effort for a number of years. For this program, NIST provides mechanisms for assessing the interlaboratory and temporal comparability of data, and on improving measurements for the monitoring of organic contaminants such as polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyl (PCB) congeners, and chlorinated pesticides in bivalve, sediment, and fish samples. This program includes the development of improved analytical methods, production of needed NIST Standard Reference Materials (SRMs) and other control materials, conduct of annual interlaboratory comparison exercises, and the coordination of workshops to discuss the results of these exercises and to provide a forum for cooperative problem-solving efforts by participants. Since 1993, private sector and other laboratories that cannot be accommodated under the NOAA, EPA, and NIST funding have reimbursed NIST for participation costs and have participated in these exercises and workshops as part of the NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment. Current participants represent multi-laboratory monitoring programs as well as a number of individual programs, and include federal, state/municipal, university/college, private sector, and international laboratories. In this performance-based program, each participating laboratory uses their current methods for analysis of similar materials for its program customers. The target analytes are listed in Table 1.

For the annual intercomparison exercises, samples of two natural-matrix, homogeneous materials derived from the marine environment that have not been fortified with any of the target analytes are analyzed by the participating laboratories. Typical materials, such as mussel or fish tissue homogenates or wetted marine sediment, have levels of target analytes in the 1 ng/g to 15000 ng/g range.

Numerical indices (z- and p-scores) are used to assess and track laboratory performance (for accuracy and precision, respectively) and to provide a mechanism for assessing the comparability of data being produced by the participating laboratories for over 60 target analytes and percent moisture.

Sources and Preparation of Materials used in 1999 Intercomparison Exercises

The Fish Homogenate IV was a subset of candidate NIST SRM 1946 (Lake Superior Fish Tissue), and the Marine Sediment IX was prepared from candidate NIST SRM 1941b (Organics in Marine Sediment). These candidate SRMs were true unknowns at the time of the exercise. The use of candidate CRMs enables eventual comparisons for accuracy-based evaluations of the exercise assigned values and the results of the individual laboratories with certified concentrations for these reference materials. Since PAHs are metabolized in the livers of fish, laboratories participating in this exercise were not requested to analyze the fish tissue for PAHs. The sediment material was issued as a wet sediment to more closely match the matrix of wet sediments typically analyzed by the laboratories.

Marine Sediment IX. Sediment used in the preparation of this material was collected on May 12, 1998 near the Francis Scott Key Bridge at approximately the same location as SRM 1941 and SRM 1941a. The sampler was a Kynar-coated modified Van Veen-type grab sampler. The material was freeze-dried, granularized, and then sieved. The material passing through a 100 mesh sieve ($< 150 \mu\text{m}$) was blended, radiation-sterilized, and homogenized. During the bottling sequence of SRM 1941b, 50 of the 3300 bottles were pulled for use in preparing Marine Sediment IX.

Clear, 2-oz, wide-mouth, glass bottles were rinsed with deionized water, thermally cleaned at 500°C for 18 h in a ventilated oven, cooled, capped, and labeled. Each label contained the material's name and code (Marine Sediment IX, QA99SED9) as well as an individual bottle number. The Teflon liners of the phenolic screw caps had been removed from the caps, cleaned with hexane, dried, and reinserted in the caps. A calibrated toploader balance (resolution of 0.01 g) was used for weighing the sediment and water. For each sample, approximately 11 g (exact weight known) of candidate SRM 1941b sediment (as received) was weighed into a tared bottle. The bottle was then capped and stored in the dark at room temperature. Approximately four days before samples were to be shipped to laboratories participating in the intercomparison exercise, approximately 9 g (exact weight known) of HPLC-grade water were added by pipet to each tared bottle of sediment. (Preliminary trials had shown that a minimum of 9 g of water would moisten 11 g of this sediment.) The masses of sediment and water in each bottle were recorded. Each sample was "tilted" by hand until no "dry" sediment was visible. Only a very small amount of water was observed on the top of the wet sediment. After 24 h at room temperature (in the dark), followed by approximately 4 h at -20°C , each bottle of material was stored at -80°C until shipped. The bottles were never inverted until the wet samples had been frozen in the bottom of the bottles. The material was not enriched or spiked with any of the analytes of interest in this intercomparison exercise.

Summary statistics of preparation of Marine Sediment IX:

	<u>SRM 1941b</u>	<u>HPLC water</u>
mean, g	11.01	9.06
median, g	11.01	9.02
number	147	147
standard deviation, g	0.01	0.15
95% confidence level, g	0.02	0.02
minimum, g	11.00	9.00
maximum, g	11.07	9.17

Fish Homogenate IV. Fish Homogenate IV was a subset of SRM 1946. During the bottling of SRM 1946, 144 clear, 2-oz, wide-mouth, glass bottles that had been labeled as Fish Homogenate IV, QA99FSH4), each with individual bottle numbers were filled with 10 g of fish homogenate. The bottles had been precleaned in the same manner as those used for the sediment. This sample is a cryogenically homogenized “fresh” material prepared from adult lake trout (*Salvelinus namaycush*) collected from Lake Superior during the 1997 fall spawning stock assesment cruises done by the states’ Departments of Natural Resources.

Each of the three bottles sent to each participant contained approximately 10 g (wet basis) of Fish Homogenate IV. This frozen fish homogenate material had not been enriched or spiked. Each 2-oz glass bottle had a Teflon-lined screw cap and was labeled with an individual bottle number as well as the material’s name and code (Fish Homogenate IV, QA99FSH4).

Percent Moisture Determinations

Marine Sediment IX. Each bottle of Marine Sediment IX, as prepared, contained 11.01 g of SRM 1941b sediment plus 9.06 g (see preparation statistics above) of HPLC water. For the purposes of this exercise, the calculated value for the percent water in the Marine Sediment IX samples is based on the mean of 9.06 g of water added to each bottle because the variability of the water mass added is much smaller than the expected analytical variability. For evaluation of exercise results, the NIST assigned value for moisture content in Marine Sediment IX (with the uncertainty expressed as the 95% confidence interval) is:

$$\text{NIST}_{\text{assigned value}} = 45.13\% \pm 0.06\% \text{ moisture.}$$

Laboratories reported results on a dry basis so the uncertainty in the NIST_{assigned value} is not a factor in the results for the other analytes.

Storage and Distribution of Materials

Each bottle of Marine Sediment IX and Fish Homogenate IV material was stored at -80 °C until shipped via overnight delivery to participating laboratories. Instructions for the storage and use of the exercise material and a diskette with files for electronic submission of data were included with each set of material shipped. These instructions are shown in Appendices A and B. Samples of each of these materials have been archived in the National Biomonitoring Specimen Bank at NIST.

Each laboratory participating in these intercomparison exercises was sent the following by overnight delivery:

Exercise 1: Fish Homogenate IV (QA99FSH4)

Three bottles of Fish Homogenate IV material (shipped on dry ice)
Description of the materials and storage/use/reporting instructions for the exercise (See Appendix A.)
Data diskette with files for the reporting of results

Exercise 2: Marine Sediment IX (QA99SED9)

Three bottles of Marine Sediment IX material (shipped on dry ice)
Description of the materials and storage/use/reporting instructions for the exercise (See Appendix B.)
Data diskette with files for the reporting of results

In the letter accompanying each shipment each participant was asked to analyze each of three replicate samples in a separate batch/set/string/catalog in order to provide a more realistic assessment of laboratory precision and, if possible, to concurrently analyze the National Research Council of Canada (NRC) certified reference material (CRM) CARP-1 [4] with Fish Homogenate IV and NIST SRM 1941a, Organics in Marine Sediment, [5] with Marine Sediment IX. Samples were sent to the laboratories the week of July 12, 1999. Laboratories were requested to submit results for these exercises by February 1, 2000. Laboratories that joined the program later than July 12, 1999 were sent samples as soon as possible after the paperwork was received.

Evaluation of Exercise Results

Establishment of the Assigned Values

The following guidelines were used by the NIST exercise coordinators for the establishment of the exercise "Assigned Values" for these two exercises. In essence, the laboratory's performance on concurrent reference material analyses was used to determine if that laboratory's results would be included in the calculation of the exercise assigned value for the unknown material for a particular analyte. The results reported for the unknown materials from laboratories that did not report results for the reference materials were not used in these calculations. After the exercise assigned values, standard deviations, and 95% confidence limits had been calculated, **all** reported

results for the Fish Homogenate IV and Marine Sediment IX materials were evaluated relative to these exercise “assigned values.”

Laboratory data submission: Each participating laboratory was to submit data from three replicate determinations of the “unknown” materials (Fish IV and Sediment IX) and were requested to report results of concurrent analyses of CRM CARP-1, a fish slurry reference material, and SRM 1941a, a marine sediment reference material. Laboratories were requested to report these results to three significant figures, and brief descriptions of their extraction, cleanup, and analytical procedures.

Determination of laboratory analyte means: For each laboratory, the laboratory analyte mean of the three sample results (S1, S2, and S3) was calculated for each analyte. Non-numerical data were treated as follows: A mean "<value" was used when three "<values" were reported; NA (not analyzed/determined) was used for three reported NA's, etc.; and, if the reported results were of mixed type, e.g., S1 and S2 were numerical values and S3 was reported as “<value”, the two similar "types" were used to either determine the mean or to set a non-numerical descriptor.

Determination of assigned values: For a particular analyte, the performance on the reference material was deemed acceptable for the purpose of this exercise if the laboratory result was within 30% of the upper and lower limits of the confidence interval for analytes listed in the Certificates of Analysis for SRM 1941a and CRM CARP-1. For each analyte of interest not certified in these materials, a “target” concentration and the associated uncertainty were calculated. The targets for SRM 1941a were based on noncertified concentrations in SRM 1941a, results of the 1992 Sediment III exercise in which SRM 1941a was used as the “unknown material,” and exercise results when SRM 1941a was used as a control. Similarly, the targets for CARP-1 were based on results of the 1993 Fish Homogenate I exercise in which CARP-1 was used as the “unknown material,” and exercise results from 1995 when CARP-1 was used as a control. Laboratory results within target upper and lower limits, typically 30% to 40%, of these concentrations were deemed acceptable for this exercise. If a laboratory demonstrated acceptable performance on a particular analyte in the reference material, that laboratory’s results for that analyte in the corresponding “unknown” exercise material was then used in the calculation of the analyte’s exercise assigned value unless it was deemed an “outlier.” For evaluation of potential outliers, statistical tests and expert analyst judgement were used after viewing both normal and log plots of the data. This judgement utilized knowledge of potential coeluters based on the laboratory's reported methods. In instances in which the analyte concentration was below the detection limit of most participating laboratories, no exercise assigned value was calculated. In data sets such as this with a number of laboratories reporting results as "not detected" at various detection limits, there is no consensus as to what "numerical" value should be assigned to these results in the computation of grand means, etc., e.g., "0," ½ Detection Limit (DL), and the DL value itself have all been used and the choice is influenced by the use of the particular data set.

Reported Results

Laboratories were assigned numerical identification codes in order of receipt of data with the exception of NIST-Gaithersburg, which is Laboratory 1 in these exercises. A laboratory was assigned the same code for each material. In this report, the triplicate results as reported by the laboratories for both the exercise materials and the two CRMs are shown in Appendix C (Fish Homogenate IV) and Appendix D (Marine Sediment IX) along with reference values for each of the materials and performance scores [numerical indicators of accuracy (bias) and precision (reproducibility)]. The laboratory mean replicate data are shown in Tables 2 and 3 and Tables 4 to 6 for the Fish Homogenate IV and Marine Sediment IX materials, respectively. Included in the means tables are the exercise assigned values, the standard deviation of the assigned value, the percent relative standard deviation (%RSD), and the calculated 95% confidence limit of the assigned value for the percent water, PAHs, chlorinated pesticides, and PCB congeners as applicable. Notes included by a laboratory with its data are listed in Appendices E (Fish Homogenate IV) and F (Sediment IX). Summaries of the methods used by each laboratory are in Appendices G (Fish Homogenate IV) and H (Sediment IX).

In Appendices I (Fish Homogenate IV) and J (Sediment IX), charts of the mean reported numerical results by laboratory for **each analyte** are shown for the exercise material and the corresponding reference material.

Performance Scores

The exercise coordinators recognize that different programs have different data quality needs. The acceptability of the results submitted by a particular laboratory will be decided by the individual program(s) for which the particular laboratory provides data. Typically, the program will use these exercise results in conjunction with the laboratory's performance in the analysis of certified reference materials and/or control materials, and of other quality assurance samples. These exercise results are shown in a number of ways in this report to facilitate their use by these programs in their acceptability assessments.

IUPAC guidelines [6] describe the use of z-scores and p-scores for assessment of accuracy and precision in intercomparison exercises such as those described in this report. These indices assess the difference between the result of the laboratory and the exercise assigned value and can be used, with caution, to compare performance on different analytes and on different materials.

Accuracy Assessment (z-score)

$$z\text{-score} = \frac{\text{bias estimate}}{\text{performance criterion}}$$

$$z = \frac{(x - \bar{X})}{\sigma}$$

where x is the individual laboratory result, \bar{X} is the "Exercise Assigned Value," and σ is the target value for standard deviation.

As described in the IUPAC guidelines, the choice of σ is dependent upon data quality objectives of a particular program. It can be "fixed" and arrived at by perception, prescription, or reference to validated methodology (e.g., $\sigma = 0.125 X$, X is the analyte concentration), or it can be an estimate of the actual variation (e.g., the calculated s from the exercise data). The "fixed" performance criterion is more useful in the comparison of a laboratory's performance on different materials while the use of the actual variation may be more useful within a given exercise, for example, if the determination of a particular analyte is more problematic than usual.

We have calculated and reported z-scores using both approaches for each analyte for each laboratory. At a previous workshop, it was decided to use "25% of the exercise assigned value" as the fixed target value for standard deviation for this program, at least for a few years. We also calculated z-scores based on "one assigned-value standard deviation." The z-scores calculated for these exercises can thus be interpreted as shown in the following examples:

z-score (25% X):

- +1 \Rightarrow laboratory result is 25% higher than the assigned value
- 2 \Rightarrow laboratory result is 50% lower than the assigned value

z-score (s):

- +1 \Rightarrow laboratory result is one "exercise standard deviation" higher than the assigned value
- 2 \Rightarrow laboratory result is "two exercise standard deviations" lower than the assigned value

From a scientific point of view, IUPAC does not recommend the classification of z-scores but allows that it is possible to classify scores, e.g.:

$ z \leq 2$	Satisfactory
$2 < z < 3$	Questionable
$ z \geq 3$	Unsatisfactory

The Tables in Appendices C (Fish IV) and D (Sediment IX) show the calculated z-scores for each

laboratory for each reported analyte. These tables of the results and performance include a summary of the number of reported analytes that fall within each category for each laboratory.

Precision Assessment (p-score)

$$p = \frac{\sigma_{lab}}{\sigma_{target}} = \frac{CV_{lab}}{CV_{target}}$$

Prior to the 1994 exercises, participating laboratories typically analyzed the three replicate samples for an exercise with the same sample set, i.e., within one set of samples with the same blank, calibration curve, etc. applicable for each. Since the repeatability for replicates within a set is generally better than for replicates in different sets, this does not result in data that are very useful for precision (repeatability) assessment. Since 1994, laboratories have been requested to process each replicate in a different sample set for precision assessment. For the calculation of p-scores for this program, the current target CV for the three replicates is 15%.

The Tables in Appendices C (Fish IV) and D (Sediment IX) show the calculated p-scores for each laboratory for each reported analyte.

Discussion

These results were discussed at the QA workshop that was held April 10, 2000 in Gaithersburg, MD. Laboratories were requested to quantify two new pesticides this year, chlorpyrifos and endosulfan sulfate. For these two pesticides, four labs returned data for Fish IV, and five labs returned data for Sediment IX. Only lab 41 found measurable levels (0.3 ng/g wet basis and 23 ng/g wet basis for chlorpyrifos and endosulfan sulfate, respectively, in the fish tissue and 1.9 ng/g dry basis and 1.6 ng/g dry basis for chlorpyrifos and endosulfan sulfate, respectively, in the sediment). The other labs reported results as being below laboratory detection limits. Since these data were requested after the samples, instructions, and data reporting formats were sent out, the labs submitted the results as part of the laboratory notes, Appendix E for Fish Homogenate IV and Appendix F for Marine Sediment IX.

The concentrations of the pesticides of interest in Fish Homogenate IV range from <1 ng/g wet basis to 91.2 ng/g wet basis while those of the PCB congeners range from <2 ng/g wet basis to 136 ng/g wet basis. Laboratories were also requested to determine the total extractable organics (TEO) in Fish Homogenate IV, but since no units were specified for reporting, the results are not comparable. The reported values of TEO are summarized in Table 3 with accompanying information submitted by laboratories summarized in Appendix G.

The z-scores based on 25 % of the exercise assigned value are summarized for Fish Homogenate IV in Tables 7 and 8 for the pesticides and PCB congeners, respectively. For the pesticides in Fish Homogenate IV, 80% of the reported concentrations were within $\pm 50\%$ of the exercise assigned value (satisfactory) while 9% were between $\pm 50\%$ and $\pm 75\%$ of the exercise assigned value (questionable) and 11% were more than $\pm 75\%$ (unsatisfactory) from the exercise assigned value. For the PCB congeners in Fish Homogenate IV, 83% of the reported concentrations were within $\pm 50\%$ of the exercise assigned value (satisfactory) while 6% were between $\pm 50\%$ and $\pm 75\%$ of the exercise assigned value (questionable) and 10% were more than $\pm 75\%$ (unsatisfactory) from the exercise assigned value. Lab 9 reported values that were more than 75% higher than the exercise assigned value for both classes of compounds and reported no values for CARP-1. Lab 40 also had a high percentage of unsatisfactory results for the PCB congeners in Fish IV. This lab did report values for CARP-1 that were low for a majority of the congeners.

Fish IV had higher concentrations than CARP-1 for all of the measurable pesticides, except 2,4'-DDE, 2,4'-DDD, and 4,4'-DDD. The PCB distribution is different in the Fish IV than in the CARP-1 with the lower chlorinated analogues, through pentachloro, present at higher concentrations in the CARP-1 while the hexa through octa chlorinated congeners are present at higher concentrations in Fish IV.

For the analytes of interest, the PAH concentrations in Marine Sediment IX range from 27.7 ng/g dry basis to 756 ng/g dry basis. The pesticide concentrations range from below the detection limits of the methods used to 5.88 ng/g dry basis while the PCB concentrations range from 0.8 ng/g dry basis to 8.6 ng/g dry basis.

The z-scores based on 25% of the exercise assigned value are summarized for Marine Sediment IX in Tables 9, 10, and 11 for the PAHs, pesticides, and PCB congeners, respectively. For the PAHs in Marine Sediment IX, 93% of the reported concentrations were within $\pm 50\%$ of the exercise assigned value (satisfactory) while 11% were between $\pm 50\%$ and $\pm 75\%$ of the exercise assigned value (questionable) and 5% were more than $\pm 75\%$ (unsatisfactory) from the exercise assigned value. For the pesticides in Marine Sediment IX, 64% of the reported concentrations were within $\pm 50\%$ of the exercise assigned value (satisfactory) while 19% were between $\pm 50\%$ and $\pm 75\%$ of the exercise assigned value (questionable) and 18% were more than $\pm 75\%$ (unsatisfactory) from the exercise assigned value. For the PCB congeners in Marine Sediment IX, 84% of the reported concentrations were within $\pm 50\%$ of the exercise assigned value (satisfactory) while 10% were between $\pm 50\%$ and $\pm 75\%$ of the exercise assigned value (questionable) and 6% were more than $\pm 75\%$ (unsatisfactory) from the exercise assigned value. Lab 4 reported values that were more than 50% lower than the exercise assigned value for the PAHs; however, the values that Lab 4 reported for SRM 1941a were in good agreement with the target concentrations. This lab did not report values for the chlorinated compounds. There was a larger percent of unsatisfactory values for the pesticides in Marine Sediment IX than in Fish Homogenate IV, but this is not unexpected considering the low levels of pesticides in this sediment. Lab 27 reported a majority of low values (>50% lower than the exercise assigned value) for both the PAHs and all values > 50% lower than the exercise assigned value for the

PCB congeners. No values were reported by that lab for the pesticides. The values that Lab 27 reported for SRM 1941a were generally lower than the target values for the PAHs with no trends for the PCB congeners. Lab 1 (NIST Gaithersburg) reported a majority of compounds that were low compared to the assigned values for Sediment IX: 50% of the PAH values were between 25% and 50% lower, 33% of the pesticides were between 25% and 50% lower while 33% were between 50% and 75% lower, and 79% of the PCB congeners were between 25% and 50% lower with one congener (PCB 180) 51% lower than the assigned value. After careful examination of the data, there is no obvious reason for these low values. This will be investigated carefully during the certification analyses of SRM 1941b from which Sediment IX was prepared.

The concentration range for the majority of PAHs in Marine Sediment IX is between 50% and 70% lower than that in SRM 1941a. Hexachlorobenzene is much lower in Marine Sediment IX (5.0 ng/g dry basis) than in SRM 1941a (70 ng/g dry basis) with the rest of the measurable pesticides approximately 50% lower in Marine Sediment IX except for 4,4'-DDT, which is approximately the same concentration in the two sediments. The PCB congeners are generally 30% to 60% lower in Marine Sediment IX compared to SRM 1941a.

No correlation could be seen between years of participation and z-scores for either Fish IV or Sediment IX. There were five new participants, as well four labs that have been involved from the beginning of the program. These nine laboratories performed approximately the same. As in the past exercises, a variety of methods were used for extraction, extract cleanup, and analysis. These are summarized in Appendix G for the fish and Appendix H for the sediment. For the PAHs in the sediment, two labs (23 and 42) used ion trap mass spectrometry (MS) while for the chlorinated analytes, Lab 19 used ion trap MS; Labs 27, 31, 34, 35, and 39 used high resolution MS; and Lab 40 used negative chemical ionization MS for the pesticides in the fish. There was also no obvious correlation between z-scores and method used.

For the 1999 exercises, the data provided in the various figures and tables of this report can be used for assessing the comparability of results of over 60 analytes of interest in this program and the performance of an individual laboratory. The z-scores and the p-scores for the individual laboratories are summarized by lab in Appendices C and D for the fish and sediment, respectively. For both materials, the highest percentage of z-scores and p-scores that were in the unsatisfactory category were for the chlorinated pesticides. The chlorinated pesticides were typically present at lower concentrations in both of these materials than the concentrations of the PAHs and PCB congeners. In these exercises, interlaboratory variability is a greater contributor to measurement incomparability than is the intralaboratory variability. Laboratories reporting results of concurrent reference material analyses typically showed better performance than those laboratories that did not analyze the reference materials.

Subgroups of the exercise participants have demonstrated comparability of results for many analytes within the 0 to 2 z-range based on use of "25% of the analyte concentration" as the performance criterion. This implies that this subgroup can distinguish between two samples that have an analyte concentration difference of 100%. The reported accuracy and reproducibility

indices (z- and p-scores, respectively) can be easily converted to conform to the acceptability requirements of a particular program. For example, a z-score based on 25% can be multiplied by two to convert to a z-score based on 12.5% of the analyte concentration.

It is important to evaluate the non-quantitative results reported by each laboratory as well. Although these results are not easily presented or numerically evaluated, they are provided in the various tables of this report that list the mean and individual results of the laboratories. The laboratory and its data users should look closely at these non-quantitative results. Decisions based on false negative or false positive results from a laboratory can lead to significant environmental and/or economic consequences. Some laboratories reported detection limits in these “real” matrix materials that may be too high for the data quality needs of their program(s) and these should be assessed as well.

Intercomparison exercises provide an important mechanism for assessing the comparability, accuracy, and reproducibility of data being produced by the participating laboratories. Exercise materials similar in matrix, form, and analyte concentration to typical samples routinely analyzed by the laboratories are most useful for demonstrating the level of comparability and for revealing potential problem areas.

For the determination of the target compounds in these complex marine matrices with relatively low levels of these analytes, the levels of bias and reproducibility of many of the participating laboratories meet their current acceptability requirements; however, there is certainly room for improvement. Minimizing the between-laboratory bias such that the analytical variability is significantly less than the sampling variability should be an achievable goal.

Acknowledgments

The time and efforts of the analysts and management of the participating laboratories, the partial support of the NOAA National Status and Trends Program (NS&T), and the assistance of the NIST Standard Reference Materials Program and National Research Council of Canada with the procurement and preparation of the exercise materials are gratefully acknowledged.

Disclaimer

Certain commercial equipment, instruments, or materials are identified in this report to specify adequately the experimental procedure. Such identification does not imply recommendation or endorsement by the National Institute of Standards and Technology, nor does it imply that the materials or equipment identified are the best available for the purpose.

Table 1. Analytes^a of Interest in NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment

*Chlorinated Pesticides**

hexachlorobenzene	2,4'-DDE
alpha-HCH (alpha-BHC)	4,4'-DDE
gamma-HCH (gamma-BHC, Lindane)	2,4'-DDD
heptachlor	4,4'-DDD
heptachlor epoxide	2,4'-DDT
<i>cis</i> -chlordane (alpha-chlordane)	4,4'-DDT
<i>trans</i> -chlordane (gamma-chlordane)	aldrin
oxychlordane	dieldrin
<i>cis</i> -nonachlor	endrin
<i>trans</i> -nonachlor	endosulfan I
mirex	endosulfan II

*Chlorpyrifos and endosulfan sulfate were added via an e-mail request on September 10, 1999.

Polychlorinated Biphenyl Congeners

<i>PCB No.</i>	<i>Compound Name</i>
8	2,4'-dichlorobiphenyl
18	2,2',5-trichlorobiphenyl
28	2,4,4'-trichlorobiphenyl
44	2,2',3,5'-tetrachlorobiphenyl
52	2,2',5,5'-tetrachlorobiphenyl
66	2,3',4,4'-tetrachlorobiphenyl
101	2,2',4,5,5'-pentachlorobiphenyl
105	2,3,3',4,4'-pentachlorobiphenyl
118	2,3',4,4',5-pentachlorobiphenyl
128	2,2',3,3',4,4'-hexachlorobiphenyl
138	2,2',3,4,4',5'-hexachlorobiphenyl
153	2,2',4,4',5,5'-hexachlorobiphenyl
170	2,2',3,3',4,4',5-heptachlorobiphenyl
180	2,2',3,4,4',5,5'-heptachlorobiphenyl
187	2,2',3,4',5,5',6-heptachlorobiphenyl
195	2,2',3,3',4,4',5,6-octachlorobiphenyl
206	2,2',3,3',4,4',5,5',6-nonachlorobiphenyl
209	decachlorobiphenyl

Table 1. (continued)

Polycyclic Aromatic Hydrocarbons (PAHs)

naphthalene	fluoranthene
2-methylnaphthalene	pyrene
1-methylnaphthalene	benz[<i>a</i>]anthracene
biphenyl	chrysene
2,6-dimethylnaphthalene	benzofluoranthenes [<i>b+j+k</i>]
acenaphthylene	benzo[<i>e</i>]pyrene
acenaphthene	benzo[<i>a</i>]pyrene
1,6,7-trimethylnaphthalene	perylene
fluorene	indeno[1,2,3- <i>cd</i>]pyrene
phenanthrene	dibenz[<i>a,h</i>]anthracene
anthracene	benzo[<i>ghi</i>]perylene
1-methylphenanthrene	

^a Please note that the following are typically reported by participants as the sums of the indicated components:

PAH

chrysene + triphenylene
benzo[*b*]- + benzo[*j*]- + benzo[*k*]fluoranthene
dibenz[*a,h*]anthracene + dibenz[*a,c*]anthracene

PCB congeners

PCB 66 + PCB 95^b
PCB 101 + PCB 90
PCB 138 + PCB 163 + PCB 164
PCB 187 + PCB 182 + PCB 159
PCB 170 + PCB 190

^b Because PCB 66 and PCB 95 can now be separated by a significant number of participants, we have changed the table for reporting results so that participants may report these as two separate concentrations or as the sum of PCB 66 and PCB 95.

**Appendix A: Description, Storage, Use, and Reporting Instructions
for Fish Homogenate IV**

**NIST Intercomparison Exercise Program for
Organic Contaminants in the Marine Environment**

NIST/NOAA-NS&T QA Program

**Intercomparison Exercise: Fish Homogenate IV
Description of Materials and Instructions**

Intercomparison Exercise Materials:

QA99FSH4 (Fish Homogenate IV)

Each of the three bottles contains approximately 10 g (wet basis) of Fish Homogenate IV, a frozen fish tissue homogenate material collected from the Great Lakes. The tissue is a cryogenically homogenized “fresh” material still containing its endogenous water. (It has not been freeze-dried.) The material has not been enriched or spiked. Each 2-oz clear glass jar has a Teflon-lined screw cap and is labeled with an individual bottle number as well as the above name.

In addition, three concurrent analyses of CARP-1 certified reference material (CRM) are recommended. This material is ground whole carp to which a small amount of water was added to raise the moisture content to 85% and 0.02 % ethoxyquin was added as an antioxidant. Each ampoule contains approximately 9 g (wet basis) of fish. The price for six ampoules is \$495 Canadian plus shipping charges. More information can be obtained from the web site <http://www.cm.inms.nrc.ca/> or by contacting NRC by any method listed below:

Storage of Materials:

Fish Homogenate IV. The tissue material should be stored in the dark at temperatures of -20 °C or lower. If allowed to thaw or if stored for extended periods at temperatures higher than -40°C, it will lose its powder-like form. This material has been stored at NIST at -80 °C and was shipped to you on dry ice. If only a portion of the contents of a jar is used, the jar should be tightly closed immediately after removal of a subsample to preserve the integrity of the remaining

material for later analysis.

Instructions for Use:

You are to analyze Fish Homogenate IV and CRM CARP-1, using **your** laboratory's and/or program's analytical protocols, for the concentrations (wt/**wet** wt) of the 22 chlorinated pesticides and 18 polychlorinated biphenyl (PCB) congeners¹ of interest in the current NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment. These compounds are listed in Table 1. Concentrations of these analytes in samples collected near the site of this collection were in the 1 to 200 ng/g **wet** weight range.

It is best if the Fish Homogenate IV material is not allowed to thaw prior to the taking of samples for analysis; however, if the material has been even partially thawed, you should use the contents of the entire jar as a single sample as it is difficult to take representative samples from a jar once the material has thawed. After removing the material for analysis from the jars, the samples should be used without delay.

The total extractable organics (TEO) in the fish materials should be determined. You should have received enough material so that you can perform separate determinations for the TEO if you typically do this determination on a separate aliquot.

The amount of material used for each analysis should correspond to the amount of fish tissue (wet basis) you would typically analyze as prescribed in your protocols. You should analyze three replicate samples of Fish Homogenate IV and at least one, and more if possible, of CRM CARP-1 in three different batches/sets/strings/catalogs using your protocol for fish tissue samples. Specifically, we are asking that you analyze one sample of Fish Homogenate IV and one sample of CRM CARP-1 with one batch of laboratory samples; analyze a second sample of each material with another batch; and the third sample with yet another batch. This will allow a more realistic assessment of laboratory precision over a longer term than the assessment obtained when a laboratory places all three samples in the same extraction and cleanup batch and the resulting extracts are analyzed using the same calibration curve, etc.

Reporting of Results:

Please report one result, as if three figures were significant, for each of the requested analytes in each of the three replicates of the Fish Homogenate IV and of the CRM CARP-1. Report results in units of ng/g **wet** basis. Report the date of measurement of each sample in the requested m/d/y format. Also, report the results of your TEO determinations of Fish Homogenate IV and CRM CARP-1.

¹If your laboratory is not analyzing samples for both chemical classes, you are expected to submit results only for those compounds in classes currently being determined in your laboratory.

We recognize that the reported concentrations for some of the requested determinands will probably include concentrations of compounds reported to coelute with the determinand of interest with methods commonly in use in environmental laboratories. The more common of these coelutions have been listed in Table 1 and in the data table format shown in Table 2. Please note at the bottom of your table of reported results if any of these listed coelutions are not applicable to the data being reported by your laboratory and/or if other coelution qualifiers not listed are applicable to your data. Please note that any changes you make to the column or row headings **within** the tables will **not** be seen by the coordinators because only the table entries and comments at the bottom of the tables are automatically transferred to the exercise database.

We prefer that concentrations be reported for each analyte determined. If the measured concentration is below your typical reporting concentration for an analyte in a particular matrix, you can report the number and list the appropriate detection limit, quantification limit, etc. at the bottom of the data table. However, if you need to report non-numerical data please use the following conventions:

NA	"Not analyzed", "not determined"
<"value"	"Less than specified concentration", e.g., <8 ng/g
Other	"Other"; add note of explanation at end of data table, e.g., interference
DL	"Below detection limit" may be used, however, <"value" is preferable

Do not use negative numbers or parentheses to indicate "less than detection limits".

The enclosed floppy diskette (DOS format) contains an EXCEL file, TIS9.XLS. If you have any software/hardware conversion problems, please contact Michele Schantz. The data file templates also include places for you to list the surrogate/internal standards and type of calibration curve used, and to provide a brief description of the analyses. Please **do not** add "spaces" before entering numbers in the table cells. Please **do not** insert any columns or rows **within** the table in the data file. If you wish to include additional data and/or other information or comments, you may add it to the bottom of the data table in the diskette file or send it in hard copy. A printout of the data file format is shown in Table 2.

Submit your results either via diskette file or as an attached file via e-mail to:

**Appendix B: Description, Storage, Use, and Reporting Instructions
for Marine Sediment IX**

**NIST Intercomparison Exercise Program for
Organic Contaminants in the Marine Environment**

NIST/NOAA-NS&T QA Program

**Intercomparison Exercise: Marine Sediment IX
Description of Materials and Instructions**

Intercomparison Exercise Materials:

QA99SED9 (Marine Sediment IX)

Each of the three jars contains 21 g (wet basis) of Marine Sediment IX. This wetted sediment was prepared from material that was collected from a site in Baltimore Harbor and then freeze-dried, sieved, and radiation-sterilized. This material has not been enriched or spiked. Each 2-oz clear glass jar has a Teflon-lined screw cap and is labeled with an individual jar number as well as the above name.

In addition, three concurrent analyses of SRM 1941a, Organics in Marine Sediment, are recommended. This material can be obtained from the NIST Standard Reference Materials Program (\$402/50 g (dry basis) (phone: 301/975-6776; fax: 301-975-948-3730).

Storage of Materials:

Marine Sediment Material. This Marine Sediment IX material should be stored in the dark at temperatures of -15 °C or lower. If only a portion of the contents of a jar is used, that jar should be tightly closed immediately after removal of a subsample to preserve the integrity of the remaining material for later analysis.

Instructions for Use:

You are to analyze Marine Sediment IX and SRM 1941a, using **your** laboratory's and/or program's analytical protocols, for the concentrations (mass/mass [dry basis]) of the 23 polycyclic aromatic hydrocarbon (PAH) compounds, 22 chlorinated pesticides, and 18 polychlorinated biphenyl (PCB) congeners¹ of interest in the current NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment. These compounds are listed in Table 1.

The percentage of water in the Sediment IX material should be determined so that the results can be reported on a dry basis. You should have received sufficient material so that you can perform separate determinations for the water content if you do not dry your sediment samples prior to analysis.

¹If your laboratory is not analyzing samples for all three chemical classes, you are expected to submit results only for those compounds currently being determined in your laboratory.

The amount of material used for each analysis should correspond to the amount (wet basis) of marine sediment that you would typically analyze as prescribed in your protocols. Prior to removing an aliquot of Sediment IX, you should thaw the sample in the jar and then **stir or otherwise mix it thoroughly**.

You should analyze three samples of Marine Sediment IX and at least one, and more if possible, of SRM 1941a in three different batches/sets/strings/catalogs using your protocol for marine sediment samples. Specifically, we are asking that you analyze one sample of Sediment IX and one sample of SRM 1941a with one batch of laboratory samples; analyze a second sample of each material with another batch; and the third sample with yet another batch. This will allow a more realistic assessment of laboratory precision over a longer term than the assessment obtained when a laboratory places all three samples in the same extraction and cleanup batch and the resulting extracts are analyzed using the same calibration curve, etc.

Reporting of Results:

Please report one result, as if three figures were significant, for each of the requested analytes in each of the three replicates of the Marine Sediment IX and of SRM 1941a. Report results in units of ng/g **dry** basis. Report the date of measurement of each sample in the requested m/d/y format. Also, report the results of your percentage water determinations of Marine Sediment IX.

We recognize that the reported concentrations for some of the requested determinands will probably include concentrations of compounds reported to coelute with the determinand of interest with methods commonly in use in environmental laboratories. The more common of these coelutions have been listed in Table 1 and in the data table format as shown in Table 2. Please note at the bottom of your table of reported results if any of these listed coelutions are not applicable to the data being reported by your laboratory and/or if other coelution qualifiers not listed are applicable to your data. Please note that any changes you make to the column or row headings **within** the tables will **not** be seen by the coordinators because only the table entries and comments at the bottom of the tables are automatically transferred to the exercise database.

We prefer that concentration values be reported for each analyte determined. If the measured concentration is below your typical reporting concentration for an analyte in a particular matrix, you can report the number and list the appropriate detection limit, quantification limit, etc. at the bottom of the data table. However, if you need to report non-numerical data please use the following conventions:

NA	"Not analyzed", "not determined"
<"value"	"Less than specified concentration", e.g., <8 ng/g
Other	"Other"; add note of explanation at end of data table, e.g., interference
DL	"Below detection limit" may be used, however, <"value" is preferable

Do not use negative numbers or parentheses to indicate "less than detection limits".

The enclosed floppy diskette (DOS format) contains an EXCEL file, SED9.xls. If you have any software/hardware conversion problems, please contact Michele Schantz. The data file templates also include places for you to list the surrogate/internal standards and type of calibration curve used, and to provide a brief description of the analyses. Please **do not** add "spaces" before entering numbers in the

table cells and enter them as "numbers" not as "labels". Please **do not** insert any columns or rows **within** the table in the data file. If you wish to include additional data and/or other information or comments, you may add it to the bottom of the data table in the diskette file or send it in hard copy. A printout of the data file format is shown in Table 2.

Submit your results either via diskette file or as an attached file via e-mail to:

Michele M. Schantz
NIST
100 Bureau Drive Stop 8392
Gaithersburg, MD 20899-8392

Other5 : Since PCB 77 and PCB 110 coelute from our column and the response of each congener vary from each other, the relative ratios of the two congeners can not be determined. We do not report the concentrations of either PCB 77 or PCB 110.

Lab	Additional notes for Fish Homogenate IV						
7	PESTICIDE ANALYSES	FISH IV	FISH IV	FISH IV	CRM Carp-1	CRM Carp-1	CRM Carp-1
		Batch A	Batch B	Batch C	Batch A	Batch B	Batch C
		Sample 1	Sample 2	Sample 3	Sample 1	Sample 2	Sample 3
	Extraction Date	9/9/99	26-Oct-99	10-Nov-99	9/9/99	26-Oct-99	10-Nov-99
	PCB CONGENER ANALYSES	FISH IV	FISH IV	FISH IV	CRM Carp-1	CRM Carp-1	CRM Carp-1
		Batch A	Batch B	Batch C	Batch A	Batch B	Batch C
		Sample 1	Sample 2	Sample 3	Sample 1	Sample 2	Sample 3
	Extraction Date	9/9/99	26-Oct-99	10-Nov-99	9/9/99	26-Oct-99	10-Nov-99
	Congeners 90, 95, 163, 164, 182, 190 are not analyzed (Not present in standard)						
8	(*) Because we have received CARM-1 a few days before sending results, it was impossible to analyze this CRM.- (**) Not analyzed in fish homogenate because of interferences.-						
11	* See note.....No data were corrected for percent moisture. Other ^ Fish IV, Batch B, sample 2 --- the sample was ruined during prep. No data for this sample were reported. Other ^^ CRM Carp-1 Batch B, sample 2 --- the sample was ruined during prep. No data for this sample were reported.						
13	Following Reported as Coeluting Congener 8 reported as Congeners 8+5 Congener 28 reported as Congeners 28+31 Congeners 101/90 reported as Congener 101 (based on Mullins '610' Method where mass of 90 is not supplied) Congener 153 reported as Congeners 132+105+153 Congeners 138/163/164 reported as Congeners 138+163 Congener 195 reported as Congeners 195+208 ppDDE...suspect that there is interference therefore not reported						
15	Detection limits reported are based on a 7-point MDL study -- the concentrations reported are directly from the study -- not sample specific for these samples. (not adjusted for sample size or dilution factors) Two aliquots of the CRM were only quantified for the PCB congeners, therefore the pesticides are reported as NA.						
19	FSH-4 was extracted once. The two other portions were lost. Results for PCB153,138 and 180 exceeded the calibration range and reported as estimated. Carp-1 was extracted once. Results for PCB 52,101,118,153 and 138 exceeded the calibration range and reported as estimated.						
20	CRM 1974a was used in place of CRM Carp-1. The results for CRM 1974a are reported in ng/g dry weight.						
22	TEO reported as % lipids.						
24	PCB 8 includes PCB 5 coelution (PCB8/5) PCB 18 includes PCB 17 coelution (PCB18/17) PCB 95 includes PCB 80 coelution (PCB95/80) PCB153 includes PCB132 coelution (PCB153/132) PCB 138 includes PCB 160 coelution (PCB138/160) endosulfan I coelutes with 2,4'-DDE						
27	FOLLOWING PCB'S WERE COELUTED PCB 18-30; PCB 20-28; PCB 44-47-65; PCB 95-98; PCB 90-101-113; PCB 153-168; PCB 138-163-129; PCB 128-166; PCB 193-180. PCB 187,182,159 were separated, values were reported for PCB 187; PCB 170,190 were separated, values were reported combined.						
28	Attachment A: Internal Standards for Pesticides 13C4-Aldrin 13C6-alpha-BHC 13C6-beta-BHC 13C6-delta-BHC 13C6-gamma-BHC (Lindane) 13C4-Dieldrin 13C12-4,4'-DDE 13C12-4,4'-DDT 13C4-Heptachlor 13C8-Mirex Attachment B: Internal Standards for PCB Congeners 15 13C12-4,4'-Dichlorobiphenyl 31 13C12-2,4,5-Trichlorobiphenyl 37 13C12-3,4,4'-Trichlorobiphenyl 47 13C12-2,2',4,4'-Tetrachlorobiphenyl 95 13C12-2,2',3,3',5,6-Pentachlorobiphenyl 194 13C12-2,2',3,3',4,4',5,5'-Octachlorobiphenyl 206 13C12-2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl 77 13C12-3,3',4,4'-Tetrachlorobiphenyl 105 13C12-2,3,3',4,4'-Pentachlorobiphenyl 118 13C12-2,3',4,4',5-Pentachlorobiphenyl 126 13C12-3,3',4,4',5-Pentachlorobiphenyl 156 13C12-2,3,3',4,4',5'-Hexachlorobiphenyl 157 13C12-2,3,3',4,4',5'-Hexachlorobiphenyl 169 13C12-3,3',4,4',5'-Hexachlorobiphenyl 180 13C12-2,2',3,4,4',5'-Heptachlorobiphenyl 189 13C12-2,3,3',4,4',5,5'-Heptachlorobiphenyl 209 13C12-Decachlorobiphenyl						

28 cont.	Attachment C: Standards added after extraction/cleanup and JUST PRIOR to Pesticide chromatographic analysis: d8-acenaphthylene d12-perylene d14-p-terphenyl d12-benzo(e)pyrene Attachment D: Standards added after extraction/cleanup and JUST PRIOR to PCB chromatographic analysis: 52 13C12-2,2',5,5'-Tetrachlorobiphenyl 101 13C12-2,2',4,5,5'-Pentachlorobiphenyl 138 13C12-2,2',3,4,4',5'-Hexachlorobiphenyl 178 13C12-2,2',3,3',5,5',6-Heptachlorobiphenyl
32	Dry weight determination: FSH4 28.5% dry weight; CARP-1 13.3% dry weight. Lipid percent determination: FSH4 10.1% lipid; CARP-1 5.1% lipid.
33	<= denoted detected but at a concentration less than the reported MDL < not detected (reported as "less than the MDL") CARP-1 not analyzed (ampoule was broken inside foil pouch so no analysis was performed) SRM1974a analyzed instead of CARP-1 Sample#211 split into duplicate (~4 g each) samples; mean values reported
34	Coelutions not shown on Table List PCB 30*/18 PCB 28/20* PCB 95/100*/93*/102*/98* PCB 113*/90/101 PCB 153/168* PBC 138/163*/129/160* PCB 128/166* PCB 180/193* PCB 44/47/65* Congeners flagged with a "*" would not be expected to contribute significantly to value reported and are shown for completeness ONLY. Co-elutions on Table List that are not applicable to Data PCB 138/163/164 PCB 187/182/159 PCB 170/190
37	other: dieltrin: sulfuric acid treatment removes analyte. 2,4'-DDD: co-elutes with PCB154 and is not measured. 4,4'-DDD: big unknown interference overwhelms this analyte. PCB 18: unknown interference causes this analyte to be corrupted.
39	** Estimated values based on poor internal standard recoveries. A major portion of Sample 2 was lost via a GPC run failure. The early eluting pesticides and PCB had especially poor recoveries. List A Pesticide Internal Standards b-BHC 4,4'-DDD-2H8 4,4'-DDE-13C12 4,4'-DDT-13C12 a-Endosulfan hexachlorobenzene methoxychlor List B PCB Internal Standards C13 labelled PCB-3;15;28;77;105;114; 118;123;126;156/157;167;169;170;180; 189;194;206;209
40	** 28 coelutes with 31. ** 132 coelutes with 153. ** 208 coelutes with 195. *** TEO is reported as percent. The corresponding ng/g measurements would be $\sim 6.2 \times 10^7$ and $\sim 10.5 \times 10^8$ ng/g.
41	We extracted and analyzed all three FISH IV and the two CARP-1 samples in one batch. For the analyses of PCBs and pesticides, 1 microliter of sample was injected into GC-ECD. We used supplemental pesticide (SRM 2274) and PCB (SRM2275) mixtures obtained from NIST for our sample analyses. We also analyzed the pesticide, chlorpyrifos, obtained from Ultra Scientific, North Kingstown, RI. Other: We found that the following pairs of analytes coeluted from our DB-5 column: Other1 : PCB 8 and alpha-HCH; Other2 : endosulfan I and PCB 101; Other3 : alpha-chlordane and PCB 99 Other4 : oxychlordane replicate values for CARP-1 SRM were inconsistent (4.94 ng/g and 1.21 ng/g).
42	NIST SRM 1974a was used in place of CRM Carp-1

Other8 : replicate values for chlorypyrifos were inconsistent for SRM1941a (0.958, 4.40 ng/g)
 Other9 : PCB 77 and PCB 110 coelute from our column. Since the responses of each congener vary from each other, the relative ratios of the two congeners in each sample can not be determined. We do not report the concentrations of either PCB 77 or PCB 110.
 Since these two congeners coelute from our column, our value for the sum of the concentrations for both congeners in SRM1941a was higher than the certified value for PCB 110. Since certified values for PCB 77 were not available, we can not judge the significance of our numbers.

<p>35</p>	<p>PCB INFORMATION SAMPLE Sediment I Sediment I Sediment I SRM 1941 SRM 1941 SRM 1941a Batch A Batch B Batch C Batch A Batch B Batch C EXTRACTION DATE 1/10/00 1/31/00 1/31/00 1/10/00 1/27/00 1/27/00 NIST SRM 2262 used as source for native PCB compounds for calibration 66 is completely resolved from 95 on this column PESTICIDE INFORMATION SAMPLE Sediment I Sediment I Sediment I SRM 1941 SRM 1941 SRM 1941a Batch A Batch B Batch C Batch A Batch B Batch C EXTRACTION DATE 1/10/00 1/31/00 1/31/00 1/10/00 1/27/00 1/27/00 NIST SRM 2261 used as source for native Pesticide compounds for calibration as well as 7 other individual pesticides from single solutions Labelled Pesticides were used as internal standards for the following compounds : A-HCH,G-HCH, Heptachlor, G-Chlordane, Aldrin, Endosulfan -I, Endosulfan-II, Dieldrin,4,4'-DDE, 4,4'-DDT, Mirex and Heptachlor Epoxide Endosulfan-II was completely lost during the cleanup and hence was not measured We observed very poor sensitivity and/or breakdown of Endrin and hence it was not measured. Conversely we had excellent sensitivity for cis-nonachlor and obtained correct ion ratios at the low levels observed in the unknown sediment On the GC column used, oxychlordane elutes as a completely resolved peak just ahead of Heptachlor epoxide. We could easily see our lowest standard (1.26). We did not observe any peaks for this compound in the SRM. (Aside we observe it in one of the tissue samples). Either it is truly not there or is not extracted. The correct approach to solving this problem would be to spike the SRM with labelled oxychlordane. CIL is now selling labelled oxychlordane, and we hope to carry out this experiment in the near future</p>																																			
<p>37</p>	<p>dieldrin: sulfuric acid treatment removes analyte. 2,4-DDD: co-elutes with BZ154 an is not measured. PCB 44: unknown interference with peak. PCB 170/190: unknown interference with peak, probably diethylhexylphthlate.</p>

Lab #	Sample extract cleanup method	PCBs and Pesticides Separated?	Method of quantitation
1	add activated copper; silica Maxi SPE column 2x with concentration in between	no	IS
2	silica gel column; activated copper; conc sulfuric acid for PCBs	yes	ES
3	acid and sulfur clean	yes	IS
4	GPC; extracted on 7/21/99, 7/22/99, and 7/23/99	only PAH data	IS
5	copper added during Soxhlet extraction; Florisil	only PCB data	IS
6	alumina-silica gel; GPC	no	IS
7	Florisil and copper for chlorinated; Florisil for PAHs	no	IS
8	silica over alumina column both 5% deactivated with H2O	no	IS for chlor; ES for PAH
9	GPC and Florisil column	no	ES for chlor; IS for PAH
10	silica gel and alumina; GPC/HPLC to further isolate aromatic fraction	only PAH data	IS
11	GPC	no	IS for PAH; ES for pest
12	GPC	only PAH data	IS
14	silica gel column	yes	IS
15	alumina (2% deactivated); HPLC/GPC, copper to extract	no	IS
16	silica/alumina column; copper granules	no	IS
17	For PAH, add copper; for chlorinated, Florisil cartridge and addition of copper	no	IS
18	50% for PAH-silica gel column; 50% for chlorinated-Hg vortex then Florisil	no	ES for chlor; IS for PAH
19		no	IS
21	column of glass wool and MgSO4; copper; SPE-LC Alumina-N and ENVI-Carb in series	only pesticide data	IS
22	silica gel and alumina; GPC followed by silica gel for PAHs	no	IS for PCB&PAH; ES for pest
23	GPC & Florisil for pesticides; GPC and alumina/silica gel for PAHs	no	ES
24	Silica gel/alumina column; copper	no	IS
25	GPC (Envirobeads), activated copper pellets	no	IS
26	aminopropyl SPE; chlorinated - separate extracts - copper; GPC; HPLC-aminopropyl column	yes	IS
27	none for PAHs; silica gel for PCBs	no	IS
28	PCBs-acid, silica gel, alumin; PAHs & pesticides-silica gel Method 3630C, sulphur method 3660B	no	IS
29	alumina/silica gel; granulated copper	no	IS
30	asphaltene and sulfur removal; alumina/silica column-pentane, pentane+dichloromethane elution	no	IS
31	florisil; mercury	no	IS
32	silica/alumina and HPLC-SEC	no	IS
33	2 g silica gel (activated) - 3 fractions	yes	ES
34	PAHs- neutral silica; pesticides-Florisil; PCBs-Florisil, copper, alumina, acid/base silica	no	IS
35	Florisil solid phase glass extraction tube	no	IS
36	20 g Florisil eluted with 30% dichloromethane in hexane	no	IS
37	Copper; silica gel column; treat portion for PCB and pest analysis with concentrated sulfuric acid	no	IS
38	PAHs-alumina/activated copper; chlorinated-alumina/activated with exchange to hexane	no	IS
39	PAH- GPC, alumina; PCB- GPC, acid, silica gel, florisil, 3% silica gel; pesticides-GPC, florisil	yes	IS (isotope dilution)
40	PAH-alumina; PCBs and pesticides-Florisil; copper wool for all	yes	IS
41	Florisil/silica/alumina; copper; HPLC-2 Phenogel columns in series	no	IS
42	SEC; cyanopropyl SPE w/ hexane eluant	only PAH data	IS

Appendix I: Charts of Fish Homogenate IV and CARP-1 Results by Analyte

See Tables 2 and 3 and Appendix C for results reported as *<number, DL, etc.*
Charts for analytes with few reported numerical results are not included in this appendix.

For Fish Homogenate IV plots:

Solid line: exercise assigned value

Dotted line: $z = \pm 1$, i. e., 25% from assigned value

Dotted/dashed line: $z = \pm 2$, i. e., 50% from assigned value

Dashed line: $z = \pm 3$, i. e., 75% from assigned value

For CARP-1 plots:

Solid line: material certified concentration or target value (see caption of each plot)

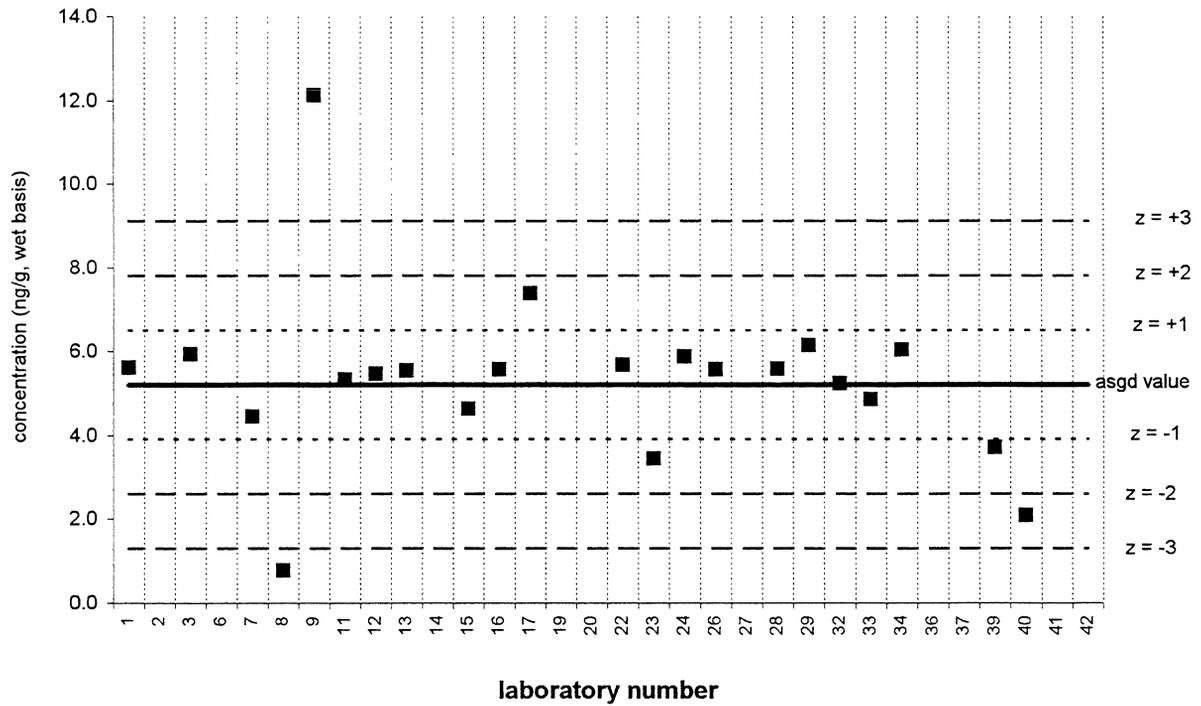

Dotted line: 95% confidence limits

Dashed line: 30% from 95% confidence limits

alpha-HCH

Fish Homogenate IV (QA99FSH4)

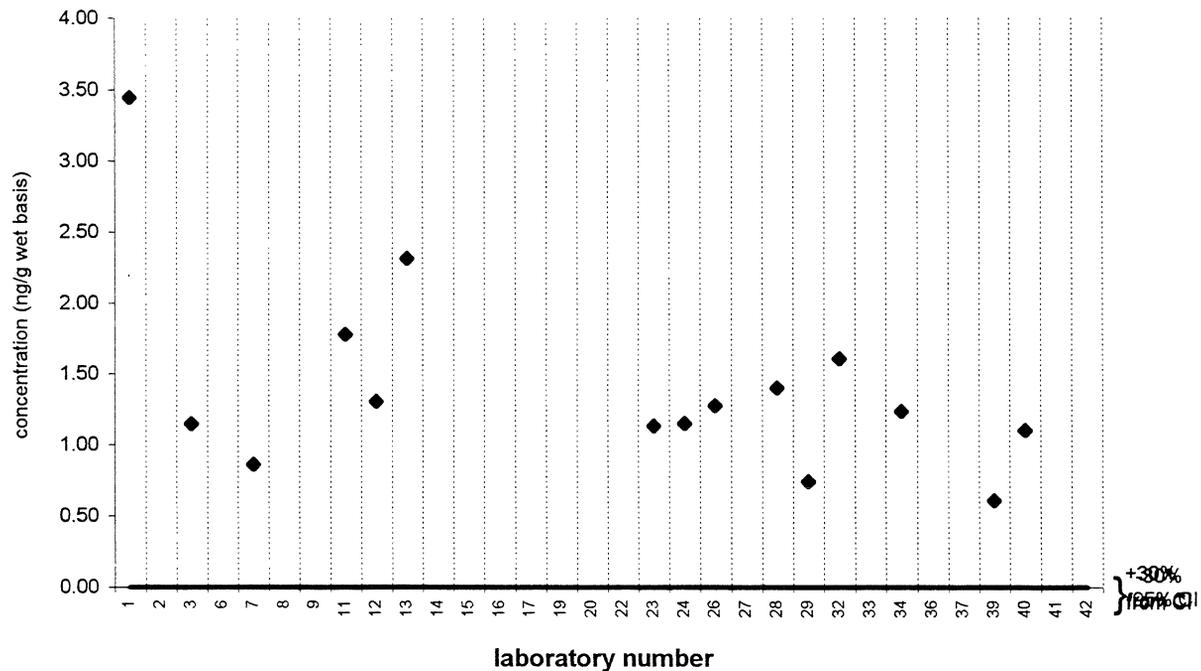

Assigned value = 5.20 ng/g $s = 1.13$ ng/g 95% CL = 0.53 ng/g (wet basis)
Reported Results: 24 Quantitative Results: 22

alpha-HCH

CARP-1

Appendix K: List of Laboratories Participating in 1999 Intercomparison Exercises

For this exercise, data was received from the following laboratories within the required timeframe. (This listing does NOT correspond to the laboratory number identification codes used in this report which were assigned in order of receipt of data with the exception of NIST-Gaithersburg which is Laboratory #1 in this exercise. The same code was used with both exercises.)

Academy of Natural Sciences
1900 Benjamin Franklin Parkway
Philadelphia, PA 19103
Jeffrey Ashley

Arthur D. Little, Inc.
20 Acorn Park
Cambridge, MA 02140
John Brown

Axys Analytical Services, LTD
2045 Mills Road West
P.O. Box 2219
Sidney, BC V8L3S8
Canada
Laurie Phillips

B& B Laboratories
1902 Pinon
College Station, TX 77845
Bernie Bernard

Battelle Ocean Sciences
397 Washington Street
Duxbury, MA 02332
Carole Peven

Bedford Institute of Oceanography
Marine Environmental Sciences Division
1 Challenger Drive
P.O. Box 1006
Dartmouth, NS B2Y 4A2
Jocelyne Hellou/Sean Stellar

California Dept. of Fish and Game
Fish and Wildlife Water Pollution Control Laboratory
2005 Nimbus Road
Rancho Cordova, CA 95670
David Crane / Kathleen Regalado

Central Contra Costa Sanitary District
5019 Imhoff Place
Martinez, CA 94553
Tri Nguyen

Chesapeake Biological Laboratory
1 Williams Street, P.O. Box 38
Solomons, MD 20688-0038
Joel Baker

CIEMAT
Avenida Complutense, 22-E70.P2.08
28040-Madrid
Spain
Rosa. Pérez-Pastor

Columbia Analytical Services
1317 S. 13th Avenue
Kelso, WA 98626
Lee Wolf

City of Los Angeles
Environmental Monitoring Division
12000 Vista del Mar
Playa del Rey, CA 90293
