REVIEW.

INTERNATIONAL METEOROLOGY.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade.*]

Beginning with the issue of the BULLETIN OF INTERNATIONAL METEOROLOGY for month of April, 1882, the following changes, relating to the charts issued with this publication, have been made, viz.:

The chart showing the pressure and temperature for each day over the northern hemisphere, as charted from observations taken simultaneously at 7 a. m., Washington mean time, will hereafter be published as chart i.

The chart showing the monthly mean pressure, mean temperature, and the prevailing wind-direction (chart iv.) will hereafter be referred to as chart ii., and will continue the series of international charts begun in January, 1877.

Chart v., showing the storm-tracks over the northern hemisphere, will hereafter be designated as chart iii. This chart continues the series of international charts begun in November, 1877. It will be noticed that these changes affect only the numerical value and not the character of the charts, the change having been made in order to secure uniformity.

With this REVIEW is issued chart iii., showing the international storm-tracks for the month of May, 1881. (See General Remarks.)

The following descriptions relate to chart iv. for the months of April and May, 1881 (which charts were issued with the SUMMARY for the respective months). In these descriptions much valuable information has been obtained from the "Monatliche Uebersicht der Witterung," published by Professor Dr. G. Neumayer, Director of the German Marine Observatory, Hamburg, Germany, and from the "Bulletin Mensuel," published by Mr. Marc Dechevrens, of Zi-Ka-Wei, China:

For the month of April, 1881, the most marked area of mean low-pressure is indicated by the isobar of 29.7 (754.4), and occupies that part of the northern hemisphere lying between 40° and 70° west longitude, and between 40° and 60° north latitude. The countries within this region are eastern Canada, including the Maritime Provinces, Newfoundland, and the extreme southern part of Greenland. An area of low mean pressures, 29.7 (754.4), is also shown over the extreme northern part of the Scandinavian peninsula. In Asia the isobar of 29.7 (754.4) occupies the central and eastern provinces of British India, lying north of the twentieth parallel of latitude; within this area the mean pressure ranged from 29.64 (752.8), at Patna, to 29.68 (753.9) at Lahore, Nagpur, and Calcutta. South of the fortieth parallel the pressure gradually increases until the isobar of 30.0 (762.0), which extends from the North American continent eastward to northern Africa, is reached.

The areas of barometric maxima are indicated by the isobarometric lines of 30.1 (764.5) and 30.0 (762.0). The first of these extends over Oregon and Washington and Idaho territories; the second, 30.0 (762.0), covers the northern part of the British Isles and extends eastward over Denmark, northern Germany, and central Russia to about 47° east longitude. The barometric gradients were of moderate inclination in both the eastern and western hemispheres.

Compared with the preceding month (March, 1881,) there has been a general increase of pressure over the North American continent, except in the Canadian Maritime Provinces, eastern Quebec, and Newfoundland. In Europe the mean atmospheric pressure has decreased over the countries lying south of the fiftieth parallel, while the contrary is exhibited over the countries situated to the north of that parallel, the greatest increase, about .22 inch, appearing over the Danish and Scandinavian peninsulas. In Asia the pressure has decreased throughout the continent, the most noteworthy and important change occurring in Siberia, where the mean pressure averages .4 inch below that of the preceding month. In British India the decrease averages .15 inch, and in China and Japan it is about .2 inch.

Compared with the corresponding month of previous years the mean atmospheric pressure is above the normal over that part of the United States lying between the eighty-fifth meridian and the Rocky mountains. From that meridian eastward to the Atlantic the mean pressure is generally below the normal, the greatest departures occurring near the coast and in Maine. On the Pacific coast the pressure is below the normal. In Canada it was below the normal, except in western Ontario, where it was about normal.

The following table shows the mean pressure and the mean temperature, with corresponding departures, for the month of April, 1881, in the several countries of the eastern hemisphere, compared with the means as determined from observations taken during the years 1877, 1878, 1879, and 1880:

Countries.	Mean pressure.			Mean temperature.		
	Apr., 1877, 1878, 1879, 1880.	April, 1881.	Departure.	Apr., 1877, 1878, 1879, 1880.	April, 1881.	Departure.

In the United States the mean temperature of the air was below the normal throughout the country east of the hundredth meridian, except in Arkansas, Louisiana, and eastern Texas, where it was normal. West of the hundredth meridian the temperature ranged from 1° to 5° above the normal. In Canada it was slightly below the normal. In Europe the mean temperature for the month was below the normal. During the first and last decades of the month the temperature was daily below the normal, and damaging frosts occurred in many sec-

tions. In the second decade (8th–18th) a constant rise of temperature took place, and the maximum temperatures of the mouth occurred during that period. In Siberia the mean temperature was above the normal. In British India the highest mean temperature reported was 100°.7 Fahr. (38°.2 Cent.) at Nagpur, and the lowest was 73°.7 Fahr. (23°.2 Cent.) at Sibsagar.

The following are some of the extreme monthly mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Freetown, Africa	87.5	30.8	York Factory, B. A	5.6	—14.7
Manila, Philippine Islands	84.6	29.2	Nikolaevsk on the Amoor	26.1	— 3.3
Bridgetown, Barbadoes	83.4	28.6	Archangel, Russia	30.2	— 1.0
Mauritius, Indian ocean	79.7	26.5	Jacobshavn, Greenland	31.1	— 0.5

In the United States the prevailing wind-directions were westerly, northwesterly, and northerly over the country north of the thirty-fourth parallel, and eastward from the Rocky mountains to the Atlantic. On the south Atlantic coast the winds were southwesterly; in Texas they were southerly and southeasterly. On the Pacific coast they were northwesterly, except in the northern district, where southerly winds prevailed. In Canada the winds were westerly and northwesterly. Over the north Atlantic ocean the wind-directions were as follows: Northwesterly from the coasts of the United States eastward to W. 60°; north of the thirtieth parallel and from W. 60° to W. 20°, generally westerly and southwesterly; off the coast of the British Isles, and over the Bay of Biscay, northeasterly. In Europe the winds were mostly easterly and northeasterly, except in the Scandinavian peninsula and in Spain and Portugal, where southerly and southwesterly winds prevailed.

The rainfall (including melted snow), during the month of April, 1881, was very much below the average in all districts of the United States, except in Florida and in the north Pacific coast region, where the precipitation was about the average. In Canada the rainfall was also much below the average. In Europe the rainfall was much below the average in the northern districts of central Europe, but in the countries to the south of the forty-seventh parallel the rainfall was above the average, the excess being greatest in Austro-Hungary and in Spain.

For the month of May, 1881, the distribution of mean atmospheric pressure over the northern hemisphere is as follows:

The area of absolute minima occupies British India north of the twentieth parallel, where the mean pressure ranges from 29.54 (750.3) to 29.6 (751.8). Over southern China and British India, except the region above-mentioned, the pressure ranges from 29.64 (752.8) to 29.88 (758.9). In Greenland the pressure ranges from 29.73 (755.1) at Godthaab to 29.82 (757.4) at Jacobshavn. Over the North American continent, Europe, and northern Asia the mean atmospheric pressure is not less than 29.8 (756.9), except at Nikolaevsk on the Amoor, Asia, where it is 29.76 (755.9).

From Greenland south-southeastward to the Azores the barometric gradient steadily increases until the area of barometric maxima is reached. This area, indicated by the isobarometric line of 30.2 (767.1), occupies the Atlantic ocean between N. 30° and 40° and W. 20° and 40°, including within its limits the Western Islands.

Compared with the chart for the preceding month (April, 1881,) there has been a slight decrease of pressure over the western part of the United States; there has also been a uniform decrease over Asia. In the eastern part of the United States, Canada, the Atlantic ocean, and the whole of Europe there has been a more or less marked increase of pressure. The increase is greatest over eastern Canada and the Maritime Provinces, the Azores and the Iberian peninsula, and is least over the Russian Empire and the Scandinavian peninsula. The increase of pressure averages about .4 inch over the Canadian Maritime Provinces; over the Azores it is about .2 inch.

Compared with the corresponding month of previous years the mean atmospheric pressure in the United States is above the normal, except in Texas, Florida, and in the Pacific coast regions. It is also above the normal in Canada, the excess being greatest over the Maritime Provinces. In Europe the pressure is much above the normal. In this connection may be mentioned the unusually high pressures that prevailed over the British Isles and western Europe from the 7th to the 12th. During that period the pressure ranged from 30.3 (769.6) to 30.7 (779.8). On the 9th–10th the pressure at stations in Scotland and in northern England was 30.77 (781.5), and was maintained throughout the twenty-four hours.

The following table shows the mean pressure and the mean temperature, with corresponding departures, for the month of May, 1881, in the several countries, compared with the means as determined from observations taken during the years 1877, 1878, 1879, and 1880:

Countries.	Mean pressure.			Mean temperature.		
	May, 1877, 1878, 1879, 1880.	May, 1881.	Departure.	May, 1877, 1878, 1879, 1880.	May, 1881.	Departure.

* Means for three years only.

In May, 1881, the mean temperature of the air in the United States was above the normal, except in Texas, New Mexico, and the Florida peninsula, where it ranged from 0°.5 below to normal. In Canada the mean temperature was above the normal in the western part of the dominion, but in the Mari-

time Provinces and eastern Quebec it was slightly below the normal. In Europe the temperature was slightly above the normal. During the prevalence of high pressures, from the 7th to the 12th, the minimum temperatures of the month occurred, and heavy and damaging frosts prevailed in nearly all parts of central Europe and in the British Isles. In British India the highest mean temperature, 104°.9 Fahr. (40°.5 Cent.), was reported at Deesa, and the lowest, 81°.5 Fahr. (27°.5 Cent.), at Dhubri and at Sibsagar.

The following are some of the extreme monthly mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Freetown, Africa	88.0	31.1	Fort St. Michael, Alaska	27.3	— 2.6
Kingston, Jamaica	86.3	30.2	York Factory, B. A	28.3	— 2.1
Manila, Philippine Islands	85.5	29.7	Gjaesvaer, Finmark, Nor'y	31.6	— 0.2
Bridgetown, Barbadoes	84.8	29.3	Jacobshavn, Greenland	36.3	2.4

In the United States the prevailing winds were as follows: From the eightieth meridian eastward to the Atlantic coast, generally northeasterly, except on the middle Atlantic coast, where they were southeasterly; from the eightieth meridian westward to the Rocky mountains, southerly and southeasterly; on the Pacific coast, westerly to northerly; over the Atlantic ocean north of 30° north latitude, and from the coast of the United States eastward to 60° west longitude, the prevailing winds were northeasterly; between N. 30° and 40° and W. 60° and 50° they were mostly southeasterly; from the fiftieth meridian eastward to the European coasts they were generally southwesterly; south of N. 30° they were northeasterly. In central Europe the winds were generally from northeast to northwest; in the British Isles, and also at stations on the coast of France, the prevailing direction was southwesterly; in Scandinavia it was southerly and southwesterly. The winds were easterly and southeasterly on the coast of China, and southerly and southwesterly in Japan.

In the United States the rainfall was generally below the average, except in the New England states, Louisiana, Texas, and Arkansas. It was also slightly above the average in Minnesota, Dakota, Kansas, Nebraska, Iowa, and Missouri. In Europe the rainfall was generally below the average, except in the southern part of Germany, and in Austria, where it was above the average.

Chart iii. (formerly chart v.) exhibits the tracks of barometric minima for the month of May, 1881, which have been traced from the daily international charts.

The data are charted for each day of the month on the maps accompanying each issue of the INTERNATIONAL BULLETIN, and from these charts and from additional reports are traced the movements of the centres of barometric minima.

Twenty-three of the more important atmospheric depressions that have appeared in the northern hemisphere have thus been traced. None of these exhibited any unusual development of storm-energy, nor have any of them been traced farther eastward over the Atlantic than the fiftieth meridian. The general distribution of these depressions was as follows:

Six appeared in the United States and Canada; only one of these, number v., appeared on the Pacific coast; of the remainder, numbers iv. and vi. are interesting because of the abnormal paths of their centres. Nine depressions are shown over Europe; all of these apparently developed near the coasts, with the exception of number xi, which first appeared in Greenland. Four depressions moved in an east-northeasterly direction south of the fiftieth parallel, while the remaining five pursued northeasterly paths over the northern part of the continent. One disturbance, number vii., developed and dissipated in the Atlantic ocean between the meridians of fifty-five and forty west longitude, and one, number xvi., remained in Greenland at the close of the month. Six depressions are traced in Asia; of these three prevailed over Siberia and three are shown in China and Japan.

On this chart is also shown the track of the first typhoon of the season of 1881 (May 22d, 28th) that occurred in the China sea.

The following are brief descriptions of the depressions that appeared in the United States and Canada:

I.—This disturbance appeared near Lake Superior on the 1st; it moved eastward, causing showery weather in the lake region and in the Saint Lawrence valley. It passed toward the Gulf during the 2d and 3d, and disappeared south of Greenland on the last-mentioned date. In connection with this disturbance rain fell in the Maritime Provinces and in New England during the 2d, attended by moderate southerly breezes. The depression was immediately followed by an area of high pressures, which caused strong northwesterly winds in the lake region and in New England and the Maritime Provinces.

II.—From the 5th to the 7th there was a slow but gradual decrease of pressure in Minnesota and Dakota. On the latter date the centre of disturbance became defined, and was indicated by the isobar of 29.6 (751.8), which covered Minnesota. During the period from the 7th to the 11th there was a slight increase of pressure, but the disturbance still remained near the lake region and the northwest, attended by cloudy weather and light rains in those districts. On the 12th the depression moved over the Saint Lawrence, attended by light local rains and constantly increasing pressure. During the day its course apparently changed to the southeastward, and the depression passed off the New England coast into the Atlantic. On the 13th the storm-centre was situated near N. 36°, W. 64°. Vessels near the fortieth parallel reported moderate east and northeast winds, while westerly winds prevailed at Bermuda. On the 14th the disturbance was central near N. 40°, W. 60°, where it gradually filled up, and by the 15th it had ceased to exist as a depression.

III.—This disturbance developed in the extreme northwest during the 13th; it moved southeastward, and on the 14th was central near Saint Paul, Minnesota, where the barometer read 29.72 (754.9), wind sw. By the morning of the 15th the centre was in Ontario, attended by light rains and southerly winds in the eastern part of the lake region, the middle Atlantic and New England states, while clearing weather and northwesterly winds had set in over the western part of the lake region. During the 15th the low area apparently moved southeastward, and by the morning of the 16th it was off the coast of Virginia, the pressure near the centre having decreased to 29.6 (751.8). Moderate to strong southerly winds were reported by vessels to the east of the centre, and fresh to strong northeasterly winds occurred over the Maritime Provinces and along the Atlantic coast. On the 17th the pressure began to increase and the disturbance gradually disappeared.

IV.—This was a secondary development of the low area just described. On the 18th an area of high pressures extended from the Canadian Maritime Provinces southeastward to the thirtieth parallel of latitude, while the pressure remained comparatively low off the coast of the Carolinas. In consequence of this distribution of pressure strong southerly breezes to moderate gales were encountered by vessels between 60° and 70° west longitude. On the 19th the region of least pressure was transferred to the southern part of Pennsylvania, and was attended by cloudy weather and occasional rains. During the day the disturbance moved north-northwestward, and on the 20th it was central in Ontario, where it finally disappeared. During the 19th the pressure increased over eastern Canada, causing moderate northeasterly gales along the Saint Lawrence.

V.—This was a slight depression which appeared in southern California on the 21st; it exhibited no energy, and finally filled up in Utah on the 22d.

VI.—This depression appeared in Minnesota on the 28th, on which date the atmospheric pressure decreased over the interior of the country from Minnesota to Texas, accompanied by light rain in Dakota, Kansas, and Missouri, and heavy rains in Texas. On the morning of the 29th the disturbance was shown in northern Kansas, whence it moved slowly southward to Texas, where it was central on the 30th and 31st. On the

latter date the pressure began to increase and the disturbance gradually dissipated.

The following descriptions refer to the depressions that appeared over the Atlantic and in Europe:

VII.—This depression appeared near N. 43°, W. 54°, on the morning of the 8th, causing moderate northerly gales in the western quadrants, and moderate to strong southerly gales in the eastern quadrants. The s. s. "Scythia," in N. 42° 41′, W. 52° 23′, reported barometer 29.35 (745.5), wind wsw., force 5, and the s. s. "Republic," in N. 42° 00′, W. 53° 51′, barometer 29.52 (749-8), wind s., force 2. On the 9th the disturbance was central near N. 45°, W. 47°, the pressure having increased slightly at the centre, but no diminution of wind-force occurred, owing to the formation of steep barometric gradients on the eastern and western sides of the depression. On the morning of the 10th the depression filled up and was followed by clearing weather. From the 10th to the 13th an extensive area of barometric maxima occupied the Atlantic from the coast of the United States to Europe, the highest readings being in the British Isles. During this period moderate winds and generally fair weather prevailed over the ocean.

VIII.—This was probably a continuation of the disturbance described as low-area xix. of the April chart. On the 1st an elongated area of low pressures stretched from the British Isles eastward to the Danish peninsula; light rains occurred in Scotland and at stations in Denmark, and the winds remained moderate in all quadrants of the depression. On the 2d the centre of disturbance was over the southwestern part of the Baltic, while another depression had developed in northwestern France; rain becoming general at stations within the zone of low pressures, but no high winds occurred. On the 3d the centre of disturbance remained over the Baltic; the region of low pressures now embraced northern France, Belgium, and Germany, the disturbance mentioned as appearing in France having apparently merged in the larger depression. On the 3d an area of high pressures began to spread over the British Isles and western France, causing the winds to shift to northerly and the temperature to fall several degrees over these districts. On the morning of the 4th the depression occupied the Gulf of Finland, attended by cloudy weather in northwestern Russia; during the day it moved northeastward, and on the 5th was near Archangel, whence it disappeared in the Arctic regions.

IX.—This was probably a secondary development of low-area viii. It appeared near the northern shores of the Bay of Biscay on the 2d, and moved eastward, causing rains and thunder-storms at numerous places in France. On the 3d, it apparently again united with low-area viii.

X.—This disturbance appeared in the region between the Black and the Caspian seas on the 1st, and was probably a continuation of the depression charted as xviii. on the chart for April. On the 2d the depression was over the Caspian sea, and on the following day it dissipated near the Sea of Aral.

XI.—This depression developed in Greenland on the 2d, when the barometer at Godthaab read 29.43 (747.5), being a fall of .42 inch in twenty-four hours. On the 3d and 4th the storm-centre moved slowly eastward, causing cloudy weather and strong southeasterly wind at Stykkisholm, Iceland. On the 5th the depression was central south of Iceland, and a decrease of pressure had set in over the northern part of the British Isles and the Scandinavian peninsula. On the 6th the centre was near the Färöe Islands; rain fell in the British Isles, and the wind veered to southwest and west and increased to moderate gales. On the 7th the centre of disturbance was transferred to Finland, while a rapid increase of pressure took place in its rear, and strong westerly winds occurred over the British Isles and southern Scandinavia, accompanied by generally clearing weather. On the 8th the storm-centre was over the White sea; it moved eastward, and on the 9th was in the vicinity of the Ural mountains, whence it moved into Siberia and beyond the stations of observation.

XII.—On the 9th pressures ranging from 30.4 (772.1) to 30.7 (779.8) occupied northwestern Europe and the British Isles, while in southern Europe the barometer was relatively low. In consequence of this distribution of pressure, strong northerly and northeasterly winds prevailed over the northwestern part of the continent, and a considerable fall in temperature took place. On the morning of the 10th a depression was over the southern part of Italy, attended by strong breezes and occasional rains in the northern quadrants. On the 11th the disturbance passed into Austro-Hungary, and during the 12th, 13th, and 14th it remained over Hungary and the Danubian Principalities, the barometer near the centre fluctuating between 29.6 (751.8) and 29.8 (756.9). By the 15th the depression had moved to the Black sea, and moving eastward during the day it finally disappeared in the Caucasus on the 16th.

XIII.—This depression appeared near the Färöe Islands on the 13th, and caused moderate southwesterly breezes over the northern part of the British Isles. By the morning of the 14th the centre had passed to the northern part of the Scandinavian peninsula, causing fresh to strong southwesterly winds in the Gulf of Bothnia and in northwestern Russia. On the 15th the depression was near Archangel, where it disappeared during the day.

XIV.—This disturbance apparently developed on the 14th in mid-ocean near N. 51°, W. 27°; on that day the s. s. "Pennsylvania," in N. 48° 36′, W. 25° 22′, reported barometer 29.86 (758.4), wind w., force 5, cloudy, while the s. s. "Volmer," in N. 50° 25′, W. 27° 44′, had a heavy nw. gale. During the day the disturbance moved eastward with rapidly decreasing pressure, and on the 15th it was shown as a deep depression of some energy, central in Ireland. Rain fell at stations in the British Isles, and the winds, increasing in force, blew with the force of a gale in the western part of Ireland. By the 16th the disturbance had moved northeastward over the North sea, and was central to the west of the Danish peninsula; rain was general over the British Isles and at stations along the coast of France near the Channel, while strong northerly and northwesterly winds prevailed in the western, and equally strong southerly and southeasterly winds prevailed in the eastern quadrants of the depression. On the 17th the storm-centre, having moved northward, was shown near the northern part of the Scandinavian peninsula. On the 18th it was to the northward of the Gulf of Bothnia, where it apparently dissipated.

XV.—This disturbance appeared northwest of Ireland on the 17th, causing rain and brisk south and southwest winds in the British Isles. During the 18th and 19th no change occurred in the distribution of pressure; the low area maintained its position over the northern part of Scotland, and rainy weather continued in the British Isles and at stations on the eastern shores of the North sea. By the morning of the 20th there was a general increase of pressure, although the lowest barometric readings were still in northern Scotland; a general improvement in the weather set in over the British Isles, but the rain still continued in France. On the 21st the depression apparently filled up off the southern coast of Norway.

XVI.—From the 21st to the 30th the barometer remained low and unsteady in the southern part of Greenland, but at the close of the month a recovery began, and the depression was apparently filling up without having moved beyond the coasts.

XVII.—This depression apparently developed between the Azores and the Iberian peninsula during the 23d. On the 24th it was central over the southern part of the Bay of Biscay; on this day fresh easterly winds prevailed over the British Isles and central Europe, but on the 25th the area of low pressures extended to the French coasts, the English channel and the southern part of England, and the winds shifted to southerly on the French coasts and in the southern part of England. During the day the disturbance moved northeastward over the English channel, and on the 26th it was central over the North sea, between the southeast coast of England and the Netherlands, the area of disturbance having become contracted;

but on the 27th the decrease again extended over central Europe, and the region of least pressure was in southeastern Germany and in Austria. During the 26th and 27th general rains, accompanied by thunder-storms, occurred over northwestern Europe, and the temperature fluctuated irregularly. On the 28th the disturbance was still in Austria, while a slight but gradual increase of pressure had set in over the country to the westward. On the 29th the storm-centre remained in Hungary and was moving very slowly toward the Black sea. By the 30th the disturbance, having moved northeastward, was situated to the northeast of the sea of Azof, causing brisk to strong northwesterly winds in southwestern Russia. On the 31st the depression was central to the north of Orenburg, eastern Russia.

Of the depressions that occurred over Asia the following are charted:

XVIII.—This disturbance apparently moved eastward, south of Pekin, during the 5th, and on the 6th it was central over the Yellow sea, causing fresh to strong south and southwest winds and rain over Japan. It moved in a course slightly north of east, and on the 7th and 8th was central, with decreased pressure, in the island of Niphon; during the latter date it passed off into the Pacific and beyond the range of the observations.

XIX.—This disturbance appeared in central Siberia on the 10th, on which date the centre was near Yeniseisk, where the barometer read 29.63 (752.6), wind w., raining. On the 11th the centre of disturbance was northwest of Nertschinsk, and by the following day it had disappeared south of that station.

XX.—This depression developed in Siberia, between Yeniseisk and Barnaul, at which stations the barometer read 29.4 (746.7) on the 13th. During the day the centre moved eastward, and on the 14th it was between Lake Barkol and Nertschinsk, while the wind at Yeniseisk had shifted to northwest and increased to a moderate gale with snow and sleet. On the 15th the shift of wind at Nertschinsk indicated that the storm-centre had passed to the northeast of that station and beyond the range of the observations.

XXI.—From the 9th to the 16th an area of high but gradually decreasing pressure occupied eastern China and Japan, and on the latter date a depression, indicated by the isobar of 29.6 (751.8), appeared near Pekin. On the 17th the position of the centre apparently remained unchanged, but the decrease of pressure had extended southward to Zi-Ka-Wei and to Amoy. During the 18th and 19th a secondary disturbance appears to have developed in southern China, and passing northeastward, attended by rain at Hankow, probably merged with xxi. over the sea of Japan. On the 20th the disturbance passed into the Pacific, causing strong westerly winds near the fortieth parallel.

XXII.—On the 26th an extensive depression appeared in the vicinity of the Ural mountains; by the 27th it was shown near Yeniseisk, the pressure near the centre having decreased to 29.3 (744.2). On the 28th the pressure increased at Yeniseisk but remained low at Barnaul; on the 29th the increase became general over that part of central Siberia lying between 80° and 100° east longitude, while a decrease had set in to the eastward. On the 30th the depression was near Nertschinsk, where the barometer read 29.23 (742.4), wind sw. By the 31st the pressure had increased and the disturbance passed beyond the limits of the stations of observation.

The track of the first typhoon of 1881, shown on chart iii., has been copied from a tracing of the same in "The Typhoons of the Chinese Sea in the year 1881," an interesting and valuable work published by Mr. Marc Dechevrens, director of the Zi-Ka-Wei Observatory, Shanghai, China.

The following brief notes in connection with this typhoon are taken from the same publication:

The typhoon probably developed between the Pelew Islands and the Philippinas Archipelago, about 135° east longitude, and between 8° and 10° north latitude; it must have begun about May 14th, when the prevailing wind at Manila changed suddenly, but its progress was very slow at first, and its presence was not determined by the observer at Manila before the 22d. On the 23d, at 8 a. m., a telegram from Tayabas, nearly sixty miles southeast of the capital, showed that the barometer at that station was about .08 inch lower than at Manila; on the eastern coast of southern Luzon the wind blew strongly from the northeast, with heavy rain—the typhoon evidently approaching. At Manila, between 9 a. m. and 4 p. m., on the 23d, the barometer fell, and after 4 p. m. the wind oscillated between north and northwest. At sunset the horizon assumed a purple coppery hue, resembling the blaze of an immense fire. At 10 p. m. the wind blew strongly from the northwest, with heavy showers. At 8 a. m. of the 24th the centre of the typhoon was east of Manila; it entered the Laguna and moved directly westward. At about 10.30 a. m., according to observations taken on board the steamer "Lipa," anchored at Santa Cruz, the central calm extended over the Laguna; at 1 p. m. the wind abated and ceased for a few moments; at 1.15 p. m. it shifted suddenly from north-northwest to east-southeast, and increased in force. The barometer reached its lowest point, 29.52 (749.8), and remained stationary until 2 p. m., when it began to rise; the wind oscillated between east and southeast, and increased in violence till 2.45 p. m., when it attained a velocity of 75.4 miles. It then settled to the east-southeastward, thus keeping a direction of marked convergence to the centre, which was running away westward and entering the China sea. It thus appears that Manila, if not in the very path of the typhoon, was at least within the narrow circle of central calm. The observations made at the observatory, when compared with those taken on board the sloop of war "Doña Maria de Molina," lying at anchor at Canacao, and with those made at Corregidor island, at the entrance to Manila bay, indicate that the centre must have passed to the southwest at about 1.30 p. m. During the passage of the storm the wind was much more violent after than before the barometric minimum occurred, being stronger from east-southeast than from northwest; the strongest squalls attained a velocity of 88 miles an hour, but such violent blows were infrequent and of short duration; the maximum velocity generally did not exceed 72 miles an hour.

Moving from Manila the typhoon passed a little to the south of the Paracels Islands and touched the coast of Cochin China on the 29th, near the fifteenth degree of latitude. It then turned back towards the east, the deflection being caused probably by the coast line; and on again reaching the open sea it appears to have abated and soon disappeared entirely. During the progress of this typhoon the s. s. "Elgin" was totally wrecked on the Paracels Reefs, and several other vessels sustained more or less damage.

From the 22d to the 24th the mean velocity of the typhoon along the eastern coast of the Philippinas Archipelago appears to have been about four to five miles an hour. Between the 24th and 28th, over the China sea, it increased to about 13.5 miles. The typhoon, at the time its central region passed Manila, seems not to have exceeded one hundred and seventy-two miles in diameter from north to south. The region of calm and of barometric minimum must have been about eighteen or twenty miles in diameter, for, according to trustworthy observations taken on board the sloop of war "Doña Maria de Molina," the centre passed over Cavite, nine miles from Manila, which town was on the limit of the central calm. The barometric gradient in this typhoon was inconsiderable, the pressure at the centre being probably not less than 29.00 (736.6).

GENERAL REMARKS.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are applied at this office. In the naval and marine series,

corrections for temperature and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz.: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in metres per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometres per hour, to metres per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations. In the MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS the position of stations (latitude and longitude) are obtained from Keith Johnston's "Index Geographicus," except where more exact information is furnished. The elevations of stations are obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms, upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the originals, is carefully computed at this office. Generally all conversions are made at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

INTERNATIONAL CHARTS ACCOMPANYING THE DAILY BULLETIN AND MONTHLY SUMMARY.

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted. Broken lines indicate that the lines so broken are doubtful.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

Arrows show the direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
→	1, 2	0 to 9	0 to 4
→	3, 4	9.1 to 22.5	4.1 to 10.1
→	5, 6	22.6 to 40.5	10.1 to 18.1
→	7, 8	40.6 to 67.5	18.1 to 30.2
→	9, 10	67.6 up.	30.2 and over.

International chart iii. shows tracks of centres of low barometer. Storm-tracks in red. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date. Broken or dotted lines are doubtful.

The following remarks relate to the individual peculiarities in the *methods* of recording and the *times* of taking the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of General Maritz, Commandant Supérieur du Génie in Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemburg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Galway, Oxford, and Sandwick Manse the barometers are given as read off. The movement of the air is indicated by force on a scale of 0 to 12, except pounds pressure per square foot at Greenwich. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind direction is given to 32 points and weather by the Beaufort notation.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Town the barometer is given on the original as corrected for temperature only. Upper and lower clouds are given on a scale of 0 to 10, and the kind occasionally indicated by abbreviating Poëy's classification.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation. At Hankow the originals give the barometer in inches, temperature in Fahrenheit, and force on a scale of 0 to 10.

DANISH SERIES (furnished by co-operation of Captain N. Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centi-

grade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Mont Louis and Perpignan. In general the rainfall is measured at 9 a. m., local time, but at Lyons at the moment of simultaneous observation. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Mont Louis and Perpignan. At Guéret the observations are taken at 12 m., instead of 12.16 p. m. At Gap the observations are taken at 12.03 p. m., instead of 12.32 p. m.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms. At Berlin observations are taken at 2 p. m., instead of 1.02 p. m.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens).—The originals give the barometer corrected for temperature only and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchina, Director of the Central Meteorological Office at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by co-operation of I. Arai, Director of the Imperial Meteorological Observatory at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 64 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (by authority of the Secretary of Public Works—furnished by co-operation of Señor Mariano Barcena, Director of the Central Meteorological Observatory in the City of Mexico, and respective observers).—All conversions (subject to correction at this office) are published as given in the originals. The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred.

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiana).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At Astrakhan the barometer-cistern is below sea-level. The movement of the air is indicated by velocity in metres per second. No distinction is made between upper and lower clouds; the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Barnaul observations are taken at 6.18 p. m., local time.

SCOTTISH SERIES (furnished by co-operation of Alexander Buchan, M. A., F. R. S. E., Secretary of the Scottish Meteorological Society at Edinburg, and respective observers).—The originals give the barometer as read off and the movement of the air as indicated by force on a scale of 0 to 6. Distinction is made between upper and lower clouds as to degree, and the amount of cloudiness is given on a scale of 0 to 10. The direction of upper clouds is given separately. The rainfall, temperature, and humidity are not given at North Unst. The wind direction is given to 32 points.

SPANISH SERIES (furnished by co-operation of Antonio Aguilar, Director of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 4 p. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—

The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of Professor E. Plantamour, Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of Professor C. V. A. van Dyck, Superintendent of the Lee Observatory at Beirut.)—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in metres per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Office, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota and Navassa the barometer is corrected for temperature only; at Puerto Berrio is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea-disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

SWEDISH NAVAL SERIES (furnished by co-operation of E. Malmburg, Director of the Nautical Meteorological Bureau at Stockholm).—The originals give the barometer as read off. The movement of the air is indicated by force on a scale of 0 to 12, and the direction is corrected for magnetic variation at this office. The humidity is not given, but is computed from the hygrometrical observations. The rainfall is omitted. The height of the sea-swell is given on a scale of 0 to 9 and the weather by the Beaufort notation.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operation of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the number of days for which observations are at hand within the respective squares, and the total number of simultaneous observations reported on those days, (3) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather-maps.

ERRATA.

Daily Bulletin, April 4th, 1882, page 4, North German Lloyd, s. s. "Salier," longitude E. 68° 34′, should read E. 8° 34′.

5th, page 6, British Naval, H. M. S. "Alert," temperature, Fahr., 82.2°, should read 88.2°.

8th, page 3, Netherlands, Utrecht, actual barometer, 30.28 inches, 769.2 mm., should read 30.32 inches, 770.2 mm.

11th, page 5, United States, Newport, Rhode Island, actual barometer, 754.6 mm., should read 755.6 mm.

23d, page 4, United States, Fort Assinnaboine, Montana, temperature, Centigrade, 5.8°, should read 5.0°.

26th, page 1, Austro-Hungarian, Kremsmunster, actual barometer, 29.17 inches, should read 28.17 inches.

28th, page 5, United States, Morgantown, West Virginia, actual barometer, 713.0 mm., reduced barometer, 739.4 mm., should read 738.4 mm. and 764.8 mm., respectively.

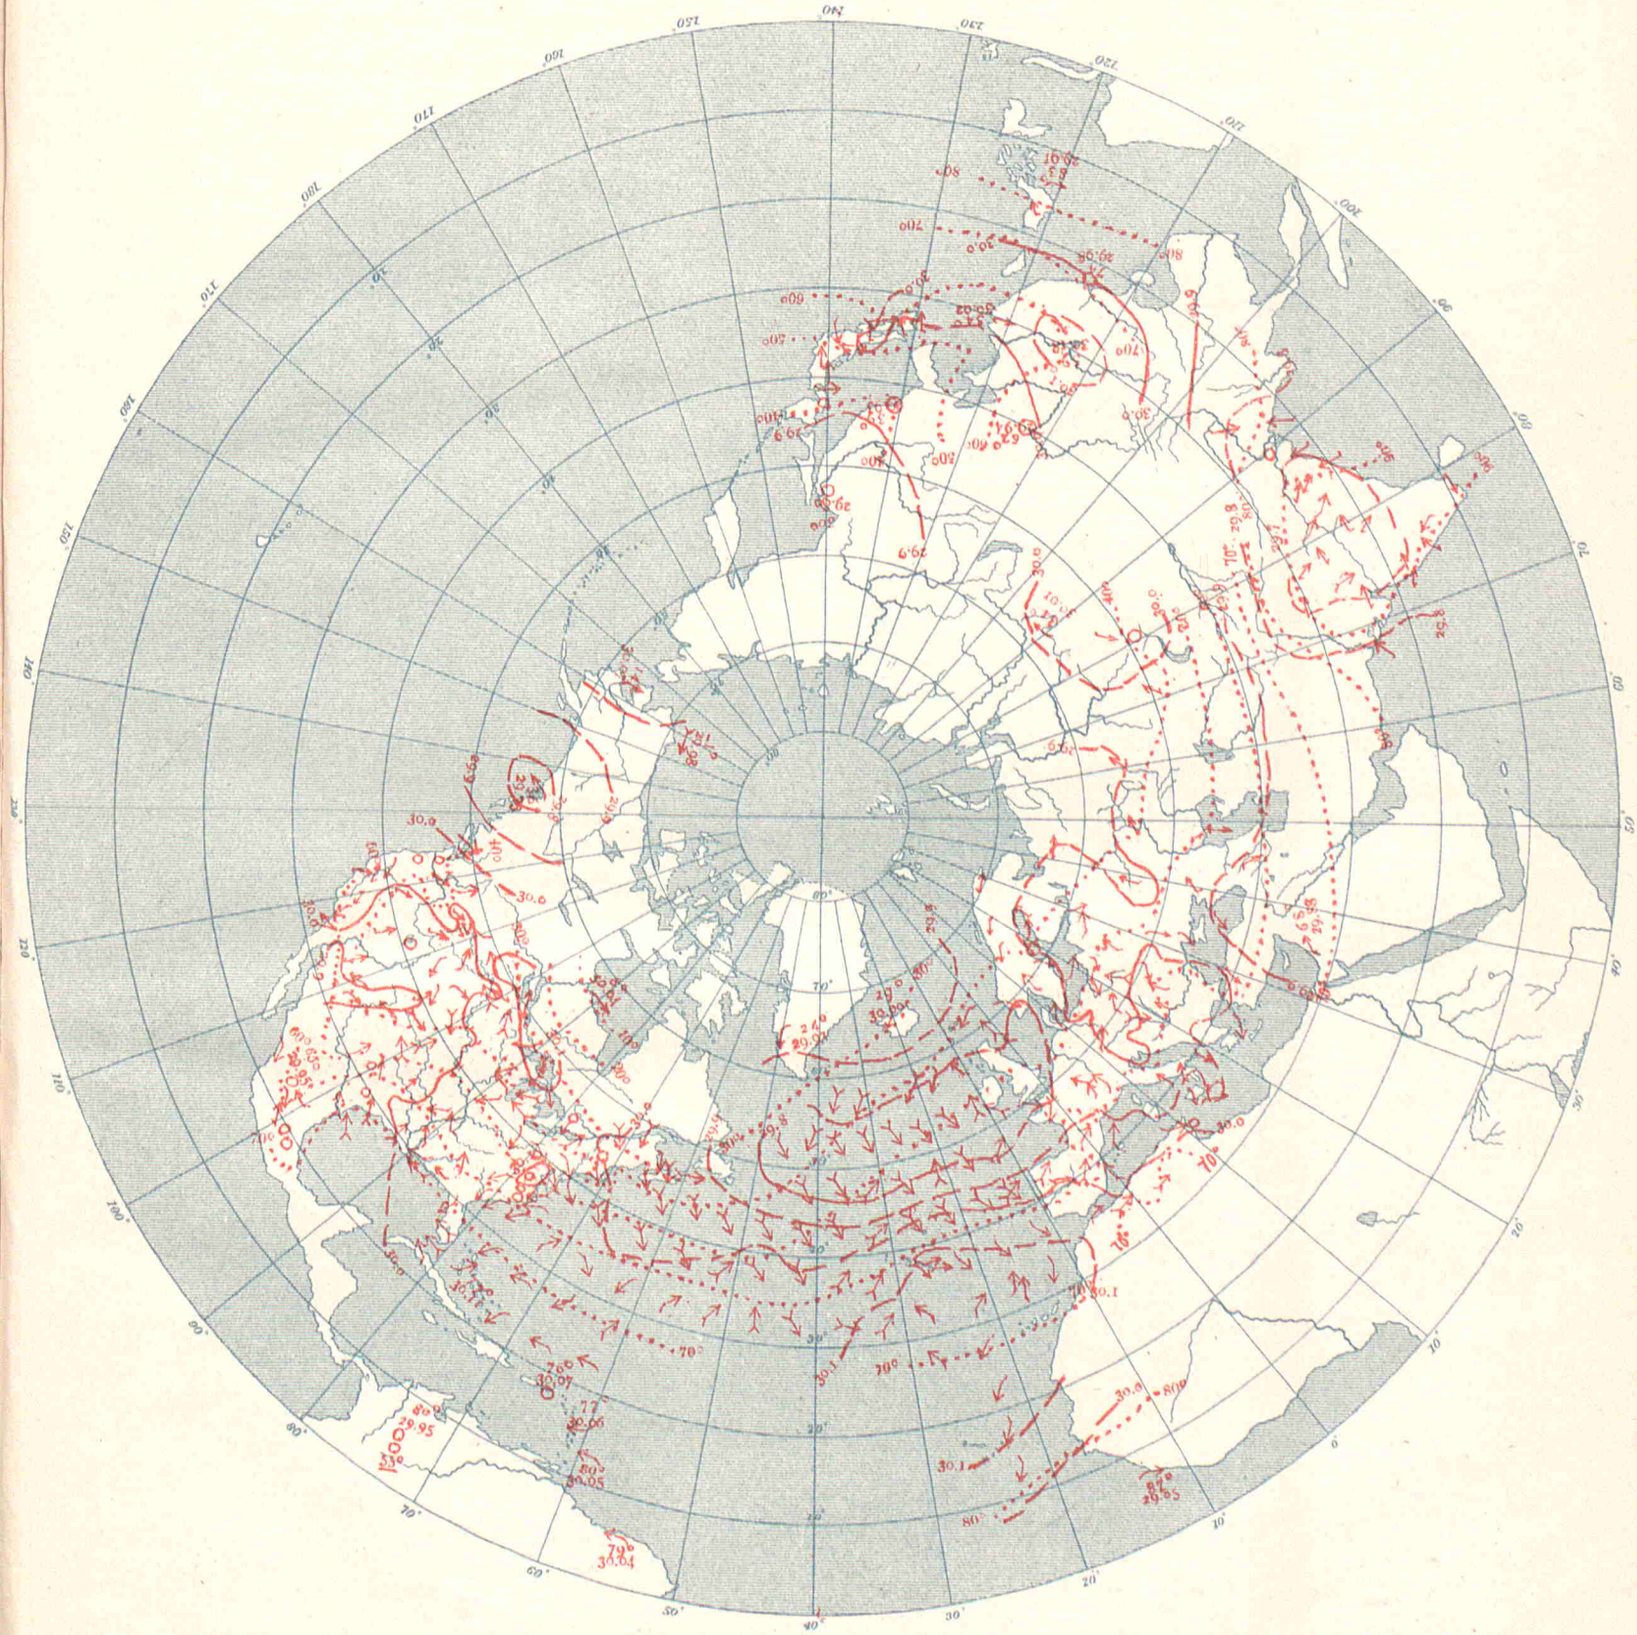
30th, page 2, French, Pic-du-Midi, temperature, 54.7° Fahr., 12.6° Cent., should read 34.7° Fahr., 1.5° Cent.

Attention is called to changes made in the latitude and longitude of the following stations of the United States series, which should date back to the first issue of SUMMARY: Camp Thomas, Detroit, Pike's Peak, Provincetown, Washington, Yankton.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

W. B. HAZEN,
Brig. & Bvt. Maj. Gen'l,
Chief Signal Officer, U. S. A.

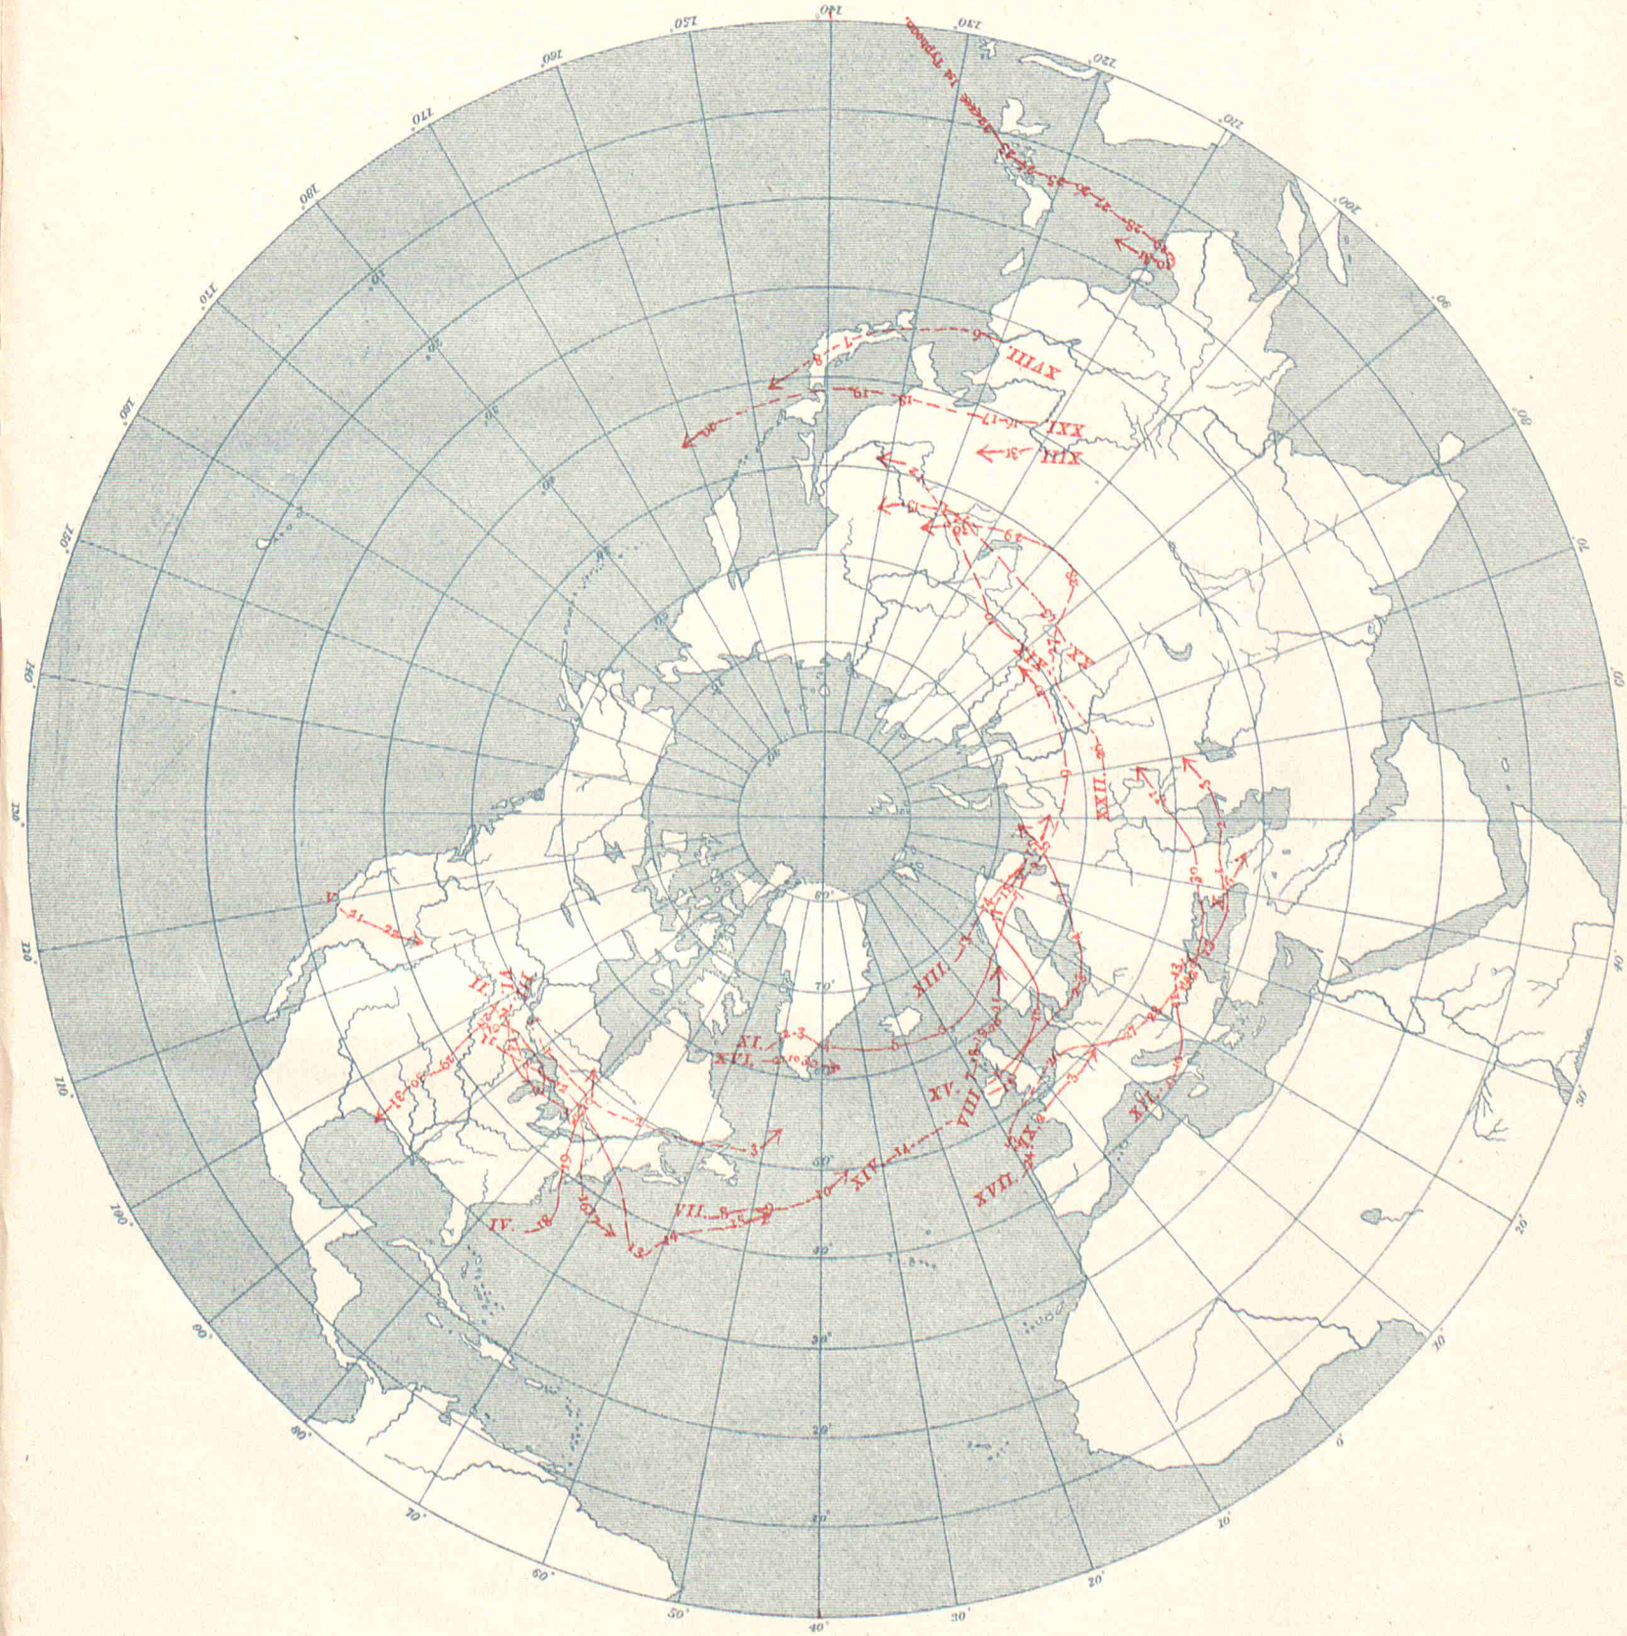
International Chart II. April, 1882. Isobars, Isotherms, and Winds.



UNITED STATES OF AMERICA.

By Order of the Secretary of War.
W.B.Hazen, Chief Signal Officer.

International Chart III. May, 1881. Storm-Tracks.



UNITED STATES OF AMERICA.

By Order of the Secretary of War.
W.B. Hazen, Chief Signal Officer.
