Data, as appearing in the International Bulletin of similar date.

Isobars in *black* exhibit atmospheric pressure at sea level, and are charted from data as reported by the several observers.

Isotherms in *red* exhibit temperature of air, similarly charted.

Broken or dotted lines indicate that the lines so broken are doubtful.

Arrows, when charted, fly with the wind and exhibit wind-direction and force.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

W. B. Hazen

Brig. & Bvt. Maj. Gen'l.
Chief Signal Officer, U. S. A.

Heliotype Printing Co. Boston

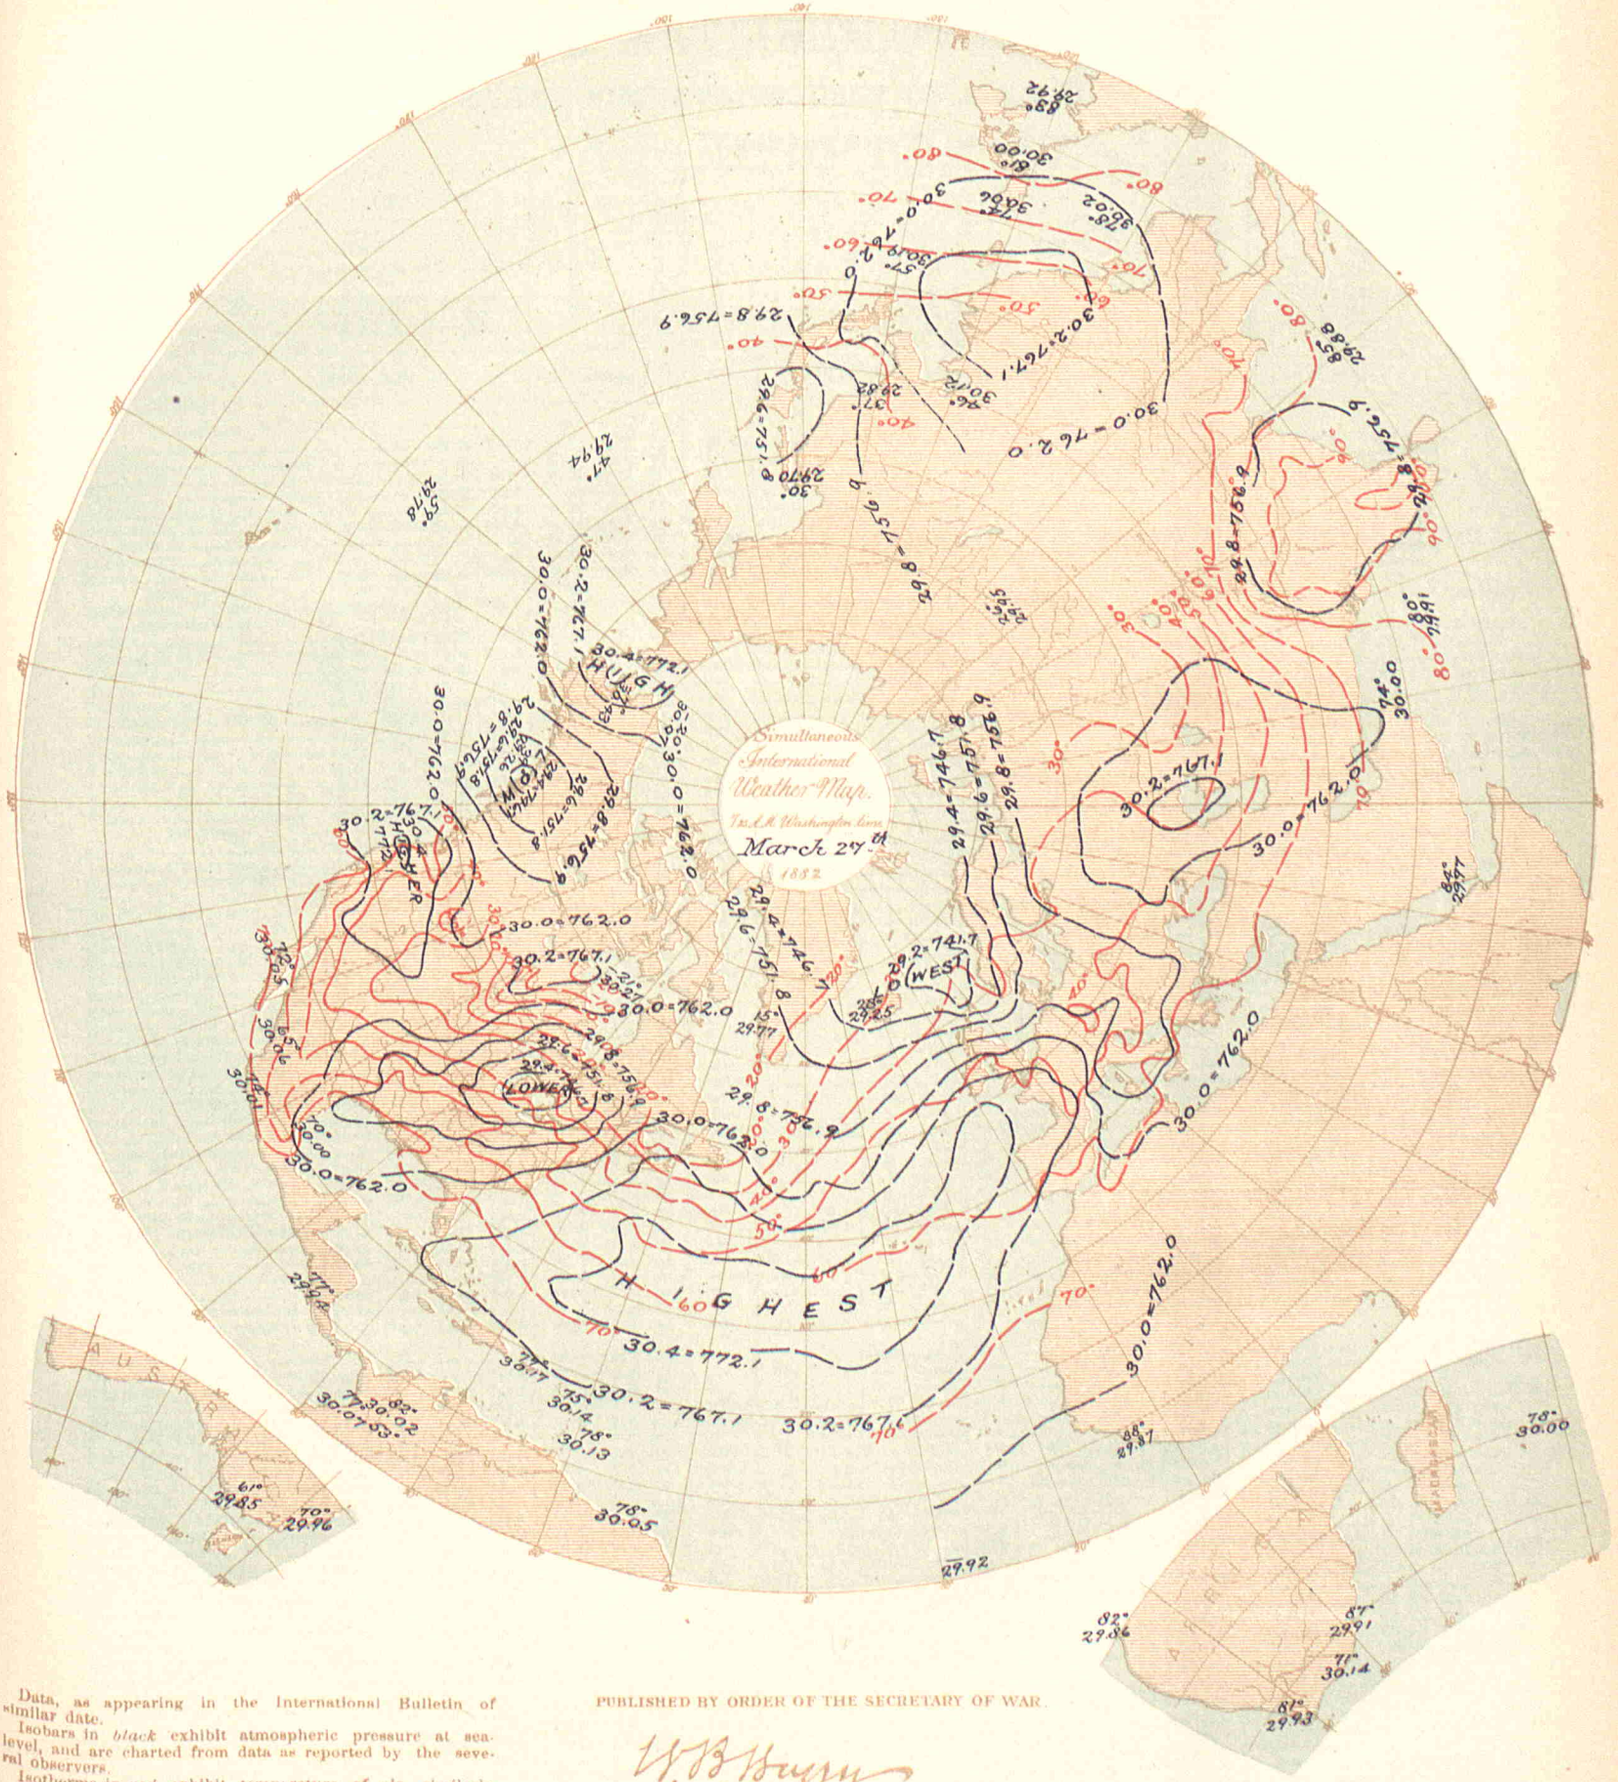
on,



Data, as appearing in the International Bulletin of similar date.

Isobars in *black* exhibit atmospheric pressure at sea-level, and are charted from data as reported by the several observers.

Isotherms in *red* exhibit temperature of air, similarly charted.

Broken or dotted lines indicate that the lines so broken are doubtful.

Arrows, when charted, fly with the wind and exhibit wind-direction and force.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

W. B. Hazen

Brig. & Bvt. Maj. Gen'l.
Chief Signal Officer. U. S. A.

Heliotype Printing Co. Boston.

INTERNATIONAL METEOROLOGICAL OBSERVATIONS

TAKEN SIMULTANEOUSLY ON MARCH 28, 1882,

7 A. M., Washington Mean Time.

Data, as appearing in the International Bulletin of similiar date.

Isobars in *black* exhibit atmospheric pressure at sea-level, and are charted from data as reported by the several observers.

Isotherms in *red* exhibit temperature of air, similarly charted.

Broken or dotted lines indicate that the lines so broken are doubtful.

Arrows, when charted, fly with the wind and exhibit wind-direction and force.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

W. B. Hazen

Brig. & Bvt. Maj. Gen'l.
Chief Signal Officer, U. S. A.

Heliotype Printing Co. Boston.

INTERNATIONAL METEOROLOGICAL OBSERVATIONS

Data, as appearing in the International Bulletin of similar date.

Isobars in *black* exhibit atmospheric pressure at sea-level, and are charted from data as reported by the several observers.

Isotherms in *red* exhibit temperature of air, similarly charted.

Broken or dotted lines indicate that the lines so broken are doubtful.

Arrows, when charted, fly with the wind and exhibit wind-direction and force.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

W. B. Hazen

Brig. & Bvt. Maj. Gen'l.
Chief Signal Officer. U. S. A.

Heliotype Printing Co. Boston.

INTERNATIONAL METEOROLOGICAL OBSERVATIONS

TAKEN SIMULTANEOUSLY ON MARCH 30, 1882,

Data, as appearing in the International Bulletin of similar date.

Isobars in *black* exhibit atmospheric pressure at sea-level, and are charted from data as reported by the several observers.

Isotherms in *red* exhibit temperature of air, similarly charted.

Broken or dotted lines indicate that the lines so broken are doubtful.

Arrows, when charted, fly with the wind and exhibit wind-direction and force.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

NOTE.—See General Remarks.

REVIEW.

INTERNATIONAL METEOROLOGY.

[*Pressure expressed in inches and millimetres.*]

With this REVIEW are issued two international storm-track charts. They are for the months of March and April, 1881, and continue the series of chart v., begun in November, 1877.

The data are charted for each day of the month, on the maps accompanying each issue of the "International Bulletin," and from these charts, and from additional reports, are traced the movements of the centres of barometric minima.

Twenty-six of the more important atmospheric depressions that have appeared in the northern hemisphere during the month of March, 1881, have thus been traced. The following concerns the general distribution of these depressions:

Ten appeared in the United States and Canada; of these, one has been traced from the Pacific coast eastward across the continent to the Atlantic, and three have been traced from the Atlantic coast eastward over the ocean.

Thirteen depressions appeared over Europe; three of which apparently developed in mid-ocean. Six of these depressions traversed northern and western Europe, the general direction of their movement being northeasterly; and seven are shown over the southern and eastern parts of the continent, moving generally in an easterly or southeasterly track.

Three storms are traced over Asia; one of these appeared in Asiatic Russia, one in China, and one in eastern Japan.

The following are brief descriptions of the storms that occurred in the United States and Canada:

I.—This was a continuation of the storm traced as low-area viii. of the February chart. At the close of February the disturbance was central in Ontario, Canada, whence it moved eastward over the New England states, and on March 1st was central, as a somewhat severe storm, off the coast. The depression exhibited much energy during the 2d and 3d, and on the latter date it probably merged with an extensive depression which, on that day, occupied the north Atlantic east of the fortieth meridian.

II.—This disturbance developed in the northwest territories of British America, and moved in a southeasterly direction toward the state of Kansas, where it was central on the 2d. The course then changed to the east-northeastward, and the centre of disturbance appeared in eastern Indiana on the morning of the 3d, causing rain or snow in the northern quadrants of the depression, and cloudy or partly cloudy weather to the south and eastward. During the 3d the disturbance apparently moved slowly and developed increased energy, and on the 4th was central over the southern part of Lake Michigan, while another depression had developed in Virginia. Under the combined influence of these depressions, the rain and snow areas increased in all directions. On the 5th the two depressions united near Lake Ontario, and the storm moved with decreasing energy over the New England states to the Atlantic, and on the 6th it was central to the southward of Nova Scotia, attended by moderate gales and rain. On the 7th the storm centre was near N. 45°, W. 51°, the pressure having decreased as the disturbance moved over the ocean; the lowest reported barometric reading was 29.15 (740.4), wind se., force 2, by the s. s "Köln," in N. 45° 06′, W. 49° 47′. On the 8th the disturbance moved slowly northeastward, the pressure remaining unchanged, but on the 9th a great increase of pressure set in, and the depression gradually filled up south of Greenland.

III.—This was a secondary depression, which developed in Georgia on the 3d, and which moved northward, exhibiting great energy. On the 4th the depression was central in Virginia, whence it moved northward and merged with low-area ii., above described.

IV.—This disturbance first appeared in southern New Mexico on the 6th, and, moving slowly northeastward, was apparently central in Indian Territory on the following day. On the 8th the storm-centre was in eastern Illinois, causing general rains in the southern and middle Atlantic states and light snows in the lake region; during the 8th its course changed to the eastward, and the disturbance exhibited increased energy as it moved toward the coast. On the 9th the storm was central in eastern Virginia, and during the 10th and 11th it moved northeastward in a line parallel to the coast, causing violent gales. During the 12th and 13th it remained near the coast of Nova Scotia, with strong easterly gales and rain and snow prevailing over the Maritime Provinces. On the 13th the storm-centre began to move eastward over the ocean, the wind changing to northerly over the Maritime Provinces and moderating in force. On the 14th the centre of disturbance was near N. 45°, W. 48°, the atmospheric pressure having somewhat decreased; on that date the s. s. "Scythia," in N. 44° 01′, W. 45° 11′, reported barometer 29.19 (741.4), wind ssw., force 7, rainy weather. On the 15th the disturbance appears to have moved northward and to have gradually dissipated, its eastward movement being checked by an area of high pressures which stretched from the British Isles in a southwesterly direction over the Atlantic.

V.—This depression appeared in the north Pacific coast region on the morning of the 9th, causing general rains in California; during the day the disturbance moved southeastward through Utah, and on the 10th the region of least pressure was shown in Colorado. The course then changed to easterly and the depression moved to eastern Kansas, where it was central on the morning of the 11th, causing rain in the southern and snow in the northern quadrants. By the 12th, the isobar of 29.4 (746.7) presented an elongated form, and extended from eastern Kansas to southern Michigan; general rains occurred in the southern and middle Atlantic states, and rain or snow in the lake region and in Ontario, accompanied by moderate easterly gales over the last-mentioned districts. By the morning of the 13th the pressure had greatly increased over the lake region and the Saint Lawrence valley, and the disturbance apparently disappeared, but the barometric readings remained low in the vicinity of Nova Scotia.

VI.—During the 13th and 14th a large area of low pressures, with no well-defined centre, occupied the country west of the hundredth meridian. On the last-mentioned date the depression apparently moved northeastward, and by the 15th it had disappeared near Lake Superior, without developing much energy.

VII.—During the 14th, 15th, and 16th the atmospheric pressure remained low over the extreme southwestern sections of the United States, and on the 16th a disturbance became central in the valley of the Rio Grande; on the 17th and 18th its centre moved very slowly through Texas, causing rainy and cloudy weather in that state. On the 19th the storm-centre was in northern Kentucky, attended by a great increase of energy; easterly and northeasterly gales, with heavy rain, prevailed over the lake region and the Saint Lawrence valley, while heavy snow-storms and northwesterly winds occurred in Missouri and Iowa. By the morning of the 20th the storm-centre was in northern Michigan, whence it moved slowly down the Saint Lawrence valley; after the 20th the rain changed to snow in the lake region and in the Saint Lawrence valley, and strong easterly winds and rain occurred in Nova Scotia. During the 21st and 22d the disturbance moved slowly across the Gulf of Saint Lawrence, and on the 23d was central east of Cape Breton Island, the pressure decreasing as the disturbance moved over the ocean, but owing to the moderate inclination of the barometric gradients on all sides of the depression, only fresh to strong breezes were reported by vessels within the area of disturbance. During the 24th and 25th the storm-centre moved very slowly eastward, but on the 26th the isobar of 29.2 (741.7), which enclosed the region of least pressure, became elongated and extended from the Banks of Newfoundland eastward to the twenty-second meridian, the winds remaining moderate in force. On the 27th the area of disturbance apparently separated into two parts; a further decrease of pressure occurring over the Gulf of Saint Lawrence, while to the eastward the pressure remained unchanged. During the 28th, 29th, and 30th the disturbance remained central

in the vicinity of the Azores, the winds increased in force over the region north of the centre, and the pressure gradually decreased over the Iberian peninsula. During the 30th a northeasterly movement began and the region of least pressure was near the Bay of Biscay at the close of the month, causing a rise in temperature and rainy weather over southwestern Europe.

VIII.—This was a secondary development of low-area vii., and appeared in Arkansas on the morning of the 21st. The disturbance increased in energy as the centre moved eastward to North Carolina, where it was shown on the 22d; by the 23d it had moved into the Atlantic, causing high winds on the coast and strong southerly gales at sea. During the 23d the depression probably moved northeastward and merged with low-area vii., then central near Nova Scotia.

IX.—As stated in the description of low-area vii., a decrease of pressure occurred over the Gulf of Saint Lawrence on the 27th. Strong westerly and northwesterly winds prevailed in the Maritime Provinces and along the Saint Lawrence valley during the 28th and 29th, after which date the pressure increased and the weather moderated over the districts abovenamed.

X.—This disturbance developed in Colorado on the 27th, but exhibited no unusual energy until the 28th, when it was central in Kansas, accompanied by rain near the centre and generally cloudy weather to the east and northward. By the 29th the storm-centre was in northern Tennessee, whence it moved in an east-northeasterly direction to Virginia. On the 30th rain became general in the southern sea-board states, with snow in the lake region, and strong gales occurred along the coast. At the close of the month the disturbance was central, as a severe storm, off the New England coast, the barometer at the centre reading 28.98 (736.1), or one inch below the normal.

The following descriptions relate to the storms that occurred over the Atlantic and in Europe:

XI.—At the close of February an area of low barometric readings remained over mid-ocean, attended by strong to moderate gales. These conditions were maintained during the 1st of March, the region of low pressures showing no change in position. On the 2d the storm-centre was transferred to the vicinity of the Azores, the winds increasing in force over those islands; on the 3d the storm-centre, having moved rapidly northeastward, was shown off the southwestern coast of Ireland, the pressure at its centre being below 29.0 (736.6). The bark "Commewyne," in N. 52° 58′, W. 17° 44′, reported barometer 28.83 (732.3), wind ese., force 6, cloudy; s. s. "Cipero," in N. 52° 35′, W. 15° 05′, barometer 28.99 (736.3), wind sse., force 4; and the s. s. "Baltic," in N. 50° 59′, W. 14° 06′, barometer 29.00, (736.6), wind s., force 5, raining. On the 3d the temperature rose in western France and the British Isles, and heavy rains occurred over Ireland, with cloudy weather in England and Scotland. Steep barometric gradients were formed over the British Isles and western France, and strong easterly and southeasterly winds prevailed, increasing to gales on the coasts. The chart for the 4th shows the region of low barometer to be in nearly the same position as on the preceding day; the decrease extends slightly to the westward. On the 5th the storm-centre moved slowly north-northeastward, and on that day it was shown off the west coast of Ireland, the area of least pressure having an elliptical form. During the 4th and 5th the barometric pressure remained high over Scandinavia and northern Germany; the gradients became steeper, and the winds increased to hard gales over the British Isles. On the 6th the disturbance was central northwest of Ireland; the anticyclone over Scandinavia began to give way and the winds decreased in force over the southern part of the British Isles, but continued with undiminished force in northern Scotland. During the 7th and 8th the depression moved slowly northeastward, throwing off small subsidiary disturbances which traversed the North sea, and caused continuous rains over western Europe. By the morning of the 9th the pressure had increased slightly, and on the following day the disturbance disappeared in the Arctic ocean.

XII.—This was probably a continuation of the storm described as low-area xxi. on the February chart. At the close of that month the disturbance was central in southern France, and on March 1st the centre was shown in northern Italy, attended by strong winds and rain. On the 2d the storm-centre was over the Adriatic, the wind shifting to northerly over Italy after the passage of the centre. On the 3d the disturbance moved southeastward over the Mediterranean where it gradually dissipated.

XIII.—This was probably a secondary development of low-area xxi. on the February chart. On the morning of the 1st a shallow depression occupied northern Germany, southern Sweden, and the Baltic. The depression moved northeastward over the Baltic and disappeared in Finland on the following day.

XIV.—The atmospheric pressure remained low over the British Isles and western Europe during the 6th and 7th under the influence of low-area xi., and on the latter date a secondary depression developed in northeastern England. The disturbance moved over the North sea, causing heavy rains accompanied by severe thunder-storms in northern Germany; on the 8th the storm-centre was in southern Sweden. After the passage of the centre the winds changed to westerly over northern Germany, and rainy or cloudy weather continued, while snow was reported at stations in southern Scandinavia. Moving northeastward from the Baltic, the disturbance on the 9th appeared central over the Gulf of Finland, accompanied by occasional snows and rising temperatures in northwestern Russia, and followed by fresh westerly breezes over the Baltic. On the 10th the disturbance was apparently central near the White sea, and finally disappeared in the Arctic regions during the day.

XV.—On the morning of the 10th an area of low pressure extended from Prussia southeastward over Austro-Hungary to the Black sea. This depression caused strong westerly and southwesterly winds in southern Germany and in Austria. At Vienna the storm attained the violence of a hurricane. The following extract indicates the severity of the gale in that city:

> Vienna has been visited by the most severe storm that has been known for years; on the evening of the 9th the wind blew strongly from the southwest, and during the night it increased to hurricane force and continued during the 10th. While the storm lasted, travel on the streets was rendered exceedingly dangerous, splinters of glass, tiles, signs, &c., being blown in all directions by the wind. The damage to buildings and other property was very great, and several persons sustained more or less serious injury. The storm ended during the night of the 10th–11th.

On the 11th the disturbance was apparently central near Kieff, Russia, where the barometer read 29.56 (750.9), wind nne., light snow; on the 12th the depression finally disappeared in the Caucasus, accompanied by rain in that region.

XVI.—This depression appeared near the Shetland Islands on the 11th; it moved southeastward during the day, and on the 12th its centre was shown in northeastern Germany, causing rain or snow and rising temperature over that region, southern Scandinavia, and the Baltic, and brisk to strong north-northwesterly winds over Denmark and northwestern Germany. By the morning of the 13th an increase of pressure had taken place over Scandinavia and northwestern and central Europe, and the region of least pressure was transferred to southwestern Russia, near the western shores of the Black sea, while cold, clearing weather prevailed over northwestern Europe. On the 13th strong southeasterly winds prevailed over the western part of the Black sea, and on the 14th the depression passed eastward, the wind changing to northerly after the passage of the centre. During the 15th and 16th the disturbance moved slowly over the region between the Black and the Caspian seas, where it finally disappeared, the pressure gradually increasing. The area of high pressures, above referred to, had now spread over the whole of Europe, the centre of the anticyclone being in northern Germany and the

Baltic, where the barometer read 30.6 (777.2); and generally fine weather prevailed over western Europe.

XVII.—During the 11th and 12th a rapid decrease of pressure occurred over the ocean near the Azores, and by the morning of the latter date the centre of disturbance was apparently situated to the northeastward of those islands; the storm-centre then moved northeastward, with increasing pressure, to the Bay of Biscay, where it was central on the 13th, causing a rise in temperature and light rains in the northeast quadrant. On the 14th the depression was central in western France; its course then changed to the southeast and the disturbance passed over southern France toward the Mediterranean, where it dissipated on the 15th.

XVIII.—From the 12th to the 17th a small but deep depression remained near Iceland and did not materially affect the weather conditions over Europe until the 16th, when the anticyclone which prevailed over that continent began to give way. On the 17th the depression moved northeastward, and by the 18th it had reached northern Norway. The gradients became steep over the British Isles and Denmark, and strong southwesterly and westerly winds occurred, increasing to gales in the northern portions. On the 19th the disturbance was central near the White sea, barometer at the centre reading 28.00 (711.2), which was the lowest barometric reading ever reported at Archangel; strong westerly gales occurred over northern Europe, accompanied by generally colder weather, with snow in Norway. This depression was remarkable for the large extent of territory subjected to its influence, as will be seen by a reference to the daily charts for the 18th and 19th. On the 19th the central depression was near Archangel, while the wind-system of Europe was affected as far south as the forty-eighth parallel, being equal to a radius of twenty-seven degrees, or 1,620 geographical miles. During the 19th and 20th the region of high pressure was forced southward to the Mediterranean, and generally stormy weather prevailed over the greater part of the continent. On the 21st the pressure at the centre of depression showed a marked increase, and the disturbance moved toward the Ural mountains, in which vicinity it disappeared on the 21st.

XIX.—The daily chart for the 16th shows an area of low pressure, enclosed by the isobar of 29.4 (746.7), over the Atlantic near N. 40°, W. 48°. On that day the s. s. "Britannic," in N. 41° 49′, W. 50° 54′, reported barometer 29.27 (743.4), wind ne., force 8, rain and hail; and the s. s. "Strassburg," in N. 40° 20′, W. 57° 21′, barometer 29.7 (754.4), wind n., force 8–9, heavy ne. swell and threatening weather. By the 17th the region of least pressure had moved slowly northeastward, but its progress was apparently checked by the area of high barometer which extended from Europe westward to the thirtieth meridian, so that on the following days (18th, 19th and 20th) the position of the low area was but little changed, although the pressure had gradually diminished over the region to the east of the disturbance. By the 21st the depression was central near and to the westward of the Azores; the ship "City of Agra," in N. 38° 48′, W. 36° 40′, reported barometer 29.6 (751.8), calm, while strong south-southwesterly winds prevailed in the Azores. On the 22d the storm-centre moved to the northward of the Azores, the wind changing to westerly over those islands, while easterly winds of moderate force prevailed north of the forty-fifth parallel. During the day the disturbance moved rapidly northeastward, and on the 23d it appeared central off the western coast of Ireland, the area of least pressure being enclosed by the isobar of 29.2 (741.7); on the 23d a considerable rise in temperature occurred over the British Isles, and general rains with moderate southerly and southwesterly gales prevailed. The pressure decreased as the disturbance moved northeastward, and on the 24th the centre was near the Shetlands, the barometer at North Unst reading 28.45 (722.6), wind s., force 2, raining; during this day strong westerly winds prevailed over Scotland. On the 25th the storm-centre was near the northern part of the Gulf of Bothnia, whence it moved northeastward and disappeared on the 26th in the Arctic region.

XX.—This disturbance appeared over the Mediterranean on the 21st; it moved in an easterly path over Italy, and on the 22d it appeared as a well-defined depression central in Austro-Hungary, but which did not, however, exhibit any marked energy. On the 23d the disturbance dissipated in southern Russia.

XXI.—This was a slight depression which appeared over the Mediterranean on the 26th, when it was central near the island of Sardinia. The disturbance apparently dissipated near the Adriatic during the 27th.

XXII.—This depression appeared off the coast of northern Norway on the 28th, causing moderate westerly and northwesterly winds over the British Isles, except in the extreme northern part, where the wind blew with the force of a gale. On the 29th the region of least pressure was transferred to central and southern Scandinavia, accompanied by snow at stations in the peninsula; during the day the course changed to northeasterly, and on the 30th the centre of disturbance was in Finland. At the close of the month the depression was shown to the eastward of the White sea.

XXIII.—During the 29th the pressure decreased over the Gulf of Lyons, and by the 30th a distinct area of low pressure was shown over Italy. The depression moved northeastward, and on the 31st was central in Austro-Hungary.

The following are the descriptions of the barometric minima that occurred in Asia:

XXIV.—This disturbance apparently originated in the region near the sea of Aral on the 13th. It moved slowly eastward on the 14th, causing a southwesterly gale at Tashkend; its course then became northeasterly, and on the 15th the disturbance was shown in central Siberia, where it finally disappeared.

XXV.—This disturbance appeared on the 20th, to the southward of the island of Kiushiu, Japan. It moved northeastward, apparently skirting the coast of Japan, and on the 22d was central to the eastward of Niphon. It then passed beyond the range of observation.

XXVI.—This was a depression which formed probably in the interior of the Chinese Empire, and on the 31st was central near Pekin, causing a fall of .3 inch in the barometer at that station.

Chart v. for April, 1881, shows the tracks of twenty-eight of the principal depressions that have appeared over the northern hemisphere during that month. These depressions were distributed as follows:

Eight appeared in the United States and Canada; of these, two have been traced from the coasts of North America eastward over the Atlantic to the European coasts. Eleven barometric minima are shown over Europe; of these, two first appeared in Greenland, and moved in an easterly or southeasterly direction toward the continent; five prevailed in the southern part of Europe, and moved from west to east; three appeared in northern Europe, their movement being easterly or northeasterly. One depression only, moving from southwest to northeast, is shown over the British Isles. Nine depressions are shown over Asia; two of these occurred in Asiatic Russia, while seven, an unusually large number for the month, prevailed over eastern Asia.

The month of April, 1881, was characterized by an unusual freedom from violent storms in the northern hemisphere, but much damage was caused by floods, especially in the United States, in Spain and in Hungary. Earthquakes were frequent and severe, the most disastrous being that which occurred in the island of Chios.

The following brief descriptions concern the storms that occurred over the United States and Canada:

I.—This was a continuation of the depression traced as low-area x. on the March chart. On the last day of March the disturbance was central, as a deep depression of great energy, south of Nova Scotia; by April 1st it had moved to the eastward, attended by a slight increase of pressure, but the winds did not moderate in force except on the coasts of the United States; southward and eastward over the ocean very

strong gales continued. On the 2d the area of low-pressure became elongated and extended from the Gulf of Saint Lawrence eastward to the thirtieth meridian, the winds moderating slightly to the east of the centre, but showing no decrease in force on the south side of the depression. From the 3d to the 7th the disturbance remained over Newfoundland and the Gulf of Saint Lawrence, the region of least pressure occupying on each day the positions as traced on the chart. During the period from the 3d to the 7th the atmospheric pressure near the centre ranged from 29.0 (736.6) to 29.4 (746.7), and strong gales continued in the eastern and southern quadrants. During the 7th the disturbance began to move slowly eastward, and on the 8th was shown near N. 47°, W. 42°. By the 9th the storm-centre, having moved in a northeasterly track, was near N. 53°, W. 31°, attended by moderate to strong southerly gales in the eastern quadrants and causing a decrease of pressure over the western part of the British Isles. On the morning of the 10th the depression was central off the southwestern coast of Ireland, causing a slight rise in temperature over that island, with light rains in the southwestern portions. On the 11th the depression appeared to have withdrawn towards the west, but on the 12th it was again shown to the northwest of Ireland. It then moved northward, or to the west of north, and disappeared near Iceland on the 13th.

II.—This disturbance appeared in Montana on the 15th, and moved by a southeasterly course to Kansas, where it was central on the 6th. On the morning of the 7th the centre of the depression was in Arkansas, whence it moved eastward over Tennessee and North Carolina, attended by heavy rains near the track of its centre. On the 9th the disturbance was shown as a storm of considerable energy, central at some distance off the coast of Virginia; during the 10th and 11th the depression moved northeastward, the barometric readings near its centre being below 29.6 (751.8). On the 13th the storm-centre was apparently near N. 49°, W. 41°; on that date the s. s. "Circassian," in N. 47° 57′, W. 42° 28′, reported barometer 29.2 (741.7), wind wsw., force 1, and vessels in the southwest quadrant reported strong westerly gales. On the 14th the disturbance probably moved eastward; during the day the course apparently changed to the southeastward, and on the 15th the depression was central near the Azores, causing a slight decrease of pressure over the western part of the Iberian peninsula. On the 16th the area of disturbance presented the form of an ellipse, the lowest barometric readings being near the coast of Spain, while the decrease of pressure extended southeastward to the Madeira Islands. This disturbance is hereafter described as low-area xiii. of this chart.

III.—This depression developed in Texas on the 10th, and on the following day it appeared in Indian Territory, attended by rainy weather in the northeast quadrant. By the morning of the 12th the area of low-pressure covered the country from Texas northeastward to the southern part of the lake region; within this area the lowest barometric readings were in northern Kentucky and in southern Ohio, where the barometer read 29.65 (753.1), or about .3 inch below the normal. During the day the depression dissipated south of the lakes.

IV.—This was a secondary development of the preceding depression, low-area iii. It moved northeastward, followed in its immediate rear by a great fall in temperature. On the 13th the depression was in West Virginia, whence it moved into the Atlantic, and on the 14th it was central south of Nova Scotia. During the day it probably became merged in low-area v. During the passage of this depression, disastrous tornadoes occurred in Mississippi and Arkansas, and under the influence of the cold wave above referred to severe frosts, injuring vegetation, were reported throughout the state of Texas, except in the southern sections.

V.—This depression formed in Georgia during the 13th, and on the 14th appeared as a well-defined storm-centre off the coast of the Carolinas. A sudden and great decrease of pressure took place during the day as the depression moved northeastward in a line nearly parallel to the coast, and on the morning of the 15th the centre of depression was indicated by the isobar of 28.8 (731.5), and was situated to the southward of Nova Scotia. On this day strong easterly and northeasterly gales prevailed in Nova Scotia, with rain or snow at stations in the Maritime Provinces and in New England. The winds had changed to northwesterly on the coast of the United States, and blew with the force of a strong gale from North Carolina to the New England coasts. On the 16th, 17th, and 18th the storm moved slowly north-northeastward over the Gulf of Saint Lawrence and finally disappeared in Labrador. During this storm all vessels between the thirtieth and fortieth parallels and west of the sixtieth meridian reported winds of cyclonic tendency and of great force, in which many vessels lost sails, spars, boats, and sustained other damage.

VI.—This disturbance entered the United States from Manitoba on the 14th; it moved southeastward, causing light rains in Wisconsin and Iowa, and finally filled up near Lake Michigan.

VII.—On the 24th the pressure was generally low over the country west of the hundredth meridian, the lowest barometric values being reported from Dakota. By the morning of the 25th the disturbance occupied the lake region, while a slight and unimportant depression existed in Texas and Indian Territory. On the 26th the disturbance, having moved eastward, was central in Ontario, where it was attended by light but general rains. During the day the depression apparently dissipated in the valley of the Saint Lawrence.

VIII.—This disturbance was shown in Manitoba on the 26th; it passed eastward north of Lake Superior and disappeared in Labrador on the 28th.

The following descriptions relate to the storms that occurred over Europe:

IX.—This was probably a continuation of the depression traced as low-area vii. on the March chart. At the close of that month it was central near the Bay of Biscay; on April 1st and 2d it remained central near the southern shores of the bay, attended by rising temperatures and rain at stations on the coasts of France and Spain. During the 2d and 3d the decrease in pressure extended eastward over the Mediterranean to Italy, but the centre of disturbance appeared to be near the Pyrenees, while a second depression had developed near the coast of Portugal. By the 4th low-area ix. was central over the western part of the Mediterranean, whence it moved slowly eastward to Italy, where it was central on the 6th; its course then changed to northeasterly, and on the 7th the disturbance was over the Adriatic, causing rain at stations in the northern quadrants. During the 7th the pressure increased, and the disturbance gradually disappeared.

X.—On the 3d an area of low-pressure formed near the coast of Portugal, and caused strong southerly winds and rain at stations in the peninsula. During the 4th and 5th the centre of disturbance remained persistently off the coast, the pressure gradually decreasing at the land stations. By the morning of the 6th the area had become elongated, and extended eastward to Italy, and northward to northern France. Within this area the lowest barometric readings remained in Spain, while the rain-area extended to the English Channel. On the 7th the pressure began to increase, and on the 8th the disturbance dissipated in northern France. From the 2d to the 6th an area of high-pressure covered the British Isles and northern Europe, in consequence of which steep gradients were formed, and strong east and northeast gales occurred over the English Channel and in France. It was during the existence of depressions ix. and x. that the destructive floods occurred in southern Spain. The Guadalquivir overflowed its banks, inundating nearly forty square miles of country near its mouth. The valley in which Seville lies was flooded for a distance of thirty miles, half of the city of Seville being under water. Many houses were vacated, the foundations having been rendered insecure, and all railroad travel was suspended. Fears were entertained that famine would increase the distress, as more than 30,000 inhabitants of Seville and its environs

were without food. The damage was estimated at ten millions of francs. The districts of Badajoz, Granada, Murcia, Almeria, Huelva and Cordova were also flooded.

XI.—This was a deep depression which first appeared in the extreme northern part of Scandinavia on the 3d and 4th. On the 5th the disturbance moved into Finland, causing strong southwest and south-southwest winds over the Gulf of Bothnia. On the 6th the depression moved toward the White sea, and on the following day disappeared in the valley of the Obi.

XII.—This depression, the only one traced across the British Isles during the month, was probably a subsidiary disturbance of low-area i. On the 14th the depression, which was shallow, appeared over the Saint George's Channel; it moved northeastward, attended by rain in England. On the 15th the disturbance passed to the North sea, and apparently dissipated before reaching the continent.

XIII.—This was a continuation of the depression traced as low-area ii. of this chart. On the 17th the disturbance was central in the southern part of the Bay of Biscay, causing strong easterly winds over France and the English Channel. On the 18th the centre of the depression remained in Spain, and the pressure decreased over central and northern Europe as a new disturbance developed near the Baltic. On the 20th low-area xiii. was central over the Mediterranean, and, under the combined influence of this and low-area xv., a considerable decrease of pressure occurred over the whole of Europe. On the 21st and 22d the disturbance moved to Italy and Austro-Hungary, and on the 23d disappeared near the Black sea.

XIV.—This disturbance first appeared off the northern coast of Norway on the 18th and caused moderate to strong westerly winds in Scandinavia. On the 19th the depression disappeared north of the White sea.

XV.—This depression first developed in northern Germany on the 19th, and on the 20th was central over the Baltic, the pressure having greatly decreased near the centre, which was now enclosed by the isobar 29.0 (736.6). Strong gales, with snow, occurred over the Gulf of Bothnia and the Scandinavian peninsula, and strong northwest and west gales in Denmark, northern Germany, and over the Baltic. On the 21st the storm-centre maintained nearly the same position as on the preceding day, but the pressure had increased and the winds had generally moderated in force. By the 22d the centre of disturbance had moved northeastward to Finland, causing strong northerly gales and snow in northern Norway. On the 23d the disturbance was over the White sea, and probably disappeared in the Arctic regions during the day, but the atmospheric pressure did not recover quickly over northern Russia, owing to the advance of low-area xvi.

XVI.—This depression first appeared in western Greenland on the 23d; it moved eastward, and on the 24th was central near Iceland, causing a southeasterly gale and rain at Stykkisholm. On the 25th the centre of disturbance was between the Shetland Islands and Norway; a considerable decrease of pressure took place over the northern part of the British Isles, and westerly gales occurred over Scotland and the North sea; there was a general rise in temperature in northwestern Europe, and the rain-area extended southward to the Netherlands. During the 25th the storm-centre moved slowly southeastward to southern Norway. On the 26th strong westerly winds and a rise in temperature occurred over Denmark, while to the westward of the centre the winds shifted to northerly and decreased in force, accompanied by lower temperatures. On the 27th the disturbance was central near the eastern shores of the Baltic; its course then changed to the northeast and the centre of the depression moved into northwestern Russia, accompanied by generally rainy weather throughout that district. On the 29th the disturbance disappeared to the eastward of Archangel.

XVII.—This disturbance appeared near the Black sea on the 25th, causing rainy weather over that region. On the 26th the low area changed only slightly in position, but during the day an increase of pressure set in and the depression filled up after passing to the eastward of the Black sea.

XVIII.—This disturbance appeared in the Mediterranean on the 27th, on which date it was apparently central between Sardinia and Italy. Strong northwesterly gales and heavy rains occurred at stations on the shores of the Gulf of Lyons and in Sardinia, and strong westerly breezes prevailed in southern Italy. On the 28th the depression occupied the Adriatic sea and the Danubian Principalities, causing strong southwesterly breezes in the southern quadrants. On the 29th the disturbance was shown in European Turkey, and at the close of the month was gradually filling up near the Black sea.

XIX.—This disturbance appeared in southern Greenland on the 27th. On the 28th and 29th it moved southeastward, and at the close of the month was central off the western coast of Ireland, the region of least pressure being enclosed by the isobar of 29.6 (751.8).

The following are brief descriptions of the atmospheric depressions that appeared in Asia:

XX.—This was a continuation of low-area xxvi. on the March chart. The disturbance passed from central China northeastward to the Gulf of Pe-Che-Li on the 1st and 2d. After crossing the peninsula of Corea its course changed to the southeastward and the disturbance moved over the Sea of Japan. During the 2d it crossed Niphon and entered the Pacific ocean. On the 3d the s. s. "Oceanic," in N. 38° 36′, E. 147° 30′, reported barometer 29.6 (751.8), wind nw., force 6, squally. On the following day the disturbance passed beyond the range of the observations.

XXI.—This depression appeared near Pekin, China, on the 6th; it passed northeastward beyond the stations of observation during that day.

XXII.—On the 6th a great decrease of pressure occurred over Japan, and on the 7th the disturbance apparently passed northeastward over the Pacific ocean.

XXIII.—This disturbance appeared in Toorkistan on the 13th and on the 14th the region of least pressure was transferred to central Siberia; it then passed beyond the stations of observation.

XXIV.—This was a slight depression which appeared on the 13th south of the island of Kiu-Siu, Japan; it disappeared to the eastward on the following day.

XXV.—During the 16th the pressure decreased at Yeniseisk, Siberia, and on the 7th the disturbance was probably near Lake Barkal. On the 18th the depression reached the vicinity of Nertschinsk, while a great increase of pressure had set in over the region to the westward of that station. On the 19th and 20th the depression was shown near the Sea of Okhotsk, where it disappeared.

XXVI.—This disturbance apparently originated in the southwestern part of China. It moved north-northeastward, and entered the Gulf of Pe-Che-Li on the 19th; on the following day it was apparently central over the Sea of Japan and near to the southern coast of Niphon. Strong southerly breezes occurred over the eastern part of Niphon on the 20th; on the 21st the shifting of the wind on the eastern coast of the island indicated that the disturbance had passed into the Pacific.

XXVII.—From the 23d to the 26th the barometer remained low in central China, and on the latter date the decrease extended to the coast-line. On the 27th the wind at Zi-Ka-Wei indicated that the disturbance had passed to the northward of that station. On the 28th the centre of depression was in Japan, causing rain at stations near the centre, and strong southerly breezes to the eastward. On the 29th the disturbance passed into the Pacific and beyond the limits of the observations.

XXVIII.—On the 30th a great decrease of pressure took place over central China, the centre of disturbance being apparently south of Pekin at the close of the month. The minimum barometric reading of the month, 29.58 (751.3), occurred at Zi-Ka-Wei during the existence of this depression.

GENERAL REMARKS.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are applied at this office. In the naval and marine series, corrections for temperature and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz.: †, aneroid; *, instrumental error not known; c, cirrus; k, cumulus; s, stratus; n, nimbus; d, scud; f, fracto; p, pallio; hz, haze; fg, fog; sk, smoke; inap, inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in metres per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometres per hour, to metres per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations. In the MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS the position of stations (latitude and longitude) are obtained from Keith Johnston's Index Geographicus, except where more exact information is furnished. The elevations of stations are obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the original forms, upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is believed for the most part, that throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least this should be the case. The local time, where omitted or not given correctly in the originals, is carefully computed at this office. Generally, all conversions are made at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used. The following remarks relate to the individual peculiarities in the *methods* of recording and the *times* of taking the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus:

ALGERIAN SERIES (furnished by co-operation of General Maritz, Commandant Supérieur du Génie in Algeria.)—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W., and respective observers.)—At Melbourne, the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemburg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers.)—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not given on the originals, but is computed from hygrometrical observations. At Cardington, Galway, Oxford, and Sandwick Manse the barometers are given as read off. The movement of the air is indicated by force, on a scale of 0 to 12, except pounds pressure per square foot at Greenwich. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind direction is given to 32 points and weather by the Beaufort notation.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers.)—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with a * are telegraphed daily to the office of the Chief Signal Officer of the Army.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers.)—At Cape Town, the barometer is given on the original as corrected for temperature only. Upper and lower clouds are given on a scale of 0 to 10 and the kind occasionally indicated by abbreviating Poëy's classification.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological observatory at Zi-Ka-Wei.)—At Zi-Ka-Wei, the originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the directions to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres and measured at the moment of simultaneous observation. At Hankow the originals give the barometer in inches, temperature in Fahrenheit and force on the scale of 0 to 10.

DANISH SERIES (furnished by co-operation of Captain N. Hoffmeyer, Director of the Royal Danish Meteorological Institute at Copenhagen.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force, on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds and the direction of movement, together with the rainfall, is entirely omitted.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second, for Mont Louis and Perpignan. In general, the rainfall is measured at 9 a. m., local time, but at Lyons at the moment of simultaneous observation. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dome, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Mont Louis and Perpig-

nan. At Guéret, the observations are taken at 12.00 m., instead of 12.16 p. m. At Gap, the observations are taken at 12.03 p. m., instead of 12.32 p. m.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumayer, Director of the German Marine Observatory at Hamburg.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower, the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms. At Berlin, observations are taken at 2 p. m., instead of 1.02 p. m.

GREEK SERIES (furnished by co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens.)—The originals give the barometer corrected for temperature only and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on the scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India at Calcutta.)—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 m.m. as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals, where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry and Commerce—furnished by co-operation of Professor P. Tacchina, Director of the Central Meteorological Office at Rome, and respective observers.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4 as at Mondovi, Florence and Cagliari. No distinction is made between upper and lower clouds and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by co-operation of I. Arai, Director of the Imperial Meteorological Observatory at Tokei.)—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds and the amount is given on the scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius.)—All conversions are published as given in the originals. The direction of the wind is given to 64 points and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (by authority of the Secretary of Public Works—furnished by co-operation of Señor Mariano Bárcena, Director of the Central Meteorological Observatory in the City of Mexico, and respective observers.)—All conversions (subject to correction at this office) are published as given in the originals. The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on the scale of 0 to 10.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys Ballot, Director of the Royal Meteorological Institute of the Netherlands at Utrecht.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on the scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred.

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute at Christiania.)—The originals give the barometer in millimetres, reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen, observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon.)—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon of each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, Director of the Imperial Central Physical Observatory of Russia at St. Petersburg.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. At Astrakhan, the barometer-cistern is below sea-level. The movement of the air is indicated by velocity in metres per second. No distinction is made between upper and lower clouds; the amount is given on the scale of 0 to 10 and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Barnaul, observations are taken at 6.18 p. m., local time.

SCOTTISH SERIES (furnished by co-operation of Alexander Buchan, M. A., F. R. S. E., Secretary of the Scottish Meteorological Society at Edinburg, and respective observers.)—The originals give the barometer as read off and the movement of the air as indicated by force on a scale of 0 to 6. Distinction is made between upper and lower clouds as to degree, and the amount of cloudiness is given on a scale of 0 to 10. The direction of upper clouds is given separately. The rainfall, temperature and humidity are not given at North Unst. The wind direction is given to 32 points.

SPANISH SERIES (furnished by co-operation of Antonio Aguilar, Director of the Royal Observatory at Madrid, and respective observers.)—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 4 p. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University.)—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of Professor E. Plantamour, Director of the Observatory at Geneva.)—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of Professor C. V. A. van Dyck, Superintendent of the Lee Observatory at Beirut.)—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in metres per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at

Valona, at which station it is inferred from the general weather terms.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Officer, U. S. Army.)

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers.)—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota and Navassa, the barometer is corrected for temperature only; at Puerto Berrio, is given as read off, and at Rivas is omitted. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo and Rivas, and 0 to 12 for Puerto Berrio. The wind direction is generally given to 16 points, except 8 points for Bogota and 32 points for Rivas.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary.)—The originals give the barometer as read off. The wind direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of sea-disturbance is given on the scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory, of the Infante Dom Luiz, at Lisbon.)—The originals give the barometer in millimetres, corrected for temperature only and the thermometer in Centigrade. The movement of the air is indicated by force on the scale of 0 to 10. The humidity is not given, but is computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on the scale of 0 to 10; the direction of movement is given without distinction between upper and lower. The height of sea-disturbance is given on the scale of 0 to 9, and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

SWEDISH NAVAL SERIES (furnished by co-operation of E. Malmburg, Director of the Nautical Meteorological Bureau at Stockholm.)—The originals give the barometer as read off. The movement of the air is indicated by force on the scale of 0 to 12, and the direction is corrected for magnetic variation at this office. The humidity is not given, but is computed from the hygrometrical observations. The rainfall is omitted. The height of the sea-swell is given on the scale of 0 to 9, and the weather by the Beaufort notation.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operation of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation.)—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels.)—Same as U. S. Naval.

OCEAN SQUARES.—The table of ocean square data shows, (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude, (2) the number of days for which observations are at hand within the respective squares, and the total number of simultaneous observations reported on those days, (3) the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather-maps.

ERRATA.

DAILY BULLETIN, March 1st, 1882, page 6, United States Naval, "Shenandoah," barometer 764.3 mm., should read 764.0 mm.

4th, page 2, French, Privas, rainfall 4.6 mm., should read 46. mm.; page 8, S. E. J. Spicer, off the Highlands, N. Y., should read N. J.

22d, page 8, Miscellaneous, Bk. "Johanne Auguste," barometer 754.4 mm., should read 755.4 mm.

27th, page 6, United States Naval, "Wachusetts," barometer 29.30 inches, should read 29.32 inches.

29th, page 2, French, Rouen, reduced barometer 768.0 mm., should read 766.0 mm.

31st, page 2, German, Bamberg, actual barometer 28.88 inches, should read 28.89 inches; page 3, Italian, Cosenza, actual barometer 763.9 mm., should read 733.9 mm.; page 8, Warren Line, s. s. "Iowa," barometer 756.4 mm., should read 767.8 mm.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

W. B. HAZEN,

INTERNATIONAL MONTHLY CHART.

Showing mean pressure, mean temperature, mean force and prevailing direction of winds at 7:00 A. M., Washington mean time, for the month of March, 1882 based on the daily charts of the International Bulletin.

ISOBARS AND ISOTHERMS.

Isobars in *black;* detached barometer means in English inches.

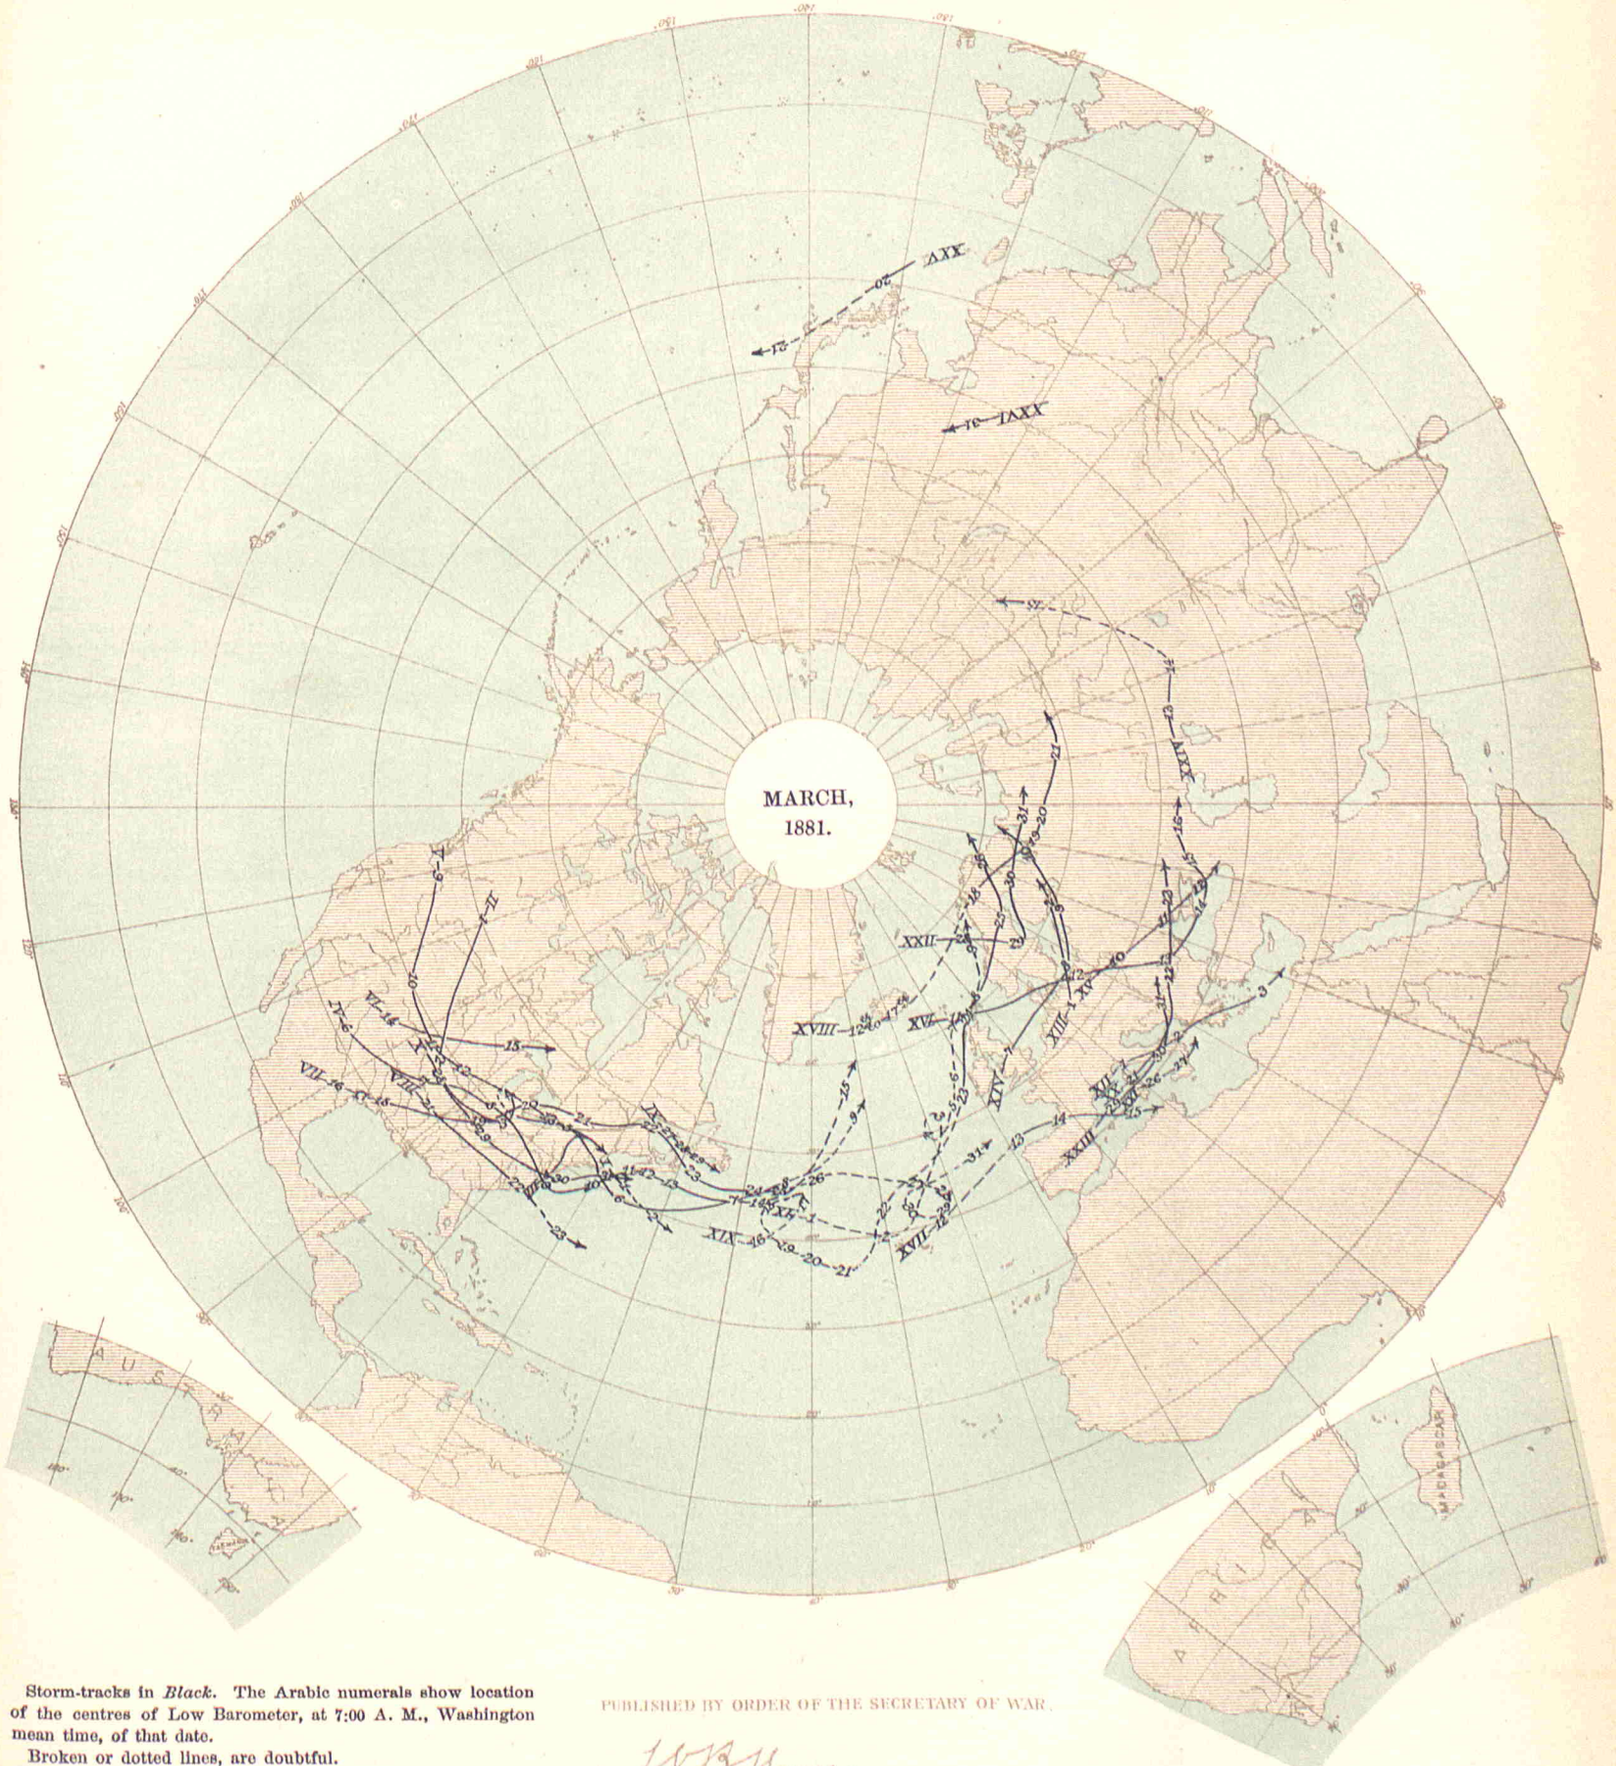
Isotherms in *red;* detached temperature means in degrees Fahrenheit.

Broken lines, are doubtful.

Office of the Chief Signal Officer,

UNITED STATES ARMY.

Charted from Actual Observations taken Simultaneously, Series commencing November, 1877.



Storm-tracks in *Black*. The Arabic numerals show location of the centres of Low Barometer, at 7:00 A. M., Washington mean time, of that date.

Broken or dotted lines, are doubtful.
