NOTE.—The above observations, taken at 7 a. m., Washington time, were received too late for publication in the DAILY BULLETIN, and are given here in full; for continuation of the same, see DAILY BULLETIN.

REVIEW.

INTERNATIONAL METEOROLOGY FOR APRIL, 1884.

[*Pressure expressed in inches and millimetres; temperature in degrees, Fahrenheit and Centigrade; wind-force by scale of* 0–10.]

The following description refers to chart ii. for the month of April, 1884, issued with this SUMMARY. This chart continues the series of international charts begun in January, 1877, and exhibits the mean pressure, mean temperature, and prevailing wind-direction over the northern hemisphere, as determined from one observation taken simultaneously each day at 7 a. m., Washington, or 0 h. 8 m. p. m., Greenwich, mean time.

Three prominent areas of barometric minima appear on the chart; the first is enclosed by the isobar for 29.7 (754.4), and occupies northern and central Hindostan; the second is a large area, enclosed by the isobar for 29.8 (756.9, which covers southern and central Europe and the Mediterranean, extending from the western shores of the Black Sea westward to the twentieth meridian west of Greenwich; at the centre of this area the mean pressure is 29.7 (754.4). The third area, 29.8 (756.9), is situated over the Atlantic ocean between W. 50° and 70° and N. 35° and 45°, including within its limits Nova Scotia and Maine. In the United States the mean pressure is least in Colorado, Utah, Arizona and New Mexico; where the means range from 29.85 (758.2) to 29.9 (759.4). In all other parts of the United States, excepting the south Pacific coast region, the extreme northwest, Missouri valley, upper lake region, Florida, and the east Gulf states, the mean pressure is less than 30.0 (762.0). In the districts above named the means ranged from 30.0 (762.0) to 30.05 (763.2). Over the Atlantic ocean north of a line running from Bermuda to the Azores, the mean pressure was less than 30.0 (762.0). Over the British Isles and the European countries lying between the fiftieth parallel and the Baltic, the mean pressure ranged from 29.8 (756.9) to 29.9 (759.4); in northwestern and central Russia it was above 30.0 (762.0); in other parts of that empire it was below 30.0 (762.0).

Three areas of high barometer, each of which is indicated by the isobar for 30.1 (764.5), are shown on the chart. The first of these occupies that part of Siberia lying between N. 50° and 60°, and E. 80° and 100°, the highest mean being 30.15 (765.8) at Semipalatinsk. The second area is situated over the Atlantic between the parallels of 20° and 30° north, and the meridians of 25° and 40° west. The third area occupies Manitoba and the Hudson Bay region, the highest means being 30.21 (767.3) at Fort Chimo, northern Labrador, and 30.13 (765.3), at York Factory.

Compared with the chart for the preceding month (March, 1884), there has been a decrease of pressure throughout the United States except on the Pacific coast and in northern Minnesota; the decrease averages .10 inch. There has also been a decrease in eastern Canada. Over the entire continent of Europe the pressure is less than in the preceding month, the differences being least in the British Isles and the northern peninsulas, and greatest in the Iberian peninsula, Russia, Italy, Austria and France, where the decrease averages .23 inch. Over the Atlantic ocean from the coast of the United States eastward to W. 50° there has been a decrease of pressure; over the region north of the fortieth parallel and between W. 50° and the European coast there has been an increase; in other parts of the Atlantic, south of 40° N. the pressure has decreased. Throughout Asia there has been a general decrease of pressure.

Compared with the corresponding month of previous years, the mean atmospheric pressure in the United States was slightly above normal in the northern districts of the country and on the eastern slope of the Rocky mountains; in all other parts of the country it was below the normal value, the deficiency being greatest along the Atlantic coast districts where it amounted to about .12 inch; in Canada it was below normal. In Europe the mean pressure was less than the normal in all countries except Russia and the northern peninsulas. In British India it was about normal.

The following table shows the mean pressure and mean temperature for April, 1884, in the several countries of the eastern hemisphere, and the departures as compared with the means determined from observations taken during the last seven years.

Countries.	Mean pressure.			Mean temperature.		
	April mean of 7 (1877–'83) years.	April 1884.	Departure.	April mean of 7 (1877–'83) years.	April 1884.	Departure.

* Means for six years only. † Mean for five years only.

The following are some of the extreme mean temperatures reported at isolated stations:

Highest.	Fahr.	Cent.	Lowest.	Fahr.	Cent.
	°	°		°	°
Cairo, Egypt	85.1	29.5	York Factory, B. A.	— 6.4	—21.3
Freetown, Sierra Leone	84.6	29.2	Upernavik, Greenland	5.6	—14.7
Bluefields, Nicaragua, C. A.	82.8	28.2	Fort Chimo, B. A	17.9	— 7.8
Manila, Philippine Islands	82.0	27.8	Nikolaevsk on the Amoor, Asia	22.5	— 5.3
Bridgetown, Barbadoes, W. I.	81.7	27.6	Yeniseisk, Siberia	25.0	— 3.9

The mean temperature of the air was below the normal in all parts of the United States except New England, the north Pacific coast district, and Idaho; in those districts it was slightly above the normal. In Canada the temperature was above the normal. In Europe it was below the normal except in Italy and the Scandinavian peninsula; in the former it was normal and in the latter it was slightly above normal. In

British India it was 1°.2 above the six years' mean; the highest monthly mean temperature reported was 99°.1 Fahr. (37°.3 Cent.), at Nagpur, and the lowest was 74°.1 Fahr. (23°.4 Cent.), at Sibsagar.

In the United States the prevailing winds were mostly northwesterly and northerly except along the Gulf coast and in the Pacific districts, where they were southerly; in Canada they were mostly from west to north and northeast. Over the Atlantic they were as follows: from the coast of the United States eastward to W. 50°, and between N. 20° and 40°, northwesterly and westerly; between W. 50° and 30° and N. 20° and 45° they were southerly and southwesterly; from W. 30° to the European and African coasts they were northwesterly and northerly, between N. 25° and 45°. North of the forty-fifth parallel they were mostly northwesterly, and south of the twentieth parallel they were easterly and northeasterly. In northern and central Europe the winds were principally from east and northeast; in the southern peninsulas they were southwesterly.

During April, 1884, the rainfall in the United States was in excess of the average on the Pacific coast, on the eastern slope of the Rocky mountains, in the Missouri valley, Gulf states, and in New England; in the other parts of the country it was less than the average; in Canada it exceeded the average. In northern Europe the rainfall was somewhat less than the average; in the southern districts it was slightly above the average.

STORM-TRACKS FOR APRIL, 1884.

Chart iii. for April, 1884, shows the paths of the depressions which have appeared in the northern hemisphere during that month. The data are charted for each day of the month on the maps accompanying each issue of the "International Bulletin," and from these charts, together with abstracts of ship's logs and other miscellaneous data on file at this office, are traced the movements of the centres of barometric minima. This chart continues the series of international charts begun in November, 1877.

The paths of forty-one depressions are shown on the chart, and are distributed geographically, as follows: Nine are traced over the United States and Canada; of this number, one (iii.) appeared near the Alaskan coast and moved thence southeastward over the United States to the Gulf of Mexico; one moved eastward along the northern boundary of the United States; two occupied the Gulf of Mexico and adjacent land areas; one appeared near the mouth of the Saint Lawrence river, and the remaining four developed in the Rocky mountain regions. The general direction of movement of the above storms was east-northeasterly, those that reached the Atlantic passing off the coast line at or south of the fortieth parallel.

Ten depressions are traced over the Atlantic ocean; of these, two only, numbers xi. and xix., are continuations of storms which were first traced in the United States. The former passed into the Atlantic from the coast near N. 40°, and the latter moved from the Gulf of Mexico over the east Gulf states and into the Atlantic ocean from the South Carolina coast; neither of these depressions reached the European coasts, number xi. moved east-northeastward to about W. 20° where it dissipated and number xix. moved slowly northeastward and remained over the region between N. 37° and the Banks of Newfoundland, and W. 55° and 70° until the close of the month. Of the other depressions that appeared in the Atlantic, two, numbers xiii. and xv. originated near the coast of the United States between N. 35° and 40°; they moved slowly eastward and southeastward and disappeared before reaching the fortieth meridian, their further movement being apparently checked by an area of high barometer which occupied the ocean to the eastward. Three depressions appeared south of N. 40°; one of them, viz: number xvii. moved from the Azores to the coasts of the Iberian peninsula and thence to to the Mediterranean, while the other two moved northeastward and disappeared before reaching the coasts. Number x. was a continuation of the depression traced as xxiv. on the chart for March; it remained off the west coast of Ireland for several days, having moved southeastward from Iceland at the close of March; on April 4th its course changed to north and west and it again moved to Iceland where it disappeared on the 8th. Two disturbances occupied southern Greenland and Iceland during the last half of the month.

Eleven depressions are shown over Europe; three of these appeared over the northern districts (north of the sixtieth parallel), their direction of movement being southeasterly; one passed from the northwest coast of Ireland, southeastward over the British Isles and France to the Mediterranean; one moved northward from southern France to the North sea, while the remaining depressions occupied the continent south of N. 50°, their paths being to the eastward and northeastward.

Nine depressions are traced in Asia; two of these appeared in the southwestern part of the continent between 50° and 70° E.; three passed over Japan, one moving northeastward along the eastern coast, and four appeared in northeastern Asia.

One depression occupied the Aleutian archipelago and Behring Sea during the last decade of the month, and one disturbance is traced over the Pacific ocean between 140° W. and the California coast.

The noteworthy features of April, 1884, were: 1st, the prevalence of stormy weather over the Atlantic during the first half of the month, owing to the presence of several deep depressions which occupied the region between N. 55° and 30° and from the coasts of the United States to those of Europe; 2d, the unusually large number of depressions, mostly slight, however, which occupied the southern districts of Europe.

The depression charted as number x. continued for several days off the coasts of the British Isles, causing moderate to strong s. winds, with rainy weather and generally high temperatures over those islands and the western districts of central Europe. From the 1st to 6th the pressure at the centre of the primary depression ranged from 28.9 (734.0) to 29.2 (741.7), while numerous subsidiary disturbances traversed western Europe. The area of high barometer which occupied Scandinavia and northern Russia at the close of March gradually gave way and moved eastward during the period from April 1st to 5th, but after the last-mentioned date another high area formed over Russia, which continued with slight movement until the 11th, when the pressure began to give way in advance of low areas from the westward and northward.

On the 11th an area of high pressures formed over Iceland and the region north of the British Isles, and continued, gradually spreading over the Atlantic, until the 19th, when it was replaced by low area xvi. The depressions traced as low areas xi. and xii. displayed great energy, the stormiest period of the month having occurred over the Atlantic during the passage of those areas; they were also remarkable for the exceedingly low pressures that accompanied them, the barometer falling as low as 28.1 (713.7) on the 8th, and remaining below 28.8 (731.5) until the 10th. During the entire month, nearly, the atmospheric pressure was relatively low over the Banks of Newfoundland and southward to about N. 37°.

The storms which passed over the United States and the principal depressions over the Atlantic are described in detail in the MONTHLY WEATHER REVIEW for April, 1884, under the headings, "Areas of low barometer" and "North Atlantic Storms," respectively. Those which passed over Europe were generally slight and deserve no special mention; they produced high local winds and rainy weather.

In the depressions traced over eastern Asia, that charted as number xxxi. produced high winds along the eastern coast of Niphon, with barometer falling to 29.4 (746.7). Number xxvii. was also attended by high winds in Japan during its passage over the Sea of Japan; the pressure ranging from 29.45 (748.0) to 29.55 (750.6). In the depressions shown over the Sea of Okhotsk and Behring Sea the barometer ranged from 29.0 (736.5) to 29.5 (749.3).

STORM-TRACKS FOR JULY, 1882.

The chart for July, 1882, shows the paths of twenty-eight of the principal depressions that appeared over the northern hemisphere during the month. The data used in the preparation of this chart are obtained from the sources mentioned above (STORM-TRACKS FOR APRIL, 1884), the marine observations, however, are neither so numerous nor so complete as in that month.

The tracks of the twenty-eight depressions shown on the chart are distributed, geographically, as follows: Five appear in the United States and Canada; of these, four developed in the northwestern part of the United States, and one is a continuation of a depression which occupied the lake region at the close of June, 1882. Two of the depressions above referred to moved eastward to the neighborhood of Lake Superior whence they passed northeastward and disappeared in the Hudson bay region: one moved northeastward from Montana to Manitoba and thence eastward north of the United States to the Gulf of Saint Lawrence, where it dissipated; one passed by a southeasterly course from Minnesota to South Carolina, where it recurved to the northeastward and passed off the coast line, but it again entered the continent and moved north-northwestward to Ontario, Canada, and thence northeastward over Labrador to the Arctic regions. The remaining disturbance moved from the lakes to Nova Scotia and thence northeastward over Newfoundland.

Eight depressions are traced over the Atlantic; of these, three, numbers vi., viii., and xiii., appear to have originated in the vicinity of Newfoundland and the Gulf of Saint Lawrence; two of them (vi. and viii.) reached the European coast, and xiii. occupied the ocean at the close of the month. Three depressions appeared over the Atlantic east of the thirtieth meridian, and moved eastward and northeastward to the European continent; one developed south of Greenland and moved to the northward of Iceland, while the remaining depression (xi.) first appeared in Iceland and passed southeastward to Ireland, where its course changed to northeast, and the depression moved to the Scandinavian coast.

Nine depressions appeared in Europe; three of these are traced over Austria and the Black Sea region; two are shown over the Mediterranean near the French and Italian coasts; one in western Russia; one in western Europe; one in central Europe, and one in Scandinavia. The general direction of movement of these disturbances was easterly or northeasterly; to this, however, there are three notable exceptions, viz., numbers xvii., xix., and xxii., whose paths were abnormal; the first, number xvii. developed in southern Germany, and passed rapidly northward as a severe storm to the Baltic and the Gulf of Bothnia, and thence to the Arctic regions; the second (xix.) developed over the western part of the Black Sea, and moved northwestward to Austro-Hungary, where it curved abruptly, and moved to the eastward; number xxii. developed in western Russia, and moved northwestward over northeastern Germany to the Baltic and thence to Scandinavia.

Five depressions are shown in Asia; one of these occupied the western part of the continent; one passed over the Gulf of Pe-Chi-Li, Corea, and the Sea of Japan, and three appeared in northeastern Asia and the Sea of Okhotsk.

On this chart is shown the track of the first typhoon of the season of 1882; taken from "Les Typhons de 1882, première partie" by the Reverend Marc Dechevrens, S. J., Director of the Zi-Ka-Wei Observatory, Shanghai, China.

This typhoon, although not exhibiting the violence usually displayed by storms of this class, is especially noteworthy on account of its long duration and unusual track, and from its having divided into numerous subsidiary or secondary typhoons, some of which were attended by winds of hurricane force. A full and interesting discussion of this meteor is given by Mr. Dechevrens in the above-mentioned work.

As a noteworthy feature in connection with the storm-tracks for July, 1882, may be mentioned the frequency and long duration of depressions over and in the vicinity of the British Isles. From the 4th to the 25th, a large area of low pressure, within which the barometer ranged from 29.15 (740.4) to 29.7 (754.4), prevailed over the northern and western parts of the British Isles, and over the ocean to the northwestward, causing a long period of unsettled weather, with much rain and strong s. and sw. winds; over those islands thunderstorms were also of frequent occurrence during this period. On the 26th an area of high barometer approached from the Bay of Biscay and continued until the close of the month. Most of the depressions traced over the European continent were accompanied by unusually heavy rains, and violent and destructive thunderstorms, but their accompanying winds were not heavy, owing to the absence of steep gradients. The month of July, 1882, was remarkable for the number and violence of the thunder-storms that occurred.

GENERAL REMARKS.

DAILY BULLETIN.

All data which appear in the DAILY BULLETIN OF SIMULTANEOUS METEOROLOGICAL OBSERVATIONS are copied from the regular exchanges of this office. The barometer readings for land stations, in the first and second columns, are reduced to freezing and their respective standards; those in the third and fourth columns to sea-level. When necessary, corrections for instrumental error, temperature, and reduction to sea-level are always applied, while those for instrumental error, only when such corrections can be ascertained with close approximation, as by comparison when vessels are at or near land stations. Relative humidity generally requires computation from the hygrometrical observations. When rain has fallen, but neither the amount nor duration is recorded, the word "blank" is published in the rainfall column. The weather is generally published as given. The following symbols and abbreviations are common to all series, viz: ϟ, aneroid; *, instrumental error not known; c., cirrus; k., cumulus; s., stratus; n., nimbus; d., scud; f., fracto; p., pallio; hz., haze; fg., fog; sk., smoke; inap., inappreciable; d. clouds, detached clouds. The movement of the air is published as given on the originals, when indicated by velocity in miles per hour, in metres per second, or by force, all variations of the latter being reduced to the common scale of 0 to 10. Those stations reporting the movement in pounds pressure per square foot are reduced to force on the common scale, and those in kilometres per hour, to meters per second and miles per hour. The distinction between upper and lower clouds is carefully made in the United States and a portion of the Canadian series, and the various formations are indicated by the letters above given and their combinations.

All marine data are classified as to districts, which are designated as follows: District No. 1, North Atlantic; District No. 2, South Atlantic, &c., under which headings the respective reports are printed.

BOUNDARIES OF DISTRICTS.

District No. 1 comprises the Atlantic ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° E., westward to 100° W., of Greenwich.

District No. 2 comprises the Atlantic ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 20° E., westward to 70° W., of Greenwich.

District No. 3 comprises the Pacific ocean, its arms and tributaries, from the equator northward to the pole, and in the Arctic from 100° W., westward to 100° E., of Greenwich.

District No. 4 comprises the Pacific ocean, its arms and tributaries, from the equator southward to the pole, and in the Antarctic from 70° W., westward to 145° E., of Greenwich.

District No. 5 comprises the Indian ocean, its arms and tributaries, from the Asiatic continent southward to the pole, and in the Antarctic from 20° E., eastward to 145° E., of Greenwich.

The following remarks relate to the individual peculiarities in the *methods* of recording, and the *times* of taking, the international simultaneous meteorological observations, under the auspices of the various meteorological bureaus.

ALGERIAN SERIES (furnished by co-operation of M. Thévenet, Director of the Meteorological Service at the College of Science of Algeria).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The rainfall is measured at 7 a. m., local time, and the amount indicated in millimetres.

AUSTRALIAN SERIES (furnished by co-operation of R. L. J. Ellery, Director of the Observatory at Melbourne, N. S. W.).—At Melbourne the conversions are published as given in the originals. The movement of the air is indicated by velocity in miles per hour. Adelaide, furnished by co-operation of Charles Todd, C. M. G., F. R. A. S. The observations are taken at 9 p. m., local time. Hobart Town, furnished by Commander J. Shortt, R. N. Observations are taken at 9 p. m., local time.

AUSTRO-HUNGARIAN SERIES (furnished by co-operation of Prof. Dr. Julius Hann, Director of the Imperial and Royal Central Meteorological Institute at Vienna).—The originals give the barometer in millimeters reduced to sea-level and the temperature in Centigrade. At the following stations rainfall is measured at local time: Lemberg, 7 p. m.; Vienna, 2 p. m.; Trieste, 7 a. m. The weather is given by the Vienna symbols or in general terms.

BELGIAN SERIES (furnished by the co-operation of J. C. Houzeau, Director of the Royal Observatory at Brussels).—The originals give the barometer in millimetres reduced to sea-level; temperature in Centigrade; weather by the Vienna symbols, and occasionally in general terms. At Arlon the observations are taken at 1 p. m., local time.

BRITISH SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary, and respective observers).—In general the originals do not give rainfall or distinction between upper and lower clouds. Relative humidity, except for Bradford and Silloth Rectory, is not

given on the originals, but is computed from hygrometrical observations. At Cardington, Oxford, and Sandwick Manse the barometers are given as read off. At Greenwich the movement of the air is indicated by pounds pressure per square foot. At the following stations rainfall is measured at local time: Bradford, 9 a. m., and Aberdeen, 10 a. m. The wind-direction is given to 32 points, and weather by the Beaufort notation. At Bradford no observations are taken on Sunday, except rainfall. Hong Kong, furnished by W. Doberck, Government Astronomer. Rainfall is measured at midnight.

CANADIAN SERIES (furnished by co-operation of Charles Carpmael, A. M., F. R. A. S., Director of the Magnetic Observatory at Toronto, and Superintendent of the Meteorological Office of the Dominion of Canada, and respective observers).—The originals give the barometer reduced to sea-level in English inches and the temperature in Fahrenheit. Meteorological reports from stations marked with an * are telegraphed daily to the office of the Chief Signal Officer of the Army.

CAPE COLONY SERIES (furnished by co-operation of the Meteorological Commission of Cape Colony, Cape Town, and respective observers).—At Cape Saint Francis Lighthouse, the original gives barometer reduced to freezing, but not to sea-level. The kind of clouds is given, but no distinction is made between upper and lower. Weather in general terms.

CHILIAN SERIES (by authority of the Secretary of Public Instruction, furnished by co-operation of Francisco Vidal Gormáz, President of the Central Meteorological Office at Santiago).—Observations are taken mostly at lighthouses on the coast; the originals give barometer as read off; temperature in Centigrade; humidity is not given, but is computed at this office from the hygrometrical observations.

CHINESE SERIES (furnished by co-operation of Marc Dechevrens, S. J., Director of the Meteorological Observatory at Zi-Ka-Wei).—At Zi-Ka-Wei the original gives the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is given in metres per second and the direction to 16 points. The kind of clouds is occasionally given, and the degree of cloudiness on the scale of 0 to 10; distinction between upper and lower clouds is sometimes made. The weather is given in general (French) terms. The rainfall is given in millimetres, and measured at the moment of simultaneous observation.

DANISH SERIES (furnished by co-operation of the Director of the Royal Danish Meteorological Institute at Copenhagen).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6. The weather is occasionally given by the Vienna symbols, but it is not certain that they always refer to the moment of simultaneous observations, except at Copenhagen. No distinction is made between upper and lower clouds, and the direction of movement, together with the rainfall, is entirely omitted. At all Greenland stations the observations are taken at 8 a. m., local time.

EGYPTIAN SERIES (furnished by the co-operation of Albert Ismulun, Director of the Laboratoire Khédivial du Caire).—Original gives barometer reduced to zero, but not to sea-level, temperature in Centigrade. The velocity is the mean for past twenty-four hours. Rainfall in millimetres.

FRENCH SERIES (furnished by co-operation of the Central Meteorological Office of France, Professor E. Mascart, Director, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Montlouis and Perpignan. In general the rainfall is measured at 9 a. m., local time. The direction of upper and lower clouds is given, but no distinction is made as to kind. The degree of cloudiness is given on a scale of 0 to 4 at Clermont-Ferrand and Puy de Dôme, while at other stations the scale of 0 to 10 is employed, or general weather terms, from which the amount of cloudiness is inferred. The weather is given in general terms, except occasionally by the Vienna symbols at Montlouis and Perpignan.

GERMAN SERIES (furnished by co-operation of Prof. Dr. G. Neumeyer, Director of the German Marine Observatory at Hamburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The kind of clouds is occasionally given, but no distinction is made between upper and lower; the amount is given on a scale of 0 to 10, but the kind is rarely given. The weather is given in Vienna symbols or in general terms.

GREEK SERIES (furnished by co-operation of Prof. D. K. Kokkides, Director of the Royal Observatory at Athens).—The original gives the barometer corrected for temperature only, and the thermometer in Centigrade. Hygrometrical observations are not given. The kind of clouds is occasionally given, and the amount is inferred from the general weather terms. The movement of the air is indicated by force on a scale of 0 to 10.

INDIAN SERIES (furnished by co-operation of H. F. Blanford, Meteorological Reporter to the Government of India, at Calcutta).—The barometric observations refer to the Calcutta standard, which requires a correction of —0.011 inch, or 0.28 mm., as compared with the Kew standard. The wind-velocity given is the average rate of wind since the observation of the preceding day. All conversions are published as given in the originals, where the data are recorded to an additional decimal. The weather is given by the Beaufort notation, Vienna symbols, or special symbols.

ITALIAN SERIES (by authority of the Minister of Agriculture, Industry, and Commerce—furnished by co-operation of Professor P. Tacchini, Director of the Central Meteorological Office, at Rome, and respective observers).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour, or by force on a scale of 0 to 4, as at Mondovi, Florence, and Cagliari. No distinction is made between upper and lower clouds, and the amount is given on a scale of 0 to 10.

JAPANESE SERIES (furnished by the co-operation of the Geographical Bureau, Department of the Interior, through I. Arai, Director of the Imperial Meteorological Observatory, at Tokei).—The rainfall is measured at 9.30 a. m., local time, and the conversions are all published as given in the originals. Distinction is generally made between upper and lower clouds, and the amount is given on a scale of 0 to 10. The weather is given in general terms.

MAURITIUS SERIES (furnished by co-operation of C. Meldrum, Secretary of the Meteorological Society of Mauritius).—All conversions are published as given in the originals. The direction of the wind is given to 32 points, and the rainfall is measured at 9.30 a. m., local time.

MEXICAN SERIES (furnished by co-operation of the respective observers).—The kind of clouds is given, and also the direction and amount of both upper and lower. The degree of cloudiness is indicated on a scale of 0 to 10. Rainfall is generally measured at 6 a. m., local time.

NETHERLANDS SERIES (furnished by co-operation of Professor Buys-Ballot, Director of the Royal Meteorological Institute of the Netherlands, at Utrecht).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by pressure in kilograms per square metre, except at Hellevoetsluis, which gives force on a scale of 0 to 12. The humidity is not given on the originals, but for two stations it is computed from the hygrometrical observations. The weather is only given for Utrecht, from which the amount of cloudiness at that station is inferred. At Batavia the elevation is stated to be "a few metres."

NORWEGIAN SERIES (furnished by co-operation of Professor H. Mohn, Director of the Royal Norwegian Meteorological Institute, at Christiania).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second, or by force on a scale of 0 to 6. The weather is occasionally given by Vienna symbols. At Bergen observations upon the weather and degree of cloudiness are made at 2 p. m., local time. At Brono the observations are taken at 2 p. m., instead of 12.57 p. m.

PORTUGUESE SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—In the originals the barometer is given in millimetres and the temperature in Centigrade. The movement of the air is indicated by velocity in kilometres per hour. The weather is occasionally given by the Vienna symbols. The rainfall is measured at noon each day.

RUSSIAN SERIES (furnished by co-operation of Professor H. Wild, Director of the Imperial Central Physical Observatory of Russia at St. Petersburg).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by velocity in metres per second. No distinction is made between upper and lower clouds: the amount is given on a scale of 0 to 10, and the kind occasionally. The weather is occasionally given by the Vienna symbols. At Astrakhan, Ashurada and Baku, the barometer-cistern is below sea-level.

SPANISH SERIES (furnished by co-operation of the Royal Observatory at Madrid, and respective observers).—The movement of the air, except for sub-series, is given in kilometres per hour. The kind of clouds is occasionally given, and the degree of cloudiness on a scale of 0 to 10. The rainfall at San Juan is measured at 10 a. m., local time, and at San Fernando at midnight. The weather is given in general (Spanish) terms.

SWEDISH SERIES (furnished by co-operation of Professor R. Rubenson, Director of the Royal Swedish Meteorological Institute, and of Professor H. H. Hildebrandsson, Director of the Meteorological Observatory of the Upsala University).—The originals give the barometer in millimetres reduced to sea-level and the temperature in Centigrade. The movement of the air is indicated by force on a scale of 0 to 6, except in metres per second for Upsala. The kind of clouds is not given, but the degree of cloudiness is indicated on a scale of 0 to 10. The rainfall is measured at 8 a. m., local time, and the weather is occasionally given by the Vienna symbols.

SWISS SERIES (furnished by co-operation of Prof. E. Gautier, Director of the Observatory at Geneva).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10.

TURKISH SERIES (furnished by co-operation of A. Coumbary, Effendi, Director of the Central Observatory at Constantinople, and of F. Nimr, B. A., Director of the Lee Observatory at Beirut).—The originals give the barometer in millimetres reduced to sea-level. The temperature is given in Centigrade. The movement of the air is indicated by force on a scale of 0 to 7 for Valona, and on a scale of 0 to 12 for Beirut. At Constantinople the velocity is given in metres per second. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10, except at Valona, at which station it is inferred from the general weather terms. At Samakov the barometer is reduced to freezing, but not to sea-level; temperature in Fahrenheit. The kind of clouds is given, also the distinction between upper and lower.

UNITED STATES SERIES (by authority of the Secretary of War—furnished by co-operation of W. B. Hazen, Brigadier and Brevet Major General, Chief Signal Officer, U. S. Army).

UNITED STATES SUB-SERIES (furnished by co-operation of the respective observers).—The originals generally give the barometer reduced to sea-level and the temperature in Fahrenheit. At Bogota the barometer is corrected for temperature only; at Puerto Berrio, is given as read off. The movement of the air is generally indicated by velocity in miles per hour, except on a scale of 0 to 10 for Bogota, Paramaribo, and Rivas, and 0 to 12 for Puerto Berrio. The wind-direction is generally given to 16 points, except 8 points for Bogota. At Rivas the humidity is obtained by readings from Saussure's hygrometer.

BRITISH NAVAL SERIES (furnished by co-operation of the Meteorological Council, London, Robert H. Scott, Esq., F. R. S., Secretary).—The originals give the barometer as read off. The wind-direction is given to 32 points. The movement of the air is indicated by force on a scale of 0 to 12. The distinction between upper and lower clouds is made as to direction, but not as to amount. The height of the sea-disturbance is given on a scale of 0 to 9, and the weather by the Beaufort notation. The direction of movement of wind, clouds, and sea is compass direction, corrected only for deviation caused by the iron in the ship, while the correction for magnetic variation is applied at this office. The humidity is not given, but is computed from the hygrometrical observations.

PORTUGUESE NAVAL SERIES (furnished by co-operation of J. C. de Brito Capello, Director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon).—The originals give the barometer in millimetres, corrected for temperature only, and the thermometer in Centigrade. The movement of the air is indicated by force on a scale of 0 to 10. The humidity is not given, but is

computed from the hygrometrical observations. The kind of clouds is not given, but the amount is indicated on a scale of 0 to 10; the direction of movement is given without distinction between the upper and lower. The height of sea disturbance is given on a scale of 0 to 9 and the weather by the Beaufort notation. The rainfall is not measured, but the duration is generally given in hours and minutes.

UNITED STATES NAVAL SERIES (by authority of the Secretary of the Navy—furnished by co-operations of the Navy Department, through Commodore John G. Walker, U. S. N., Chief of Bureau of Navigation).—The originals give the barometer as read off. The humidity is not given, but is computed from the hygrometrical observations. The sea-swell and weather are given in general terms. The direction of the wind is compass direction, corrected for variation.

MERCHANT-MARINE SERIES (furnished by co-operation of the owners, agents, &c., of the respective lines and vessels).—Same as U. S. Naval.

MONTHLY SUMMARY OF INTERNATIONAL SIMULTANEOUS METEOROLOGICAL OBSERVATIONS.

The position of stations (latitude and longitude) are obtained from Keith Johnston's "Index Geographicus," except where more exact information is furnished. The elevation of stations is obtained either from the annual, semi-annual, and monthly publications of the various meteorological bureaus here represented, or from the orignal forms upon which are entered the daily observations. In the United States series the elevations are computed from the latest surveys, and are carefully revised each month, in order to note any change in the elevation of the barometer-cistern at any station. It is belived for the most part that, throughout the European and other series, the elevations as given represent the height of the barometer-cistern above sea-level; at least, this should be the case. The local time, where omitted or not given correctly in the original, is carefully computed at this office. A letter placed opposite the name of a station or some portion of the data credited thereto, indicates that a certain number of observations are missing, corresponding to the relative position in the alphabet of the letter so used.

BRITISH SERIES, Bradford: a letter placed opposite the name of station, refers to all the data except rainfall.

On April 1st, 1884, the following changes occur in the elevation of the barometer cistern, at stations of the United States series: Benton, Fort, Montana, to 2681 feet or 817 metres; Los Angeles, California, to 299 feet or 91 metres; Philadelphia, Pennsylvania, to 117 feet or 36 metres.

OCEAN SQUARES.—The table of ocean square data shows (1) the location of the centres of squares whose sides extend 5° each in latitude and longitude (2), the the monthly mean pressure and temperature of the air, and the mean force and total frequency of the wind at 7 a. m., Washington time, computed for the centre of each square from daily readings as obtained by interpolation between the isobars and isotherms of the daily international simultaneous weather maps.

INTERNATIONAL CHARTS ACCOMPANYING DAILY BULLETIN AND MONTHLY SUMMARY.

International chart i. shows isobars and isotherms charted from data as appearing in the INTERNATIONAL BULLETIN of same date, as reported by the several observers. Isobars, in continuous lines, exhibit atmospheric pressure at sea-level in English inches; isotherms, in dotted lines, exhibit temperature of the air in degrees, Fahrenheit, similarly charted.

International chart ii. (monthly mean chart), showing mean pressure at sea-level in English inches, mean temperature in degrees, Fahrenheit, mean force and prevailing direction of wind at 7 a. m., Washington mean time.

International chart iii. shows tracks of centres of low barometer. The Arabic numerals show location of the centres of low barometer at 7 a. m., Washington mean time, of that date.

In the above charts broken lines indicate that the lines so drawn are doubtful. Arrows show direction of, and fly with, the wind. Force is shown as follows:

SYMBOLS.	FORCE.	VELOCITY.	
		MILES PER HOUR.	METRES PER SECOND.
○	0	0	0
	1, 2	0 to 9	0 to 4
	3, 4	9.1 to 22.5	4.1 to 10.1
	5, 6	22.6 to 40.5	10.1 to 18.1
	7, 8	40.6 to 67.5	18.1 to 30.2
	9, 10	67.6 up.	30.2 and over.

ERRATA.

United States Series, Cincinnati, Ohio, from opening of station to May 1st, 1884, reduced barometer is too high by .01 of an inch (.25 mm).

DAILY BULLETIN, April 1st, 1884, page 2, Indian; transpose name of stations Bellary and Trichinopoly, so that Bellary will read 28.31 and Trichinopoly 29.54, &c.; same correction on 2d, 3d, 4th, 5th, and 6th.
