Vorwort.

Mit dem Jahrgange 1874 beginnt das Jahrbuch des norwegischen meteorologischen Instituts eine neue Reihe, in welcher die Beobachtungs- und Uebersichtstabellen sich an die vom permanenten Comité des Wiener-Meteorologen-Congresses vorgeschlagenen Schemata anschliessen. Im Jahre 1874 wurden die Beobachtungen noch nach der früheren Ordnung ausgeführt, die indessen nicht viel von der durch den Wiener-Congress festgesetzten abwich. 1875 wurden die Stationen mit neuen Instrumenten versehen, und seit Anfang 1876 beobachten sämtliche Stationen nach der neuen Anordnung, die, soweit die Verhältnisse es zulassen, mit den Beschlüssen des Wiener-Congresses übereinstimmt.

Durch die in der Einrichtung des Druckes vorgenommenen Veränderungen ist die Ausgabe des Jahrbuches für 1874 bedeutend verspätet worden. Die späteren Jahrgange werden verhältnissmässig früher erscheinen.

Das Normal-Barometer des Instituts, Negretti & Zambra No. 648, ist von Fortins Construction. Nach der Vergleichung, die im Sommer 1866 durch Hr. James Glaisher in Greenwich zwischen diesem und dem Greenwicher Normalinstrument vorgenommen wurde, und nach einer von mir im Herbst desselben Jahres veranstalteten Vergleichung zwischen der englischen Skala unseres Normalbarometer mit der Meterskala, zeigt unser Barometer $0,^{mm}12$ niedriger als das Greenwich-Normal. Nach Director Wild*) steht das Greenwich-Normal $0,^{mm}06$ niedriger als das Normalbarometer in St. Petersburg. Darnach steht also das Christiania Normal $0,^{mm}18$ niedriger als das Petersburger Normal. Ebenfalls nach Wild zeigt das Normalbarometer in Kew $0,^{mm}41$ höher, als das Petersburger Normal. Nach 1875 und 1876 vorgenommener Vergleichung mit 24 verschiedenen Kew-Barometern, welche das norwegische meteorologische Institut durch Hr. Robert A. Scotts Wohlwollen erhalten hat, steht das Christiania-Normal $0,^{mm}59$ niedriger als das Kew-Normal. Hiernach würde also das Christiania-Normal $0,^{mm}18$ niedriger, als das Petersburger Normal zeigen. Aus dem gesagten ergiebt sich mit ziemlich grosser Sicherkeit, dass die absolute Correction des hiesigen Normalbarometers $+ 0,^{mm}18$ beträgt, und dass dieselbe sich von 1866 bis 1876 nicht verändert hat. Die constanten Fehler der Stationsbarometer sind durch directe Ver-

*) Ueber Normalbarometer und ihre Vergleichung. Mélanges physiques et chimiques tirés du Bulletin de l'académie Impériale des sciences de St. Pétersbourg Tome X Seite 98.

gleichung mit dem Normalbarometer auf dem Institute und durch Vergleich mit dem Reisenormalbarometer auf den Inspectionsreisen bestimmt. Bei der Ermittelung dieser Correctionen ist die constante Correction des Normalbarometer $0{,}^{m}2$ gleich gesetzt.

Die Barometerbeobachtungen der Stationen wurden controllirt theils dadurch, dass man die Morgenbeobachtungen auf den Meeresspiegel reducirte, und dieselben auf synoptischen Karten für jeden Morgen eintrug, theils dadurch, dass man die auf gleiche Weise reducirten Monatsmittel auf Monatskarten aufzeichnete. Der regelmässige Lauf der nach diesen Barometerhöhen gezogenen Isobaren giebt die Controlle der Beobachtungen. Die Nachmittags- und Abendbeobachtungen des Barometers sind durch dieses Verfahren nur wenig controllirt. Bei der Reduction der Beobachtungen hat man beständig die Aufmerksamkeit auf verdächtig grosse Sprünge im Barometerstand zwischen den nächstliegenden Terminen gerichtet gehabt; doch könnte es immerhin möglich sein, dass Fehler in dieser Beziehung sich der Beachtung entzogen hätten Sollte man bei der Benutzung unserer Beobachtungen dergleichen vermuthen, so würde man dies am einfachsten durch Construction der Curven für den gleichzeitigen Gang des Barometers auf der betreffenden und zwei Nachbarstationen controlliren. Fehler von 10^{mm} (oder vielleicht auch 5^{mm}) würden bei Vergleichung der Curven alsbald zu Tage treten. Zu weiterer Controlle kann man die synoptische Karte für die Stunde, in welche die verdächtige Observation gemacht wurde, auszeichnen. In dieser Weise werden unsre Barometerbeobachtungen seit Anfang 1876 überwacht.

Die auf den Stationen benutzten Thermometer sind alle mit den Normalthermometern des Instituts verglichen. Die seit 1866 im Gebrauch gewesenen Normalthermometer von Secretan wurden in vollster Uebereinstimmung mit den zwei Kew-Thermometern befunden, welche das Institut 1875 vom Kew-Commité in London erhielt. Bei den Stationsthermometern übersteigt die Correction nicht $0^{\circ}{,}1$. Für den Gebrauch als Psychrometer wurden solche Thermometer ausgesucht, welche in Dimension und Correctionen möglichst übereinstimmen. Auf den Psychrometer-Stationen standen die Thermometer im Jahre 1874 in kleinen Holzgehäusen mit Jalousien an den Aussenwänden; an den meisten Stellen vor einem Fenster, an einigen wenigen vor einer Wand, in ungefähr $0{,}^{m}3$ Abstand von denselben. Zur Befeuchtung wurde Gefäss und Docht benutzt, ausgenommen in Frostzeiten, wo der Docht entfernt, und die Benetzung vor jeder einzelnen Beobachtung vorgenommen wurde. Die Thermometerhäuschen standen so gut wie immer im Schatten. Wo dies für alle Observationstermine nicht durch ein Thermometer erreicht werden konnte, wurden zwei Instrumente gebraucht. Auf den Leuchtthurmstationen waren die Thermometer nicht beschirmt.

Windfahnen finden sich nur auf einigen Stationen.

Die Regenmesser waren von verschiedener Construction. Die meisten waren viereckig, mit 15 Centimeter Seite; andre waren rund, theils mit 0,04 Quadratmeter, theils mit 1 norw. Quadratfuss Oberfläche. Sämtliche Messgläser sind auf dem Institute eingetheilt und geben die Regenhöhe unmittelbar in Millimetern.

Die Windstärken sind geschätzt und nach der Scala $0 =$ Stille bis $5 =$ Sturm notirt. Im Jahre 1876 waren auf einer grösseren Anzahl unser Stationen Wild'sche Platten-Geschwindigkeitsmesser im Gebrauch, während gleichzeitig noch nach früherer Weise die Windstärke notirt

wurde. Eine für Jannuar und Juli ausgeführte Vergleichung zwischen der abgeschätzten Windstärke und der gleichzeitig beobachteten, und nach den letzten Untersuchungen über die Windtafel reducirten Windgeschwindigkeit in Metern pr Secunde, hat für die Stationen, deren Beobachtungen in extenso gedruckt vorliegen, folgendes Resultat ergeben.

Wind-Stärke.

Windgeschwindigkeit in Metern pr. Secunde.

Vardø	0,0	3,0	5,0	8,1	11,8	14,8

Die folgende Tabelle ergiebt eine Uebersicht über die Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Observationszeiten und die Reduction auf die Mitteltemperatur des Monats. In Bezug auf die Observationsstunden muss bemerkt werden, dass diese aus Rücksicht auf die verschiedenen Berufsbeschäftigungen der Beobachter nicht überall und zu allen Zeiten dieselben sein können. Da es bei Anordnung der Observations- und Uebersichtstabellen nicht möglich gewesen ist, in diesen die genauen Observationsstunden für die verschiedenen Monate auf den verschiedenen Stationen mit aufzunehmen, so sind diese abgesondert in untenstehender Tabelle gegeben. Dem hier berührten, minder glücklichen Umstande ist in der Folge abgeholfen worden.

Die Station Christiania erhielt am 13 Juli eine neue Thermometer-Beschirmung, bestehend aus einem doppelten Zinkgehäuse mit Jalousien an allen Wänden. Dieselbe ist vor einem Fenster aufgestellt, neben der bisherigen, die aus Holz bestand und nur einfache Wände hatte. Eine Vergleichung zwischen den Beobachtungen in beiden Thermometergehäusen ergab eine beinahe ganz vollständige Uebereinstimmung. Im October wurde der Regenmesser nach einem niedrigeren Platz auf dem Dache versetzt, wo er für die Messung des Schnees vortheilhafter steht. Seine Höhe über der Platform auf dem Dache ist 0,3 Meter.

In Alten wurde die Regenmenge im April und Mai nicht gemessen, da der Regenmesser behufs Veränderung in seiner Aufstellung weggenommen war.

In Vardø wurde das Psychrometer im Januar, Februar und März nicht beobachtet. In Folge des häufigen Schneetreibens während des Winters kann in Vardø keine zuverlässige Messung des Niederschlages stattfinden.

*

Auf der Station Flesje wurde vom 20 März bis 1 September an einem Orte, der 14^m über dem Meere liegt, beobachtet. Die Barometerstände sind alle auf die gewöhnliche Höhe 4,^{m}8 über dem Meere reducirt.

Dovres Meereshöhe ist durch Nivellement 643,^{m}2 gefunden und so in der untenstehenden Tabelle aufgeführt, während die barometrisch bestimmte Höhe, welche früher angewendet wurde, in den Observationstabellen beibehalten ist.

Die Temperatur der Meeresoberfläche wurde bei Torungen, Lindesnes, Lister, Udsire, Hellisø und Ona 8 Uhr a. m beobachtet. Bei Prestø wurde von März bis October (beide in-

clusive) ebenfalls 8 Uhr a. m. observirt, im Januar, Februar und November aber um 9 Uhr, December fehlt. Bei Fruholmen wurde im März, April und August 2 Uhr p. m., im September, October und November 8 Uhr a. m. beobachtet. Bei Torungen wurde die Temperatur der See im Januar wegen Eises nicht gemessen. Aus derselben Ursache im Februar blos vom 11ten bis 28ten. Bei Lindesnes fehlen die Beobachtungen vom 6—17 April in Folge der Abwesenheit des Beobachters. Bei Lister verhinderten unruhige See und Eis die Observation der Meerestemperatur im Januar und December.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt. Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Nur Christiania hat Minimumtemperatur, mittelst Minimumthermometer observirt. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Der Dunstdruck aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind fett gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. $00 = 100\,\%$.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt

Die Windstärke nach Schätzung, Scala 1—6. Siehe oben.

Die Bewölkung nach der Scala 0 = klar bis 10 = überzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem sie gemessen wurde.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. Die Bezeichnungen sind:

● Regen.	^{n} Nacht	als Exponent
✱ Schnee.	^{a} Vormittag	
△ Graupeln.	^{p} Nachmittag	
≡ Nebel.	^{v} schwach	
⌴ Reif.	^{2} stark	
∞ Höhenrauch.		
⸗ Starker Wind.	^{1} Erste Beobachtungsstunde.	
⊼ Gewitter.	^{2} Zweite —	
< Blitz ohne Donner.	^{3} Dritte —	
⩛ Nordlicht.		
⊕ Sonnenring.		
ⓞ Sonnenhof.		
ⓤ Mondring.		
ⓦ Mondhof.		

Die Monatsmittel in diesen Tabellen sind ohne Berücksichtigung der an den einzelnen Orten in den Beobachtungsreihen sich findenden Lücken genommen.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der 3 Beobachtungsstunden berechnet. Alle sind auf 0° und absoluten Stand, aber nicht auf Meeresfläche reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind als Mittel der Morgen und Abendbeobachtung mit Beifügung einer Correction bestimmt. Diese Correctionen sind für die einzelnen Stationen nach ihrer Lage im Verhältniss zu den Stationen Christiania, Bergen, Throndhjem und

Vardø (an welchen Orten stündliche Beobachtungen ausgeführt sind) berechnet und finden sich in obenstehender Tabelle. Für Christiania, welches Minimumthermometer besitzt, sind die Monatsmittel der Minima angegeben. Für Christiania sind gleichfalls die mittelst Minimum- und Maximumthermometer beobachteten absolut niedrigsten und höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Für alle übrigen Stationen sind die auf die festen Beobachtungsstunden fallenden Maxima und Minima nebst Datum angegeben.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Klare Tage sind solche, wo die Summe der Bewölkung für alle 3 Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Windrichtung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Medium aus den 3 täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die obenangegebenen Stunden.

Christiania, Mai 1877.

H. Mohn.

Druckfehler.
