Inhalt.

Vorwort.

I. Meteorologische Beobachtungen an zwölf Stationen in Norwegen 1889.

II. Monats- und Jahres-Resumé für das Jahr 1889.

III. Anhang. Beobachtungen der Bewegung der Cirruswolken 1889.

Druckfehler und Verbesserungen.

| | | |

Vorwort.

Das Jahrbuch für 1889 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 87 Stationen; von letzteren sind 35 solche, die mit Quecksilberbarometern versehen sind, 5 Stationen mit Psychrometern, 7 Leuchtfeuerstationen, und 40 Regenmesserstationen.

Im Sommer 1890 wurden zwei Inspectionsreisen unternommen, die erste vom Herrn Steen, die zweite von mir. Als Reise-Control-Barometer diente ein neues Wild-Fuess-Barometer, Fuess No. 270. Eine Reihe Vergleichungen mit dem Normalbarometer Fuess No. 214 vor der Reise des Herrn Steen gab für Fuess No. 270 eine Correction von $+0^{mm}.16$. Zwischen den beiden Reisen fand ich für dasselbe Reisebarometer durch 8 Vergleichungen vom Juni 30. bis Juli 4:

Altes Normalbarometer Negretti & Zambra No. 640	$+0^{mm}.60$	= Fuess 270	$+0^{mm}.16$	(M. F. $\pm$ 0.035)
Neues — Fuess No. 214	$+0^{mm}.12$	= „ -	$+0^{mm}.19$	(— $\pm$ 0.025)
Mittel vor der Reise			$+0^{mm}.18$	(— $\pm$ 0.028)

Durch 9 Vergleichungen September 5.—8. fand ich:

Negretti & Zambra	$+0^{mm}.60$	= Fuess 270	$+0^{mm}.16$	(M. F. = $\pm$ 0.042)
Fuess Normal	$+0^{mm}.12$	= „ -	$+0^{mm}.18$	(— $\pm$ 0.038)
Mittel			$+0^{mm}.17$	(— $\pm$ 0.032)

Am 8. September wurde der niedere Schenkel von Fuess 214 gereinigt. 10 Vergleichungen September 9.—27. gaben:

Negretti & Zambra	$+0^{mm}.60$	= Fuess 270	$+0^{mm}.14$.	(M. F. = $\pm$ 0.046)
Fuess Normal	$+0^{mm}.12$	= „ -	$+0^{mm}.16$.	(— $\pm$ 0.042)
Mittel			$+0^{mm}.15$.	($\pm$ 0.041)

Die constante Correction des Reisebarometers Fuess No. 270 war also

vor der Reise	$+0^{mm}.18$
nach - „ I	$+0^{mm}.17$
— - „ II	$+0^{mm}.15$
Mittel	$+0^{mm}.17$

mit welcher ich meine Vergleichungen an den Stationen reducirt habe.

Man sieht, dass unsere zwei Normalbarometer ihren gegenseitigen Unterschied bewahrt haben (Jahrbuch für 1884 Vorwort), und dass das neue Reisebarometer sich auf der Reise vorzüglich bewährt hat. Die durch der Construction gebotene Gelegenheit zur Beobachtung und Controle mit verschiedenen Werthen der Grösse des Vacuums wurde auf allen Stationen benützt.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen:

Dovre. Am 27. August 1890 fand ich die Thermometer bei 9°.7 um 0°.2 zu hoch. Bei 0° ist die Correction um —0°.1 gefunden.

Hamar. Neue Station, sehr gut gelegen in einem entlegenen Stadttheil, nahe am Ufer des Sees Mjøsen. Das Stationsbarometer, Adie No. 1475, brachte ich am 21. August 1889 von der eben temporär niedergelegten Station Tønset mit. Aus 6 Vergleichungen mit dem Reisebarometer Sécrêtan (siehe Jahrb. f. 1888 Vorwort) fand ich die constante Correction bei 728^{mm} = + 0^{mm}.85 (M. F. = ± 0.013). Am 20. Juni 1890 fand Herr Steen aus 5 Vergleichungen mit Fuess No. 270 die Correction + 0^{mm}.79 (M. F. = ± 0.022). Die Beobachtungen werden mit der Correction + 0^{mm}.81 reducirt.

Die Höhe des Barometers über Mittelwasser bei Christiania ist durch genaues Nivellement der Eisenbahnverwaltung zu 140.2 Meter gefunden.

Die übrigen Instrumente haben eine gute Aufstellung.

Eidsvold. Am 15. Juni 1890 fand Herrn Steen die Correction des Stationsbarometers Adie No. 1576 aus 3 Vergleichungen = + 0^{mm}.30 (M. F. = ± 0.017). Am 23. August 1889 hatte ich gefunden + 0^{mm}.34. also eine genügende Uebereinstimmung hier wie in Hamar.

Die Meereshöhe des Eidsvold-Barometers bestimmte Herr Steen aufs Neue durch correspondierenden Barometerbeobachtungen auf der meteorologischen Station und auf der 5 Kilometer entlegenen Eisenbahnstation. Das Resultat war 189.5 Meter, also nur um 1.9 Metern mehr als die früher angenommene Höhe.

Die nächste Veranlassung zu dieser Neubestimmung war, dass die auf Meeresniveau reducirten Barometerhöhen von Eidsvold und Hamar nicht besonders gute Uebereinstimmung zeigten. Die neue Bestimmung geht zwar in der Richtung einer Besserung, hebt aber die Nichtübereinstimmung nicht auf. Es scheint somit hier locale Anomalien anwesend zu sein.

Laurvik. Die Beobachtungen sind unvollständig wegen der Ueberführung der Instrumente in ein neues Local an dem anderer Ende der Stadt.

Dalen. Neue Station in Thelemarken, 4 Kilometer zu Thal von der oberen, westlichen Ende des Bandaksees. Die Station liegt auf einer kleinen Terrasse, so frei als die Lage in dem ziemlich engen Thale unterhalb des Zusammenstosses des Hauptthales mit einem Seitenthale es zulässt. Die Winde sind ganz local. Die Instrumente haben eine sehr gute Aufstellung gefunden.

Das Stationsbarometer, Adie No. 1478, hatte im Mai und Juni 1889 am Institute die Correction + 0^{mm}.10. Nach der Aufstellung derselben an der Station am 12. Juli 1889 fand ich in den folgenden Tagen, Juli 12.—16., durch 5 Vergleichungen mit zwei anderen mitgebrachten Barometern die Correction + 0^{mm}.18. Das Barometer Adie No. 1478 war früher auf der Station Dombesten in Nordfjord und dessen Correction war gefunden in 1875 am Institute + 0^{mm}.145. bei der Inspection am 28. Juni desselben Jahres + 0^{mm}.13, and bei der Inspection am 25. August 1880 + 0^{mm}.155. Die Beobachtungen werden mit + 0^{mm}.18 reducirt.

Die Höhe des Barometers über dem Mittelwasser des Meeres bei Skien ist durch Nivellement zu 103 Metern gefunden. Es sind zwei von einander unabhängige Bestimmungen vorhanden, von welchen die eine als letztes Glied die von mir barometrisch bestimmte Höhe des Barometers über dem Bandaksee enthält. Diese giebt 102.9 im Mittel. Die andre Bestimmung, zu welcher ich mein eigenes Spezialnivellement an das Hauptnivellement der Wegbau- und Kanal-behörden angeknüpft habe, giebt 102.6 Meter.

Oxø. Bei der Inspection am 7. Juli 1890 fand ich durch 13 Vergleichungen die Correction des Stationsbarometers Adie No. 1567 = —0^{mm}.018 (M. F. = ± 0.064). Am Institute wurde in 1882 gefunden + 0^{mm}.10. Bei der Inspection am 29. und 30. August 1885 fand Herr Steen —0^{mm}.013. Die Kew-Correction ist bei 750—780 ^{mm} = 0^{mm}.0. Die Correction ist also zu

$-0^{mm}.02$ bei 750^{mm} zu setzen und die Beobachtungen von 1882 bis 1890, die mit $+ 0.1$ reduciert worden sind, um $0^{mm}.1$ zu vermindern.

Die Thermometer, deren Nullpunkte in 1878 und in 1889 bei $0^{0}.0$ lagen, zeigten bei $11^{0}.6$ um $0^{0}.1$ zu hoch.

Eg. Die Thermometer zeigten am 8. Juli 1890 bei $11^{0}.8$ um $0^{0}.1$ zu hoch.

Mandal. Bei der Inspection am 8. Juli 1890 musste das Stationsbarometer Adie No. 1508 zuerst auswendig vor Staub gereinigt werden, und es wurde der Bequemlichkeit halber um 0.2 Meter tiefer als früher aufgehängt. Am 9. Juli gaben 9 Vergleichungen mit dem Reisebarometer die Correction $+ 0^{mm}.314$ (M. F. $= \pm 0.026$). Früher war gefunden: In 1876 am Institute $+ 0^{mm}.32$, und in 1885 bei Inspection $+ 0^{mm}.33$.

Die Thermometer zeigten bei $14^{0}.7$ um $0^{0}.25$ zu hoch. Die Nullpunkte waren in 1889 bei $0^{0}.2$ gefunden.

Skudenes. Nach 10 Vergleichungen am 11. Juli 1890 fand ich die Correction des Stationsbarometers Adie No. 1505 $= + 0^{mm}.303$ (M. F. $= \pm 0.028$). Früher ist gefunden: In 1876 am Institute $+ 0^{mm}.31$, und bei den Inspectionen in 1880 $+ 0^{mm}.305$, in 1885 $+ 0^{mm}.321$.

Die Thermometer zeigten bei 14^{0} um $0^{0}.3$ zu hoch. Nullpunkt in 1889 bei $+ 0^{0}.1$.

Røldal. Die Beobachtungen sind leider unvollständig, und sind später aufgehört. Hoffentlich werden sie bald wieder aufgenommen werden.

Bergen. Bei der Inspection am 15. bis 18. Juli 1890 fand ich aus 9 Vergleichungen die Correction des Stationsbarometers Adie No. 1564 $= + 0^{mm}.122$ (M. F. $= \pm 0.020$). Bei der vorigen Inspection im August 1886 fand ich $+ 0^{mm}.136$. Die Thermometer standen bei 16^{0} um $0^{0}.2$ zu hoch. Bei 0^{0} in 1889 um $0^{0}.1$ zu hoch.

Voss. Die Beobachtungen sind in den letzten Jahren offenbar nicht so gut wie früher.

Florø. Die Station wurde am 22. Juli 1890 von mir inspiciert. 12 Vergleichungen gaben für die Correction des Stationsbarometers Adie No. 1510 $+ 0^{mm}.097$ (M. F. $= \pm 0.035$). Früher war gefunden am Institute in 1876 $+ 0^{mm}.03$, und bei den Inspectionen in 1880 $+ 0^{mm}.06$, in 1885 $+ 0^{mm}.093$. Die Beobachtungen sind mit $+ 0^{mm}.06$ reduciert worden.

Die Thermometer zeigten bei $11^{0}.8$ um $0^{0}.2$ zu hoch. In 1889 waren die Nullpunkte bei $0^{0}.1$ gefunden.

Aalesund. Bei der Inspection am 24. und 25. Juli 1890 erhielt ich 22 Vergleichungen unter wechselnden äusseren Umständen mit Regen und Sonnenschein, von denen das Barometer nicht ganz frei zu sein scheint, ungeachtet dessen, dass es auf dem best möglichen Platze im Telegrafenzimmer aufgestellt ist. Das Resultat war eine Correction von $+ 0^{mm}.114$ (M. F. $= \pm 0.065$). Am Institute wurde in 1877 gefunden $-0^{mm}.03$, bei den Inspectionen in 1880 $+ 0^{mm}.03$, und in 1885 $+ 0^{mm}.07$. Es scheint also die Correction steigend zu sein. Die Beobachtungen sind mit $+ 0^{mm}.03$ reduciert worden, und haben also vielleicht noch eine Correction von $+ 0^{mm}.08$ nöthig.

Die Thermometer zeigten bei 12^{0} um $0^{0}.2$ zu hoch, und in 1889 bei 0^{0} um $0^{0}.1$ zu hoch.

Christiansund. Am 1. September 1887 wurde das Stationsbarometer, Adie No. 1513, wie früher mitgetheilt, in ein neues Local überführt. Hier war die Beleuchtung nicht gut, aber ein besserer Platz war nicht zu finden. Als ich am 29. Juli 1890 die Station besuchte, theilte mir der Beobachter mit, dass das Quecksilber bei fallendem Barometer seine Convexität verlor, und das bei steigendem Barometer die Convexitätet der Kuppe vergrössert wurde. Bei der Ueberführung vom alten in das neue Local war das Instrument sorgfällig herabgenommen worden und davon in horizontaler Stellung getragen. Nach den Vergleichungen, die ich am 29. und 30. Juli mit dem Reisebarometer anstellte, zeigte es sich sogleich, das dass Stationsbarometer seit

der letzten Inspection in 1885 seine Correction geändert hatte. Im März 1876 wurde am Institute gefunden $+ 0^{mm}.26$, und bei der Inspection im Mai 1885 $+ 0^{mm}.25$. Nach meinen Vergleichungen am 29. und 30. Juli 1890 fand ich die Correction $= + 0^{mm}.43$ und den Mittelfehler einer Vergleichung M. F. $= \pm 0^{mm}.06$. Eine Aenderung von $+ 0^{mm}.18$ war also constatiert. Ich habe den Versuch gemacht durch Zusammenstellung der Beobachtungen von Aalesund und Christiansund herauszufinden, ob sich eine bestimmte Epoche für diese Aenderung nachweisen liese, aber ohne Erfolg. Ich muss bei der Hypothese stehen bleiben, dass die Aenderung bei der Ueberführung ins neue Local am 1. September 1887 statgefunden hat. Im October 1890 wurde ein neues Barometer nach Christiansund geschickt und am 1. November in Brauch genommen. 26 Vergleichungen an der Station in Christiansund zwischen dem neuen Barometer Adie C. 674 und dem alten Adie 1513 gab für das letztere die Correction $+ 0^{mm}.50$. Das Mittel von dieser und meiner Bestimmung ist $+ 0^{mm}.46$. Die Beobachtungen sind mit $+ 0^{mm}.25$ reduciert worden, und verlangen also, vom 1. September 1887 ab gerechnet, noch eine Correction von $+ 0^{mm}.21$, bis Ende 1889. Leider wurde das Barometer Adie No. 1513 bei der Versendung nach Christiania zerschlagen, so dass eine neue directe Vergleichung mit dem Normalbarometer vereitelt wurde.

Das trockne Thermometer zeigte um $0^{0}.2$, das feuchte um $0^{0}.1$ zu hoch bei $12^{0}.8$. In 1889 waren die respectiven Correctionen bei $0^{0} - 0^{0}.05$ und $0^{0}.0$.

Hatfjelddalen. Die Meereshöhe ist in diesem Jahrbuche nach neueren, aber noch nicht definitiven, Bestimmungen aufgeführt.

Ranen. Diese Station müsste vom 1. Juli 1889 ab aufgegeben werden wegen Mangel von Geldmitteln um den Beobachter zu honoriren.

Svolvær. Nachdem die Beobachtungen in Svolvær am 1. Juli 1889 wieder aufgenommen waren, zeigte es sich, durch Vergleichung mit den Nachbarstationen, dass das Stationsbarometer Adie No. 1483 sehr nahe um 5 Millimeter zu tief stehen musste, während es früher eine Correction von $+ 0^{mm}.2$ hatte. Die Aenderung musste während der Sistierung der Beobachtungen eingetreten haben. Ein neues Barometer, Adie No. 1480, wurde mit Dampschiff direct nach Svolvær geschickt, und daselbst mit dem alten verglichen. 10 Vergleichungen im Mai 1890 gaben die Correction auf Normalstand $= + 4.89 - 0.0119(b - 747.5)^{mm}$. Nachdem das Barometer Adie No. 1483 auf demselben Wege wieder nach dem Institute zurückgekommen war, wurde es mit dem Normalbarometer verglichen und die folgenden Correctionen gefunden:

			Nach Beob. in Svolvær	Mittel
bei $738^{mm}.0$	$+ 4.77$	6 Beob.	$+ 5.00$	$+ 4.88$
„ $748^{mm}.6$	$+ 4.72$	9 —	$+ 4.87$	$+ 4.80$
„ $758^{mm}.5$	$+ 4.71$	4 —	$+ 4.76$	$+ 4.74$

Die Beobachtungen mit Adie No. 1483 sind nach den in Svolvær erhaltenen Correctionen reduciert worden.

Karasjok. Siehe Jahrbuch für 1880, Vorwort S. II. Die Beobachtungen wurden in 1889 von einem neuen Beobachter wieder aufgenommen. Die Instrumente sind dieselbe wie früher.

Rasten. Die Beobachtungen für März fehlen.

Holmestrand, am Christianiafjord, Kampen in Christiania, Biri am Mjøsen, Egeland, nahe bei Risør, Skagerakküste, Stumdal, Thalstation südwestlich von Leirdal, Sveingaard, Thalstation in Hallingdal, östlich von den Langfjelden, Ulvik, Nord-Hardanger und Moss am Christianiafjord, sind neue Regenmesserstationen.

In Bezug auf die Schwerecorrection ist auf das Jahrbuch für 1882, Vorwort, Seite III und IV zu verweisen.

Die Tabelle auf Seite IX und X giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchtthürmen werden die Beobachtungen vom betreffenden Leuchtfeuerverwalter ausgeführt.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —
R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

Die Barometerhöhe in Millimetern, auf 0° reducirt und mit der constanten Correction des Instrumentes corrigirt[1]). Die beobachteten Maxima und Minima des Monats sind mit fetten Typen gedruckt.

Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben mit dem trocknen Thermometer corrigirt worden. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr Abends und 8 Uhr Morgens, kein Minimum nachweist, ist die Temperatur für 2 Uhr Morgens interpolirt und mit Cursiv gedruckt worden. Dies ist geschehen, damit das Mittel aus den 4 täglichen Beobachtungen, inclusive der interpolirten Nachttemperatur, möglichst genau die wahre 24 stündige Mitteltemperatur des Tages ergeben kann.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

Die relative Feuchtigkeit auf dieselbe Weise berechnet. $00 = 100\%$.

Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[1]).

Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. Die Bezeichnungen sind:

● Regen.	^{n} Nacht	Als Exponent
✱ Schnee.	^{a} Vormittag	Als Exponent
△ Graupeln.	^{p} Nachmittag	Als Exponent
≡ Nebel	^{o} Schwach	Als Exponent
⌴ Reif.	^{2} Stark	Als Exponent
∝ Höhenrauch.	1 Erste Beobachtungsstunde.	
⸝ Starker Wind.	2 Zweite —	
⊼ Gewitter.	3 Dritte —	
< Blitz ohne Donner.		
⩚ Nordlicht.		
⊕ Sonnenring.		
⊙ Sonnenhof.		
ⓤ Mondring.		
ⓤ Mondhof.		

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ●1, Regen 8^h Morgens; ✱3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes ^{n}, ^{a} oder ^{p}.

Interpolirte Werthe sind mit Cursiv gedruckt.

In den Uebersichtstabellen der zweiten Abtheilung sind die Luftdrucksmittel direct aus den Monatsmitteln der drei Beobachtungsstunden berechnet. Alle sind auf 0° und das Normalbarometer (wahre Barometerhöhe), aber nicht auf die Meeresfläche und nicht auf die Normalschwere reducirt.

Die Monatsmittel der Lufttemperatur (Celsius) sind für alle Stationen des südlichen Norwegens bis an die Breite von Trondhjem ($63^1/_2$ Grad) als Mittel der drei täglichen festen Beobachtungen und der Minimumtemperatur bestimmt. Für die Stationen, welche eine nördlichere Lage haben, ist die im Jahrbuch für 1884 Vorwort S. XII—XIII angegebene Berechnungsweise angewendet worden.

Für Christiania, Aas und Trondhjem sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigen Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt wurden.

---

[1]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort. Seite II., so wie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Die Monatsmittel der absoluten und relativen Feuchtigkeit sind als Mittel aus den Morgen- und Abendbeobachtungen, ohne Correction, berechnet. Für Dovre, Röros und Tönset ist Correction wegen des Luftdrucks an den Mitteln angebracht worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen*, *J. Schroeter*, *C. Krafft*, *N. Nielsen* und *H. Chr. Löcken* ausgeführt.

Christiania, März 1891.

H. Mohn.
