Vorwort.

Das Jahrbuch für 1893 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 93 Stationen; von letzteren sind 40 mit Quecksilberbarometern versehen; 42 haben Psychrometer, 14 nur trocknes Thermometer (davon 6 Leuchtfeuerstationen); 37 sind Regenmesserstationen.

In 1894 wurde keine Inspectionsreise unternommen.

Frydenlund. Die Station liegt im Valdresthal, 20 Kilometer in nordwestlicher Richtung von Tonsaasen. Die Meereshöhe ist durch Hypsometerbeobachtungen, mit den correspondirenden Barometerablesungen auf Granheim und Tonsaasen verglichen, zu 434.5 Meter bestimmt.

Gjervan. Die Station liegt am Johnsvand, ca. 20 Kilometer in südostlicher Richtung von Trondhjem. Die Meereshöhe ist durch Nivellement zu 188 Meter bestimmt.

Kongens Grube. Die Station liegt 16 Kilometer in nordwestlicher Richtung von Röros. Die Meereshöhe ist zu 860 Meter aufgegeben.

Kragerö. Die Beobachtungen wurden am Tode des Beobachters, Herrn Bergmeister Dahll, abgebrochen. Sie wurden später auf demselben Ort von seinem Erben, Herrn George Dahll, aufgenommen.

Skudenes. Die Station wurde am 29 September 1893 nach einem neuen Local, in der Nähe des vorigen, verlegt. Die Meereshöhe des Barometers wurde nur von 4 Meter auf 3.6 Meter geändert. Alle Beobachtungen des Jahres sind auf das alte Niveau reduciert worden.

Soggendal. Der Regenmesser hatte einige Zeit geleckt, bevor es vom Beobachter entdeckt wurde, wesshalb die Resultate der zwei letzten Monate des Jahres unbrauchbar sind. Vielleicht sind auch die Mengen der vorhergehenden Monate ein wenig zu klein.

Südvaranger. Das Stationsbarometer Adie No. 1489 wurde wie im Jahrbuche für 1892, Seite VI, bemerkt im Sommer 1893 als Controlbarometer für die Stationen in Finmarken benutzt. Auf der Rückreise von Alten nach Trondhjem nahm ich Adie No. 1489 mit und fand folgende Correctionen:

In Tromsö	durch	Fuess	No. 361	Cor. $= +0.61$ mm.	M. F. $= \pm 0.062$ mm.	6	Vergl.
„ Bodö	„	Adie	„ 1497	„ $= +0.57$ „	„ $= \pm 0.022$ „	4	„
„ Trondhjem	„	Fuess	„ 361	„ $= +0.61$ „	„ $= \pm 0.023$ „	7	„

Adie No. 1489 wurde von Trondhjem nach Südvaranger mit Dampfschiff geschickt. Während seiner Abwesenheit wurde in Südvaranger ein Heberbarometer von Lundh für die Beobachtungen daselbst benutzt. 12 Vergleichungen vom 1893 September 18. bis October 2. vom Beobachter angestellt gaben

Adie 1489 $+ 0.61$ mm. $=$ Lundh $+ 0.40$ mm. M. F. $= \pm 0.39$ mm.

Das Barometer Lundh diente als Stationsbarometer vom 21. Juli bis 16. September 1893, und die Beobachtungen sind mit der Correction $+ 0.40$ mm. reduciert worden. Die Beobachtungen mit Adie 1489 sind bis zum 21. Juli mit der in Alten gefundenen Correction $+ 0.43$ mm., und nach dem 16. September mit der später auf der Reise nach Trondhjem gefundenen Correction $+ 0.61$ reduciert worden.

Für einige Monate sind die Psychrometerbeobachtungen missgelungen.

Tvedestrand. Wegen des Todes des vorigen Beobachters, Herrn Arzt Fr. Vogt, hörten die Beobachtungen am Ende vorigen Jahres auf. Sie wurden mit October 1893 vom Herrn Arzt S. Erichsen auf demselben Ort wieder aufgenommen.

Ulefos. Die Station liegt am Auslauf des Ulefos—Strengen Kanals in den grossen Binnensee Nordsjö. Sie ist von der Kanaldirection eingerichtet, und die Meereshöhe ist von derselben zu 82 Meter aufgegeben.

Vardö. Eine Station für die Beobachtung und Messung der Niederschläge wurde im Herbst 1893 auf der Festung Vardöhus durch die Güte des Commandanten eingerichtet.

Die Tabelle auf Seite VI und VII giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphen-, Eisenbahn- und Leuchtfeuer-Stationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,

II — zweiter —

III — dritter —

R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf **die Normalschwere** reduciert.[1]) Die Reduction auf die Normalschwere nach der Formel

$$\text{Schwerecorrection} = b\,(-0.00259\cos 2\varphi - 0.000\,000\,196\,H)$$

wo b die auf 0° und das Normalbarometer reducierte Barometerhöhe, φ die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerecorrection angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort, und auch Meteorologische Zeitschrift 1891. S. 252.

hat. Die nach der Schwerecorrection stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerecorrection, im Sinne unreducierte minus reducierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraction der angegebenen Schwerecorrection, auf die uncorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Correctionen der Thermometer auf das **Luft**thermometer reduciert worden.[1]) Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben, um 8 Uhr a. m., mit dem trocknen Thermometer, corrigiert worden. Das Minimumthermometer wird um 8 Uhr p. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. $00 = 100\%$.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[2]).

7. Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

◉ Regen.	^{n} Nacht	Als Exponent
✱ Schnee.	^{a} Vormittag	Als Exponent
△ Graupeln.	^{p} Nachmittag	Als Exponent
≡ Nebel.	^{o} Schwach	Als Exponent
⊷ Thau.	^{2} Stark	Als Exponent
⌴ Reif.	1 Erste Beobachtungsstunde.	
∞ Höhenrauch.	2 Zweite —	
⸝ Starker Wind.	3 Dritte —	
⊼ Gewitter.		
≺ Blitz ohne Donner.		
⩓ Nordlicht.		
⊕ Sonnenring.		
⊙ Sonnenhof.		
ⓤ Mondring.		
ⓤ Mondhof.		

[1]) Dies ist durch den glücklichen Umstand erreicht, dass die Correctionen des Normalthermometers auf das Luftthermometer weniger als $0^0.05$ betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ● 1, Regen 8^h Morgens; ✱ 3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolierte Werthe sind mit Cursiv gedruckt.

Die Uebersichtstabellen der zweiten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0^0, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobactungen plus eine Correction. Diese Correctionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christiansand, Bergen und Bossekop abgeleitet worden.[1]) Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Correctionsgrössen, welche für 1893 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Factor ist, der mit der Station und dem Monate wechselt, wie die Tabelle auf Seite XIII des Jahrbuchs für 1891 zeigt. Siehe auch die Bemerkungen in demselben Jahrbuche Seite XIV.

Für Christiania, Aas, Bjelland und Trondhjem sind die mittelst Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometers gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Correction. Die Werthe dieser Correctionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Jerkin, Dovre und Tonsaasen ist Correction wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Factors c. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

---

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den ersten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen, N. J. Nielsen, Aa. Grårud, K. Irgens, P. S. Nissen, H. H. Alme, C. Krafft* und *H. Chr. Löcken* ausgeführt.

Christiania, December 1895.

H. Mohn.
