Vorwort.

Das Jahrbuch für 1895 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 93 Stationen; von letzteren sind 40 mit Quecksilberbarometern versehen; 42 haben Psychrometer, 14 nur trocknes Thermometer (davon 6 Leuchtfeuerstationen); 37 sind Regenmesserstationen.

In 1895 wurde keine Inspectionsreise unternommen.

Aasnes. Neue Station im Glommenthale. Der Beobachter ist derselbe wie früher in Bjelland. Gute Lage und gute Station.

Bergen. Am 4. und 5. November 1895 wurde die Station nach ein neues Local verlegt, unweit des früheren. Im neuen Local wurde die erste Barometerbeobachtung am 4. November 8 p gemacht, und die übrigen Beobachtungen am 5. November 2 p. Im Jahrbuch sind die Barometerbeobachtungen auf das alte Niveau 17.4 Meter reduciert gegeben. Das neue Niveau des Barometers ist 21.8 Meter. Die neue Höhe der Thermometer ist 4.8 m. über dem Boden.

Bjelland. Mit der Abreise des Beobachters wurden die Beobachtungen am 30. April 1895 abgeschlossen.

Eidsvold. Nach dem Tode des früheren Beobachters auf dem Gehöfte „Bakken" ist später die Station nach dem alten Stationsort Dokken zurückgeführt.

Fagernes. Da die Beobachtungen mit dem Minimumthermometer weniger zuverlässig gewesen sind, wurden sie nicht gebraucht und die Monatsmittel sind berechnet nach der Formel: $m = q + c\,(2^p - q)$, wo $q = \frac{1}{2}(8^a + 8^p)$ ist; c hat für die Monate folgende Werthe:

0.20, 0.20, 0.18, 0.09, —0.05, —0.09, —0.07, 0.03, 0.16, 0.19, 0.20, 0.22.

Die angegebenen Temperaturextreme sind aus den Temperaturen an den 3 Beobachtungszeiten genommen.

Gjervan. Diese Regenmesserstation ist am Ende des Jahres 1894 aufgehört Beobachtungen zu senden.

Röldal. Für die Monate Januar, Februar und December 1895 sind die Psychrometerbeobachtungen nicht gelungen.

Sydvaranger. Für die Monate Januar, Februar, März und December sinn die Psychrometerbeobachtungen nicht gelungen.

Tromsö. Am 20. October 1895 vormittags wurde das Barometer nach ein neues Local verlegt, wo seine Meereshöhe 11.8 m. ist. Im Jahrbuche sind die Luftdruckswerthe auf das ältere Niveau, 15.3 m. reduciert gegeben. Die übrigen Instrumente wurden später

Ullensvang. Am 31. December 1894 um 9 p. wurde die Station nach dem früheren Orte, Kvitavol, verlegt. Die Meereshöhe des Barometers war am letzten Orte die frühere, 43.0 m. Am 7. Mai 1895 um 10 p, wurde das Barometer im ersten Stockwerk aufgestellt in der Meereshöhe 40.75 m. Um auf das letzte Niveau reduciert zu werden, brauchen die Beobachtungen vom 1. Januar bis zum 7. Mai eine Correction von + 0.2 mm. Eine solche Reduction ist für die im Jahrbuch gegebenen Luftdruckswerthe nicht gemacht worden.

Die Tabelle auf Seite VI und VII giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphen-, Eisenbahn- und Leuchtfeuer-Stationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —
R Regenmesserstation.

Am 1. Januar 1895 wurde die mitteleuropäische Zeit, eine Stunde früher als Greenwich, durch Gesetz in Norwegen eingeführt. An den meisten meteorologischen Stationen wurden die früheren Beobachtungstermine beibehalten, indem die respectiven Uhrzeiten nach Normalzeit den Beobachtern mitgetheilt wurden. Nur an einigen Telegraphenstationen, musste die Aenderung gemacht werden, dass die Beobachtungen auf 8 a, 2 p und 8 p Normalzeit verlegt wurden. Als aber eben diese Stationen früher nach Christiania Zeit beobachteten, und diese Zeit nur 17 Minuten später ist als die Normalzeit, hat die Aenderung nur wenig Bedeutung.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf **die Normalschwere** reduciert.[1]) Die Reduction auf die Normalschwere nach der Formel

$$\text{Schwerecorrection} = b\,(-0.00259\cos 2\varphi - 0.000000196\,H)$$

wo b die auf 0° und das Normalbarometer reducierte Barometerhöhe, φ die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerecorrection angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerecorrection stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerecorrection, im Sinne unreducierte minus redu-

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252.

cierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraction der angegebenen Schwerecorrection, auf die uncorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Correctionen der Thermometer auf das **Luft**thermometer reduciert worden.[1]) Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben, um 8 Uhr a. m., mit dem trocknen Thermometer, corrigiert worden. Vom 1sten Januar 1894 wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Psychrometerbeobachtungen sind im Jahrbuch für 1895 nach Jelincks Tafeln berechnet worden, mit der Aenderung, dass, nach Ekholms Anweisung, wenn das feuchte Thermometer Kältegrade zeigt, eine Correction an die (für Theilungsfehler berichtigten) Ablesungen dieses Thermometers angebracht worden ist, wie diese Tabelle zeigt

Von	$-0^0.1$	bis	$-1^0.1$	Corr. =	$-0^0.1$
„	−1 .3	„	−2 .2	„	−0 .2
„	−2 .4	„	−3 .3	„	−0 .3
„	−3 .5	„	−4 .4	„	−0 .4
über	−4 .4			„	−0 .5.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan[2]).

7. Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. Die Bezeichnungen sind:

● Regen.	$_n$ Nacht	Als Exponent
✱ Schnee.	$_a$ Vormittag	
△ Graupeln.	$_p$ Nachmittag	
≡ Nebel.	$_o$ Schwach	
⏢ Thau.	$_2$ Stark	
⌴ Reif.	1 Erste Beobachtungsstunde.	
∞ Höhenrauch.	2 Zweite —	
⚡ Starker Wind.	3 Dritte —	

[1]) Dies ist durch den glücklichen Umstand erreicht, dass die Correctionen des Normalthermometers auf das Luftthermometer weniger als $0^0.05$ betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ● 1, Regen 8^h Morgens; ✱ 3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes *n*, *a* oder *p*.

Interpolierte Werthe sind mit Cursiv gedruckt.

Die Uebersichtstabellen der zweiten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobactungen plus eine Correction. Diese Correctionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christiansand, Bergen und Bossekop abgeleitet worden.[1]) Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Correctionsgrössen, welche für 1893 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel[2])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Factor ist, der mit der Station und dem Monate wechselt.[3])

Für Christiania, Aas, Aasnes, Bjelland und Trondhjem sind die mittelst Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometers gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Correction. Die Werthe dieser Correctionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Jerkin, Dovre und Tonsaasen ist Correction wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Factors *c*. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

---

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.

[2]) Siehe Met. Zeitschr. 1891, S. 253 flg.

[3]) Siehe Jahrbuch für 1894. S. IX.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den ersten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen, N. J. Nielsen, Aa. Grårud, K. Irgens, P. S. Nissen, H. H. Alme, C. Krafft* und *H. Chr. Löcken* ausgeführt.

Christiania, Mai 1896.

H. Mohn.
