Inhalt.

Vorwort.

Meteorologische Litteratur, im Jahre 1898 in Norwegen erschienen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Christiania 1898.

II. Termin-Beobachtungen an zwölf Stationen in Norwegen 1898.

III. Monats und Jahres-Resumé für das Jahr 1898.

IV. Anhang. Beobachtungen der Bewegung der Cirruswolken 1898.

Druckfehler und Verbesserungen.

Im Jahrbuch für 1896:

Vorwort.

Das Jahrbuch für 1898 enthält die stündlichen Luftdruck- und Temperatur-Registrierungen in Christiania, die vollständigen Terminbeobachtungen für dieselben 12 Stationen wie die vorhergehenden Jahrgänge, die Uebersichtstabellen für 62 Stationen und einen Anhang mit Cirrusbeobachtungen. Von den 62 Stationen haben 40 Quecksilberbarometer, 41 Psychrometer, 21 nur trocknes Thermometer, unter welchen 6 Leuchtfeuerstationen sind. Die in den früheren Jahrgängen mitgenommenen Regenmesserstationen sind im Jahrbuch für 1898 nicht eingenommen, da seit Juli 1895 eine erweiterte Niederschlagsmessung in Norwegen eingeführt worden ist, mit 350 Stationen ausserhalb der in diesem Jahrbuch enthaltenen, und deren Beobachtungen in einer besonderen Publikation mitgetheilt werden.

Im Sommer 1898 machte ich eine Inspektionsreise nach Stationen im nördlichen und südlichen Norwegen. Als Reise-Kontroll-Barometer benutzte ich Wild-Fuess No. 270. Ich beobachtete mit der unteren Hülfsskala auf Null gestellt. An den Stationen wurden Kontroll-Beobachtungen mit verschiedenen Grössen vom Vakuum gemacht. In der Tabelle 1 bedeutet Korr. das einfache Mittel der für Fuess 270 durch Vergleichungen mit dem Normalbarometer (Fuess No. 214 + 0.12 mm.) gefundenen Korrektionen und M. F. die mittlere Abweichung einer einzelnen Korrektionsbestimmung vom resp. Mittel derselben.

Tab. 1.

1898 Tage.	Anzahl d. Beob.	Korr. mm.	M. F. mm.	Bemerkungen.
Mai 7—31.	21	+0.139	±0.019	
Juni 2—29.	13	+0.120	0.019	
August 24—27.	10	+0.135	0.019	
Summe u. Mittel.	44	+0.131	±0.019	

Die Beobachtungen an den Stationen sind mit einer Korrektion für Fuess 270 gleich +0.13 mm berechnet worden.

Das Resultat der Barometervergleichungen auf der Inspektionsreise ist aus der Tabelle 2 zu ersehen. Korr. 1898 zeigt die für die Stationsbarometer gefundene Korrektion auf die wahre Barometerhöhe. Frühere Korr. zeigt den Werth der Korrektion, mit welcher früher gerechnet war, und △ den Unterschied zwischen der neuen und der früheren Korrektion. Die Bemerkungen, zu welchen dieser Anleitung giebt, finden sich unten mitgetheilt. Wenn der genannte Unterschied nicht 0.05 mm übersteigt, wird die Korrektion des Barometers als unverändert angesehen.

An sämmtlichen Stationen, die ich besuchte, wurden die Quecksilberthermometer mit einem Normalthermometer verglichen, dessen Korrektion auf das Luftthermometer bekannt war.

In Bezug auf die einzelnen Stationen verweise ich auf die früheren Jahrgänge und folgende Bemerkungen.

Aabogen. Die Beobachtungen (eines neuen Beobachters) des nassen Thermometers für Januar, Februar, März und April sind missgelungen.

Alten. Am 14. Sept. 1898 um 9 Uhr Vorm. wurde das Barometer aus dem zweiten in das erste Stockwerk heruntergebracht und ebenso die Thermometer gegen NW. Die Seehöhe des Barometers ist jetzt 10.3 m. Bis zum Schlusse des Jahres sind die Luftdruckbeobachtungen auf die frühere Seehöhe 13.0 m reduciert worden. Die neue Höhe der Thermometer ist 2.4 m. Die Psychrometerbeobachtungen sind (von einem neuen Beobachter) bei Kältegraden weniger zuverlässig ausgeführt und waren im December ganz unbrauchbar.

Austad. Neue Station in Sætersdal auf der östlichen Seite der Otteraa am Ausflusse dieser in den Aaraksfjord. Das Gehöft liegt auf einer horizontalen Terrasse ganz nahe am schroffen Gebirge im NE und E. Auf der westlichen Seite des Flusses in einer Entfernung von $1^1/_2$ Kilometer steigt das Gebirge langsamer in die Höhe. Das Thermometergehäuse ist vor einem Fenster gegen SSE angebracht, wo es durch einem Holzschirm gegen die Mittagssonne geschützt ist. Bei der Morgenbeobachtung ist die Sonne noch nicht über das Gebirge gekommen.

Brønø. Die Korrektion des Barometers in Brønø hat sich etwas schwankend gezeigt. In 1887 fand Hrr. Schroeter +0.37 mm, in 1893 fand ich +0.27 mm, und in 1898 +0.47 mm. Die Beobachtungen werden seit Mitte August 1897 mit dem Mittel + 0.38 mm reduciert.

Fagernes. Die Beobachtungen sind im Anfang des Jahres eingestellt worden wegen der Krankheit und des darauffolgenden Todes des alten braven C. Mosling, der in 26 Jahren ohne irgendwelche Vergütung dem meteorologischen Institute seinen Dienst geleistet hat.

Jerkin. Die Beobachtungen für August sind verloren gegangen.

Kistrand. Da die Centralstelle des finmarkischen Telegraphennetzes von diesem Orte nach Hammerfest verlegt war, wurden am Ende des Aprils die meteorologischen Instrumente nach Mehavn übergeführt.

Mehavn. Neue Station auf der Nordseite der Nordkyn-Halbinsel an einer kleinen vom N eingehenden Bucht. Die Instrumente sind im Telegraphenlokale untergebracht. Die Seehöhe des Barometers ist 5.8 m. Die Thermometergehäuse sind vor Fenstern gegen SE und NW aufgestellt. Der Regenmesser ist ungünstig angebracht und wird nächsten Sommer eine andre Stelle erhalten.

Nes. Neue Station in Hallingdal. Das Thal hat hier eine beinahe N—S gehende Richtung und erweitert sich in einigem Grade, indem auch ein Nebenthal aus W kommt. Das

Haus liegt frei und das Thermometergehäuse hat eine günstige Aufstellung vor einem Fenster gegen N.

Opstryn. Neue Station in Stryn in Nordfjord. Die Instrumente sind im Gehöfte Skaare untergebracht. Dies liegt mitten im Thale auf einer Terrasse. Die Gebirge sind schroff im N und S; im E beginnt gleich der Thalboden zu steigen und auch gegen W hat man keine Fernsicht, indem sich das Thal verengt. Das Thermometer ist in seinem Gehäuse vor einem Fenster gegen ENE aufgestellt und durch einen Schirm gegen die Morgensonne geschützt.

Stenkjær. Das Mittel der in 1877, 1880, 1882, 1883, 1885, 1888 und 1893 gefundenen Korrektionen des Barometers ist + 0.08 mm. (M. F. = + 0.044). Die Beobachtungen sind mit + 0.06 reduciert worden. Die in 1898 gefundene Korrektion von — 0.06 scheint weniger gut verbürgt.

Sundalen. Neue Station in Nordmøre, 35 Kilometer vom Sundalstjorde. Das Thal geht vom Fjorde aus zuerst in südöstlicher Richtung, macht hier an der Station eine scharfe Biegung und setzt sich gegen NNE fort, während ein Nebenthal aus SW herunterkommt. Hierdurch ist eine dreieckige Erweiterung des Thalbodens entstanden, und mitten in dieser auf der Halbinsel, die vom Haupt- und dem Nebenflusse gebildet ist, liegt das Gehöft Nisja, wo die Instrumente untergebracht sind. Sowohl im N, W und E in 1—2 Kilometer Entfernung steigen die Gebirge sehr schroff bis 1000 m über den Thalboden, doch ein wenig sanfter gegen E. Die Thermometer sind in ihren Gehäusen vor Fenstern ungeheizter Zimmer gegen E und W aufgestellt. Die Ablesung des letzten geschieht nur eine kürzere Zeit im Sommer bei der Morgenbeobachtung; sonst kommt die Sonne zu dieser Tageszeit nicht über das Gebirge.

Svolvær. Am 20. Januar 1898 wurde die Station in ein neues Lokal übergeführt. Die Barometerbeobachtungen der ersten 20 Tagen des Jahres 1898 sind auf die neue Seehöhe reduciert worden.

Sydvaranger. Die Beobachtungen des nassen Thermometers im Winter und bisweilen im Sommer sind nicht zu brauchen.

Tonsaasen. Die Beobactungen (eines neuen Beobachters) des nassen Thermometers vom Oktober, November und December haben sich untauglich erwiesen.

Tromsø. Das Mittel der bei den Inspektionen gefundenen Korrektionen des Stationsbarometers in 1881, 1885, 1887 und 1893 ist + 0.26 mm. In 1898 fand ich + 0.32 mm. Die Beobachtungen sind mit + 0.21 mm reduciert worden.

Trondhjem. Die Barometervergleichungen wurden im früheren Lokal gemacht. Am 15. Juli 1898 wurden die Station nach einem neuen Lokal übergeführt, nach der Abendbeobachtung. Hier haben sämmtliche Instrumente eine sehr gute Aufstellung gefunden. Die Barometerbeobachtungen sind bis Ende 1898 auf die frühere Seehöhe reduciert worden.

Tønset. Die 2 Thermometerbeschirmungen sind ausserhalb Fenstern gegen NNW und ENE aufgestellt. Die Seehöhe des Barometers ist 496.7 Meter.

Veggli. Neue Station in Numedal. Das Thal geht hier in E—W'licher Richtung und ist ziemlich weit mit nur niedrigeren Gebirgseiten. Die Station auf dem Gehöft Mogen in einiger Entfernung vom Flusse hat eine günstige Lage. Die Thermometergehäuse sind vor Fenstern gegen NE und SW angebracht.

Die folgende Tabelle giebt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die konstante Korrektion der Barometer, die Schwerekorrektion, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphen-, Eisenbahn- und Leuchtfeuer-Stationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich.

In der ersten Rubrik „Ordnung" bedeutet: I Station erster Ordnung,
II — zweiter —
III — dritter —

Am 1. Januar 1895 wurde die mitteleuropäische Zeit, eine Stunde früher als Greenwich, durch Gesetz in Norwegen eingeführt. An den meisten meteorologischen Stationen wurden die früheren Beobachtungstermine beibehalten, indem die respektiven Uhrzeiten nach Normalzeit den Beobachtern mitgetheilt wurden. Nur an einigen Telegraphenstationen musste die Aenderung gemacht werden, dass die Beobachtungen auf 8 a, 2 p und 8 p Normalzeit verlegt wurden. Als

aber eben diese Stationen früher nach Christiania Zeit beobachteten, und diese Zeit nur 17 Minuten später ist als die Normalzeit, hat die Aenderung nur wenig Bedeutung.

Wegen der Kontrolle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die erste Abtheilung enthält die stündlichen Beobachtungen für Christiania, die mit Richards Barograph und Thermograph registriert worden sind.

Der Barograph ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reducierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph steht in der Wild'sche Hütte im Park des astronomischen Observatoriums. Seine Bügel steht im Kupferhäuschen, wo das Psychrometer aufgestellt ist, und ganz nahe an der Kugel des trocknen Thermometers. Seine Angaben für jede Stunde Lokalzeit sind reduciert auf die auf das Lufttthermometer reducierten Ablesungen des Normal-(Luft) Thermometers [1]).

Die Tabellen der zweiten Abtheilung enthalten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf **die Normalschwere** reduciert [2]). Die Reduktion auf die Normalschwere nach der Formel

$$\text{Schwerekorrektion} = b\,(-0.00259\cos 2q - 0.000000196\,H)$$

wo b die auf 0° und das Normalbarometer reducierte Barometerhöhe, q die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerekorrektion angegeben: und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerekorrektion stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerekorrektion, im Sinne unreducierte minus reducierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die Luftdruckswerthe sind nicht auf das Meeresniveau reduciert.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

[1]) Am Institut haben wir die folgenden mit Barograph und Thermograph registrierten Beobachtungen berechnet und eingeführt in Manuskript-Tabellen wie die in diesem Jahrbuch für Christiania gedruckten.

	Luftdruck	Lufttemperatur.
Christiania.	Barogr. Richard von Juli 1892 bis jetzt.	Thermogr. Rung von Juli 1883 bis Januar 1896. Thermogr. Richard von Juni 1893 bis jetzt.
Bergen.	Barogr. Hottinger von Januar 1891 bis Oktober 1894. Barogr. Richard von August 1896 bis jetzt.	Thermogr. Richard von Sept. 1895 bis jetzt.
Trondhjem.	Barogr. Richard von Januar 1896 bis jetzt.	Thermogr. Richard von Januar 1896 bis jetzt.
Dovre.	Barogr. Richard von Januar 1896 bis jetzt.	
Aasnes.		Thermogr. Richard von Januar 1896 bis jetzt.

[2]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252 sammt Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math.-naturv. Klasse, 1896 No. 1. Side 1—15.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Korrektionen der Thermometer auf das **Luft**thermometer reduciert worden[1]). Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m., mit dem trocknen Thermometer, korrigiert worden. Vom 1sten Januar 1894 an wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. 00 = 100%.

Die Psychrometerbeobachtungen sind seit 1895 nach Jelineks Tafeln berechnet worden, mit der Aenderung, dass, nach Ekholms Anweisung, wenn das feuchte Thermometer Kältegrade zeigt, eine Korrektion an die (für Theilungsfehler berichtigten) Ablesungen dieses Thermometers angebracht worden ist, wie diese Tabelle zeigt

Von	−0°.1	bis	−1°.1	Korr. =	−0°.1
„	−1 .3	„	−2 .2	„	−0 .2
„	−2 .4	„	−3 .3	„	−0 .3
„	−3 .5	„	−4 .4	„	−0 .4
unter	−4 .4			„	−0 .5.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 6 = Orkan[2]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Ueberzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden, sind nach der Bewölkungszahl angeführt worden. ◉ Regen; ✱ Schnee; ⁕ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiss, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit. (Normalzeit).

Die Bezeichnungen sind:

◉	Regen.	n	in der (vorhergehenden) Nacht
✱	Schnee.	a	vormittags
△	Graupeln.	p	nachmittags
≡	Nebel.	mg.	morgens
⏢	Thau.	mtg.	mittags
⌴	Reif.	abd.	abends
∞	Höhenrauch.	o	Schwach } Als Exponent
𝒻	Starker Wind.	2	Stark }

[1]) Dies ist durch den glücklichen Umstand erreicht, dass die Korrektionen des Normalthermometers auf das Luftthermometer weniger als 0°.05 betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen worden ist.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

⇱	Gewitter.	I	Erste Beobachtungsstunde.
<	Blitz ohne Donner.	II	Zweite —
⌘	Nordlicht.	III	Dritte —
⊕	Sonnenring.	u.	und.
⊙	Sonnenhof.	st.	stark.
☾	Mondring.	sp.	später.
☾	Mondhof.	zeitw.	zeitweise.
		sch.	Schauer.
		tr.	Tropfen.
		fl.	Flocken.
		körn.	körnig.

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *u*, *a* oder *p*. Die Angaben der Tagestunden beziehen sich auf mitteleuropäische Zeit. Die Zeitangabe „früh" bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr Morgens, „spätabd" zwischen 8 Uhr Abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. „abd" ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. „mtg" umfasst die Stunden 12 bis 2.

Interpolierte Werthe sind mit Kursiv gedruckt.

Die Uebersichtstabellen der dritten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduciert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen plus eine Korrektion. Diese Korrektionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christiansand, Bergen und Bossekop abgeleitet worden.[1] Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die Tabelle Seite XII im Jahrbuch für 1891 enthält die Korrektionsgrössen, welche für 1897 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel[2]

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt.[3]

Für Christiania, Aas, Aasnes, Eg und Trondhjem sind die mittelst Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometers gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion. Die Werthe dieser Korrektionen stehen in der Seite XV im Jahrbuche für 1891 gegebenen Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden. Für Röros, Tönset, Jerkin Dovre und Tonsaasen ist Korrektion wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

---

[1]) Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.

[2]) Siehe Met. Zeitschr. 1891, S. 253 flg.

[3]) Siehe Jahrbuch für 1894. S. IX.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'sche. Formel:

$$m = q + c\,(2p - q),\ q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden. Die Tabelle Seite XVI im Jahrbuch für 1891 enthält die Werthe des Faktors *c*. Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direkt aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtthurmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den zweiten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten *A. Steen, N. J. Føyn. Aa. Grårud, K. Irgens, H. Chr. Löcken* und *K. Maalstad* ausgeführt.

Christiania, April 1899.
