METEOROLOGISKE STASJONER, INSTRUMENTER OG OBSERVASJONER

Bortsett fra nedbørstasjonene var det 279 meteorologiske stasjoner i drift i 1971, heri er også medregnet værskipet på stasjon M, de 7 radiosondestasjonene og de 6 arktiske stasjonene. Av stasjonene sendte 210 værtelegrammer til forskjellige tider, mens 69 bare sendte månedsrapporter. På de telegraferende stasjoner ble hovedobservasjonene tatt kl. 7, 13 og 19 M.E.T., på de ikke-telegraferende kl. 8 (7), 13 og 19 M.E.T. Den klimatologiske statistikken i årboken er basert på observasjonene tatt kl. 7, 13 og 19, henholdsvis kl. 8, 13 og 19 M.E.T.

Årboken for 1971 inneholder forskjellige klimatologiske data for 236 stasjoner. Dessuten inneholder den tilsvarende data fra de arktiske stasjonene Isfjord Radio, Longyearbyen, Ny-Ålesund, Hopen, Bjørnøya og Jan Mayen for 1970.

I årboken for 1971 er følgende 3 nye stasjoner tatt inn: Otta — Bredvangen, Evenstad — Svea, til erstatning for Koppang — Øyset, som ble nedlagt 30. april 1971, og Upsangervatn, til erstatning for Indre Matre, som ble nedlagt 17. september 1971.

Med hensyn til de enkelte stasjoner er følgende å bemerke:

Koppang — Øyset: Stasjonen ble nedlagt 30. april 1971. Den nye stasjonen Evenstad — Svea ligger 22,5 km SSE for Koppang — Øyset, og har vært i drift siden 4. juni 1971.

Otta — Bredvangen: Stasjonen ble opprettet 12. juni 1970.

Bjørke — Ilseng: Stasjonen ble nedlagt 31. desember 1971.

Staur Forsøksgård: De nye geografiske koordinater og den nye stasjonshøyde skyldes bedre kart.

Stokke: Stasjonen ble nedlagt 17. juni 1971.

Båstad: Stasjonen ble nedlagt 1. mai 1971.

Rød i Råde: Stasjonen ble nedlagt 31. desember 1971.

Gvarv: Stasjonen ble utstyrt med termograf 8. juli 1971, med hygrograf 13. juli 1971 og med grasminimumstermometer 13. september 1971.

Lyngør Fyr: Stasjonen ble utstyrt med sjøtermometer 23. april 1971.

Hylestad — Brokke: Stasjonen ble utstyrt med «Plumatic» 14. juli 1971.

METEOROLOGICAL STATIONS, INSTRUMENTS AND OBSERVATIONS

Not including rainfall stations, 279 meteorological stations were in operation during the year 1971, including also the ocean weather ship at station M, the 7 radiosonde stations and the 6 arctic stations. Telegraphic reports were received at various hours from 210 stations, the remaining stations furnishing monthly reports only. At the stations furnishing telegraphic reports, the hours of observations were 7, 13 and 19^h C.E.T., at the remaining stations 8 (7), 13 and 19^h C.E.T. The climatological statistics in the year book refer to the observations made at 7, 13 and 19^h and 8, 13 and 19^h C.E.T., respectively.

The year book for 1971 contains various climatological data from 236 stations. In addition it also contains similar data from the arctic stations Isfjord Radio, Longyearbyen, Ny-Ålesund, Hopen, Bjørnøya (Bear Island) and Jan Mayen for 1970.

In the year book for 1971 the following 3 new stations have been included: Otta — Bredvangen, Evenstad — Svea, replacing Koppang — Øyset, which was closed on April 30. 1971, and Upsangervatn, replacing Indre Matre, which was closed on September 17. 1971.

With regard to the individual stations the following should be noted:

Koppang — Øyset: The station was closed on April 30. 1971. The new station Evenstad — Svea is situated 22.5 km SSE of Koppang — Øyset, and has been operated from June 4. 1971.

Otta — Bredvangen: The station was established on June 12. 1970.

Bjørke — Ilseng: The station was closed on December 31. 1971.

Staur Forsøksgård: The new geographical longitude and latitude and the new H_s are due to a better map.

Stokke: The station was closed on June 17. 1971.

Båstad: The station was closed on May 1. 1971.

Rød i Råde: The station was closed on December 31. 1971.

Gvarv: The station was equipped with a thermograph on July 8. 1971, with a hygrograph on July 13. 1971 and with a gras minimumthermometer on September 13. 1971.

Lyngør Fyr: The station was equipped with a sea thermometer on April 23. 1971.

Hylestad — Brokke: The station was equipped with a «Plumatic» on July 14. 1971.

Sola: Instrumenthytte og nedbørstolpe ble flyttet 70 m mot N 19. november 1971.

Nedre Vats: Den nye H_S skyldes bedre nivellement.

Indre Matre: Stasjonen ble nedlagt 17. september 1971. Den nye stasjonen, Upsangervatn, ligger 12,7 km WSW for Indre Matre, og har vært i drift siden 1. oktober 1971.

Midtlæger: Stasjonen er ikke tatt med i årbok 1971 p. gr. a. meget ufullstendige observasjoner.

Leikanger: Stasjonen ble utstyrt med vindfløy M. I. 65 9. september 1971.

Nordfjordeid: Stasjonen ble nedlagt 9. mars 1971.

Sunndal: Stasjonen ble utstyrt med vindfløy M. I. 65 23. mai 1971.

Ålvundfjord: Stasjonen ble nedlagt 30. april 1971.

Vinjeøra: Instrumenthytte og nedbørstolpe ble flyttet ca. 18 m mot NNE 22. mai 1971.

Sandnessjøen — Bjørkli: Stasjonen ble nedlagt 30. juni 1971.

Nerdal i Rana: Stasjonen ble utstyrt med vindfløy M. I. 65 16. oktober 1971.

Gibostad: Stasjonen ble utstyrt med nedbørskjerm 9. mars 1971.

Torsvåg: Stasjonen ble utstyrt med barometer 3. juni 1971.

Alta Lufthavn: Instrumenthytte og nedbørstolpe ble flyttet 83 m mot W 30. juni 1971.

Ved utgangen av 1971 var følgende stasjoner, som er med i årboken, utstyrt med termograf og hygrograf (eller termohygrograf): Hornset, Ottåsen, Fokstua II, Otta — Bredvangen, Gjeilo i Skjåk, Øvre Tessa, Hindseter, Varden — Filefjell, Løsset, Kise på Hedmark, Egnerfjell, Oslo — Blindern, Nesbyen II, Finse, Torp, Gvarv, Sæli II og III, Landvik, Kjevik, Fana Forsøksstasjon, Bergen — Fredriksberg, Bergen — Florida, Fortun, Hareid — Grimstad, Ørstavik — Velle, Stranda — Helsem, Valldal — Linge, Ona — Husøy, Sunndal, Trondheim — Tyholt, Vennafjell, Værnes, Mosjøen — Mosal, Kletkovfjell, Bolna, Bardufoss, Tromsø, Karasjok, Isfjord Radio, Hopen, Bjørnøya og Jan Mayen.

Følgende stasjoner hadde bare termograf: Gaustatoppen, Ås, Prestebakke, Lærdal — Tønjum, Fana-

Sola: The thermometer screen and the precipitation gauge were moved 70 m towards N on November 19. 1971.

Nedre Vats: The new H_S is due to a better levelling.

Indre Matre: The station was closed on September 17. 1971. The new station Upsangervatn is situated 12.7 km WSW of Indre Matre, and has been operated from October 1. 1971.

Midtlæger: The station is not included in the year book 1971 because of very irregular observations.

Leikanger: The station was equipped with a wind vane pattern M. I. 65 on September 9. 1971.

Nordfjordeid: The station was closed on March 9. 1971.

Sunndal: The station was equipped with a wind vane pattern M. I. 65 on May 23. 1971.

Ålvundfjord: The station was closed on April 30. 1971.

Vinjeøra: The thermometer screen and the precipitation gauge were moved about 18 m towards NNE on May 22. 1971.

Sandnessjøen — Bjørkli: The station was closed on June 30. 1971.

Nerdal i Rana: The station was equipped with a wind vane pattern M. I. 65 on October 16. 1971.

Gibostad: The station was equipped with a Nipher shield on March 9. 1971.

Torsvåg: The station was equipped with a barometer on June 3. 1971.

Alta Lufthavn: The thermometer screen and the precipitation gauge were moved 83 m towards W on June 30. 1971.

At the end of 1971 the following stations included in the year book were equipped with a thermograph and a hygrograph (or a thermohygrograph): Hornset, Ottåsen, Fokstua II, Otta — Bredvangen, Gjeilo i Skjåk, Øvre Tessa, Hindseter, Varden — Filefjell, Løsset, Kise på Hedmark, Egnerfjell, Oslo — Blindern, Nesbyen II, Finse, Torp, Gvarv, Sæli II and III, Landvik, Kjevik, Fana Forsøksstasjon, Bergen — Fredriksberg, Bergen — Florida, Fortun, Hareid — Grimstad, Ørstavik — Velle, Stranda — Helsem, Valldal — Linge, Ona — Husøy, Sunndal, Trondheim — Tyholt, Vennafjell, Værnes, Mosjøen — Mosal, Kletkovfjell, Bolna, Bardufoss, Tromsø, Karasjok, Isfjord Radio, Hopen, Bjørnøya and Jan Mayen.

The following stations had a thermograph only: Gaustatoppen, Ås, Prestebakke, Lærdal — Tønjum,

råken, Nordli — Brattvoll, Vardefjell, Tennevoll, Øverbygd, Mestervik, Lyngseidet IV, Nordreisa, Pasvik og Kautokeino II.

Ved utgangen av 1971 hadde følgende værstasjoner pluviograf av vanlig type: Oslo — Blindern, Lista, Bergen — Fredriksberg, Bergen — Florida, Mosjøen — Mosal og Tromsø. I tillegg var følgende værstasjoner utstyrt med pluviograf av typen «Plumatic»: Sæter i Kvikne, Bråtå, Varden — Filefjell, Trysil, Gardermoen, Oslo — Blindern, Drammen — Marienlyst, Nesbyen II, Gvarv, Hylestad — Brokke, Modalen, Opstryn, Sunndal, Trondheim — Tyholt, Høylandet, Nordli — Brattvoll, Øvre Saltdal, Bardufoss, Kirkenes Lufthavn og Karasjok.

Hvilke stasjoner som er utstyrt med barometer, henholdsvis anemometer og vindfløy, ses av rubrikkene H_p, henholdsvis h_a og h_d i stasjonsfortegnelsen side XV.

Lufttrykket ble i 1971 observert på 125 stasjoner, men lufttrykkobservasjonene er bearbeidet klimatologisk bare for 113 stasjoner. Stasjonsbarometrene er kvikksølvbarometre av Fuess- eller Kew konstruksjon. Av stasjonene er 111 utstyrt med barograf, de fleste av typen Fuess.

Lufttemperaturen ble observert på 251 stasjoner. Alle disse målte også minimumstemperaturen og maksimumstemperaturen. Mens lufttemperaturen blir observert kl. (8) 7, 13 og 19 M. E. T. på de fleste stasjonene, blir ekstremtemperaturene avlest bare kl. (8) 7 og 19 M. E. T. Termometrene er hovedsakelig av tysk type, inndelt i $^1/_5$° C. De fleste maksimums- og minimumstermometre er inndelt i $^1/_2$° C. 59 stasjoner er utstyrt med termograf, de fleste av typen Fuess. 39 stasjoner er utstyrt med grasminimumstermometer. Jordtemperaturen kl. 7(8), 13 og 19 M.E.T. måles i 5, 10, 20, 50 og 100 cm's dyp på 13 stasjoner.

251 stasjoner er utstyrt med instrumenthytte av tre, og 1 stasjon har slyngetermometer. 8 stasjoner er utstyrt med aspirasjonspsykrometer. 9 stasjoner er ikke utstyrt med instrumenter, og utfører bare visuelle observasjoner for flygeværtjenesten.

Temperaturen i havoverflaten ble målt hver dag kl. 13 M. E. T. på 16 representative kyststasjoner.

Luftens fuktighet ble målt på 259 stasjoner; av disse har 251 stasjoner Russeltvedts torsjonshygrometer montert i instrumenthytten, 8 stasjoner brukte

Fanaråken, Nordli — Brattvoll, Vardefjell, Tennevoll, Øverbygd, Mestervik, Lyngseidet IV, Nordreisa, Pasvik and Kautokeino II.

At the end of 1971 the following weather stations had a pluviograph of the usual type: Oslo — Blindern, Lista, Bergen — Fredriksberg, Bergen — Florida, Mosjøen — Mosal and Tromsø. In addition the following weather stations had a pluviograph pattern «Plumatic»: Sæter i Kvikne, Bråtå, Varden — Filefjell, Trysil, Gardermoen, Oslo — Blindern, Drammen — Marienlyst, Nesbyen II, Gvarv, Hylestad — Brokke, Modalen, Opstryn, Sunndal, Trondheim — Tyholt, Høylandet, Nordli — Brattvoll, Øvre Saltdal, Bardufoss, Kirkenes Lufthavn and Karasjok.

The stations which are equipped with a barometer, respectively an anemometer and a wind vane, are shown in the columns H_p, respectively h_a and h_d in the list of stations, page XV.

Atmospheric pressure was observed at 125 stations in 1971, but only the observations from 113 of these have been included in the climatological statistics. The station barometers are mercurial barometers of the Fuess or of the Kew pattern. 111 stations are supplied with barographs, most of them of the Fuess type.

The air temperature was observed at 251 stations. All of them recorded the minimum temperature and the maximum temperature. Whilst the air temperature is read at (8) 7, 13 and 19^h C. E. T. at most of the stations, the extreme temperatures are observed only at (8) 7 and 19^h C. E. T. The thermometers are mostly of the German type, graduated in fifths of degrees Centigrade. Most of the maximum- and minimum thermometers are graduated in half degrees Centigrade. 59 stations are equipped with thermographs, most of them of the Fuess type. 39 stations are equipped with grass minimum thermometer. The soil temperature at the following depths: 5, 10, 20, 50 and 100 cm is measured at 7(8), 13 and 19^h C.E.T. at 13 stations.

251 stations are equipped with louvre-boarded thermometer screens, and 1 station uses a whirling thermometer. 8 stations are equipped with aspiration psychrometers. 9 stations are not equipped with instruments, and furnish only visual observations for aviation reports.

The temperature of the sea surface was observed daily at 13^h C.E.T. at 16 representative coastal stations.

Humidity observations were made at 259 stations; 251 of the stations are equipped with a Russeltvedt torsion hygrometer, mounted in the thermo-

aspirasjonspsykrometer, 42 stasjoner har hygrograf og 10 stasjoner termohygrograf av typen Fuess.

meter screen, 8 stations used aspiration psychrometers, 42 stations are equipped with hygrographs and 10 stations with termohygrographs of the Fuess type.

Globalstrålingen ble registrert på 6 stasjoner og antall solskinnstimer på 24 stasjoner. 44 stasjoner er utstyrt med fordunstningsmåler.

Vindens retning og styrke observeres på alle stasjonene, og likeså noteres også den maksimale vindstyrke mellom observasjonsterminene. På 148 stasjoner bedømmes vindretningen etter vindfløy eller vaker, den registreres på 36 stasjoner (hvorav 25 også har indikator), 11 stasjoner har bare indikator. På de øvrige stasjonene bedømmes vindretningen etter skjønn. Vindstyrken registreres på 50 stasjoner (hvorav 25 også har indikator). 11 stasjoner har bare indikator. 8 stasjoner har håndanemometer. På de øvrige stasjonene bedømmes vindstyrken skjønnsmessig etter Beauforts skala.

The global radiation (sun+sky) was measured at 6 stations and hours of bright sunshine at 24 stations. 44 stations are equipped with an evaporimeter.

The direction and the force of the wind are observed at all stations, and so is also the maximum wind force occurring between the standard hours of observation. 148 stations are equipped with a wind vane or a "wind sleeve", 36 stations with dial recorders, (25 of the stations having also dial indicators), 11 stations with dial indicators only. At the remaining stations the wind direction is estimated. 50 stations are equipped with wind recorders (25 of the stations having also dial indicators), 11 stations with dial indicators only. 8 stations are equipped with a hand anemometer. At the remaining stations the wind force is estimated according to the Beaufort scale.

Nedbørmengden (smeltevannet når det er snø eller hagl) blir målt på samtlige stasjoner kl. (8) 7 M.E.T., på de telegraferende stasjoner også kl. 19 M.E.T. Fra 1. april 1966 blir dessuten nedbøren målt kl. 1 og 13 M.E.T. på 22 stasjoner. I den årstid nedbøren vesentlig faller som snø, benyttes en snømåler. Både regn- og snømåleren har en samleflate på 225 cm^2. 210 stasjoner er utstyrt med Nipher vindskjerm, 28 stasjoner er også forsynt med pluviograf, derav 7 av vanlig type med grafisk registrering og 21 av typen «Plumatic», som er konstruert for helautomatisk databehandling og registrerer på magnetbånd. «Plumatic» er foreløpig ikke brukbar når nedbøren kommer som snø, og er ute av drift om vinteren. På Oslo—Blindern og Trondheim—Tyholt er «Plumatic» forsøksvis i drift året rundt. Når det er snø på bakken, observeres snødybden og snødekket hver dag kl. (8) 7 M.E.T.

The amount of precipitation (melted when snow or hail) is measured at all stations at (8) 7^h C.E.T., at the stations furnishing telegraphic reports also at 19^h C.E.T. In addition the precipitation is measured at 1 and 13^h C.E.T. at 22 stations from April 1. 1966. During the time of the year when the precipitation is mainly falling as snow, a snow-gauge is used. Both the rain-gauge and the snow-gauge have a collecting surface of 225 sq.cm. 210 stations are equipped with a Nipher wind shield, 28 stations are also supplied with a pluviograph, 7 of which of the usual type with graphic recording, and 21 of the pattern «Plumatic», which is constructed for automatic rainfall recording and records on magnetic tape. «Plumatic» is for the present not fit for use for snow recording, and is out of operation in the winter time. However, «Plumatic» is being used experimentally throughout the year at Oslo—Blindern and Trondheim—Tyholt. When snow is present on the ground, the depth of the snow and the snow cover are observed daily at (8) 7^h C.E.T.

De daglige nedbørhøyder på 759 stasjoner, derav 240 værstasjoner, er trykt i årboken «Nedbøriakttagelser i Norge» 1971.

The daily depth of precipitation at 759 stations, thereof 240 weather stations, is published in the year book "Nedbøriakttagelser i Norge" 1971.

Været, skydekket, synsvidden og nedbørslags samt været mellom observasjonsterminene observeres på samtlige stasjoner.

Observations of weather, cloudiness, visibility, type of precipitation and past weather are made at all stations.

Av registreringene er bare verdiene fra Oslo — Blindern tatt inn i årboken.

Only data obtained from the recording instruments at Oslo — Blindern are included in the year book.

FORKLARINGER TIL TABELLENE

Tabellene er satt opp i overensstemmelse med de vedtak som ble gjort av den Internasjonale Meteorologiske Organisasjon på møtene i Warszawa 1935 og i Salzburg 1937. De symboler som er benyttet, er forklart på side XIII.

Fra og med årbok 1957 er alle summer og middelverdier beregnet maskinelt ved hjelp av hullkort. Alle tabeller skrives nå ferdig på en Bull-tabulator BZ og nedfotograferes for trykning i offset, slik som beskrevet i Technical Report No. 3: The Norwegian meteorological punch-card layouts for land surface weather stations.

Videre er ekstensotabellene omarbeidet og innholdet revidert og utvidet. Det er også tatt inn en ny tabell som viser nattens midlere minimumstemperatur i 10 cm's høyde over bakken i de enkelte måneder og året for noen stasjoner.

På vanlig tabulator er det umulig å skrive parenteser. Stasjonsnavnene er derfor forandret til f. eks. Oslo — Blindern (istedenfor som tidligere Oslo (Blindern)). Desimalpunktum er i de nye tabellene erstattet med en tynn strek.

Registreringene i Oslo — Blindern. — Verdiene i tabellene på side 1—18 er tatt ut for hver annen time av registreringene og påført de nødvendige korreksjoner. Vindhastigheten representerer den midlere hastighet i m/s i 10 minutter forut for det anførte klokkeslett. Nedbørregistreringene gir sum nedbør i de to timene forut for det angitte klokkeslett. Verdiene for de øvrige elementer er momentanverdier. Følgende registrerinstrumenter har vært benyttet:

Fuess barograf.
Fuess termograf.
Fuess hygrograf.
Anemograf Fuess 90Z.
Fuess pluviograf.

Ekstensotabellene. — Tabellene på side 20—43 inneholder observasjonene kl. 7, 13 og 19 M. E. T. fra Oslo — Blindern, Bergen — Fredriksberg, Trondheim — Tyholt og Tromsø for 1971. Tabellene på side 130—159 inneholder observasjonene kl. 6,30, 12,30 og 18,30 M.E.T. fra Isfjord Radio, Longyearbyen og Jan Mayen, og kl. 6,45, 12,45 og 18,45 M.E.T. for Bjørnøya og Hopen for 1970.

Regnet fra venstre til høyre inneholder rubrikkene:

1. *Datum.*
2. *Lufttrykk* P, på stasjonen i mb.

EXPLANATORY NOTES TO THE TABLES

The tables are arranged in accordance with the decisions made by the International Meteorological Organization at the meetings in Warsaw 1935 and Salzburg 1937. Symbols used are defined on page XIV.

Including the year book 1957 all summaries are calculated by means of punch-cards. All tables now are listed on a Bull-tabulator BZ, ready for photographing to a smaller scale and for printing in offset, as described in Technical Report No. 3: The Norwegian meteorological punch-card layouts for land surface weather stations.

Further the Ekstenso tables have been rearranged, and the contents has been revised and extended. A new table, showing the mean monthly and annual grass minimum temperature during the night at some stations, has been included.

It is impossible to list brackets on an ordinary tabulator. The names of the stations therefore are altered to for instance Oslo — Blindern, while earlier Oslo (Blindern). In the new tables the decimal point is replaced by a thin line.

Data obtained from recording instruments at Oslo — Blindern. — The values given in the tables on pp. 1—18 are obtained from the bi-hourly readings of the selfrecording instruments appropriately corrected. The values for wind speed represent the mean values in $^{m}/_{sec}$ through a period of 10 minutes prior to the time indicated. The records of precipitation give the amount of precipitation in the 2 hours prior to the time indicated. The other elements represent instantaneous values. The following recording instruments have been used:

Fuess barograph.
Fuess thermograph.
Fuess hygrograph.
Anemograph Fuess 90Z.
Fuess pluviograph.

Tables of individual observations. — The tables on pp. 20—43 contain observations made at 7, 13 and 19^{h} C. E. T. at Oslo — Blindern, Bergen — Fredriksberg, Trondheim—Tyholt and Tromsø for 1971. The tables on pp. 130—159 contain observations made at 6,30, 12,30 and 18,30^{h} C.E.T. at the stations Isfjord Radio, Longyearbyen and Jan Mayen and at 6,45, 12,45 and 18,45^{h} C.E.T. at Bjørnøya and Hopen for 1970.

The contents of the columns from left to right are as follows:

1. *Date.*
2. *Atmospheric pressure* P, in mb at cistern level.

3. *Lufttemperatur* T, i °C.
4. *Været* ved observasjonstiden angitt ved et eller flere av symbolene på side XIII.
5. *Været* (ww) ved observasjonstiden uttrykt ved synopkoden 00—99.
6. *Været* siden forrige observasjon angitt ved et eller flere av symbolene på side XIII.
7. *Relativ fuktighet* U, i %.
8. *Vindretningen* dd, i skalaen 01—36.
9. *Vindstyrken* F, i Beaufort.
10. *Det totale skydekket* N, i åttendedeler.
11. *Synsvidden* V, etter synopkoden.
12. *Snødekket* [*], i skalaen 0—4 og snødybden s, i hele cm.
13. *Døgnets minimumstemperatur* T_n, i °C mellom kl. 19 den angitte og kl. 19 den foregående dag.
14. *Døgnets maksimumstemperatur* T_x, i °C mellom kl. 19 den angitte og kl. 19 den foregående dag.
15. *Døgnets samlede nedbørhøyde* R, i mm mellom kl. 7 den angitte og kl. 7 den foregående dag.
16. *Den maksimale vindstyrken* F_x, i Beaufort mellom kl. 19 den angitte og kl. 19 den foregående dag.

Måneds- og årsoversikter. — Tabellene på side 44 — 121 og 160—161 inneholder måneds- og årsmidler og summer av de forskjellige elementer. I «hodet» er bare angitt observasjonstid kl. 7. Stasjonsfortegnelsen viser at morgenobservasjonen tas kl. 6 ved 1 stasjon, kl. 8 ved 33 stasjoner og kl. 9 ved 1 stasjon. Regnet fra venstre til høyre inneholder rubrikkene:

1. *Måned.*
2. *Lufttrykket i stasjonens nivå* (P_m) og lufttrykket redusert til havets overflate ($P_{o,m}$) eller til nærmeste standard-geopotensial flate. Lufttrykket reduseres til havets nivå for alle stasjoner unntatt Fanaråken, Gaustatoppen og Midtlæger. Siden 1. januar 1969 er benyttet de reduksjonsmetoder som er beskrevet i WMO Technical Note No. 61 (jfr. WMO No. 226. TP. 120: Methods in use for the reduction of atmospheric pressure). Reduksjonstabellene er fra samme dato beregnet og skrevet ut ved hjelp av EDB. De reduserte lufttrykk beregnet etter de nye metoder avviker lite fra dem en tidligere benyttet[1,2]). På stasjoner hvor sterke temperaturinversjoner kan forekomme om vinteren, gir imidlertid de nye meto-

3. *Air temperature* T, in °C.
4. *Present weather* characterized by one or more of the symbols on page XIV.
5. *Present weather* ww, expressed by the synop-code numbers 00 – 99.
6. *Past weather* since the foregoing observation characterized by one or more of the symbols on page XIV.
7. *Relative humidity* U, in per cent.
8. *Wind direction* dd, on the scale 01—36.
9. *Wind force* F, on the Beaufort scale.
10. *Total cloud amount* N, in oktas.
11. *Horizontal visibility* V, according to the synopcode.
12. *Snow cover* [*], on the scale 0—4 and snowdepth s, in whole cm.
13. *Daily minimum temperature* T_n, in °C covering the 24-hour period ending at 19^h the date concerned.
14. *Daily maximum temperature* T_x, in °C covering the 24-hour period ending at 19^h the date concerned.
15. *Daily total height of precipitation* R, in mm covering the 24-hour period ending at 7^h the date concerned.
16. *Maximal wind force* F_x, on the Beaufort scale during the 24-hour period ending at 19^h the date concerned.

Monthly and annual summaries. — The tables on pp. 44—121 and 160—161 contain monthly and annual means and sums of the different elements. The heading indicates morning observation at 7^h C.E.T. only. The list of stations shows that the morning observation is made at 6^h C.E.T. at 1 station, at 8^h C.E.T. at 33 stations, at 9^h C.E.T. at 1 station. The contents of the columns from left to right, are as follows:

1. *Month.*
2. *Atmospheric pressure at station level* (P_m) and atmospheric pressure reduced to mean sea level ($P_{o,m}$) or to the nearest standard geopotential surface. The air pressure is reduced to mean sea level for all stations except Fanaråken, Gaustatoppen and Midtlæger. Since January 1. 1969 the methods described in WMO Technical Note No. 61 (compare WMO No. 226. TP. 120: Methods in use for the reduction of atmospheric pressure) have been used. From the same date the reduction tables are calculated and listed by means of EDB. The reduced air pressures calculated by means of the new methods differ very little from the results derived from the old methods[1,2]). On stations with strong temperature

[1] Arnt Eliassen: On the Correction and Reduction of Barometer Readings. Geof. Publ. Vol XIII No: 11.

[2] Jahrbuch des Norwegischen Meteorologischen Instituts für 1944 S. XI.

der noe lavere verdier, og dette synes å gi bedre overensstemmelse med de reduserte trykk for lavlandsstasjonene.

3. Lufttemperaturen (i Celsiusgrader). — Månedsmidlene (Dies) er beregnet av formelen[1])

$$M = n - k(n - \overline{Min})$$

hvor n er midlet av observasjonene kl. (8) 7, 13 og 19 M.E.T., k en faktor som varierer med årstiden og fra stasjon til stasjon[2]), og $\overline{Min}$ er den midlere minimumstemperatur. Temperaturekstremene gjelder for døgnet regnet fra kl. 19 til kl. 19.

4. Vindfordelingen. — Vindstyrken er gitt etter Beaufortskalaen. Vindretningen er gitt i skalaen 01—36 og henført til den nærmeste retning delelig med 3, nemlig:
N (36), N30°E (03), N60°E (06), E (09)
E 30°S (12), E60°S (15), S (18), S30°W (21)
S60°W (24), W (27), W30°N (30), W60°N (33).
Den første tallkolonnen under hver retning gir antall tilfeller med vind fra vedkommende retning, og den andre kolonnen gir den midlere vindstyrke.

5. *Relativ fuktighet* (i prosent). — På stasjoner hvor Russeltvedts torsjonshygrometer blir brukt, tas den relative fuktighet ut av tabeller som er beregnet for hvert instrument. Fuktighetene som observeres med psykrometer blir omregnet til relativ fuktighet ved hjelp av Jelineks tabeller når temperaturen er over frysepunktet, og ved hjelp av Birkelands[3]) tabeller når temperaturen er under frysepunktet. Den relative fuktighet refererer seg alltid til metningstrykket over vann.

Månedsmidlet er beregnet av Køppens formel

$$M = q + c(p - q)$$

hvor q er midlet av morgen- og aftenobservasjonene, p midlet av middagsobservasjonene og c er en faktor som varierer med stedet og tiden.[4])

6. *Skydekket* (i skalaen 0—8). — Månedsmidlene beregnes som det aritmetiske middel av morgen-, middags- og kveldsobservasjonene.

inversions during the winter, however, the new methods give somewhat lower values, which apparently are in better accordance with the reduced air pressures at the lowland stations.

3. *Air temperature* (in degrees Centigrade). — The monthly means are computed from the formula[1])

$$M = n - k(n - \overline{Min})$$

where n is the mean of the observations made at (8) 7, 13 and 19[h] C.E.T., k a factor appropriate for the station and season[2]), and $\overline{Min}$ is the mean minimum temperature. The extreme temperatures refer to the 24-hour period from 19 to 19 hours.

4. Wind distribution. — The wind force is given according to the Beaufort scale. The wind direction is given on the scale 01—36, reduced to the nearest direction divisible by 3, viz:
N (36), N30°E (03), N60°E (06), E (09)
E30°S (12), E60°S (15), S (18), S30°W (21)
S60°W (24), W (27), W30°N (30), W60°N (33).
The first column of figures under each direction gives the number of cases of winds from the direction indicated, and the second column of figures gives the mean wind force.

5. *Relative humidity* (in per cent). — At stations where Russeltvedt's torsion hygrometers are used, the relative humidity is obtained from tables computed for each instrument. Humidities observed by psychrometers are converted to relative humidity by the aid of Jelinek's tables when the temperature is above freezing and by aid of Birkeland's[3]) tables when the temperature is below freezing. Throughout, the relative humidity refers to saturation over water. The monthly means are computed from Køppen's formula

$$M = q + c(p - q)$$

where q denotes the mean of the morning and the evening observations, p the mean of the midday observations and c is a factor appropriate for the station and the season.[4])

6. *Amount of cloud cover* (on the scale 0—8). — The monthly means are computed as the arithmetic means of morning, midday and evening observations.

[3] B. J. Birkeland: Neue Feuchtigkeitstafeln für das Psychrometer unter dem Gefrierpunkt, Christiania, 1907, Vorwort.

[4] Jahrbuch des Norwegischen Meteorologischen Instituts für 1920, S. XI og Norsk Meteorologisk Årbok 1949, S. 135 og 139.

7. *Nedbøren* (i mm). — Nedbørhøyden blir målt kl. (8) 7 M. E. T., og gjelder for de foregående 24 timer. Månedssummene er gitt på nærmeste hele mm, mens de maksimale nedbørhøyder (R_d, max) er gitt på nærmeste 0,1 mm. Prosenten av normalen $\left(100 \cdot \frac{\Sigma R_d}{\overline{R}}\right)$ refererer seg til normalen for perioden 1931—60.

8. *Antall dager med visse fenomener.* — Når det gjelder nedbørmengden, regnes døgnet fra kl. (8) 7 til kl. (8) 7, i forbindelse med andre fenomener regnes det fra kl. 19 til kl. 19.

Som nedbørdager regnes alle dager når nedbørhøyden er 0.1 mm eller mer. Dager med sludd telles opp for seg og tas dessuten med i kolonnene under dager med regn og dager med snø. Likeledes telles også antall dager med yr opp som dager med regn når nedbørmengden er 0.1 mm eller mer. Til antall dager med yr, hagl og tordenvær regnes alle dager da slike fenomener har forekommet, uten hensyn til nedbørhøyden. Dessuten skjelnes mellom tåke og tåkedis ettersom den tilhørende synsvidden er mindre eller større enn 1 km. Fra og med 1956 er «antall dager med tåke» erstattet med en tabell som gir antall tilfeller med tåke ved observasjonstidene kl. (8) 7, 13 og 19 M.E.T., og antall dager med solskinn og tåkedis er sløyfet. Som klare dager regnes dager på hvilke summen av skydekketallene kl. (8) 7, 13 og 19 M. E. T. er 4 ($^4/_8$) eller mindre. På samme vis regnes hver dag når summen av skydekketallene kl. (8) 7, 13 og 19 M. E. T. er 20 ($^{20}/_8$) eller mer, som en overskyet dag. Dager med snødekke er dager når $^3/_4$ eller mer av bakken er dekket med snø.

Avvikelser fra normalene. — Tabellene på side 19 gir avvikelsene i de midlere lufttrykk i stasjonens nivå (ΔP) og i middeltemperaturene (ΔT) i 1971 fra middelverdiene for perioden 1931—60.

Nattens midlere minimumstemperatur 10 cm over bakken T_g. I tabellen på side 19 er den midlere minimumstemperaturen i 10 cm's høyde over bakken i løpet av natten (mellom kl. 19 og (8) 7) beregnet for 15 utvalgte stasjoner i 1971.

Sjøtemperaturen (T_s). — Måneds- og årsmidler for temperaturen i havoverflaten 1971 på 13 representative kyststasjoner finnes på side 19.

Pentademidler av lufttemperaturen. — Tabellene på side 122—128 viser temperaturmidlene i perioder på

7. *Amount of precipitation* (in mm). — The amount of precipitation is measured at (8) 7^h C. E. T. and refers to the preceding 24-hour period. The monthly sums are given to the nearest mm, while the maximum amounts (R_d, max) are given to the nearest tenths mm. The percentage of the normal amount of precipitation $\left(100 \cdot \frac{\Sigma R_d}{\overline{R}}\right)$ refers to the normal value for the period 1931—60.

8. *Number of days with specified phenomena.* — Insofar as the amount of precipitation is concerned, the «day» is reckoned from (8) 7 to (8) 7^h, in connection with other elements the «day» refers to the period from 19 to 19^h.

As a day with precipitation is counted any day on which the amount of precipitation is 0.1 mm or more. Days with sleet are counted separately and are also included in the columns referring to days with rain and snow. Likewise the number of days with drizzle is included in the number of days with rain when the amount of precipitation is 0.1 mm or more. As days with drizzle, hail and thunderstorm are reckoned any day on which such phenomena occurred, regardless of the amount of precipitation associated with them. Furthermore, differentiation is made between fog and mist according to whether the associated visibility is lower or higher than 1 km. From 1956 "the number of days with fog" are replaced by a table giving the frequency of days with fog at (8) 7, 13 and 19^h C. E. T., and number of days with sunshine and mist have been omitted. As clear days are counted days on which the sum of the amount of cloud cover at (8) 7, 13 and 19^h C. E. T. is 4 (i.e. $^4/_8$) or less. Similarly, as an overcast day is taken any day when the sum of the cloud cover at (8) 7, 13 and 19^h C. E. T. is 20 (i.e. $^{20}/_8$) or more. Finally, a day with snow cover is a day on which $^3/_4$ or more of the ground is covered by snow.

Departures from normals. — The tables on p. 19 give the departures of the mean pressures at cistern level (ΔP) and the mean temperatures (ΔT) for 1971 from the mean values for the period 1931—60.

Mean grass minimum temperature during the night T_g. The table on p. 19 gives the mean monthly and annual grass minimum temperature during the night (from 19^h to (8) 7^h) at 15 selected stations in 1971.

Sea surface temperature (T_s). — Monthly and annual means of the sea surface temperature 1971 at 13 representative coastal stations are given on p. 19.

Five-day means of temperature. — The tables on pp. 122—128 give the mean temperature for conse-

5 dager for 107 utvalgte stasjoner i 1971. Midlene er beregnet av formelen

$$M = n - k(n - \overline{\text{Min}})$$

hvor n er midlet av observasjonene kl. (8) 7, 13 og 19 M. E. T., k en faktor som varierer med årstiden og fra stasjon til stasjon[1]) og $\overline{\text{Min}}$ den midlere minimumstemperatur i 5-dagers perioden.

Den relative solskinnstid. — I 1953 opprettet Geofysisk Institutts avdeling B ved Universitetet i Bergen et nett av stasjoner for registrering av solskinnstimer. En del av stasjonene i dette nettet ble overtatt av Meteorologisk Institutt i 1959. Antall timer med klart solskinn har hele tiden vært registrert med Campbell-Stokes solskinnsautograf. I årbok 1963 ble trykt månedsverdier for den relative solskinnstid, d.v.s. forholdet mellom den registrerte solskinnstid og den maksimalt mulige solskinnstid på vedkommende stasjon, uttrykt i prosent, for 8 stasjoner for årene 1953—63.

På side 129 er gitt de tilsvarende verdier for 1970 for 2 stasjoner og for 1971 for 22 stasjoner.

Globalstråling. — Globalstrålingen på en horisontal flate er målt med Kipp & Zonen solarimeter. Tabellen på side 129 gir månedssummene av globalstrålingen i cal/cm² for 6 stasjoner. Tilsvarende data for Bergen publiseres i «Monthly Radiation Values for Bergen, Norway», utgitt av Universitetet i Bergen.

Oslo, juni 1972.

[1] Jahrbuch des Norwegischen Meteorologischen Instituts für 1943, S. 96—97 og Norsk Meteorologisk Årbok 1949 S. 136—137 og 140—141.

cutive periods of 5 days for 107 selected stations in 1971. The means are computed from the formula

$$M = n - k(n - \overline{\text{Min}})$$

where n is the mean of the observations at (8) 7, 13 and 19^{h} C. E. T., k a factor appropriate for the station and season[7]) and $\overline{\text{Min}}$ is the mean minimum temperature during the 5-day period.

Relative duration of sunshine. — In 1953 the Geophysical Institute, Section B, at the University of Bergen established a network of stations for recording of hours of sunshine. Some of the stations in this network were undertaken by the Norwegian Meteorological Institute in 1959. Hours of bright sunshine have all the time been recorded with Campbell-Stokes sunshine recorder. In the year book 1963 were printed monthly values of the relation in per cent between the recorded hours of sunshine and the maximum possible hours of sunshine at the respective stations for 8 stations during the years 1953—63.

On p. 129 are given the corresponding values for 1970 for 2 stations and for 1971 for 22 stations.

Global radiation — Global radiation on a horizonal surface has been recorded with a Kipp & Zonen solarimeter. The table on p. 129 gives the monthly totals of global radiation in cal/cm² for 6 stations. The corresponding values for Bergen are published in «Monthly Radiation Values for Bergen, Norway», issued by the University in Bergen.

Oslo, June 1972.

SYMBOLER

Symboler som forekommer i rubrikkene for «Været ved observasjonstiden» og «Været siden forrige observasjon» på Ekstensotabellene samt i Måneds- og Årsoversiktene.

∞	Ølrøyk.
