SURVEY DEPARTMENT,
MINISTRY OF FINANCE.

REPORT ON THE WEATHER OF JANUARY, 1911.

January has been a month of disturbed conditions on the whole. In spite of the existance of low pressure areas to the north-west, the first ten days were characterized by settled weather, with a certain amount of cloudiness and mist. On the 10th, a low pressure area advanced from Tripoli north-eastwards to Greece on the 11th. It then changed direction and moved eastwards, at first slowly but more rapidly later, till on the 15th, the centre lay near Cyprus. On the 13th gradients were very steep and strong southerly winds prevailed as far south as Assiut. Some rain fell after the passage of the trough.

From the 15th to 18th a high pressure area existed over Greece, but conditions to the west of Egypt were undecided, and some small local depressions gave rise to bad weather in the north. On the 20th a more decided depression appeared to the south of Cyprus, and in consequence winds freshened and a considerable amount of rain fell generally as far south as Beni Suef.

From the 21st to 23rd, pressure was high over Greece, and fresh, cold northerly winds prevailed as a consequence; but on the 24th, another shallow depression brought rainy weather which lasted till the 29th. On the 30th and 31st another depression threatened bad weather with south-westerly winds and rain.

Pressure has been below normal in all our districts except the South Sudan. Temperature has been below normal in Lower and Middle Egypt, and in the South Sudan, but well above normal in Upper Egypt and the rest of the Sudan.

Rainfall has been about normal for the month in the north, and slightly below normal for Middle Egypt. The Red Sea coast of the Sudan has been abnormally rainless during the month.

Table showing the departures from normal of January 1911 by districts.

Districts	Barometer Reduced to 0°C, Sea level, & Mean Gravity			Temperature (Max. + Min.)/2			Rainfall		
	Normal	1911	Dept.	Normal	1911	Dept.	Normal	1911	Dept.
	mm.	mm.	mm.	°C	°C	°C	mm.	mm.	mm.
I Mediterranean ...	763·4	763·2	−0·2	13·3	12·3	−1·0	53	53	0
II Middle Egypte ...	764·9	763·6	−1·3	12·8	12.4	−0·4	17	15	−2
III Saharan	765·0	763·6	−1·4	15·0	15·9	+0·9	—	—	—
IV North Sudan ...	761·4	759·8	−1·6	22·2	23·3	−1·1	0	0	0
V Red Sea	761·9	761·4	−0·5	22·8	—	—	21	0	−21
VI Central Sudan ...	760·0	758·8	−1·2	24·3	25·4	+1·1	0	0	0
VII South Sudan ...	756·4	757·4	+1·0	28·2	27·5	−0·7	4	[2]*	−2

* For 30 days from Mongalla only.

State of the River. — On the White Nile levels were at first high, but in the end of the month they fell very rapidly and were normal at its close. The Blue Nile was slightly above normal, and the main Nile at Wadi Halfa from normal improved slightly during the month.

J. I. Craig,
Director Computation Office.

REPORT ON THE WEATHER OF FEBRUARY, 1911.

The month may be divided into five chief periods as regards the weather. These all characterised by the passage of depressions of greater or less intensity, which ed one another with short intervals of high pressure. As a consequence, February has month of bad weather on the whole. The first low pressure system appeared between st and 5th, persisted for some days to the north of the country, and caused much itation on the coast. A second depression affected Egyptian weather between the 6th 8th and was accompanied by strong winds, dust and rain.

The third influenced our northern districts between the 14th and 18th, and was also panied by strong winds and rain. Between the 21st and 23rd the fourth depression strong winds but no rainfall, and on the 26th the high pressure area which usually the west passed to the east of Egypt and two depressions, apparently connected, eastward accompanied by khamsin weather and followed by cold northerly winds ain.

In spite of the regularity with which low depressions appeared, pressure was every- above normal for the month, a condition due largely to the distance at which most em passed.

As is usual when pressure is above normal, temperature was considerably below the ge, by from 1°.9 C. to 2°.8 C. in Egypt and 0°.3 to 1°.0 in the Sudan.

Rainfall was considerably above normal in Egypt, slightly so in the Central Sudan, elow normal on the Red Sea Coast. Much rainfall is reported from the neighbourhood as Jemsa.

State of the river. — The White Nile was about normal throughout the month, and lue Nile at Roseires was slightly above normal. In consequence, the main river was bove normal, but it appears probable that for the next month it will fall to its average for the season.

Table showing the departures from normal of February 1911 by districts.

SURVEY DEPARTMENT,
MINISTRY OF FINANCE

REPORT ON THE WEATHER OF MARCH, 1911.

The month opened with bad weather under the influence of a depression which passed rapidly from Crete eastwards, and led to southerly winds and rain over the Delta. Another period of low pressure, terminating on the 7th, was also characterised by southerly winds and wet weather in the north. It was followed by an interval of fine weather which lasted till the 17th. On this date another depression appeared over Tripoli, and on the 18th it caused khamsin weather in Egypt. This was followed by fine weather until the 24th, when a fourth depression led again to khamsin weather, strong winds and some drops of rain. After the 25th weather remained fine, but cold, expecially at night.

Pressure was on the whole above normal, and temperature was decidedly below normal in all our districts except the Central Sudan.

Rainfall was in excess in the north, but in defect in Middle Egypt and the Central Sudan. In the South Sudan and East Africa rainfall was in excess.

State of the River. — The Bahr el Jebel, following on the weak rains and low levels of Lake Albert last November, was at a very low level, and the White Nile at Tawfikia fell slightly below normal during the first fortnight, but recovered to normal during the second fortnight. The Blue Nile was a few centimetres above normal at Roseires throughout the month, and normal at Khartoum. The main river at Wadi Halfa was a few centimetres above normal, but fell to almost normal during the last week.

Table showing the departures from normal of March 1911 by districts.

COMPARISON OF THERMOMETRIC SCALES

PROBABLE WEATHER — for 24 hours ending noon 3/3/1911

The depression to which the bad weather has been due has now passed to the N.E. and fresh N.W. winds may be expected, with more rain. An improvement tomorrow is probable.

REMARKS:

Light rain yesterday at Helwan.

COMPARISON OF THERMOMETRIC SCALES

PROBABLE WEATHER for 24 hours ending noon 31/3/1911

Pressure is high over the Levant, and low in the central Mediterranean. The fine weather will continue today and probably tomorrow, but may be expected to give way to southerly winds after that.

Relative Humidity.

REPORT ON THE WEATHER OF APRIL, 1911.

On the 6th and 7th a depression moved rapidly from Candia to Cyprus, and led to southerly winds and warm weather. From the 10th to the 13th, two depressions again gave strong southerly winds followed by very light rain in some parts. Another deep depression from the 15th to 17th was accompanied by strong southerly winds with rain in the north on the 16th. Thereafter normal settled weather prevailed till the period from the 22nd to 24th when a high pressure area over the Aègean Sea was, as usual, accompanied by fresh northerly wind with cool weather. A considerable amount of rain fell on the 25th but at present the reasons are obscure as no definite depression can be traced. Weather continued fine and cool, with a high barometer till the 29th when a distant depression led to light khamsin weather over Lower Egypt.

Pressure was low for the first half of the month and high for the second half; for the whole month the barometer was below average over Egypt and above it in the Sudan. Temperature was on the whole normal. Rainfall was slightly less than usual at this time in Egypt, and the Central Sudan, but was considerably in defect in the South Sudan. There was a considerable excess of rain at Zanzibar, which is a circumstance to some extent unfavourable for the coming flood.

State of the river. — The Bahr el Jebel continues to be very low as a consequence of the lowness of Lake Albert, but the first rises have begun at about their usual time. Probably in consequence of the deficiency of water on the Bahr el Jebel, the White Nile is now slightly below normal at Malakal (Taufikia). The Blue Nile at Roseires was about normal, and at Khartoum slightly under it. The Main Nile either normal or very slightly above it. Average conditions appear to be indicated for the next month.

Table showing the departures from normal of April 1911 by districts.

COMPARISON OF THERMOMETRIC SCALES

PROBABLE WEATHER for 24 hours ending noon 14 4 1911

The distribution of pressure is very abnormal. The strong northerly winds may be expected to continue today and probably tomorrow.

The distribution in the Sudan marks the transition from winter to summer conditions.

Relative Humidity.

COMPARISON OF THERMOMETRIC SCALES

PROBABLE WEATHER for 24 hours ending noon 17·4·1911

A deep depression passed yesterday along the Mediterranean. Following this, strong northerly winds with rain in the north are probable.

REMARKS:

Light rain yesterday afternoon at Minia.

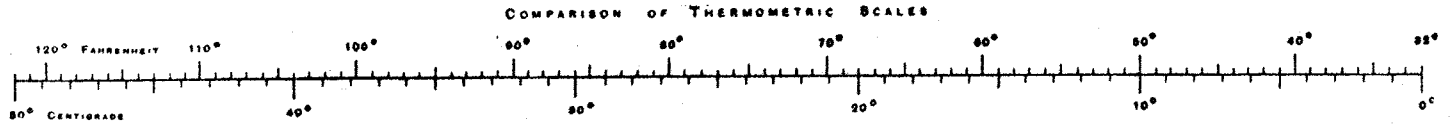
COMPARISON OF THERMOMETRIC SCALES



PROBABLE WEATHER — for 24 hours ending noon 18/4/1911

The depression has moved to the N.E. and fresh, cold northerly winds are probable with more rain.

The strong winds have reached the Sudan, and have caused the distribution of pressure to revert to the winter type.

REMARKS:

Light rain yesterday at Giza, Ezbekia, and Helwan.

SURVEY DEPARTMENT,
MINISTRY OF FINANCE

REPORT ON THE WEATHER OF MAY, 1911.

Anticyclonic conditions persisted throughout the month except on three occasions when low pressure areas approached from the west or south-west. These were on the 15th, 19th and from the 22nd to 25th. On the 24th an intense secondary depression to a primary over the Mediterranean developed over Middle Egypt at 12h 40m. and caused very strong lifting winds. Much dust was raised so that the sky was obscured. Many trees were uprooted, probably owing to the lifting force of the gale, damage was done to the electric tram lines, and several boats were sunk on the Nile. The storm raged with almost equal intensity over the Delta. The wind continued very strong the whole afternoon and at intervals drops of rain fell, but next day fresh cold northerly winds set in.

Although conditions were anticyclonic pressure was below normal in all our districts except the Central Sudan and Red Sea Coast.

Temperature was below normal in the North, slightly above it in the rest of Egypt, and considerably below it in the Sudan.

In Egypt rainfall was slightly below normal, but in the Sudan where interest chiefly centres at this season, there was a considerable excess. The same excess extended to Equatorial East Africa, a condition slightly adverse to the approaching flood.

Table showing the departures from normal of May 1911 by districts.

Districts	Barometer Reduced to 0°C. Sea level, & Mean Gravity			Temperature (Max. + Min.)/2			Rainfall

VIII Equatorial	—	—	—	—	—	—	238	360	+122

State of the River. — The Bahr el Jebel continues low but has begun to improve under the heavy rainfall, the full effect of which will not be felt, however, until the earth becomes saturated. The poor supply on this river has sent the White Nile below normal at Taufikia. Early in the month a brisk rise began on the Blue Nile some eight days ahead of the usual date. This culminated about the 19th, since when there has been a return to levels about normal or a little below normal. The rise has just begun to affect Wadi Halfa gauge, but a return to normal conditions is probable for the rest of the month.

J. I. CRAIG,
Director Computation Office.

Giza, June 4th, 1911.

REPORT ON THE WEATHER OF JUNE, 1911.

The usual summer conditions prevailed during the whole month exept on the following occasions :—

(1) A high pressure area advanced from the north on the 1st and 2nd and simultaneously:

(2) A low pressure system developed to the west of Egypt causing warm southerly and easterly winds. This depression was filled up on the 3rd.

(3) From the 11th-13th a depression passed from Malta to Athens without affecting Egyptian weather except for warm winds on the afternoon of the 13th.

Pressure was above normal and temperature below in all districts, except that in the Central Sudan temperature was above normal.

Table showing the departures from normal of June 1911 by districts.

* For 29 days only.

Pressure. — The mean pressure of the month was above normal in Egypt, at Athens and Beirut and at the Indian Ocean stations.

River Gauges. — Both White and Blue Niles have been rising at about their normal rates, the river level being normal at Malakal and slightly above at Roseires. Wadi Halfa gauge rose during the first ten days of the month owing to the rainfall of May in the Blue Nile Basin, but owing to the check in the rains it is now 25 cms. below normal.

St. Helena Conditions. — At St. Helena, pressure and wind velocity were below normal.

Forecast. — There is no reason to modify the forecast, issued on June 17, that the flood may be expected to be about 10 % below average.

J. I. Craig,
Director Computation Office.

Giza, July 3rd, 1911.

SURVEY DEPARTMENT.
MINISTRY OF FINANCE

REPORT ON THE WEATHER OF JULY, 1911.

No depressions entered the East Mediterranean Basin during July, and normal conditions prevailed throughout the month. Barometric Pressure was on the whole decidedly above normal, and fresh and cool northerly winds were common in consequence. Temperature was below normal in all our districts except in the Red Sea Coast and Central Sudan.

Table showing the departures from normal of July 1911 by districts.

Districts	Barometer Reduced to 0°C, Sea level, & Mean Gravity			Temperature (Max. + Min.)/2			Rainfall

Pressure. — The mean pressure for the month was above normal in all our districts, at Athens and Beirut, and at the Indian Ocean stations.

Rainfall. — All over the Sudan it was decidedly above normal, but at Zanzibar it was below.

River Gauges. — Both White and Blue Niles have been rising at about their normal rates, the river level being about normal at Malakal and slightly above at Roseires. Wadi Halfa gauge has been rising more slowly than usual, and is now 75 cms. below normal.

Forecast. — There is no reason to modify the forecast issued on June 17, that the flood may be expected to be about 10 % below average.

J. I. Craig,
Director Computation Office.

Giza, August 3rd, 1911.

REPORT ON THE WEATHER OF AUGUST, 1911.

During August the usual summer conditions prevailed throughout the month. In Egypt, pressure was above normal except during the last few days when it was below. In consequence temperature was mostly below normal but at the end of the month it was above.

Table showing the departures from normal of August 1911 by districts.

Districts	Barometer Reduced to 0°C, Sea level, & Mean Gravity			Temperature (Max. + Min.)/2			Rainfall

,, ,,	Renk	132	208	+76	Red Sea Coast	Suakin	5	0	−5

Pressure. The Mean pressure for the month was above normal in all our districts except in the North Sudan and on the Red Sea Coast. At Athens and Beirut it was below normal throughout the month. At the Indian Ocean stations, pressure was above normal at the beginning and below at the end of the month.

Rainfall was greatly in defect in all districts except in the Central Sudan where it was about normal.

River Gauges. The White Nile was slightly below normal throughout the month. The Blue Nile was below normal at the beginning, it improved about the middle, and at the end of the month was fluctiating about the normal. The main Nile, which was below normal during the first half of the month, rose rapidly and remained about normal during the latter half.

St. Helena Conditions. Pressure and wind velocity were both below normal.

F. S. Richards
Act. Supt. Computation Office.

REPORT ON THE WEATHER OF SEPTEMBER, 1911.

The weather was settled in character throughout the month and the only depression which entered the Mediterranean basin during September passed to the north of Greece, and had no influence on weather in this country. In the Sudan there were signs that the summer distribution of pressure was changing into the winter one, a state of affairs which indicates the approaching break-up of the monsoon and cessation of the rainy season.

Pressure during the month was above normal in all our districts. Temperature was below normal in Egypt, but above it in the Sudan. Humidity has been slightly above normal in Egypt. The North Coast was rainless, and the Sudan as a whole suffered from a deficiency of rain amounting to about 15 percent.

Table showing the departures from normal of September 1911 by districts.

Districts	Barometer Reduced to 0°C. Sea level, & Mean Gravity			Temperature (Max. + Min.)/2			Rainfall

* For 1-15.
† For 28 days only.

River Gauges. The latest information shows that the Bahr el Jebel is considerably below its normal level, largely in consequence of the depletion of Lake Albert in the early part of the year. The Upper Sobat was above normal in the early part of the month, but the Lower Sobat and White Nile did not rise at their usual rate and are now about 50 cms below normal. There were two good flushes down the Blue Nile in the first three weeks, but during the last ten days the river fell very rapidly, and is now 45 cms below its usual level at Roseires, and 40 cms at Khartoum. The Atbara, like the Blue Nile, was high for the first portion of the month (17 days) but thereafter fell below normal. In consequence of the flushes down these two rivers, gauge readings on the main Nile rose by about half a metre during the first ten-day period, and all of them passed above normal; but the rise was not well sustained, and the river is now below its average height for the season.

The volume of the flood water passing Halfa is 14 % below average to date.

J. I. Craig,
Director Computation Office.

Giza, October 4th, 1911.

SURVEY DEPARTMENT,
MINISTRY OF FINANCE

REPORT ON THE WEATHER OF OCTOBER, 1911.

Up to the 18th of the month weather was normal in character, but on the 19th and 20th, a shallow depression over the Mediterranean led to southerly winds, followed by rain over the Delta when the wind veered round to west. On the 25th and 26th another shallow depression led to southerly winds and light rainfall in the north. Thereafter fine but damp weather continued till the end of the month. In the Sudan monsoon conditions began to give way and, towards the end of the month, winter conditions showed signs of becoming established.

Pressure was above normal in all districts of Egypt and the Sudan. Temperature was slightly below average in Egypt and in the Central and Southern Sudan, but above average in the North Sudan. From the 6th to the 15th, temperature in Egypt was well above average, and this heat coming at this time was of considerable benefit to cotton cultivation. After the middle of the month temperature fell considerably, especially during the night, and the fall was accompanied by an increase in the humidity and of fogs, during the last ten days of the month.

Table showing the departures from normal of October 1911, by districts.

Districts	Barometer Reduced to 0°C. Sea level, & Mean Gravity			Temperature (Max. + Min.)/2			Rainfall		
	Normal	1911	Dept.	Normal	1911	Dept.	Normal	1911	Dept.

VII South Sudan* ...	757·7	759·6	+1·9	27·3	27·2	−0·1	115	[64]*	−51
VIII Equatorial	—	—	—	—	—	—	—	—	—

* For 28 days only at Mongalla.

Rainfall was below normal in Egypt and the Sudan, with the exception of the Red Sea coast and Central Sudan where there was a slight deficiency.

State of the River. According to last information (Sept. 30) the Bahr el Jebel continued some 70 cm. below its normal height for the season. The Bahr el Ghazal had begun to fall and fell rapidly about three weeks before its usual date, but this river is negligible as a factor in the economy of the Nile. The River Sobat in the end of September was well up to its average. The White Nile, however, was weak, probably in consequence of the poor supply on the Bahr el Jebel. The Blue Nile had begun to fall rapidly in the end of September, but two flushes early in October sent readings above normal for a few days, and they are now apparently about normal. From an inspection of the readings for lower stations, however, it is safer to conclude that this river was steadily below normal levels in October, and finished the month some 25 cm. too low. The effect of this appears on all the gauges of the main Nile, which were below their normal height by greater or less amounts throughout the month.

The volume of the flood passing Wadi Halfa between July 1 and October 31 was 10 per cent below normal.

J. I. Craig,
Director Meteorological Service.

Cairo, November 4th, 1911.

JAN 2 1912
Weather Bureau

SURVEY DEPARTMENT,
MINISTRY OF FINANCE.

REPORT ON THE WEATHER OF NOVEMBER, 1911.

On the 3rd a low pressure area advanced from near Malta eastwards and reached the north of Egypt on the 5th. Next day the depression led to a thunderstorm accompanied by rain over Lower Egypt, in the afternoon, and for four days it appears to have remained nearly stationary over Syria, causing disturbed weather in Lower Egypt.

A second depression led to disturbed weather with heavy rain in the central Mediterranean from the 11th to 18th, but Egypt was not affected.

For the rest of the month Egypt enjoyed high pressure and fine weather and on the last two days cold dry northerly winds, owing to the existance of an area of high pressure over Greece.

Pressure was above normal in the north of the country, slightly below it in Upper Egypt and the North Sudan, and about normal in the Central Sudan. Temperature was above normal in all our districts except the Central Sudan where it was very slightly lower than usual.

Rain fell between the 5th and 9th in the NW and between the 6th and 10th in the rest of Lower Egypt, but thereafter the month was rainless. The total quantity that fell was below the average in the north, but considerably above it in the south of the Delta and Cairo district. Very heavy rains are reported from the Red Sea littoral of the Sudan and from the South Sudan, but the showers that may usually be expected in the Central Sudan were lacking. This intensification of the November rains extended to Abyssinia, and if it has prevailed over the basins of the Sobat and Upper Bahr el Jebel, it cannot fail to have an important influence on the discharges of the White Nile.

Table showing the departures from normal of November 1911, by districts.

* Mongalla only.

State of the River. — The latest information from the Bahr el Jebel shows that levels were still very low, but were not falling at their usual rate, so that a slight relative improvement has resulted. The Sobat fell rapidly in October, but the rainfall of the beginning of November has checked the fall and the levels at latest information were above normal. In consequence there was a slight improvement on the White Nile which, however, is still same 30 cm. below normal. Throughout October the Blue Nile was low, but in the beginning of November the heave rainfall in Abyssinia caused a brisk flush, and at the end of the month levels were only slightly below normal.

As a consequence, the main Nile at Wadi Halfa improved to its normal levels at the end of the month. A supply slightly under average may be looked for during the next two months.

J. I. Craig,
Director Meteorological Service.

Giza, December 6th, 1911.

REPORT ON THE WEATHER OF DECEMBER, 1911.

The first 8 days of the month were fine, on the whole, with light winds. On the 10th, a depression appeared to the north of Egypt, followed by another over Greece on the 11th, and Asia Minor on the 12th; this led to some rain. Weather was fine again with light winds until the 17th, when a second depression appeared south of Crete; it moved to the north of Egypt on the 19th to 20th and then passed off eastwards. It was accompanied by heavy rain in the north. On the 22nd a distribution of pressure favourable to southerly winds and bad weather set in, and lasted to the end of the month. During this time two deep depressions passed over Italy, Greece and Asia Minor and led to strong winds and some rain.

Pressure was below average in Egypt and the Red Sea; but above average in the rest of the Sudan.

Temperature was slightly above average in Lower Egypt and on the Red Sea, but below it in Upper Egypt and the rest of the Sudan.

Rainfall was considerably in excess in Egypt, as a consequence of the depressions but considerably below average on the Red Sea coast and in the Sudan.

Table showing the departures from normal of December 1911, by districts.

River Gauges. — Latest information from Lake Victoria is that levels were below normal in summer. The Bahr el Jebel throughout November continued to be far below normal, but at the end of the month there was a brisk rise which brought its level at Gondokoro up to normal. The November rains, therefore, have failed, or are very late. The Bahr el Ghazal also shows considerable weakness. The latest information from the Sobat in the beginning of November shows that it was rising again as a consequence of the same rainfall which gave the flush on the Blue Nile early in November. The White Nile at Tewfikia has begun to suffer from the want of water on the Bahr el Jebel, and has begun to drop much before its usual date. The Blue Nile was slightly below normal throughout the month. The main Nile as a consequence of the deficiency on the Blue Nile and White Nile was also slightly below normal throughout December.

J. I. Craig,
Director Meteorological Service.

Giza, January 3rd, 1912.

COMPARISON OF THERMOMETRIC SCALES

PROBABLE WEATHER for 24 hours ending noon 24/12/1911

A depression has moved rapidly from WNW and the centre now lies to the north of the Delta. Fresh westerly winds today followed by north-westerly tomorrow are probable. Rain may be expected today or tomorrow over Lower Egypt.

Relative Humidity.

COMPARISON OF THERMOMETRIC SCALES

PROBABLE WEATHER — for 24 hours ending noon 27/12/1911

The depression to which the bad weather has been due has moved off over Syria, and a general improvement of the weather later is probable. North-westerly winds with some rain are likely today.

Relative Humidity.
