Vorwort.

Das Jahrbuch für 1917 enthält stündliche Werte des Luftdrucks und der Temperatur in Kristiania, diejenigen der relativen Feuchtigkeit, der Windrichtung und der Windgeschwindigkeit, des Niederschlags und des luftelektrischen Potentialgefälles in Aas, die vollständigen Terminbeobachtungen für dieselben 12 Stationen wie die vorhergehenden Jahrgänge, die Uebersichtstabellen für 61 Stationen und drei Anhänge. Der dritte von diesen enthält die stündlichen Werte des Luftdrucks und der Temperatur, die vollständigen Terminbeobachtungen und die Uebersichtstabelle für Green Harbour in Spitzbergen.

Von den 61 Stationen haben 41 Quecksilberbarometer, 40 Psykrometer oder Haarhygrometer und 21 nur trockenes Thermometer, unter welchen 5 Leuchtfeuerstationen sind. Sämtliche Stationen haben Minimumsthermometer, während nur Kristiania, Aas, Bergen, Trondhjem und Haldde mit Maximumsthermometer versehen sind. Die Thermometer sind in kleinen Gehäusen am Fenster aufgestellt. Hütten sind nur an Stationen mit Termographen im Gebrauch.

Die Quecksilberbarometer sind beinahe ausschliesslich Adie-Stationsbarometer. Die Thermometer sind Küchlerthermometer mit Papierskala und 1/5° C, für Minimumthermometer 1/1° C Einteilung. Bei den Psykrometerbeobachtungen wird Aspirator nicht verwendet. Die Haarhygrometer, welche bei uns verwendet werden, sind ausschliesslich die Russeltvedt'schen Torsionshygrometer [1]). Folgende 19 Stationen haben diese: Røros, Tønset, Dovre, Listad, Granheim, Lillehammer, Rena, Hamar, Aabogen, Kristiania, Dalen, Kvassheim, Bergen, Voss, Stenkjær, Hatfjelddalen, Alten, Sydvaranger, Spitzbergen. Kristiania und Bergen beobachten ausserdem Psykrometer in allen Monaten, während Alten das Psykrometer in den Sommermonaten benutzt, weil zu der Zeit die Sonne das Hygrometer antrifft. Vergleich zwischen den Beobachtungen ist in 7 Jahren ausgeführt worden, und er hat gezeigt, dass das Russeltvedt'sche Torsionshygrometer sehr gut ist, und selbst in der warmen Jahreszeit zuverlässigere Feuchtigkeitswerte gibt, als das Psykrometer geben kann, wenn Aspirator nicht verwendet wird.

An den Stationen Kristiania, Aas, Bergen, Trondhjem, Dovre und Spitzbergen sind Richard'sche Barographen und in Kristiania, Aas, Bergen, Trondhjem, Røros und Spitzbergen Richard'sche Thermographen aufgestellt. Die Registrierungen dieser Barographen und Thermographen sind alle ausgewertet und in Manuskripttabellen eingeführt wie die in diesem Jahrbuch gedruckten Tabellen für Kristiania und Spitzbergen.

In diesem Jahrbuch sind die Stationen dieselben wie im vorhergehenden, mit der Ausnahme, dass Kvassheim neu aufgenommen ist, während Vang, Hedemarken, herausgegangen ist.

In bezug auf die einzelnen Stationen wird auf die früheren Jahrgänge und auf folgende Bemerkungen verwiesen.

[1]) Met. Zeitschrift 1908 S. 396—400.

Aas. Da die Psykrometerbeobachtungen der Landwirtschaftlichen Hochschule im Winter nicht zuverlässig waren, wurden die Feuchtigkeitswerte aus den Registrierungen des Meteorologischen Observatoriums herausgenömmen. Das Mittel ist von allen 24 Stunden gebildet.

Der Polonium-Kollektor hat in der letzten zeit so viel in Aktivität verloren, dass die Potentialregistrierrung mit dem wekselenden Isolationsverlust etwas variiert. Die Beobachtungen sind deshalb nicht so gut wie früher.

Balestrand. Die Beobachtungen der Feuchtigkeit im Januar und Februar sind falsch und nicht zu verwenden.

Kvassheim. Neue Station an Kvassheim Leuchtturm auf der Küste von der Jäderschen Ebene in unmittelbarer Nähe des Meeres. Die Station hat eine ausgezeichnet freie Lage. Die Thermometer stehen vor einem Fenster in einer Ecke gegen N, durch einem grossen Holzschirm vor der Abendsonne zu Sommer geschützt. Der Regenmesser, ca. 20 m. im Norden vom Gebäude, ist dem Winde stark ausgesetzt.

Lillehammer. Neuer Beobachter im Laufe des Jahres.

Lyster. Die Feuchtigkeitsbeobachtungen sind nicht ganz zuverlässig. Im August und September sind sie nicht zu verwenden. Neuer Beobachter vom Oktober.

Molde. Die Beobachtungen sind besser als früher, doch nicht ganz gut.

Svolvær. Neuer Beobachter im Laufe des Jahres.

Sydvaranger. Herr Forstmeister Klerck wünschte nicht den Beobachtungsdienst fortzusetzen und stellte die Beobachtungen am Ende des Oktober ein. Ein anderer Beobachter war in Elvenes nicht zu erhalten, und erst im folgenden Jahre wurden die Beobachtungen in Kirkenes weitergeführt.

Torungen. Die angaben der Niederschläge ganz unvollständig.

Ullensvang. Durch die Krankheit und das später eingetretene Hinscheiden des Beobachters wurden die Beobachtungen im December unvollständig.

Auf Seite XII sind die wichtigsten Erläuterungen über die Stationen tabellarisch gegeben. In der letzten Kolonne sind die Beobachtungsstunden angegeben, aus welchen zu sehen ist, dass die gewöhnlichen Beobachtungstermine 8 a, 2 p und 8 p nach Mitteleuropäischer Zeit sind. Das Beobachten nach Ortzeit hat man für die meisten Beobachter aus Bequemlichkeitsrücksichten ändern müssen.

Das Jahrbuch ist in drei Abteilungen geteilt.

Die erste Abteilung enthält die stündlichen Werte des Luftdrucks und der Temperatur in Kristiania nach Ortzeit, diejenigen der relativen Feuchtigkeit, der Windrichtung und der Windgeschwindigkeit, des Niederschlags und des luftelektrischen Potentialgefälles in Aas nach M. E. Z.

Der Barograph in Kristiania ist im Lokal des Instituts aufgestellt. Seine Angaben für jede Stunde sind reduziert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reduzierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph in Kristiania steht in der Wild'schen Hütte im Park des astronomishen Observatoriums. Seine Angaben sind reduziert auf die auf das Luftthermometer reduzierten Ablesungen des Normalthermometers.

Der Hygrograph in Aas steht unterhalb eines auf 2 Meter hohen Phählen erbauten kleinen Hauses in 1.8 Meter Höhe über dem Erdboden. Die Angaben sind mit Hilfe eines Aspirationspsykrometers reduziert worden.

Die Windgeschwindigkeit in Aas wird mit einem in 4.7 Meter Höhe über dem Erdboden aufgestellten Wild'schen Windtafel ermittelt. Der Windtafel ist durch eine mechanische Ueberführung mit starker Dämpfung mit einer Registrieranordnung verbunden. Die Verificierung des Apparats wird mit einem kleinen Robinsonschen Schalenkreuzanemometer ausgeführt.

Die Windrichtung in Aas wird mit Hilfe einer Windfahne in 4.7 Meter Höhe über dem Erdboden ermittelt. Die Fahne ist unter starker Dämpfung mit einer Registrieranordnung verbunden.

Der Niederschlag in Aas wird mit einem registrierenden Schneemesser, Süstem Hellmann, gefunden.

Das luftelektrische Potentialgefälle in Aas wird mit einem Poloniumskollektor und einem etwas abgeänderten Bendorffschen Quadrantelektrometer ermittelt. Bei der Verifizierung wird ein Flammenkollektor und entweder ein Elster und Geitel Elektrometer oder ein von Russeltvedt konstruiertes Elektrometer verwendet. Die Kurven sind mit einer Genauigkeit von 2.5 Volt/Meter ausgewertet. In der Tabelle sind die Zahlen auf nächste 10 Volt/Meter abgerundet. Die Mittel sind aus den nicht abgerundeten Zahlen gebildet. Für die Mittelberechnung sind nur Normaltage verwendet, für welche die Zahlen fett gedruckt sind. An perturbierte Werte ist p zugefügt. Wo in der Tabelle +p steht ist das luftelektrische Potentialgefälle grösser als 1500 Volt/Meter, während —p bezeichnet dass es niedriger als —800 Volt/Meter ist. Schliesslich bezeichnet ±p schnell auf einander folgende positive und negative Perturbationen von unmessbarer Grösse.

Die zweite Abteilung enthält die vollständigen Terminbeobachtungen an den 12 Stationen Dovre, Kristiania, Færder, Mandal, Skudenes, Bergen, Florø, Kristiansund, Brønnø, Bodø, Alten und Vardø. Interpolierte Werte sind mit Kursiv gedruckt. Die Tabellen haben folgende Daten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C. auf das Normalbarometer und auf die Normalschwere, aber nicht auf das Meeresniveau, reduziert[1]). Die Reduktion auf die Normalschwere geschiet nach der Formel.

$$C = \frac{g - g_{45}}{g_{45}} b \text{ (für Pendelstationen) oder } C = \frac{C_0}{b_0} b,$$

wo g die Schwerebeschleunigung an der Station, g_{45} die Normalschwere (9.80616 m.), b die Barometerhöhe, reduziert auf 0° und das Normalbarometer, C die Schwerekorrektion bei b, C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite sind zwei zusammengehörige Werte von C und b angegeben. C wird dort C_g genannt um anzugeben, dass es sich um die Schwerekorrektion handelt. Die angegebene Barometerhöhe ist so gewählt, das die Schwerekorrektion für diese Höhe eben von einem Zehntel bis nächsten überspringt. Man sieht dann unmittelbar mit welcher Schwerekorrektion man zu rechnen hat und es ist auch ganz leicht die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort. und auch Meteorologische Zeitschrift 1891, S. 252 sowie Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math. naturv. Klasse, 1896 No. 1. S. 1—15.

3. Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m. mit dem trocknen Thermometer korrigiert worden. Vom 1. Januar 1894 an wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psykrometerbeobachtungen nach Jelineks und für Kältegrade nach Birkelands Tabellen berechnet. Für die Haarhygrometer Stationen Dovre, Alten und Spitzbergen aus der relativen Feuchtigkeit und der Luft-Temperatur. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet oder direkt nach den korrigierten Haarhygrometerbeobachtungen genommen. 00 = 100 %.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 6 = Orkan[1]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Überzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden sind, sind nach der Bewölkungszahl angeführt worden. • Regen; * Schnee; ⁕ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gemessen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tagezeit M. E. Z.

Die Bezeichnungen sind:

● Regen.	sch.	Schauer.		n	in der (vorhergehenden) Nacht
* Schnee.	tr.	Tropfen,		a	vormittags.
△ Graupeln.	fl.	Flocken.		p	nachmittags.
≡ Nebel.	körn.	körnig.		mg.	morgens.
⏢ Tau.	o	Schwach	Als Exponent	mtg.	mittags.
⌴ Reif.	2	Stark.	Als Exponent	abd.	abends.
⸝ Starker Vind.				I	Erste Beobachtungsstunde.
⸙ Gewitter.				II	Zweite —
< Blitz ohne Donner.				III	Dritte —
⩓ Nordlicht.				u.	und.
⊕ Sonnenring.				st.	stark.
⏀ Sonnenhof.				sp.	später.
⏁ Mondring.				zeitw.	zeitweise.
⏂ Mondhof.					

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Zeitangabe »früh« bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr morgens, »spätabd«. zwischen 8 Uhr abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittags-

[1]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

beobachtung und zwischen Nachmittags- und Abendbeobachtung. «abd.« ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. »mtg.« umfasst die Stunden 12 bis 2.

Die dritte Abteilung enthält die Übersichtstabellen des Monats- und Jahresresumé in Mitteln und Summen. Die Tabellen haben dieselben Daten wie die der 2. Abteilung.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, aber nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen plus eine Korrektion. Diese Korrektionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Kristiania, Kristiansand, Bergen und Bossekop abgeleitet worden[1]). Die Berechnungen sind mit zwei Dezimalen durchgeführt worden.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der zweiten Abteilung gesagt. Die Monatsmittel sind berechnet nach der Formel[2])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt[3]).

Für Kristiania, Aas, Bergen (Met. Obs.), Trondhjem und Haldde sind die mittels Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, welche angegeben worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion[4]). Diese sind aus den stündlichen Beobachtungen in Kristiania, Bergen und Bossekop (Alten) berechnet worden.

Die Terminmittel für Haarhygrometerstationen sind aus den Mitteln der relativen Feuchtigkeit und der Lufttemperatur berechnet mit einer empirisch bestimmten Korrektion, die nur von der Temperatur abhängt:

Temp.	Korr.
$> 20°$	— 0.2
15-20	— 0.1
10-15	0.0
0-10	+ 0.1
— 6-0	+ 0.2
— 10- —6	+ 0.3
< -10	+ 0.4

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden[5]). Sie sind nach den stündlichen Beobachtungen in Kristiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

---

[1]) Die Korrektionsgrössen sind gegeben im Jahrbuch für 1891 S. XIII; übrigens siehe Met. Zeitschr. 1891. S. 251 und Met. Zeitschr. 1906, S. 540.

[2]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg.

[3]) Siehe Jahrbuch für 1894. S. IX.

[4]) Die Werte dieser Korrektion sind angegeben im Jahrbuch für 1891, S. XV.

[5]) Die Werte des Faktors c sind angegeben im Jahrbuch für 1891, S. XVI.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tage mit merkbarem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Als Schneetage sind in diesem Jahrbuche nur diejenigen gerechnet, an welchen eine messbare Menge gefallen ist. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Als Tage mit Nebel sind auch diejenigen gerechnet, wo schwache Nebel vorhanden war, aber Tage mit Bodennebel sind nicht mitgezählt. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Als Gewittertage sind diejenigen gerechnet, an welchen Donner gehört wurde. Übrigens sind die Angaben der Gewitter bei den meisten Stationen ganz unvollständig. Sturmtage sind solche, an welchen die Windstärke über 4 notiert ist. Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergibt. Eine Ausnahme bilden die ausführlichen Angaben von Haldde. Weiter sind die Angaben von Trondhjem auch ziemlich vollständig.

Die Windverteilung ist direkt aus den notierten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtturmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr morgens.

Sonst gelten für die Übersichtstabellen dieselben Bemerkungen wie für den zweiten Teil.

Anhang I enthält die Abweichungen der Monatsmittel des Luftdrucks und der Temperatur vom Normalwert für beziehungsweise 12 und 21 Stationen. Die verwendeten Normalperioden sind für Luftdruck (1866—95) und für Temperatur (1841—90).

Anhang II gibt Beobachtungen über die Bewegung der Cirruswolken über Kristiania Kongsberg und Trondhjem. Die Beobachtungen sind ohne Hilfsapparäte gemacht und deshalb ist nur die Zugrichtung angegeben.

Anhang III enthält die Beobachtungen an der norwegischen Radiostation in Green Harbour auf Spitzbergen vom Juli 1916 bis Juni 1917 nebst einem Monats- und Jahresresumé für das Jahr 1916.

Die stündlichen, aus den Registrierungen eines Richards Barographen herausgenommenen Luftdruckswerte sind auf die Angaben des Stationsbarometers reduziert. Die Seehöhe des Stationsbarometers ist 11.4 Meter.

Der Thermograph steht in einer norwegischen Thermometerhütte und die stündlichen Temperaturwerte sind auf die Angaben eines dortigen Quecksilberthermometers reduziert.

Kristiania, Mai 1918.
