Vorwort.

Das Jahrbuch für 1923 enthält stündliche Werte des Luftdrucks und der Temperatur in Kristiania, diejenigen des Niederschlags und des luftelektrischen Potentialgefälles in Aas, die Terminbeobachtungen für 12 Stationen, die Uebersichtstabellen für 131 Stationen und vier Anhänge. Im ersten von den Anhängen finden sich die Abweichungen des Luftdrucks und der Temperatur von den normalen Werten für einige älteren Stationen, im zweiten die Monatsmittel der Seetemperatur für einige Küstenstationen, im dritten stündliche Werte und Terminbeobachtungen mit Uebersichtstabellen für Green Harbour in Spitzbergen und Terminbeobachtungen mit Uebersichtstabellen für Jan Mayen, im vierten stündliche Werte und Terminbeobachtungen für Haldde.

Von den 133 Stationen haben 62 Quecksilberbarometer, 97 Psykrometer oder Haarhygrometer und 36 nur trockenes Thermometer. Sämtliche Stationen haben Minimumthermometer, während nur Kristiania, Bergen, Trondhjem und Haldde mit Maximumthermometer versehen sind. Die Thermometer sind in kleinen Gehäusen am Fenster aufgestellt. Hütten sind nur an Stationen mit Thermographen im Gebrauch.

Die Quecksilberbarometer sind Stationsbarometer hauptsächlich englischen Fabrikates Ungefähr die Hälfte der Stationen hat neue Barometer mit Millibarteilung erhalten. Die Thermometer sind Küchlerthermometer mit Papierskala und 1/5° C Einteilung, für Minimumthermometer 1/1° C. Bei den Psykrometerbeobachtungen wird Aspirator nicht verwendet. Die Haarhygrometer, die bei uns verwendet werden, sind hauptsächlich die Russeltvedt'schen Torsionshygrometer [1]). Die meisten Stationen im nördlichen Teile des Landes haben doch Devik'sche Hygrometre [2]).

Ungefähr 50 Stationen sind mit Barograph, 20 mit Thermograph und 6 mit Hygrograph versehen. Von den Registrierungen dieser Instrumente sind die Barogrammen in Kristiania und Haldde, die Thermogrammen in Kristiania, Aas, Bergen, Rundemanden, Trondhjem, Lærdal, Rena, Spitzbergen, Jan Mayen und Haldde, die Hygrogrammen in Aas, Bergen und Lærdal zur Ermittelung der stündlichen Werte benutzt.

In diesem Jahrbuch befinden sich dieselben Stationen wie im vorhergehenden mit Ausnahme von Fusa, Snaasa, Henningsvær und Sydvaranger, die herausgegangen sind, während Eg, Sörvaagen, Tana und Bjørnøen zugekommen sind, und Asker, die im vorigen Jahre unvollständig war, wieder heraufgenommen ist.

In Bezug auf die einzelnen Stationen ist zu erwähnen:

Alten. Die Luftdruckbeobachtungen sind misslungen. Teils entstanden Fehler am Barometer, teils haben mehrere Wechsel von Beobachtern stattgefunden. Die täglichen Werte sind aus den Registrierungen ermittelt worden, wodurch doch keine Genauigkeit erhalten werden konnte. Monats- und Jahreswerte sind daher im Jahrbuch nicht mitgenommen.

Bjørnøen. Die kleine Insel Bjørnøen liegt ungefähr halbwegs von Norwegen nach Spitzbergen. Die meteorologischen Instrumente sind in der Radiostation untergebracht auf der

[1]) Met. Zeitschrift 1908 S. 396—400.

[2]) Das Prinzip des Instrumentes beruht darauf, dass die Länge des Haares durch eine Mikrometerschraube gemessen wird. Keine Beschreibung veröffentlicht.

Nordostküste der Insel. Beobachtungen sind seit dem Jahre 1918 mehr oder weniger vollständig gemacht worden.

Eg. Die Beobachtungen an diser Station, die im Jahre 1915 aufhörten, sind wieder mit dem Anfang des Jahres 1923 angefangen.

Fusa. Die Station wurde als entbehrlich angesehen und daher vom 30. Juni 1923 aufgehoben.

Hamar. Die Station wurde nach ihrem früheren Ort bei Herrn J. Rud auf der anderen Seite der Strasse verlegt. Die Meereshöhe ist nur um 0.4 m geändert.

Henningsvær. Die Beobachtungen sind stets lückenhaft gewesen und waren in disem Jahre so unvollständig, dass sie im Jahrbuch nicht mitgenommen werden konnten. Die Station ist im Jahre 1924 eingegangen.

Horten. Die Station wurde wegen Beobachterwechsels im December 1922 von der Insel Mellemøen nach der Insel Vealøs verlegt.

Mandal. Das Quecksilberbarometer wurde bei der Inspektion im Jahre 1922 fehlerhaft erfunden. Es war Luft ins Vacuum hineingekommen und ein Haften an der Glaswand war zu entdecken. Die Beobachtungen sind daher um den Zehntel nicht zuverlässig. Das Barometer ist im Jahre 1924 getauscht.

Mehavn. Die Station ist am 28. Januar 1923 nach dem alten Lokal in der Telegraphenstation verlegt. Die Beobachtungen sind vom Anfang des Jahres auf die neue Meereshöhe 8.2 m. reduziert.

Nes. Die Station war im Mai 1922 nach einem anderen Lokal, ca. 100 m. in nördlicher Richtung verlegt. Neuer Beobachter.

Ona. Wegen Beobachterwechsels ist die Station am 4. Juli von dem Haus S. Olsens nach demjenigen J. Vikens verlegt. Das letztere ist nur unweit vom ersteren gelegen und hat eine freie Lage.

Snaasa. Die Station wurde als entbehrlich angesehen und ist daher vom 30. Juni aufgehoben.

Sydvaranger. Die Beobachtungen, die in den letzten Jahren in Kirkenes von den Wachtleuten der Aktiengesellschaft Sydvaranger gemacht sind, haben sich stets als minderwertig erwiesen und wurden im Jahre 1923 ganz unbrauchbar.

Sorvaagen. Neue Station auf der Moskenesinsel in Lofoten.

Tana. Neue Station an der »Fagskole for Finmarkens Næringsliv« auf dem Bauerhof Birkelund in Tana (Finmarken).

Ulefoss. Die Station wurde im Mai 1923 wegen der Umziehung des Beobachters nach einen anderen Ort, ca. 1½ Km. entfernt, verlegt.

Auf Seite XII sind die wichtigsten Erläuterungen über die Stationen tabellarisch gegeben. In der letzten Kolonne sind die Beobachtungsstunden angegeben, aus welchen zu sehen ist, dass die gewöhnlichen Beobachtungstermine 8 a, 2 p und 7 p nach Mitteleuropäischer Zeit sind Nur an ganz wenigen Stationen ist der Mittagstermin aus verschiedenen Gründen auf 1 p statt 2 p verlegt

In diesem Jahrbuch ist das Luftdruck wie in dem vorhergehenden in Millibaren angegeben, während für die Dampfspannung Millimeter beibehalten ist.

Das Jahrbuch ist in drei Abteilungen geteilt.

Die erste Abteilung enthält die stündlichen Werte des Luftdrucks und der Temperatur in Kristiania, diejenigen des Niederschlags und des luftelektrischen Potentialgefälles in Aas.

Der Barograph in Kristiania ist seit dem 1. Januar 1922 im Lokal des Astronomischen Observatoriums aufgestellt. Seine Angaben für jede Stunde sind reduziert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reduzierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph in Kristiania steht in der Wild'schen Hütte im Park des astronomischen Observatoriums. Seine Angaben sind reduziert auf die auf das Luftthermometer reduzierten Ablesungen des Normalthermometers.

Der Niederschlag in Aas wird mit einem registrierenden Schneemesser, Süstem Hellmann, gemessen.

Die in diesem Jahrbuch angeführten Potentialregistrierungen sind durch die im Oktober 1918 aufgestellte neue Potential-Registrieranordnung erhalten.

Ausser den Stundenwerten des Luftelektrischen Potentials sind angegeben sowohl »Monatsmittel des luftelektrischen Potentialgefälles für jede Stunde« und »Täglicher Gang des luftelektrischen Potentialgefälles nach Abweichungen vom Monatsmittel« als »Monatsmittel der luftelektrischen Leitfähigkeit (für positive Elektricität) für jede Stunde» und »Täglicher Gang der luftelektrischen Leitfähigkeit nach Abweichungen vom Monatsmittel», während die Kurven der früheren Jahrgänge weggelassen sind. Wie man sieht, fehlen die Monatsmittel für November und December. Dieses ist dem Umstande zu verdanken, dass die Elektrode dieser Zeit meistens ausser Thätigkeit war.

Für die Mittelberechnung sind (es gilt die beiden elektrischen Elemente) nur Normaltage verwendet, für welche die Zahlen fett gedruckt sind.

Im Jahre 1922 sind die Ablesungen der luftelektrischen Leitfähigkeit unrichtig für die vier letzten Monate des Jahres. Der Fehler ist auf den Spannungselektrometer zurückzuführen, indem dieses Instrument wegen des Austauschens der Elemente in einer der Spannungsbatterien gestört war, aber leider in solcher Weise, dass der Fehler erst nach einer eingehenden Kontrolle im Anfang des Jahres 1923 wahrgenommen wurde. Die Monatsmittel für September sind um etwa 4 %, dieselben für Oktober, November und December um etwa 115 % zu hoch angegeben.

Die zweite Abteilung enthält die vollständigen Terminbeobachtungen an den 12 Stationen Dovre, Kristiania, Færder, Mandal, Skudenes, Bergen, Aalesund, Trondhjem, Bromo, Bodø, Alten und Vardø. Interpolierte Werte sind mit Kursiv gedruckt. Die Tabellen haben folgende Daten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0° C, auf das Normalbarometer und auf die Normalschwere, aber nicht auf das Meeresniveau, reduziert[1]). Die Reduktion auf die Normalschwere geschiet nach der Formel.

$$C = \frac{g - g_{45}}{g_{45}} \quad b = \frac{C_0}{b_0} b,$$

wo g die Schwerebeschleunigung an der Station, g_{45} die Normalschwere (9.80616 m.), b die Barometerhöhe, reduziert auf 0° und das Normalbarometer, C die Schwerekorrektion bei b, C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite sind zwei zusammengehörige Werte von C und b angegeben. C wird dort C_g genannt um anzugeben, dass es sich um die Schwerekorrektion handelt. Die

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891. S. 252 sowie Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math. naturv. Klasse, 1896 No. 1. S. 1—15.

angegebene Barometerhöhe ist so gewählt, das die Schwerekorrektion für diese Höhe eben von einem Zehntel bis nächsten überspringt. Man sieht dann unmittelbar mit welcher Schwerekorrektion man zu rechnen hat und es ist auch ganz leicht die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumsthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m. mit dem trocknen Thermometer korrigiert worden. Vom 1. Januar 1894 an wird das Minimumsthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psykrometerbeobachtungen nach Jelincks und für Kältegrade nach Birkelands Tabellen berechnet. Für die Haarhygrometer Stationen Dovre, Alten und Spitzbergen aus der relativen Feuchtigkeit und der Luft-Temperatur. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet oder direkt nach den korrigierten Haarhygrometerbeobachtungen genommen. $00 = 100\ \%$.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala $0 =$ Still bis $12 =$ Orkan[1]).

7. Die Bewölkung nach der Skala $0 =$ Heiter bis $10 =$ Überzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden sind, sind nach der Bewölkungszahl angeführt worden. • Regen; * Schnee; ⁘ Regen und Schnee; △ Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern am 8 Uhr mg. gemessen, angeführt für den Tag, an welchem er gemessen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tagezeit M. E. Z.

Die Bezeichnungen sind:

• Regen.	sch. Schauer.			n	in der (vorhergehenden) Nacht
* Schnee.	tr. Tropfen,			a	vormittags.
△ Graupeln.	fl. Flocken.			p	nachmittags.
≡ Nebel.	körn. körnig.			mg.	morgens.
⌒ Tau.	o Schwach	}	Als Exponent	mtg.	mittags.
⌓ Reif.	2 Stark.	}		abd.	abends.
↗ Starker Vind.				I	Erste Beobachtungsstunde.
⊼ Gewitter.				II	Zweite —
< Blitz ohne Donner.				III	Dritte —
⌘ Nordlicht.				u.	und.
⊕ Sonnenring.				st.	stark.
⊙ Sonnenhof.				sp.	später.
ⓤ Mondring.				zeitw.	zeitweise.
ⓤ Mondhof.					

[1] Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Zeitangabe »früh« bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr morgens, »spätabd«. zwischen 7 Uhr abends und Mitternacht. Wenn *a* und *p* nicht an einer Stundenzahl stehen, bezeichnen sie die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. »abd.« ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. »mtg.« umfasst die Stunden 12 bis 2.

Die dritte Abteilung enthält die Übersichtstabellen des Monats- und Jahresresumé in Mitteln und Summen. Die Tabellen haben dieselben Daten wie die der 2. Abteilung.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, aber nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen.

Lufttemperatur. Von den Minimumstemperaturen gilt dasselbe wie oben von denen in der zweiten Abteilung gesagt. Die Monatsmittel sind berechnet nach der Formel [1])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt [2]).

Für Kristiania, Bergen (Met. Obs.), Trondhjem und Haldde sind die mittels Maximumsthermometers beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, welche angegeben worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion [3]). Diese die aus den stündlichen Beobachtungen in Kristiania, Bergen und Bossekop (Alten) berechnet worden sind, können mit dem Abendtermin um 7 p ungeändert gebraucht werden.

Die Terminmittel für Haarhygrometerstationen sind aus den Mitteln der relativen Feuchtigkeit und der Lufttemperatur berechnet mit einer empirisch bestimmten Korrektion, die nur von der Temperatur abhängt:

Temp.	Korr.
> 20°	— 0.2
15-20	— 0.1
10-15	0.0
0-10	+ 0.1
— 6- 0	+ 0.2
— 10- —6	+ 0.3
< — 10	+ 0.4

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden [4]).

[1]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg.
[2]) Siehe Jahrbuch für 1920. S. IX.
[3]) Die Werte dieser Korrektion sind angegeben im Jahrbuch für 1891, S. XV.
[4]) Die Werte des Faktors c sind angegeben im Jahrbuch für 1920, S. XI.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tage mit merkbarem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Als Schneetage sind in diesem Jahrbuche nur diejenigen gerechnet, an welchen eine messbare Menge gefallen ist. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Als Tage mit Nebel sind auch diejenigen gerechnet, wo schwache Nebel vorhanden war, aber Tage mit Bodennebel sind nicht mitgezählt. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Als Gewittertage sind diejenigen gerechnet, an welchen Donner gehört wurde. Übrigens sind die Angaben der Gewitter bei den meisten Stationen ganz unvollständig. Sturmtage sind solche, an welchen die Windstärke über 8 notiert ist. Die Nordlichtbeobachtungen waren im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergab. Sie sind daher in diesem Jahrbuch weggefallen.

Die Windverteilung ist direkt aus den notierten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Sonst gelten für die Übersichtstabellen dieselben Bemerkungen wie für den zweiten Teil.

Anhang I enthält die Abweichungen der Monatsmittel des Luftdrucks und der Temperatur vom Normalwert für beziehungsweise 9 und 18 Stationen. Die verwendeten Normalperioden sind für Luftdruck (1866—95) und für Temperatur (1841—90).

Anhang II gibt die Monats- und Jahresmittel der Temperatur des Ueberflächewassers für 15 Küstenstationen. Die Temperatur wird um 8 Uhr morgens gemessen.

Anhang III enthält die Beobachtungen an den norwegischen Radiostationen in Green Harbour, Spitsbergen, und auf Jan Mayen vom Juli 1922 bis Juni 1923 nebst Monats- und Jahresresumées für das Jahr 1922.

Der Thermograph in Green Harbour steht in einer norwegischen Hütte, und die stündlichen Temperaturwerte sind auf die Angaben eines dortigen Quecksilberthermometers reduziert.

Auf Jan Mayen sind Luftdruck- Temperatur- und Windbeobachtungen auch um 2 Uhr nachts ausgeführt und hier unter den gewöhnlichen Terminbeobachtungen mitgenommen. Die Art des Niederschlags ist von dieser Station nur bei den gemessenen Höhen angeführt, und keine sonstigen Notierungen gemacht. Darum ist die Bemerkungrubrik in den Terminbeobachtungen herausgenommen. Im Resumée ist die Geschwindigkeit des Windes in Stärke nach Beauforts Scala umgesetzt. Das Mittel sowohl der Windstärke als der Bewölkung ist nur aus den Beobachtungen um 8 a, 2 p med 7 p ermittelt worden.

Anhang IV enthält die stündlichen Werte des Luftdrucks und der Temperatur auf Haldde, nebst den Terminbeobachtungen im Laufe des Jahres 1923.

Das Monats- und Jahresresumé findet sich, wie in den vorhergehenden Jahrbüchern, in der dritten Abteilung.

Kristiania, Oktober 1924.

Aas. Meteorologisches Observatorium. **1923.**

Luftelektrisches Potentialgefälle in 10 Volt/Meter.

$H = 95.4$ m

$h_k = 4.5$ m

Perturbierte Stunden sind mit p bezeichnet. Normaltage sind fett gedruckt.

September.
