Inhalt.

Vorwort.

Verzeichnis der Stationen.

I. Stündliche Luftdruck- und Temperaturregistrierungen in Oslo (Kristiania), die des Niederschlags und des luftelektrischen Potentialgefälles in Aas 1928.

II. Termin-Beobachtungen an zehn Stationen in Norwegen 1928.

III. Monats- und Jahres-Resumé für das Jahr 1928.

IV. Anhang I. Abweichungen der Monatsmittel 1928 vom Normalwert.

V. Anhang II. See-Temperatur 1928.

VI. Anhang III. Beobachtungen auf Spitzbergen in Green Harbour, Eisfjord, Juli 1927—Juni 1928.
Monats- und Jahres-Resumé 1927.
Beobachtungen auf Jan Mayen Juli 1927—Juni 1928.
Monats- und Jahres-Resumé 1927.

VII. Anhang IV. Flugzeugaufstiege. Kjeller 1928.

Druckfehler und Verbesserungen.

Vorwort.

Das Jahrbuch für 1928 enthält stündliche Werte des Luftdrucks und der Temperatur in Oslo (Kristiania,) diejenigen des Niederschlags und des luftelektrischen Potentialgefälles in Aas, die Terminbeobachtungen für 10 Stationen, die Übersichtstabellen für 120 Stationen und vier Anhänge. Im ersten von den Anhängen finden sich die Abweichungen des Luftdrucks und der Temperatur von den normalen Werten für einige älteren Stationen, im zweiten die Monatsmittel der Seetemperatur für einige Küstenstationen, im dritten stündliche Werte der Temperatur und Terminbeobachtungen mit Übersichtstabellen für Green Harbour in Svalbard (Spitzbergen) und Terminbeobachtungen mit Übersichtstabellen für Jan Mayen. Anhang IV enthält die Ergebnisse der aerologischen Flugzeugaufstiege vom militärischen Flugplatz Kjeller aus.

Von den 122 Stationen haben 57 Quecksilberbarometer, 80 Psykrometer oder Haarhygrometer und 62 nur trockenes Thermometer. Sämtliche Stationen haben Minimumthermometer, während nur Oslo (Kristiania,) Bergen, Trondhjem und Tromso (Geof. Inst.) mit Maximumthermometer versehen sind. Die Thermometer sind in kleinen Gehäusen am Fenster aufgestellt. Hütten sind nur an Stationen mit Thermographen im Gebrauch.

Die Quecksilberbarometer sind Stationsbarometer hauptsächlich englischen Fabrikates. Ungefähr drei Viertel der Stationen haben neue Barometer mit Millibarteilung erhalten. Die Thermometer sind Küchlerthermometer mit Papierskala und 1/5° C Einteilung, für Minimumthermometer 1/1° C. Bei den Psychrometerbeobachtungen wird Aspirator nur in Oslo verwendet. Die Haarhygrometer, die bei uns verwendet werden, sind hauptsächlich die Russeltvedt'schen Torsionshygrometer [1]). Die meisten Stationen im nördlichen Teile des Landes haben doch Devik'sche Hygrometer [2]).

Ungefähr 50 Stationen sind mit Barograph, 20 mit Thermograph und 6 mit Hygrograph versehen. Von den Registrierungen dieser Instrumente sind die Barogrammen in Oslo (Kristiania), die Thermogrammen in Oslo (Kristiania), Aas, Bergen, Rundemanden, Trondhjem, Svalbard (Spitzbergen) die Hygrogrammen in Aas, Bergen und Trondhjem zur Ermittelung der stündlichen Werte benutzt.

In diesem Jahrbuch befinden sich dieselben Stationen wie im vorhergehenden mit Ausnahme von Ljøsne, Lødingen und Mehavn, die herausgegangen sind, während Førde, Galten und Sletnes zugekommen sind.

[1]) Met. Zeitschrift 1908 S. 396—400.

[2]) Das Prinzip des Instrumentes beruht darauf, dass die Länge des Haares durch eine Mikrometerschraube gemessen wird. Zeitschr. für Instrumentenkunde, 1928 S. 226.

Barometerkorrektionen.

In Bezug auf die einzelnen Stationen ist zu erwähnen:

Dalen. Die Station wurde in Juli 1928 nach einer neuen Stelle überführt. H_b hier = 76.4 m. Die Beobachtungen sehr schlecht.

Rundemanden. Von Juli 1928 an ist $H_b = 560$, früher 556.7 m.

Førde. Diese neue Station ist schon 1919 errichtet worden.

Trondhjem. Ein Hygrograph ist seit August 1928 in Gebrauch.

Myken. Von 25. April 1928 an ist $H_b = 19.9$, früher 18.0 m. Die Beobachtungen des Jahres 1928 sind auf die neue Höhe, 19.9 m reduziert.

Bodø. Die alte Station im Telegraphenamt ist im September 1928 eingegangen. Eine neue Station ist schon im Jahre 1925 errichtet worden in der Ackerbauschule, etwas östlicher als die alte Station. Die neue H_b ist 17.0 m gegen früher 22.4 m. Nur die Beobachtungen der neuen Station sind hier gedruckt.

Ingøy. Vom 1. August 1928 an ist $H_b = 4.3$. Die Luftdruckbeobachtungen dieses Jahres sind auf der alten Höhe, 7.5 m, reduziert worden.

Alta (Alten). Die Feuchtigkeitsbeobachtungen sind unbrauchbar.

Galten. Diese neue Station ist im December 1927 errichtet worden.

Sletnes und Mehavn. Siehe Jahrbuch für 1927 S. X.

Auf Seite XI und XII sind die wichtigsten Erläuterungen über die Stationen tabellarisch gegeben. In der letzten Kolonne sind die Beobachtungsstunden angegeben, aus welchen zu sehen ist, dass die gewöhnlichen Beobachtungstermine 8, 14 und 19 nach mitteleuropäischer Zeit sind. Nur an ganz wenigen Stationen ist der Mittagstermin aus verschiedenen Gründen auf 13 statt 14 verlegt.

In diesem Jahrbuch ist der Luftdruck wie in den vorhergehenden in Millibar angegeben, während für die Dampfspannung Millimeter beibehalten ist.

Das Jahrbuch ist in drei Abteilungen geteilt.

Die erste Abteilung enthält die stündlichen Werte des Luftdrucks und der Temperatur in Oslo (Kristiania,) diejenigen des Niederschlags und des luftelektrischen Potentialgefälles in Aas.

Der Barograph in Oslo (Kristiania) ist seit dem 1. Januar 1922 im Lokal des Astronomischen Observatoriums aufgestellt. Seine Angaben für jede Stunde sind reduziert auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reduzierten Stationsbarometers, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers ist 24.9 Meter.

Der Thermograph in Oslo (Kristiania) steht in der Wild'schen Hütte im Park des astronomischen Observatoriums. Seine Angaben sind auf die dreimal täglichen Beobachtungen des Stationsthermometers reduziert.

Der Niederschlag in Aas wird mit einem registrierenden Schneemesser, Süstem Hellmann, gemessen.

Die in diesem Jahrbuch angeführten Potentialregistrierungen sind durch die im Oktober 1918 aufgestellte neue Potential-Registrieranordnung erhalten.

Ausser den Stundenwerten des Luftelektrischen Potentialgefälles sind angegeben sowohl »Monatsmittel des luftelektrischen Potentialgefälles für jede Stunde« und »Täglicher Gang des luftelektrischen Potentialgefälles nach Abweichungen vom Monatsmittel« als »Monatsmittel der luftelektrischen Leitfähigkeit (für positive Elektricität) für jede Stunde« und »Täglicher Gang der luftelektrischen Leitfähigkeit nach Abweichungen vom Monatsmittel«.

Für die Mittelberechnung sind (es gilt die beiden elektrischen Elemente) nur Normaltage verwendet, für welche die Zahlen fett gedruckt sind.

Die zweite Abteilung enthält die vollständigen Terminbeobachtungen an den 10 Stationen Dovre, Oslo (Kristiania), Oksøy, Bergen, Ålesund, Trondhjem, Brønnøysund, Bodø, Alta und Vardø. Interpolierte Werte sind mit Kursiv gedruckt. Die Tabellen haben folgende Daten:

1. Den Monatstag.

2. Den Luftdruck oder die Barometerhöhe auf 0^0 C, auf das Normalbarometer und auf die Normalschwere, aber nicht auf das Meeresniveau, reduziert[1]). Die Reduktion auf die Normalschwere geschiet nach der Formel:

$$C = \frac{g - g_{45}}{g_{45}} \quad b = \frac{C_0}{b_0} b,$$

wo g die Schwerebeschleunigung an der Station, g_{45} die Normalschwere (9.80616 m.), b die Barometerhöhe, reduziert auf 0^0 und das Normalbarometer, C die Schwerekorrektion bei b, C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite sind zwei zusammengehörige Werte von C und b angegeben. C wird dort C_g genannt um anzugeben, dass es sich um die Schwerekorrektion handelt. Die angegebene Barometerhöhe ist so gewählt, dass die Schwerekorrektion für diese Höhe eben von einem Zehntel bis nächsten überspringt. Man sieht dann unmittelbar mit welcher Schwerekorrektion man zu rechnen hat und es ist auch ganz leicht die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraktion der angegebenen Schwerekorrektion, auf die unkorrigierte Barometerhöhe zurückzuführen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben um 8 Uhr a. m. mit dem trocknen Thermometer korrigiert worden. Vom 1. Januar 1894 an wird das Minimumthermometer um 8 Uhr a. m. eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks und für Kältegrade nach Birkelands Tabellen berechnet. Für die Haarhygrometerstationen Dovre und Svalbard (Spitzbergen) aus der relativen Feuchtigkeit und der Luft-Temperatur. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet oder direkt nach den korrigierten Haarhygrometerbeobachtungen genommen. $00 = 100\ \%$.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedruckt.

Die Windstärke nach Schätzung; Skala $0 =$ Still bis $12 =$ Orkan[2]).

7. Die Bewölkung nach der Skala $0 =$ Heiter bis $10 =$ Überzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden sind, sind nach der

---

[1]) Wegen des Normal-Barometers siehe Jahrbuch für 1884 Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252, sowie Klimatabeller for Norge. II. Lufttryk. Videnskabsselskabets Skrifter. I. Math. naturv. Klasse, 1896 No. 1. S. 1—15. Siehe auch Jahrbuch für 1927, S. VI—IX.

[2]) Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889, S. 365—372, und Meteorologische Zeitschrift, 1890, S. 50—55.

Bewölkungszahl angeführt worden. • Regen; * Schnee; ⁕ Regen und Schnee; △ Hagel oder Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimeter am 8 Uhr mg. gemessen, angeführt für den Tag, an welchem sie gemessen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tagezeit M. E. Z.

Die Bezeichnungen sind:

◍ Regen.	sch.	Schauer.		n	in der (vorhergehenden) Nacht
* Schnee.	tr.	Tropfen.		a	vormittags.
△ Hagel oder Graupeln.	fl.	Flocken.		p	nachmittags.
≡ Nebel.	körn.	körnig.		mg.	morgens.
⏢ Tau.	o	schwach	als Exponent	mtg.	mittags.
⌙ Reif.	2	stark.		abd.	abends.
⸗ Starker Wind.				I	Erste Beobachtungsstunde.
⊼ Gewitter.				II	Zweite —
< Blitz ohne Donner.				III	Dritte —
⌘ Nordlicht.				u.	und.
⊕ Sonnenring.				st.	stark.
⊙ Sonnenhof.				sp.	später.
⏀ Mondring.				zeitw.	zeitweise.
⏁ Mondhof.					

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens nachgesetztes *n*, *a* oder *p*. Die Zeitangabe »früh« bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr morgens, »spätabd«. zwischen 19 Uhr abends und Mitternacht. *a* und *p* bezeichnen die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. »abd.« ist eine unbestimmtere Zeitangabe, welche im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. »mtg.« umfasst die Stunden 12 bis 14. Die Zeit wird jetzt von 0 bis 24 angegeben.

Die dritte Abteilung enthält die Übersichtstabellen des Monats- und Jahresresumé in Mitteln und Summen. Die Tabellen haben dieselben Daten wie die der 2. Abteilung.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, aber nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben von denen in der zweiten Abteilung gesagt ist. Die Monatsmittel sind berechnet nach der Formel [1])

$$m = n - k\,(n - \text{Min.})$$

wo n das einfache Mittel aus den drei fixen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt [2]).

Für Oslo (Kristiania,) Bergen (Met. Obs.), Trondhjem und Tromsø (Geof. Inst.) sind die mittels Maximumthermometers beobachteten absolut höchsten Temperaturen in jedem

[1]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg. und »Klimatabeller for Norge« I, Luftens Temperatur, S. 6—7.

[2]) Siehe Jahrbuch für 1920. S. IX.

Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, welche angegeben worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Korrektion [1]). Diese, die aus den stündlichen Beobachtungen in Oslo (Kristiania), Bergen und Bossekop (Alten) für 20 Uhr berechnet worden sind, können mit dem Abendtermin um 19 Uhr ungeändert gebraucht werden.

Die Terminmittel für Haarhygrometerstationen sind aus den Mitteln der relativen Feuchtigkeit und der Lufttemperatur berechnet mit einer empirisch bestimmten Korrektion, die nur von der Temperatur abhängt:

Temp.	Korr.	Temp.	Korr.
> 20°	— 0.2	— 10- — 6	+ 0.3
15-20	— 0.1	— 20- —10	+ 0.4
10-15	0.0	— 25- —20	+ 0.3
0-10	+ 0.1	— 30- —25	+ 0.2
— 6- 0	+ 0.2	— 40- —30	+ 0.1
		< —40	0.0

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c\,(2p - q),\ q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden [2]).

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tage mit merkbarem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Als Schneetage sind nur diejenigen gerechnet, an welchen eine messbare Menge gefallen ist. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Als Tage mit Hagel sind diejenigen gerechnet, an welchen Hagel oder Graupeln gefallen sind; die letztere Art ist ganz überwiegend. Als Tage mit Nebel sind auch diejenigen gerechnet, wo schwache Nebel vorhanden war, aber Tage mit Bodennebel sind nicht mitgezählt. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Als Gewittertage sind diejenigen gerechnet, an welchen Donner gehört wurde. Übrigens sind die Angaben der Gewitter bei den meisten Stationen ganz unvollständig. Sturmtage sind solche, an welchen die Windstärke über 8 notiert ist.

Die Windverteilung ist direkt aus den notierten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Sonst gelten für die Übersichtstabellen dieselben Bemerkungen wie für den zweiten Teil.

Anhang I enthält die Abweichungen der Monatsmittel des Luftdrucks und der Temperatur vom Normalwert für beziehungsweise 10 und 17 Stationen. Die verwendeten Normalperioden sind für Luftdruck (1866—95) und für Temperatur (1841—90).

Anhang II gibt die Monats- und Jahresmittel der Temperatur des Oberflächenwassers für 19 Küstenstationen. Die Temperatur wird um 8 Uhr morgens gemessen.

---

[1]) Die Werte dieser Korrektion sind angegeben im Jahrbuch für 1891, S. XV.

[2]) Die Werte des Faktors c sind angegeben im Jahrbuch für 1920, S. XI.

Anhang III enthält die Beobachtungen an den norwegischen Radiostationen in Green Harbour, Svalbard (Spitzbergen), und auf Jan Mayen vom Juli 1927 bis Juni 1928 nebst Monats- und Jahresresuméen für das Jahr 1927.

Der Thermograph in Green Harbour steht in einer norwegischen Hütte, und die stündlichen Temperaturwerte sind auf die Angaben eines dortigen Quecksilberthermometers reduziert.

Auf Jan Mayen sind Luftdruck-, Temperatur- und Windbeobachtungen auch um 2 Uhr nachts ausgeführt und hier unter den gewöhnlichen Terminbeobachtungen mitgenommen. Die Stärke des Windes ist nach Beauforts Scala angegeben. Das Mittel sowohl der Windstärke als der Bewölkung ist nur aus den Beobachtungen um 8, 14, 19 ermittelt worden.

Anhang IV enthält die Ergebnisse der aerologischen Flugzeugaufstiege vom militärischen Flugplatz Kjeller aus. Beschreibung des Aufstiegsortes in Calwagen: Zur Diagnoze und Prognose lokaler Sommerschauer, Geof. Publ. III, 10, Oslo 1926, S. 13. Als Registrierinstrument wurde ein Flugzeugmeteorograph von Jaumotte verwendet (vgl. Ciel et Terre, 6—10, Bruxelles 1925).

Oslo, Mai 1929.

Aas. Meteorologisches Observatorium. **1928.**

Luftelektrisches Potentialgefälle
in 10 Volt/Meter.

H = 95 m

h_i = 4.5 m

Perturbierte Stunden sind mit p bezeichnet.
Normaltage sind fett gedruckt.

Januar.
