Vorwort.

Das Jahrbuch für 1931 enthält zweistündliche Werte des Luftdrucks und der Temperatur in Oslo, Doppelstundenwerte des Niederschlags und zweistündliche Werte des luftelektrischen Potentialgefälles in Ås, die Terminbeobachtungen an 10 Stationen, die Übersichtstabellen an 120 Stationen und vier Anhänge. Im ersten Anhang finden sich die Abweichungen des Luftdrucks und der Temperatur von den normalen Werten einiger älterer Stationen, im zweiten die Monatsmittel der See-Temperatur für einige Küstenstationen, im dritten zweistündliche Werte der Temperatur in Green Harbour, Svalbard (Spitzbergen) in der Zeit Januar—August und an Svalbard Radio September—Dezember, Terminbeobachtungen der arktischen Stationen Green Harbour Januar—August, Svalbard Radio September—Dezember und Jan Mayen und Übersichtstabellen für Green Harbour Januar—August, Svalbard Radio September—Dezember, Bjørnøya und Jan Mayen (alles für 1930). Anhang IV enthält die Ergebnisse der aerologischen Flugzeugaufstiege vom Militärflugplatz Kjeller. (In der Zeit 9. Juni—3. August wurden die Aufstiege vom Militärflugplatz Værnes (63°. 5 N, 10°. 9 E, Seehöhe 10 m) ausgeführt).

Von den 124 Stationen haben 73 Quecksilberbarometer, 74 Psychrometer oder Haarhygrometer und 50 nur trockenes Thermometer. Sämtliche Stationen haben Minimumthermometer, während nur Oslo, Bergen, Trondheim und Tromsø mit Maximumthermometer versehen sind. Im Laufe des Jahres sind eine Reihe Stationen mit Maximum—Minimumthermometer versehen. Die Thermometer sind in kleinen Gehäusen am Fenster aufgestellt. Hütten sind nur an wenigen Stationen im Gebrauch.

Die Quecksilberbarometer sind Stationsbarometer teils englischen und teils deutschen (Fuess) Fabrikates. Ungefähr vier Fünftel der Stationen haben neue Barometer mit Millibarteilung erhalten. Die Thermometer sind Küchler-Thermometer mit Papierskala und 1/5° C Einteilung, für Minimumthermometer 1/1° C. Bei den Psychrometerbeobachtungen wird ein Aspirator nur in Oslo verwendet. Die Haarhygrometer sind hauptsächlich die Russeltvedt'schen Torsionshygrometer[1]). Ein paar Stationen im nördlichen Teile des Landes haben jedoch Devik'sche Hygrometer[2]).

An 58 Stationen findet sich ein Barograph, an 31 ein Thermograph, an 9 ein Hygrograph, an 4 ein Thermo-Hygrograph, an 9 ein Pluviograph und an 17 ein Anemograph. Von den Registrierungen dieser Instrumente werden die Barogramme in Oslo, die Thermogramme

[1]) Met. Zeitschrift 1908, S. 396—400.

[2]) Zeitschr. für Instrumentenkunde 1928, S. 226.

in Oslo, Ås, Bergen, Rundemannen, Svalbard (Green Harbour und Svalbard Radio), die Hygrogramme in Ås, Bergen, Trondheim, die Anemogramme und Pluviogramme in Ås und Bergen zur Ermittelung der stündlichen, zum Teil zweistündlichen Werte benutzt.

In diesem Jahrbuch befinden sich dieselben Stationen wie im vorhergehenden, mit Ausnahme von Hellesylt und Beitstad, wo nicht mehr beobachtet wird, und Tafjord und Berkåk, die neu hinzugekommen sind.

In Bezug auf die einzelnen Stationen ist folgendes zu erwähnen:

Folgende zwei Stationen sind mit neuem Barometer versehen:

Røros, am 14. Juni 1931 Fuess 19456, statt des früheren Adie 1561.

Nordøyan, am 17. Januar 1931 Fuess 19435, statt des früheren Negretti & Zambra 1563.

Horten wurde 18. März 1931 mit Barometer Fuess 19447 ausgestattet.

Halden. Die Station wurde am 1. Juni 1931 von Langbryggen 21 nach Fredriksten verlegt. Die Stationshöhe ist aus 1 m in ca. 50 m ü. d. M. verändert.

Obrestad. Das Barometer wurde 3. Juli 1931 aus einem Zimmer in ein anstossendes verlegt. Die Höhe ist unverändert.

Utsira. Die Aufstellung der Instrumente ist zwischen 1928 und 1931, wahrscheinlich im März 1928, verändert. Früher $H_b = 58.1$ m, jetzt $H_b = 56.0$ m. Die Beobachtungen im Jahre 1931 sind auf die neue Höhe reduziert.

Skjernøy und Vibberodden. Die Beobachtungen sind Ende Juni, und

Byrknesøy am 25. April eingestellt worden.

Nygård. Die Station wurde am 20. Februar vollständig eingeäschert. Die Beobachtungen sind bis November nicht ausgeführt worden.

Hellesøy. Die Barometerhöhe wahrscheinlich nicht richtig. Die Barometerwerte sind zu niedrig.

Sunndalsøra. Wegen schlechter Hygrometerbeobachtungen werden diese dieses Jahr nicht mitgenommen.

Glomfjord. Die Stationshöhe ü. d. M. ist bis jetzt fehlerhaft mit 6 m angegeben. Sie soll 38 m ü. d. M. sein.

Grøtøy. Die Instrumente wurden am 17. November 1931 in einem Neubau an der alten Beobachtungsstelle aufgestellt. Die neuen Höhen sind in den Tabellen angeführt.

Sørvågen. Die Station wurde im März 1931 von der Telegraphenstation nach der Wohnung des Telegraphenboten verlegt.

Bjørnøya. Wegen Krankheit des Beobachters fehlen Beobachtungen im September 1930 und teilweise im Oktober. Die fehlenden Temperatur- und Barometerbeobachtungen sind aus den Registrierungen teilweise ergänzt.

Svalbard. Die Station wurde im Sommer 1930 von Green Harbour nach Advent Bay (Longyearbyen) verlegt. Die Station wird ab September 1930 Svalbard Radio genannt.

Im letzten Jahre sind an einer Reihe Stationen bei der Barometerreduktion neue Konstantkorrektionen verwendet.

V. Slidre. Adie 1511. Früher K.K. = 0.20 mm, jetzt K.K. = 0.98 mm = 1.31 mb.

Mandal. Fuess 3220. Früher K.K. = 0.47 mb, jetzt K.K. = — 0.70 mb bei 1005 mb.

Utsira. Negretti & Zambra 1566. Früher K.K. = 1.83 mb bei 980 mb, jetzt K.K. = 1.39 mb.

Lærdal. Adie 1509. Früher K. K. = 0.51 mm, jetzt K. K. = 0.83 mm = 1.11 mb.

Alta. Fuess 3242. Früher K. K. = 0,08 mb, jetzt K. K. = — 0.38 mb.

Ingøy. Fuess 3250. Früher K. K. = — 0.56 mb, jetzt K. K. = 0.20 mb.

Karasjokk. Adie 1566. Früher K. K. = 0.06 mm, jetzt K. K. = 0.68 mm = 0.91 mb.

Über die Barometerhöhe in Røros werden folgende Bemerkungen angeführt:

Steen im Jahre 1879 ($^{21}/_{9}$): «Die Barometer hängen im Büro des Bahnhofsvorstehers. Die Höhe von der Kapsel des Quecksilberbarometers wurde gleich 1.2 m über dem Geleise gemessen. Da die Höhe der letztgenannten vom Eisenbahnwesen gleich 628.0 m ü. d. M. angegeben ist, ergibt sich eine Höhe des Barometers in Røros gleich 629.2 m ü. d. M.»

Schroeter im Jahre 1887 ($^{9}/_{8}$): «Die Instrumente sind in den Wohnräumen des Bahnhofs angebracht und haben denselben Platz wie früher, als der vorige Beobachter Hr. Z. Johnsen verantwortlicher, besoldeter Beobachter war.

Die Höhe der Barometerkapsel ermittelte ich gleich 1.67 m über dem Geleise. Nach dem Nivellement der Eisenbahn ist die Höhe des Geleises 628 m ü. d. M., also die Höhe des Barometers gleich 629.7 m ü. d. M.»

Bjørkdal 1931 ($^{14}/_{6}$): «Bei Messung der Barometerhöhe über den Geleisen am 14. Juni 1931 wurde die Angabe von Steen richtig befunden.»

Auf Seite XIV und XV sind die wichtigsten Erläuterungen über die Stationen tabellarisch gegeben. In der letzten Kolonne sind die Beobachtungsstunden angegeben, aus denen ersichtlich ist, dass die gewöhnlichen Beobachtungstermine 8, 14, 19 Uhr M. E. Z. sind.

Das Jahrbuch ist in drei Abteilungen geteilt.

Die erste Abteilung enthält die zweistündlichen Werte des Luftdrucks und der Temperatur in Oslo, sowie die Doppelstundenwerte des Niederschlags und die zweistündlichen Werte des luftelektrischen Potentialgefälles in Ås.

Der Barograph in Oslo ist seit dem 1. Juli 1892 in Gang. Die zweistündlichen Angaben sind auf den Stand des auf 0°, auf das Normalbarometer und die Normalschwere reduzierten Stationsbarometers reduziert, aber nicht auf das Meeresniveau. Die Meereshöhe des Stationsbarometers beträgt 24.9 m.

Der Thermograph in Oslo steht in der Wild'schen Hütte im Park des astronomischen Observatoriums. Seine Angaben sind auf die täglich dreimaligen Beobachtungen des Stationsthermometers reduziert.

Der Niederschlag in Ås wird mit einem registrierenden Schneemesser, System Hellemann, gemessen.

Die Potentialregistrierungen sind durch die im Oktober 1918 neuaufgestellte Potential-Registrieranordnung gewonnen.

Ausser den zweistündlichen Werten des luftelektrischen Potentialgefälles sind angegeben sowohl «Monatsmittel des luftelektrischen Potentialgefälles für jede zweite Stunde» und «Täglicher Gang des luftelektrischen Potentialgefälles nach Abweichungen vom Monatsmittel» als auch «Monatsmittel der luftelektrischen Leitfähigkeit (für positive Elektrizität) für jede zweite Stunde» und «Täglicher Gang der luftelektrischen Leitfähigkeit nach Abweichungen vom Monatsmittel». Für die Mittelberechnung sind (es gilt die beiden elektrischen Elemente) nur Normaltage verwendet, für die die Zahlen fett gedruckt sind.

Die zweite Abteilung enthält die vollständigen Terminbeobachtungen an den 10 Stationen: Dovre, Oslo, Oksøy, Bergen, Ålesund, Trondheim, Brønnøysund, Bodø, Alta, Vardø. Interpolierte Werte sind kursiv gedruckt. Die Tabellen enthalten folgende Daten:

1. Den Monatstag.

2. Den wahren Luftdruck oder die Barometerhöhe auf 0°, auf das Normalbarometer und die Normalschwere, aber nicht auf das Meeresniveau, reduziert[1]).

Die Reduktion auf die Normalschwere geschieht nach der Formel:

$$C = \frac{g - g_{45}}{g_{45}} \quad b = \frac{C_0}{b_0} b,$$

wo g die Schwerebeschleunigung an der Station, g_{45} die Normalschwere (9.80616), b die Barometerhöhe, reduziert auf 0° und das Normalbarometer, C die Schwerekorrektion bei b und C_0 die Schwerekorrektion bei b_0 ist.

Auf jeder Druckseite sind zwei zusammengehörige Werte von C und b angegeben C wird dort C_g genannt, um anzugeben, dass es sich um die Schwerekorrektion handelt. Die angegebene Barometerhöhe ist so gewählt, dass die Schwerekorrektion für diese Höhe gerade von einem Zehntel bis zum nächsten springt. Man sieht dann unmittelbar, mit welcher Schwerekorrektion man zu rechnen hat, und es ist auch ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck durch einfache Subtraktion der angegebenen Schwerekorrektion auf die unkorrigierte Barometerhöhe zurückzuführen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen des Index des Minimumthermometers sind durch tägliches Vergleichen um 8 Uhr mit dem trocknen Thermometer korrigiert worden. Seit dem 1. Januar 1894 wird das Minimumthermometer um 8 Uhr eingestellt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dampfdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks und für Kältegrade nach Birkelands Tabellen berechnet, für die Haarhygrometerstationen Dovre und Svalbard (Spitzbergen) aus der relativen Feuchtigkeit und der Lufttemperatur. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet oder direkt nach den korrigierten Haarhygrometerbeobachtungen angesetzt. 00 = 100 %. Die beobachteten Minima sind mit fetten Typen gedruckt.

6. Die Windrichtung rechtweisend nach 16 Strich, in den englischen Bezeichnungen ausgedrückt.

Die Windstärke nach Schätzung; Skala 0 = Still bis 12 = Orkan[2]).

7. Die Bewölkung nach der Skala 0 = Heiter bis 10 = Überzogen. Niederschläge, die während eines der 3 festen Beobachtungstermine wahrgenommen worden sind, sind nach der

[1]) Über das Normalbarometer siehe Jahrbuch für 1884 Vorwort und auch Meteorologische Zeitschrift 1891, S. 252, sowie Klimatabeller for Norge, II. Lufttryk. Videnskabsselskabets Skrifter. I. Mat. naturv. Klasse, 1896 No. 1. S. 1—15. Siehe auch: Ältere meteorologische Beobachtungen in Oslo (Kristiania). Geofys. Publikationer Vol. III, No. 9 (1926), S. 56, und: Jahrbuch d. norw. met. Inst. für 1927, S. VI—IX.

[2]) Ein Vergleich der schätzungsweise festgestellten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II, sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889, S. 365—372, Meteorologische Zeitschrift 1890, S. 50—55, und G. C. Simpson: The Velocity Equivalents of the Beaufort Scale, Professional Notes, No. 44, 1926.

Bewölkungsziffer angeführt: • Regen; * Schnee; ⁕ Regen und Schnee; △ Hagel oder Graupeln; ≡ Nebel.

8. Die Höhe des Niederschlags in Millimetern um 8 Uhr gemessen, angeführt für den Tag, an dem sie gemessen ist[1]).

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit M. E. Z.

Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind durch ein dem Zeichen des Phänomens beigefügtes *n*, *a* oder *p* bezeichnet. Am 1. Januar 1931 wurde eine Serie neuer Zeichen eingeführt. Die Angaben der Beobachter sind noch nicht befriedigend. Die Zeitangabe «früh» bezeichnet eine Zeit zwischen Mitternacht und 8 Uhr, «spätabd.» zwischen 19 Uhr und Mitternacht. *a* und *p* bezeichnen die resp. Zeiträume zwischen Morgen- und Nachmittagsbeobachtung und zwischen Nachmittags- und Abendbeobachtung. «abd.» ist eine unbestimmtere Zeitangabe, die im Winter gewöhnlich eine frühere Zeit bezeichnet als im Sommer. «mtg.» umfasst die Stunden 12 bis 14. Die Zeit wird jetzt von 0 bis 24 angegeben.

Die Bezeichnungen sind:

•	Regen.	sch.	Schauer.		
*	Schnee.	tr.	Tropfen.		
△	Hagel oder Graupeln.	fl.	Flocken.		
≡	Nebel.	körn.	körnig.		
⏜	Tau.	o	schwach	als Exponent.	
⌴	Reif.	2	stark		
↿	Starker Wind.				
⌅	Gewitter.				
<	Blitz ohne Donner.				
⊤	Ferne Gewitter.				
⩓	Nordlicht.				
⊕	Ring.				
⌀	Hof.				
∞	Höhenrauch.				
≏	Dunst.				
∔	Schneegestöber.				
⊙	Sonnenschein.				
⌒	Regenbogen.				
~	Glatteis.				

n	in der (vorhergehenden) Nacht.
a	vormittags.
p	nachmittags.
mg.	morgens.
mtg.	mittags.
abd.	abends.
I	Erste Beobachtungsstunde.
II	Zweite —
III	Dritte —
u.	und.
st.	stark.
sp.	später.
zeitw.	zeitweise.

Die dritte Abteilung enthält die Übersichtstabellen des Monats- und Jahresresumés in Mitteln und Summen. Die Tabellen haben dieselben Daten wie die der 2. Abteilung.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, aber nicht auf das Meeresniveau. Die Zahlen sind das Mittel der drei täglichen Beobachtungen.

[1]) Viele Stationen messen auch den Niederschlag bei der Abendbeobachtung; diese Menge wird zu der am folgenden Morgen gemessenen addiert.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie von denen der zweiten Abteilung. Die Monatsmittel sind berechnet nach der Formel [1])

$$m = n - k\,(n - \text{Min.}),$$

wo n das einfache Mittel aus den drei festen täglichen Beobachtungen und k ein Faktor ist, der mit der Station und dem Monate wechselt [2]).

Für Oslo, Bergen, Trondheim und Tromsø sind die mittels Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, die angegeben sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen zuzüglich einer Korrektion [3]). Diese, die aus den stündlichen Beobachtungen in Oslo, Bergen und Bossekop (Alta) für 20 Uhr berechnet worden sind, können mit dem Abendtermin um 19 Uhr unverändert gebraucht werden.

Die Terminmittel für Haarhygrometerstationen sind aus den Mitteln der relativen Feuchtigkeit und der Lufttemperatur berechnet, mit einer empirisch bestimmten Korrektion, die nur von der Temperatur abhängt:

Temp.	Korr.	Temp.	Korr.
$> 20^0$	— 0.2	— 10- — 6	+ 0.3
15-20	— 0.1	— 20- —10	+ 0.4
10-15	0.0	— 25- —20	+ 0.3
0-10	+ 0.1	— 30- —25	+ 0.2
— 6- 0	+ 0.2	— 40- — 30	+ 0.1
		$<$ —40	0.0

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppenschen Formel:

$$m = q + c\,(2p - q),\quad q = \tfrac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden [4]).

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen. Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag usw. Die drei ersten Rubriken geben die Zahl der Tage mit merkbarem Niederschlag, mit Niederschlag über oder gleich 0.1 mm und mit über oder gleich 1.0 mm. Als Schneetage sind nur diejenigen gerechnet, an denen eine messbare Menge gefallen ist. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Als Tage mit Hagel sind diejenigen gerechnet, an denen Hagel oder Graupeln gefallen sind; die letzte Art ist ganz überwiegend. Als Tage mit Nebel sind auch diejenigen gerechnet, an denen schwacher Nebel vorhanden war, aber Tage mit Bodennebel sind nicht mitgezählt. Heitere Tage sind solche, an denen die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Als Gewittertage sind diejenigen gerechnet, an welchen Donner gehört wurde. Übrigens

---

[1]) Siehe Met. Zeitschr. 1891, S. 253 flg.; auch 1906, S. 540 flg., und «Klimatabeller for Norge» I, Luftens Temperatur, S. 6—7.

[2]) Siehe Jahrbuch für 1920. S. IX.

[3]) Die Werte dieser Korrektion sind im Jahrbuch für 1891, S. XV, angegeben.

[4]) Die Werte des Faktors c sind im Jahrbuch für 1920, S. XI, angegeben.

sind die Angaben über Gewitter bei den meisten Stationen ganz unvollständig. Sturmtage sind solche, an welchen die Windstärke über 8 notiert ist.

Die Windverteilung ist direkt aus den notierten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Sonst gelten für die Übersichtstabellen dieselben Bemerkungen wie für den zweiten Teil.

Anhang I enthält die Abweichungen der Monatsmittel des Luftdrucks und der Temperatur vom Normalwert für 10 bzw. 17 Stationen. Die verwendeten Normalperioden sind für Luftdruck (1866—95) und für Temperatur (1841—90).

Anhang II gibt die Monats- und Jahresmittel der Temperatur des Oberflächenwassers für 20 Küstenstationen. Die Temperatur wird um 14 Uhr gemessen.

Anhang III enthält die Beobachtungen an den norwegischen Radiostationen auf Svalbard, auf Bjørnøya und auf Jan Mayen für das Jahr 1930.

Der Thermograph auf Svalbard steht in einer norwegischen Hütte, und die zweistündlichen Temperaturwerte sind auf die Angaben eines dortigen Quecksilberthermometers reduziert.

Auf Jan Mayen sind Luftdruck-, Temperatur- und Windbeobachtungen auch um 2 Uhr ausgeführt und hier unter den gewöhnlichen Terminbeobachtungen mitgenommen. Die Stärke des Windes ist nach Beauforts Skala angegeben.

Anhang IV enthält die Ergebnisse der aerologischen Flugzeugaufstiege vom Militärflugplatz Kjeller. Beschreibung des Aufstiegortes in Calwagen: Zur Diagnose und Prognose lokaler Sommerschauer, Geof. Publ. III, 10, Oslo 1926, S. 13. Als Registrierinstrument wurde ein Flugzeugmeteorograph von Jaumotte verwendet (vgl. Ciel et Terre, 6—10 Bruxelles 1925). In der Zeit 9. Juni—3. August wurden die Aufstiege am Militärflugplatz Værnes (63°. 5 N, 10°. 9 E, Seehöhe 10 m) ausgeführt.

Oslo, im Juni 1932.
