I N L E I D I N G.

Hierdie band is die een-en-twintigste van 'n reeks Jaarverslae en bevat opsommings van waarnemings wat by weerstasies in die Unie van Suid-Afrika, Basoetoland, Swaziland en Betsjoeanaland-Protektoraat gedurende die jaar 1946 gedoen is.

Vir hierdie verslag word die weerstasies in drie hoofgroepe ingedeel, naamlik:-

(1) Eerste en tweede orde stasies, waar tenminste tweekeer per dag, d.w.s. om 8.30 vm. (0830) en om 3 nm. (1500) S.A. Standaard Tyd, waarnemings gedoen word.

(2) Derde orde stasies, waar waarnemings net eenkeer per dag, om 8.30 vm. uitgevoer word.

(3) Reënvalstasies, waar die meting van reënval eenkeer per dag (8.30 vm.) onderneem word.

Die tabelle is gerangskik soos in vorige verslae en verskyn in die volgende orde:-

(i) Klimatologiese opsommings van 78 eerste en tweede orde stasies.

(ii) Klimatologiese opsommings van 136 derde orde stasies.

(iii) Maandelikse gemiddeldes en uiterste waardes van 'grasminimum' temperature by 18 stasies.

(iv) Maandelikse gemiddeldes van grondtemperature op verskillende dieptes by 16 stasies.

(v) Maandelikse gemiddeldes en persentasies van sonskynduur by 10 stasies.

(vi) Uurlikse gemiddeldes van lugtemperatuur vir elke maand by 11 stasies.

(vii) Uurlikse gemiddeldes van relatiewe vogtigheid vir elke maand by 11 stasies.

(viii) Maandelikse en jaarlikse hoeveelheid neerslag en aantal reëndae by 2682 stasies.

Die gekorrigeerde <u>lugdrukwaardes</u> is herlei tot die naaste 100 geodinamiese meter-vlak. Die bepaalde niveau vir elke stasie word bo-aan die betrokke tabel vermeld, soos volg:- Ps by ____ gdm.

By al die klimatologiese stasies word die <u>lugtemperatuur</u> in 'n Stevenson skerm gemeet. Die skerm huisves 'n maksimum- en minimum-termometer en 'n droog- en natbol-psychrometer. Die droëbol-termometer is so gestel dat sy bol 4 vt. bo die grondvlak is. Gemiddelde lesings van die natbol-termometer word slegs vir eerste en tweede orde stasies gepubliseer.

'<u>Grasminimum' temperature</u> word verkry van 'n gewone minimum-termometer wat binne 'n glasbuis gemonteer, en horisontaal opgestel is, sodat sy bol nie meer as een duim bokant kortgeknipte gras lê nie.

<u>Grondtermometers</u> is die gewone Symons-tipe en word in staalbuise by verskillende dieptes blootgestel.

I N T R O D U C T I O N.

The present volume is the twenty-first of a series of Annual Reports and contains summaries of observations made at weather stations in the Union of South Africa, Basutoland, Swaziland and Bechuanaland Protectorate during the year 1946.

For the purpose of this report, weather stations in South Africa are classified in three main groups, namely:-

(1) First and second order stations, where observations are made at least twice daily, i.e. at the main observation hours 8.30 a.m. (0830) and at 3 p.m. (1500) South African Standard Time.

(2) Third order stations, where observations are carried out at 8.30 a.m. only.

(3) Rainfall stations, where rainfall is measured once daily at 8.30 a.m.

The tabular matter, as in preceding reports, is arranged in the following order:-

(i) Climatological summaries for 78 first and second order stations.

(ii) Climatological summaries for 136 third order stations.

(iii) Monthly means and extremes of "grass-minimum" temperature at 18 stations.

(iv) Monthly means of earth temperatures at various depths at 16 stations.

(v) Monthly means and percentages of daily sunshine duration for 10 stations.

(vi) Hourly means of air temperature for each month at 11 stations.

(vii) Hourly means of relative humidity for each month at 11 stations.

(viii) Monthly and annual amounts of precipitation and number of rainfall days at 2682 stations.

Corrected mean <u>pressure values</u> are reduced to the nearest 100 geodynamic metre level. The appropriate level for each station is given in the heading of the respective table, thus:- Ps at ____ gdm.

At all climatological stations, <u>air temperatures</u> are measured in a Stevenson screen housing a maximum and minimum thermometer and a dry and wet bulb psychrometer. The height of the bulb of the dry-bulb thermometer is 4 ft. above ground level. Means of wet-bulb thermometer readings only appear for first and second order stations.

'<u>Grass-minimum' temperatures</u> are obtained by an ordinary sheathed alcohol minimum thermometer exposed horizontally so that its bulb is not more than one inch above the surface of short cut grass.

<u>Earth thermometers</u> are of the usual Symons pattern, exposed in steel tubes at various depths.

Uurlikse waardes van temperatuur en relatiewe vogtigheid (bladsye 72 tot 79) is verkry uit die grafieke van Fries termohigrograwe wat in Stevensonskerms op 'n hoogte van ongeveer 4 vt. bo die grondvlak opgestel is.

Die sonskynduur is deur middel van Campbell-Stokes sonskynmeters verkry, terwyl die sonskynduur volgens die voorskrifte in die Waarnemershandboek (M.O. London) bepaal is. By die berekening van die persentasie-waardes het die „moontlike" sonskynduur in elke geval betrekking op die wat sou geld, oor 'n horisontale oppervlakte met 'n vrye horison en wolklose hemel by die breedtegraad van die betrokke stasie.

Die windfrekwensie wat in die klimatologiese tabelle vir eerste en tweede orde stasies voorkom, verteenwoordig die totale frekwensie van windrigtings wat om 8.30 vm. en 3 nm. waargeneem is. Vir eerste orde stasies wat met 'n Dines drukbuisanemometer voorsien is, word die frekwensies egter uurliks van die anemogramme afgelees.

Die standaard reenmeter, wat in die Unie in gebruik is, het 'n deursnee van 5 duim en is op 'n voetstuk gemonteer sodat die rant daarvan 4 voet van die bodem is. Verdamping van reenwater uit die meter word beperk deur die nou opening van die opvangesmeert is en deur die feit dat laasgenoemde geheel en al binne die voetstuk van die meter ingesluit is.

Weens die baie tekortkomings van die tot onlangs bestaande sisteem vir die toekenning van stasienommers en die boekstaving van reenvalgegewens, is 'n verbeterde sisteem nou in werking gebring. Hierdie nuwe stelsel is baie meer doeltreffend wat betref die vergelyking en toetsing van reenvalopgawes, en vergemaklik en bespoedig die naslaan van enige deel van die Unie se reenvalsyfers in die grootregisters van die Weerburo. Volgens die nuwe stelsel is Suid-Afrika in kwartgraad seksies verdeel wat agtereenvolgens van links na regs en van Suid na Noord genommer is soos aangedui op die nuwe reenvalseksiekaart wat tussen bladsye 158 en 159 verskyn. Elke seksie bevat op sy beurt 900 kruispunte van een-minuut-intervalle van lengte- en breedtegraad wat met toenemende langtegraad genommer word en almal eventuele stasienommers is. In sy geheel is 'n stasienommer dus tweeledig, d.w.s., die eerste deel het betrekking op die seksie en die tweede op sy posisie binne die seksie. Die volgorde van nommers binne 'n bepaalde seksie word verduidelik in die volgende voorbeeld:-

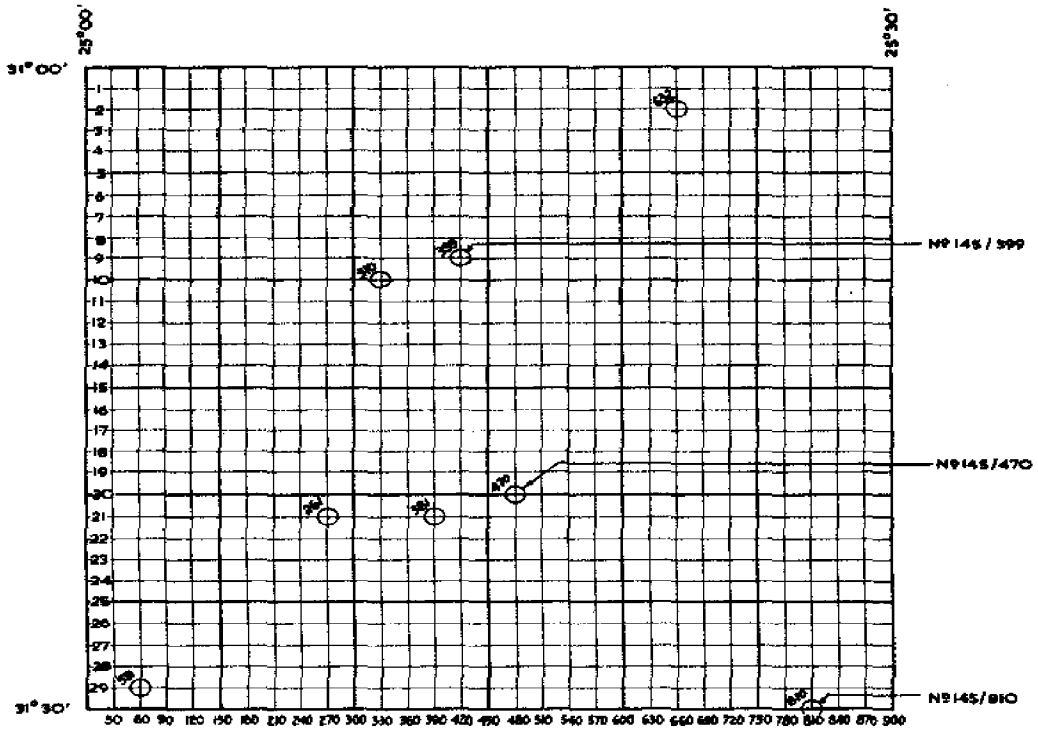
Hourly values of temperature and relative humidity (pages 72 to 79) are deduced from the traces of Fries thermohygrographs which are exposed in Stevenson screens at a height approximately 4 ft. above ground level.

The duration of bright sunshine is measured by means of Campbell-Stokes sunshine recorders. The traces are evaluated according to the instructions appearing in the Observers' Handbook (M.O. London). In the computation of the percentage values, the "possible" sunshine in each case refers to its duration over a horizontal surface with an unobstructed horizon and clear sky at the latitude of the station in question.

Wind frequencies appearing in the climatological tables for first and second order stations represent the total frequency of wind directions observed at 0830 and 1500 S.A. Standard Time. For first order stations equipped with a Dines Pressure Tube Anemometer, however, the frequencies are derived from the anemograms read off hourly.

The standard raingauge used in the Union is 5 inches in diameter and is mounted on a stand so that its rim is 4 feet above ground level. Evaporation of rainwater from the gauge is reduced by having a small orifice to the collecting bucket and by enclosing the latter completely inside the outer stand.

On account of the many defects inherent in the hitherto existing system of numbering rainfall stations and recording rainfall data, an improved system has now been adopted. This system permits a greater efficiency in comparing and checking rainfall returns, and facilitates rapid reference to rainfall statistics for any part of the Union from the basic rainfall registers of this Bureau. According to this new scheme, South Africa is partitioned into quarter-degree sections which are numbered consecutively from left to right and from South to North as shown in the new Rainfall Section map appearing between pages 158 and 159. Each section has 900 intersections of one-minute intervals of latitude and longitude which, being numbered in progressive longitudinal order, are all potential station numbers. Thus a rainfall station number in full consists of two parts, the first referring to the section and the second to its position within the section. The order of numbering within a particular section is shown in the following example:-



Die sirkels het betrekking op die teenswoordige distribusie van stasies in seksie 145. Aangesien die kruispunte van een-minuut intervalle van lengte- en breedtegraad in ons land min of meer een myl van mekaar lê, is dit duidelik dat die nommers van alle moontlike stasies, binne 'n netwerk met 'n digtheid van een stasie per vierkante myl, vooruit bepaal is.

Die volgende is 'n lys van simbole waarvan die betekenis nie alreeds in die hoofde van die tabelle verduidelik is nie:-

- ϕ = Breedtegraad.
- λ = Lengtegraad.
- H = Hoogte van stasie bo seespieël.
- h_t = Hoogte van droëbol-termometer bo grondvlak.
- h_r = Hoogte van reënmeterrand bo grondvlak.
- h_a = Hoogte van windmeterkop bo grondvlak.
- Σ = Som (Totale hoeveelheid neerslag).
- \- = *Geen waarnemings, of geen betroubare waarnemings.*
- ( ) = Syfers in hakies is bereken uit 'n onvoldoende aantal daaglikse waarnemings.

The circles represent the present distribution of stations within section 145. Since intersection of one-minute intervals of latitude and longitude in this country are approximately one mile apart it is clear that, according to this system, the numbers of all possible stations are predetermined whilst provision is made for a density of approximately one station per square mile.

The following is a list of symbols used, whose meanings are not already indicated in the headings of the tables:-

- ϕ = Latitude.
- λ = Longitude.
- H = Height of station above M.S.L.
- h_t = Height of dry-bulb thermometer above ground level.
- h_r = Height of raingauge above ground level.
- h_a = Height of anemometer head above ground level.
- Σ = Sum (Total amount of precipitation).
- \- = *No observations, or no reliable observations.*
- ( ) = Figures in brackets are computed from an insufficient number of daily readings.
