PROLOGO

El INSTITUTO METEOROLOGICO NACIONAL, publica el anuario de datos climatológicos de 1973 en el que se incluye los datos de las estaciones meteorológicas del Instituto y de o -- tras entidades según normas establecidas.

El Departamento de Climatología tuvo bajo su responsabilidad la preparación de los datos y la Sección de Procesa - miento Mecanizado de Datos, preparó los cuadros y resúmenes respectivos.

El procesamiento se realizó en un computador HP 9830 A con lector de tarjetas IBM y la impresión del anuario la realizó el Instituto Geográfico Nacional.

1.- INTRODUCCION

Las estaciones climatológicas de la red costarricense están clasificadas de acuerdo con lo establecido en el Raglamento Técnico de la Organización Meteorológica Mundial en las siguientes categorías:

a. Estaciones climatológicas principales (tipo A)

b. Estaciones climatológicas ordinarias (tipo B)

c. Estaciones de observación de precipitaciones (tipo C)

d. Estaciones termopluviométricas

Los programas de observaciones y la dotación de instrumental están asímismo de acuerdo con las normas internacionales establecidas en la siguiente forma:

a. Programa de Observaciones

Las estaciones climatológicas realizan tres observaciones diarias con fines climatológicos: a las 07:00, 13:00 y 18:00 horas de = tiempo local, lo que está en consonancia con el criterio establecido en el sentido de que las horas de observación deben fijarse de manera que reflejen las variaciones diurnas importantes de los elementos climatológicos.

i. El programa de observaciones de una estación climatológica principal comprende en una observación la obtención de todos los elementos siguientes:

a. Tiempo, presente y pasado y meteoros principales
b. Viento, dirección y velocidad
c. Nubosidad, cantidad de octavos
d. Tipo de nubes
e. Altura de la base de las nubes
f. Visibilidad, mínima prevaleciente en Km. o m.
g. Temperatura (incluyendo valores extremos en 24 horas)
h. Indices de humedad, calculando tensión del vapor y humedad relativa a partir de lecturas de aspiropsicrómetro
i. Presión atmosférica, en la estación (esto es reduciendo a 0° C y gravedad normal) presión reducida al nivel del mar
j. Precipitación, cantidad en mm. y características y duración de la precipitación
k. Evaporación en abrigo y al aire libre
l. Registro contínuo de la Insolación; insolación absoluta y relativa
m. Registro contínuo de la Radiación solar global utilizando un actinógrafo
n. Temperatura del suelo a varias profundidades y temperatura mínima junto al césped
o. Estado del terreno

Por definición en las estaciones climatológicas principales al no hacerse observaciones horarias deben obtenerse estos valores horarios de los registros automáticos correspondientes.

ii. El programa de observaciones en una estación climatológica ordinaria incluye la determinación de los siguientes alementos:

a. Tiempo, características generales, meteoros principales
b. Nubosidad, cantidad en octavos
c. Visibilidad media y/o mínima
d. Temperaturas (incluyendo extremas)
e. Indice de humedad, lecturas del psicrómetro
f. Evaporación a la sombra (Piche) y/o al aire libre (tanque)
g. Precipitación, características generales y cantidad total (de 07 a 07 del día siguiente y duración (en general del pluviógrafo)

Las estaciones climatológicas ordinarias pueden o no estar provistas de instrumentos registradores.

Las estaciones pluviométricas realizan comúnmente una sola observación midiendo el agua recogida en 24 horas; la lectura se realiza a las 07:00 horas (tiempo local), totalizando la lluvia caída en el período de las 07:00 a las 07:00 del día siguiente. La anotación correspondiente se hace en la casilla = del día en que se inicia el período.

En las estaciones dotadas de pluviógrafo se determinan valores horarios de la precipitación, duraciones de la precipitación, e intensidades de precipitación en períodos fijos, 5, 10, 15 y 30 minutos y 1, 2, 6 y 12 horas.

b. Exposición del instrumental

Los instrumentos se encuentran expuestos de acuerdo a las normas de la siguiente manera:

i. Presión atmosférica. El barómetro y el barógrafo casi = siempre microbarógrafo, van instalados en la caseta que se = construye en cada estación, con un aislamiento casi completo = de corrientes de aire, cambios bruscos de temperatura, evitando incidencia directa de rayos solares, etc.

ii. Temperatura y humedad. El abrigo meteorológico utilizado normalmente es de doble persiana, pero en algunas estaciones = Limón y Puntarenas, se utiliza abrigo de tipo tropical. La altura de los bulbos de los termómetros sobre el suelo está compredida entre 1.25 y 1.50 m.

Se utiliza normalmente aspirosicrómetro con los dos termómetros ventilados, con ventilador grande de corriente de altura de 2.5 m/s.

Los termómetros de temperaturas extremas van unidos al = soporte del sicrómetro, colocados horizontalmente es de mínima y ligeramente inclinado el de máxima.

El higrotermógrafo va instalado junto al psicrómetro directamente sobre el suelo del abrigo meteorologico.

iii. Evaporación. Se determinan valores de evaporación potencial a la sombra, en el abrigo meteorológico utilizando un evaporímetro piche recto de disco de 30 mm. de diámetro, que = se instala en el abrigo suspendido del techo.

Al aire libre se determinan valores de evaporación utilizando el tanque WB tipo A que va instalado en una tarima de = madera que permite ventilación en su base. Simultáneamente = se observan temperatura del agua, y recorrido del viento a la altura del tanque lo que nos permite conocer velocidades medias del viento.

iv. Precipitación. Los pluviómetros y pluviógrafos están = instalados de forma que ls bocas receptoras estén a 1.50 m. = sobre el suelo.

v. Viento. Las observaciones de viento se realizan en las estaciones climatológicas principales utilizando anemocinemógrafos, que tienen el elemento receptor a una altura sobre el nivel del suelo de aproximadamente 6 m.

vi. Sol. El heliógrafo del tipo Campbell Stokes, puede estar instalado en un poste o pedestal a 1.50 m. sobre el suelo, o sobre la terraza de la construcción de la estación; y análogamente va instalado el actinógrafo Robitzsch.

c. Elaboración promaria de la información, unidades de medida y criterios de cálculo

En las estaciones dotadas con instrumentos registradores, se obtienen valores horarios de los diferentes elementos meteorológicos registrados, corrigiéndolos a base de las observaciones diarios disponibles, y obtenidas con instrumentos de lectura directa.

El valor medio diario se determina como media aritmética de los veinticuatro valores horarios obtenidos del registro correspondiente así elaborados.

$$\bar{X}_{día} = \frac{\sum_{h=1}^{h=24} \bar{X}_h}{24}$$

Los promedios mensuales se obtienen como media aritmética de los valores diarios disponibles.

$$\bar{X}_{Mes} = \frac{\sum_{d=1}^{d=n} \bar{X}_d}{n}$$

n: Número de días del mes, con datos

Los valores medios anuales se obtienen como media aritmética de los valores mensuales.

$$\bar{X}_{año} = \frac{\sum_{n=1}^{n=12} \bar{X}_m}{12}$$

En aquellas variables meteorológicas de las cuales interesan valores totales acumulados se determinan los valores mensuales como suma de las cantidades diarias correspondientes.

$$\sum_{d=1}^{d=1} X_{dia}$$

y los valores totales anuales se obtienen sumando los valores mensuales.

$$\sum_{m=1}^{m=12} X_{mes}$$

Cuando falten datos de algún día o de algún mes, completo o no, no debe reseñarse el dato total mensual o anual.

En las estaciones que carecen de instrumentos registradores y para los elementos meteorológicos que no se registran, adoptaremos por ahora como criterio para definir el valor medio, la media aritmética de los valores determinados en las tres observaciones disponibles.

$$\bar{X} = \frac{X_I + X_{II} + X_{III}}{3}$$

La definición de los valores y unidades de cada elemento meteorológico presentado en este anuario es la siguiente.

i. Presión atmosférica*: Los valores de presión corresponden a lecturas del barómetro reducidas a temperatura (0°C) y gravedad (980.665) normales, esto es presión en la estación. Las unidades son milibares y décimas de milibar, omitiendo las cifras superiores a las decenas. Así:

998.3 mb. = 98.3 1013.6 mb. = 13.6

En el encabezamiento del cuadro aparece la cifra total que hay que sumar al valor que aparece en el cuadro para tener la presión:

900 + ó 1000 +

ii. Temperaturas: Los valores de temperatura corresponden a lecturas directas de los termómetros de extremas. Aunque en muchas ocasiones estos valores extremos representan la máxima y mínima del día natural, debe considerarse siempre que lo sean del período de veinticuatro horas comprendidas entre las horas en que se leen los termómetros. Los valores absolutos máximo y mínimo de temperatura en un mes, son la máxima de las máximas producidas diariamente y la mínima de las mínimas observadas diariamente durante los días de ese mes; ambos valores corresponderán generalmente a dos días diferentes del mes que se reseñan en el resumen.

Todas las temperaturas se dan en grados centígrados o Celsius (°C) y décimas de grado así:

23.9°C 32.5°C 08,2°C

iii. Humedad del aire: Se definan dos índices de humedad: la tensión o presión del vapor, e, que es la presión que ejerce el vapor de agua en la mezcla de gases que constituye el aire, y que siendo p la presión total atmosférica y r la razón de mezcla vale:

$$e = \frac{r \quad p}{0.62198 + r}$$

La tensión del vapor se da en mm. Hg.;

El otro índice de humedad es la humedad relativa U del aire húmedo con respecto al agua que a la presión p y temperatura t, es el cociente, expresado en tantos por ciento, de la

* En algunas estaciones las presiones se indican en milímetros de mercurio y décimas de milímetro. En tal caso se ha hecho la indicación correspondiente al pié del listado de datos.

cantidad del vapor que contiene un volumen dado de aire y la cantidad máxima que podría contener.

La humedad relativa se da en unidades enteras de tanto = por ciento, 68%, 43%, etc.

iv. Insolación y radiación global solar: El tiempo de duración de la insolación se determina registrándolo en heliógrafo de Campbell-Stokes, se da en horas y décimas de hora. Mensualmente se determina el número total de horas.

Además se calcula lo que se define como heliofanía relativa y que es la razón entre el valor real de horas de sol habidas en un día y el valor máximo teórico posible, en función de la latitud y la estación astronómica; expresándola en tanto por ciento, en unidades enteras, así:

$$\text{heliofanía } \% = 100 \times \frac{\text{N° de horas de sol reales}}{\text{N° de horas de sol máximo posible}}$$

El valor de radiación que se registra es la radiación = global diaria, recibida por una superficie horizontal con un piranómetro de tercera (actinógrafo bimetal de Robitzsch). = Los valores diarios de radiación se dan en langleys, caloría por cm^2/día. Mensualmente se da el valor medio para un período de veinticuatro horas.

v. Evaporación. En el Anuario se presentan valores de evaporación potencial determinados con evaporímetros Piche a la sombra, dentro del abrigo meteorológico. Los valores diarios corresponden al período de veinticuatro horas comprendido entre las 07:00 horas (T local) del día en que se anote la observación y las 07:00 horas del día siguiente:

La evaporación potencial se presenta em mm., haciendo notar que los instrumentos vienen graduados en mililitros (ml).

La segunda sección de evaporación, está destinada a proporcionar valores de evaporación en agua libre del sol, utilizando el tanque tipo A (W.B.).

Aquí también se dan valores diarios correspondientes al período de veinticuatro horas comprendido entre las 07:00 del día en que se anota el dato y las 07:00 del día siguiente. = Las unidades utilizadas son altura de la capa evaporada en milímetros (mm.). Con este dato se incluyen: valor de la velocidad media del viento en m/seg., calculado con los datos de recorrido de un anemómetro totalizados instalado a la altura del tanque, y temperatura media del agua. Cuando se hacen = lecturas de valores extremos de la temperatura del agua se = calcula la media.

$$\bar{t}_{\text{media agua}} = \frac{t_{max} + t_{min}}{2}$$

y cuando se obtienen lecturas de la temperatura del agua a la hora de observación se utiliza el promedio de las tres observaciones.

$$t_{\text{media agua}} = \frac{t_{07} + t_{13} + t_{18}}{3}$$

Las temperaturas se dan en grados centígrados o celsius y décimas de grado (°C).

vi. Precipitación. La lluvia total medida corresponde a = un período de veinticuatro horas comprendido entre las 07:00 horas (tiempo local) del día en que se anota y las 07:00 horas del día siguiente:

La duración es el tiempo total en que estuvo lloviendo en el día.

La altura total de precipitación se da en mm. y la duración en horas y minutos.

En los cuadros resumen se proporciona información sobre la lluvia máxima en 24 horas y corresponde a la mayor cantidad de lluvia recogida en el pluviómetro en un período de = veinticuatro horas, de 07:00 a 07:00 del día siguiente para = todas las estaciones.

También se da el número de días en que la precipitación fue mayor de unos límites fijados que son 0.1 mm., 1.0, 10.0, 50.0 y 100.0 mm.

Cuando en un día no ha habido precipitación aparede (0.0) y si no hubo información aparece ( ). Cuando hay algún día sin dato, los valores totales mensuales que se obtienen son la suma de los días en los cuales hubo precipitación.

Los valores de intensidades máximas de precipitación en períodos de tiempo seleccionados se determinan en los registros de los pluviógrafos en las zonas de la gráfica de máxima pendiente. Directamente se obtienen cantidades máximas de = lluvia en 5', 10', 15', 30', 2h., 6h. y 12 horas y después se calculan intensidades en mm./hora.

vii. Viento

Solo se consignan los datos de vientos obtenidos con anemógrafo o anemocinemógrafo. El cuadro se confeccionó partiendo de datos horarios de dirección y velocidad del viento.

Tomando en cuenta los veinticuatro valores horarios de = cada día del mes, se encontró el número de casos en que el = viento prevaleció en un rumbo determinado (usando la rosa de

ocho rumbos). A la par de ese valor de frecuencia se incluyó la velocidad promedio de cada dirección.

En la última columna se encuentra el número de "calmas" por día. (Se = considera calma cuando la velocidad es inferior a 3.7 Kms./hora.)

VIENTO FRECUENCIA Y VELOCIDAD MEDIA SEGUN CADA DIRECCION									DIA
N	NE	E	SE	S	SW	W	NW	C	
1 4	5 5	0 00	2 11	0 00	2 11	0 00	0 00	14	1
3 5	2 5	0 00	2 6	3 6	6 7	0 00	0 00	8	2
1 4	7 7			3 00	6 8	0 00	1 6	8	3

En el día 2 se lee: tres nortes con una velocidad promedio ($\bar{v}$) de 5, 2 norestes con un $\bar{v}$ = 5, 2 surestes con $\bar{v}$ = 6, 3 sures con $\bar{v}$ = 6,6 suroestes con $\bar{v}$ = 7 y 8 calmas.

En la última línea del cuadro se ofrece un resumen mensual; la dirección se da en frecuencia en tanto por ciento pero las velocidades siguen = siendo valores medios para cada dirección.

Cuando la suma de las frecuencias no totalizan 100% la diferencia corresponde a vientos de dirección variable.

Las unidades en que se dan las velocidades en un Km./hora a excepción del Aeropuerto Juan Santamaría que está en m/s.

Distribución de los cuadros estadísticos

Los cuadros estadísticos del Anuario Meteorológico contienen información correspondiente al año 1973, utilizando como unidades de tiempo el año civil del calendario gregoriano (Reglamento Técnico de la O.M.M. 8.4.1.1.), los meses de dicho = calendario, y el día solar medio cuando los datos lo permitan, utilizando en los demás el período de veinticuatro horas comprendido entre las 07:00 horas tiempo local del día en que se anota el dato y las 07:00 horas del día siguiente.

La información está agrupada en la siguiente forma:

I Valores diarios es las estaciones climatológicas principales.

II Valores mensuales y anuales en las estaciones climatológicas principales y ordinarias

III Valores diarios de las estaciones de precipitación.

IV Valores mensuales y anuales de las estaciones de precipitación.

I. Valores diarios en las estaciones climatológicas principales

Valores diarios de los siguientes elementos meteorológicos.

Presión atmosférica: Valores de la presión reducida a 0°C y gravedad normal a las 07 (I), 13 (II) y 18 (III) horas.

Valor medio diario de la presión reducida a 0°C y gravedad normal obtenida como media aritmética de veinticuatro valores horarios del barograma (P).

Temperatura del aire: Valores de temperaturas máxima y mínima (MAX, MIN), valores de la temperatura a las 07 (I), 13 (II) y 18 (III) horas.

Valor medio de la temperatura diaria, media aritmética de veinticuatro valores horarios del termograma (T).

Humedad del aire: Valores de tensión del vapor a las 07 (I), 13 (II) y 18 (III) horas.

Valores de humedad relativa a las 07 (I), 13 (II) y 18 (III) horas y valor medio de la humedad relativa como media aritmética de valores horarios del higrograma (U).

Sol y radiación global: Número de horas de sol diario, y porcentaje (%) del valor máximo teórico.

Radiación global en cal/cm^2 $día^{-1}$

Tiempo y meteoros: Caracterización del tiempo en el día de referencia, mediante los meteoros más significativos que se produjeron.

Evaporación: Altura de evaporación potencial en mm. para el período de veinticuatro horas comprendido entre 07:00 de hoy y 07:00 de mañana.

Altura de evaporación: al aire libre en mm. correspondiente al mismo período de 24 horas.

Velocidad media del viento.

Temperatura media del agua del tanque

Precipitación: Altura de precipitación total medida en el período de 24 horas comprendido de 07:00 del día en que se anotó el dato y las 07:00 del día siguiente.

Duración de la precipitación, durante las 24 horas.

Valores máximos de intensidad de la lluvia en los períodos fijos de 5', 20', 15', 30', 1h, 2h, 6h y 12 horas.

Viento: Frecuencias y velocidades medias según cada dirección expresadas en número de casos y promedios de las velocidades en Kms./hora y m/seg.

Los valores mensuales en la parte inferior de cada cuadro presentan valores medios para presiones, temperatura del aire, humedad del aire, heliofanía relativa, radiación global y velocidad del viento, se refieren a valores totales en horas de sol, evaporación, precipitación, y frecuencias de la dirección del viento (estas reducidas a %) y son valores máximos en las columnas correspondientes a intensidades de la lluvia.

II. Valores mensuales y anuales en las estaciones climatológicas principales y ordinarias

Presión atmosférica (solo en las principales): Valores medios de la presión reducida a 0°C y gravedad normal a las horas 07 (I) 13 (II) y 18 (III) y presión media mensual.

Los valores medios anuales se obtienen de los valores mensuales sin tomar en cuenta que los meses tienen diferente número de días dividiendo la suma de medias mensuales por doce.

Temperatura del aire: Valor máximo absoluto de temperatura en cada mes y día en que se produjo. Valor mínimo absoluto de la temperatura en cada mes y día en que se produjo. Valores máximos y mínimos promedios. Valores medios de temperatura a las 07 (I), 13 (II) y 18 (III), y temperatura media diaria para el mes (T).

Los valores anuales son medias de los doce valores mensuales, excepto para la máxima y la mínima absolutas.

Humedad relativa: Valores medios de humedad relativa a las 07 (I), 13 (II) y 18 (III) y media diaria (U).

Los valores medios anuales son promedio de los doce valores mensuales.

Sol y radiación: Mensualmente se reseña el resumen total de horas de sol para cada mes, y anualmente el total anual.

El porcentaje se refiere a la media de valores diarios.

La radiación global se da en cal cm^{-2} para cada mes, y el promedio de los 12 meses como valor anual.

Evaporación: Valores totales mensuales de evaporación en piché y tanque tipo A (W.B.)

Velocidad media del viento en m/seg.
Temperatura media del agua.

Anualmente el valor total de la evaporación

Precipitación: Altura total de precipitación mensual, y total anual como suma de los doce valores mensuales.

Valores máximos correspondientes a períodos de 24 horas y día de la máxima.

Número de días en que la precipitación fue mayor que los márgenes establecidos.

Número de días de niebla

Número de días de lluvia

Número de días de tormenta

Viento: Frecuencia y velocidad media del viento para cada una de las ocho direcciones de la rosa de los ocho rumbos.

Los valores anuales son también frecuencias en porcentaje y velocidades medias.

III Valores diarios de las Estaciones de Precipitación

En estos cuadros las estaciones están agrupadas por cuencas hidrográficas, y en cada columna se presentan los valores diarios de precipitación de cada estación, el total mensual y el número de días en que la precipitación fue superior a los márgenes establecidos, 0.1, 1.0, 10.0, 50.0 y 100.0 mm.

IV. Valores mensuales y anuales de las estaciones de precipitación

Aquí se dan valores mensuales y suma anual de precipitación de todas las estaciones pluviométricas disponibles cuando el total anual se encuentra.

V. Otros símbolos utilizados

* Inicio de las observaciones. (Incluye el caso de estaciones reinstaladas).

\# Datos aproximados o dudosos

| El valor al extremo de la flecha es la precipitación acumulada, de esos días en que no hubo observaciones diarias

Blancos No hay datos

0.0 Precipitación nula

Nota: Cuando el total anual de precipitación aparece entre parentesis, corresponde únicamente a la suma de los días en que hubo observación
