# THE CALIFORNIA-WASHINGTON ARC OF PRECISE TRIANGULATION.

## GENERAL STATEMENT.

The arc of precise triangulation, the results of which are here published, extends from latitude  $39^{\circ}$ , in northern California, to Puget Sound, Wash. The data for this arc, together with a discussion of the least-squares adjustment and other purely scientific matter, were originally published in United States Coast and Geodetic Survey Special Publication No. 13, by A. L. Baldwin, computer. The original publication is now exhausted, and there is reprinted here only that part of the data which is of value to the engineer or surveyor for the control of surveys, namely, the geographic positions, elevations, and descriptions of stations.

## FIELD WORK.

Early in 1903 Assistant O. B. French organized a reconnaissance and signal-building party at Eugene, Oreg. With this party Mr. French made a reconnaissance through the Willamette Valley to connect with the triangulation of the Columbia River. He then returned to Eugene with part of the party to do the observing, leaving the rest of the party to build the signals. The observing was carried as far as the reconnaissance had been completed by the latter part of September. Both parties then returned to Eugene, where a base net was laid out and partly observed. Mr. French then made a reconnaissance to the southward to connect with the precise triangulation along the thirty-ninth parallel, which he completed by the middle of November.

In 1904 Assistant J. S. Hill was also assigned to the work, thus allowing Mr. French to devote more time to the reconnaissance without delay to the observing party. The observing started at Marysville Butte soon after May 1, and the season closed about the middle of November. During this time the whole scheme was completed between the transcontinental triangulation along the thirty-ninth parallel and the work of the previous season. Mr. French spent about a month of this season in making a reconnaissance from the Columbia River to Puget Sound.

During the season of 1905 the organization of the parties was the same as in the previous season. The work of this season started in the vicinity of the Columbia River, but though every effort was made, the work was not completed to a connection with the Puget Sound triangulation. This was partly due to the bad weather and to the difficult character of the country, and was partly due to the necessity of revising the reconnaissance in order to eliminate some very high signals and an excessive amount of cutting of timber.

The work of the last season, 1906, was in charge of Assistant J. S. Hill, who organized the party on June 11 and completed the work on July 26.

## THE LEAST-SQUARES ADJUSTMENT.

The geographic positions of Snow Mountain West and Mount Helena, together with the length and azimuth of the line between them, was held fixed as determined by the thirty-ninth parallel triangulation. A single least-squares adjustment served for the entire precise scheme. The Willamette base and the Tacoma base required the use of two length equations, and the Laplace azimuths at Gazelle, Willamette, and Tacoma necessitated three azimuth equations. The maximum correction to a direction, from the adjustment, was  $2''.03$ , and the probable error of an observed direction was  $\pm 0''.53$ . The average closing error of the 148 triangles was  $1''.22$ .

## ACCORD OF BASES.

There are three bases which serve to fix the lengths in the triangulation discussed in this report.

The Yolo base in the thirty-ninth parallel triangulation fixed the length of the line Snow Mountain West-Mount Helena and also the other two sides of triangle Snow Mountain West-Marysville Butte-Mount Helena. The Willamette and Tacoma bases furnish two important tests of the accuracy of the triangulation.

In solving the normal equations in each section of the figure adjustment the length equation was, as usual, assigned to the last place, so that after all the conditions relating to triangle closures and ratios of length had been satisfied the discrepancy in length became known. In the following table the discrepancies developed between bases are given in terms of the seventh place of logarithms and are also expressed as ratios. A plus sign before the discrepancy expressed in terms of logarithms means that the first base mentioned is longer as measured than as computed through the intervening triangulation from the second base mentioned.

Bases	Discrepancy in seventh place of logarithms	Discrepancy expressed as a ratio.
Mount Helena-Snow Mountain West to Willamette base.....	+79	1-55000
Willamette base to Tacoma base.....	-19	1-229000

## ACCORD OF AZIMUTHS.

True geodetic azimuths were determined at three Laplace stations, viz, at Gazelle astronomic, Eugene astronomic, and Tacoma astronomic. In each case the true geodetic azimuth as held fixed was larger than the azimuth as computed through the triangulation, the direction of the computation being from the south to the north. At Gazelle astronomic the discrepancy was  $3''.14$ , at Eugene astronomic  $2''.98$ , and at Tacoma astronomic  $3''.95$ .

## THE NORTH AMERICAN DATUM.

Concerning the actual use of the table of geographic positions, it is necessary to explain the "North American datum," which serves as the basis for all the geodetic values in this report.

Early in the year 1913 the Superintendent of the U. S. Coast and Geodetic Survey was notified by the director of the Comisión Geodésica Mexicana and by the chief astronomer of the Dominion of Canada Astronomical Observatory that the so-called United States standard datum had been adopted as the datum for the triangulation of those organizations. They also reported that the Clarke spheroid of 1866, now used in the United States, would be used by them.

Owing to the international character of the datum adopted by the three countries, the Superintendent of the U. S. Coast and Geodetic Survey changed its designation from the "United States standard datum" to the "North American datum."

EXPLANATION OF POSITIONS, LENGTHS, AND AZIMUTHS, AND OF THE  
NORTH AMERICAN DATUM.

All of the positions and azimuths have been computed upon the Clarke spheroid of 1866, as expressed in meters, which has been in use in the U. S. Coast and Geodetic Survey for many years.

After a spheroid has been adopted and all the angles and lengths in a triangulation have been fully fixed it is still necessary, before the computation of latitudes, longitudes, and azimuths can be made, to adopt a standard latitude and longitude for a specified station and a standard azimuth of a line from that station. For convenience the adopted standard position (latitude and longitude) of a given station, together with the adopted standard azimuth of a line from that station, is called the geodetic datum.

The triangulation in the United States was commenced at various points and existed at first as a number of detached portions in each of which the geodetic datum was necessarily dependent only upon the astronomic stations connected with that particular portion. As examples of such detached portions of triangulation there may be mentioned the early triangulation in New England and along the Atlantic coast, a detached portion of the transcontinental triangulation centering on St. Louis and another portion of the same triangulation in the Rocky Mountain region, and three separate portions of triangulation in California, in the latitude of San Francisco, in the vicinity of Santa Barbara Channel and in the vicinity of San Diego. With the lapse of time these separate pieces expanded until they touched.

The transcontinental triangulation, the office computation of which was completed in 1899, joined all the detached portions mentioned and made them one continuous triangulation. As soon as this took place the logical necessity existed of discarding the old geodetic data used in these various pieces and substituting one for the whole country, or at least for as much of the country as is covered by continuous triangulation. To do this was a very tedious piece of work and involved much preliminary study to determine the best datum to be adopted. On March 13, 1901, the superintendent adopted what was known from that time until 1913 as the United States standard datum, but is now known as the North American datum, and it was decided to reduce the positions to that datum as rapidly as possible. The datum adopted was that formerly in use in New England, and therefore its adoption did not affect the positions which had been used for geographic purposes in New England and along the Atlantic coast to North Carolina, nor those

in the States of New York, Pennsylvania, New Jersey, and Delaware. The adopted datum does not agree, however, with that used in the Transcontinental Triangulation and in the Eastern Oblique Arc of the United States, publications which deal primarily with the purely scientific problem of the determination of the figure of the earth and which were prepared for publication before the adoption of the new datum.

As the adoption of such a standard datum was a matter of considerable importance, it is in order here to explain the desirability of this step more fully.

The main objects to be attained by the geodetic operations of the U. S. Coast and Geodetic Survey are, first, the control of the charts published by the Survey; second, the furnishing of the geographic positions (latitudes and longitudes), of accurately determined elevations, and of distances and azimuths, to officers connected with the Survey and to other organizations; third, the determination of the figure of the earth. For the first and second objects it is not necessary that the reference spheroid should be accurately that which most closely fits the geoid within the area covered, nor that the adopted geodetic datum should be absolutely the best that can be derived from the astronomic observations at hand. It is simply desirable that the reference spheroid and the geodetic datum adopted shall be, if possible, such a close approximation to the truth that any correction which may hereafter be derived from the observations which are now, or may become, available shall not greatly exceed the probable errors of such corrections. It is, however, very desirable that one spheroid and one geodetic datum be used for the whole country. In fact, this is absolutely necessary if a geodetic survey is to perform fully the function of accurately coordinating all surveys within the area which it covers. This is the most important function of a geodetic survey. To perform this function, it is also highly desirable that when a certain spheroid and geodetic datum have been adopted for a country they be rigidly adhered to, without change for all time unless shown to be largely in error.

In striving to obtain the third object, the determination of the figure of the earth, the conditions are decidedly different. This problem concerns itself primarily with astronomic observations of latitude, longitude, and azimuth and with the geodetic positions of the points at which the astronomic observations were made, but is not concerned with the geodetic positions of other points fixed by the triangulations. The geodetic positions (latitudes and longitudes) of comparatively few points are therefore concerned in this problem. However, in marked contrast to the statements made in preceding paragraphs, it is desirable in dealing with this problem that with each new important accession of data, a new spheroid fitting the geoid with the greatest possible accuracy, and new values of the geodetic latitudes, longitudes, and azimuths of the highest degree of accuracy should be derived.

The North American datum was adopted with reference to positions furnished for geographic purposes but has no reference to the problem of the determination of the figure of the earth. It was adopted with reference to the engineer's problem of furnishing standard positions and does not affect the scientist's problem of the determination of the figure of the earth.

The principles which guided in the selection of the datum to be adopted were: First, that the adopted datum should not differ widely from the ideal datum for which the sum of the station errors in latitude, longitude, and azimuth should each be zero; second, it was desirable that the adopted datum should produce minimum changes in the publications of the U. S. Coast and Geodetic Survey, including its charts; and third, it was desirable, other things being equal, to adopt that datum which allowed the maximum number of positions already in the office files to remain unchanged, and therefore necessitated a minimum amount of new computation. These considerations led to the adoption, as the standard, of that datum which had been in use for many years in the northeastern group of States and along the Atlantic coast as far south as North Carolina.

An examination of the station errors of the astronomical stations so far reduced, scattered widely over the United States from Maine to Louisiana and to California, indicated that this datum approaches closely the ideal for which the algebraic sum of the station errors of each class would be zero.

The North American datum, upon which the positions and azimuths given in this publication depend, may be defined in terms of the position of the station Meades Ranch, Kansas, as follows:

$\phi=39$	13	28.686
$\lambda=98$	32	30.506
$\alpha$ to Waldo=75	28	14.52

Points are then said to be upon the North American datum when they are connected with the station Meades Ranch by a continuous triangulation, through which the corresponding latitudes, longitudes, and azimuths have been computed on the Clarke spheroid of 1866, as expressed in meters, starting from the above data.

#### USE OF HORIZONTAL CONTROL DATA.

The plan or map for any extensive engineering project, whether or not map construction is the primary object, should have all of its parts properly correlated and should be on the same datum as adjacent surveys. Federal and State mapping organizations have long been aware of the necessity for having all surveys based upon a common datum, but the local engineers and surveyors in this country have too often in the past been content, and in many cases compelled, to use a local datum for their surveys. The future economic disadvantage of such a system is now becoming recognized, with the result that city and county surveys are being more generally placed upon a permanent basis by connecting them to stations on the North American datum.

One other factor must be taken into consideration by the engineer of to-day. As the States develop industrially they will undoubtedly follow the lead of one of the Eastern States, Massachusetts, which with splendid foresight has extended its triangulation control over the entire State for the purpose of defining property boundaries in terms of latitude and longitude. The advantage of such a system is well stated in the following extracts from the Report on the Maryland Oyster Survey:

The difficulties of accurately locating and permanently defining the boundaries of a farmer's plantation on land, even with the aid of monuments, public

roads, streams of water, and other points of reference are often great, judging from the disputes frequently arising in connection with boundaries. \* \* \*.

There is only one point on the earth's surface at the intersection of any one parallel of latitude and any one meridian of longitude, and therefore there can be no dispute as to the meaning of such a geographic definition of the location of a point, even though all the original triangulation station marks used in its determination, together with the chart on which its position was originally plotted, have been totally destroyed.

In the case of the destruction of an original triangulation station mark, or any other point defined by a geographic position, a competent geodetic engineer can reestablish its exact location by means of a new system of triangulation connecting with other distant triangulation marks which have not been destroyed.

In a section of the country covered by adequate geodetic control the data are available to the engineer for any of the following operations, in addition to its possible future use as a basis for cadastral surveys:

(1) **Extensive mapping.**—The topographer needs as initial data for beginning a topographic survey the distance and direction between two points and the geographic position of one of them, in latitude and longitude, on the North American datum. His local triangulation, based on this control, will prevent the accumulation of excessive errors as he carries on his mapping operations. In the event that the available precise triangulation in that region has lines of too great length to join to conveniently he can measure a base and azimuth at some place visible from a precise or a primary triangulation station and connect his base to the station by triangulation, thus obtaining proper geographic positions for his local surveys.

Instructions for secondary (formerly called tertiary) triangulation, suitable for the control of local surveys, may be found in U. S. Coast and Geodetic Survey Special Publication No. 26, which can be had at a nominal cost from the Superintendent of Documents, Government Printing Office, Washington, D. C.

(2) **Boundary lines.**—If it is desired to locate or to delimit accurately and permanently the boundaries of political subdivisions, such as States, counties, or cities, the methods indicated in the preceding paragraph may be followed. Whenever possible, a line of the adjusted triangulation should be used as a basis for local surveys rather than a point, since a line gives the three essentials of position, length, and direction.

(3) **Local intensive surveys.**—The necessity for such surveys arises most frequently in connection with extensive improvements over a considerable area, or as a basis for city planning, where the needs of a city are being anticipated for a number of years. Here the requirements are somewhat different from those in the two preceding operations, for it is often necessary to extend precise or primary control in considerable detail over the entire area affected, secondary triangulation or traverse then being used to furnish additional points for the survey. In such a control survey the triangulation should invariably be started from a line of adjusted triangulation on the North American datum.

While it may be noted in the preceding paragraphs that the azimuth and length of one line and the geographic position of one end of that line constitute the essential data for the complete utilization of old work as a basis for new work, there is always grave danger in depending upon this minimum of data. There may be failure to

identify the true station mark, or the mark, though genuine, may have been tampered with or otherwise disturbed in position. This will, of course, introduce an error into the new work based on these stations. It is the present practice in this Survey, unless unusual conditions render it unnecessary, to establish the integrity of the recovered points by using at least three old stations as a basis for new work, the third station serving as a check for the two stations on which the new work may actually depend.

In local surveys where the area is of limited extent it is usually desirable to use a system of plane coordinates, the origin being connected to some point of the precise or primary triangulation scheme. Tables for computing plane coordinates from geographic positions are found in U. S. Coast and Geodetic Survey Special Publication No. 71.

The U. S. Coast and Geodetic Survey will be glad to give advice on any problem arising out of the use of its control points or on any proposed extension of triangulation from them.

### EXPLANATION OF TABLES.

#### ARRANGEMENT OF TABULATED DATA.

In the tables of positions the latitude and longitude of each point are given on the North American datum (see p. 2); also the length and azimuth of each line observed over, whether in one way or both ways, to other points of the triangulation. NO LENGTHS OR AZIMUTHS ARE REPEATED, AND FOR A GIVEN LINE THE LENGTH AND AZIMUTH WILL BE FOUND OPPOSITE THE POSITION OF ONE OR THE OTHER OF THE TWO STATIONS INVOLVED.

The distances between stations are given in both meters and feet. To facilitate further the use of the tables, a column is given of the logarithms of the lengths in meters. It must be remembered that it is the logarithm of the length in meters which is derived first in the computation, the lengths in meters given in this table being derived from the corresponding logarithm and the lengths in feet in turn derived from the lengths in meters by the aid of the conversion tables on pages 37-44. Where further work of considerable extent is contemplated, an accumulation of error in the last two operations can be avoided by using the logarithm.

#### EXPLANATION OF LENGTHS.

The lengths as given in the tables are all reduced to sea level. If the actual length of a line simply reduced to the horizontal is desired—that is, its length in its actual elevation on the surface of the earth—it may be obtained by adding to the sea level length as given in meters a correction = (length of line as given in meters) times

$$\left[ \frac{\text{mean elevation of the two ends of the line in meters}}{6\,370\,000} \right].$$

The maximum value of this correction does not exceed  $\frac{1}{2000}$  of the length of any line of the triangulation here published. The error introduced by the use of the above approximate formula does not exceed  $\frac{1}{1000000}$  of the length of any portion of this triangulation.

## AZIMUTH AND BACK AZIMUTH.

Because of the convergence of the meridians the azimuth and back azimuth of a line do not differ by exactly  $180^\circ$ , the amount of the divergence varying with the latitude and the difference of longitude of the two points. To illustrate from the tables, page 10, the azimuth from Mears to Bally is  $16^\circ 28' 16.''81$ , while the back azimuth, or the azimuth from Bally to Mears is  $196^\circ 20' 20.''42$ .

The azimuths of the triangulation lines offer a very convenient and accurate means of testing the error of the magnetic needle on a surveyor's transit, and even the azimuth over such short distances as those between a station mark and its reference mark may be used for this purpose with fair accuracy, provided the distance is greater than 100 feet.

## ACCURACY OF DATA INDICATED IN TABLES.

The rule followed in recent publications of this office has been to give latitudes and longitudes to thousandths of seconds for all points, the positions of which are fixed by fully adjusted triangulations. Points, the positions of which are given to hundredths of seconds only, are marked by footnotes as being without check (observed from only two stations) or checked by vertical angles only.

In the columns giving azimuths, distances, and logarithms of distances, the accuracy is indicated to a certain extent by the number of decimal places given, it being understood that in each case two doubtful figures are given. In some cases there is very little doubt of the correctness of the second figure from the right, while in a few cases some doubt may be cast on the third figure from the right.

## HOW TO FIND THE DATA DESIRED.

Following the index at the back of this publication are seven maps. The first is an index map showing all areas in the United States covered by published triangulation rigidly computed on the North American datum. Following that is an index map showing the boundaries of each of the triangulation sketches. (Figs. 3 to 7.) The other five are detailed maps showing the scheme of triangulation plotted by latitudes and longitudes on a polyconic projection.

Having found from these sketches the names of the points desired, the tables may then be conveniently consulted by using the index at the end of this publication. In the appropriately headed columns opposite the name of each station are given the pages on which may be found its geographic position, description, and elevation above sea level, and the number of the detailed sketch showing the scheme of observed lines from that station.

## RELATED PUBLICATIONS.

Engineers and other using the data given in this report for the control of maps and surveys will find it of help to have Special Publications Nos. 5, 8, and 71 of the U. S. Coast and Geodetic Survey. They may be obtained at a nominal cost from the Superintendent of Documents, Government Printing Office, Washington, D. C.

Special Publication No. 5 is entitled "Tables for a polyconic projection of maps based on Clarke's reference spheroid of 1866." This publication contains the necessary explanation of the method employed in constructing a polyconic projection, and also gives the values in meters of the degrees, minutes, and seconds of latitude and longitude for all latitudes.

Special Publication No. 8 is entitled "Formulæ and tables for the computation of geodetic positions." As the title of this publication implies, the data contained in it will enable one to compute the spherical coordinates for triangulation where the distances and angles are known.

Special Publication No. 71 is entitled "Relation between plane rectangular coordinates and geographic positions." This book contains tables which will facilitate the use by engineers of plane coordinates for local surveys.

The principal lists of geographic positions published on the North American datum throughout the United States, together with descriptions of stations, are contained in the following publications of the U. S. Coast and Geodetic Survey and of other organizations:

Appendix 8 of the Report for 1888, positions in Connecticut.

Appendix 8 of the Report for 1893, positions in Pennsylvania, Delaware, and Maryland.

Appendix 6 of the Report for 1901, positions and descriptions in Kansas and Nebraska.

Appendix 4 of the Report for 1903, positions and descriptions in Kansas, Oklahoma, and Texas.

Appendix 9 of the Report for 1904, positions and descriptions in California.

Appendix 5 of the Report for 1905, positions and descriptions in Texas.

Appendix 3 of the Report for 1907, positions and descriptions in California.

Appendix 5 of the Report for 1910, positions and descriptions in California.

Appendix 4 of the Report for 1911, positions and descriptions in Nebraska, Minnesota, North Dakota, and South Dakota.

Appendix 5 of the Report for 1911, positions and descriptions in Texas.

Appendix 6 of the Report for 1911, positions and descriptions in Florida.

Special Publication No. 11, positions and descriptions in Texas, New Mexico, Arizona, and California.

Special Publication No. 13, positions and descriptions in California, Oregon, and Washington.

Special Publication No. 16, positions and descriptions in Florida.

Special Publication No. 17, positions and descriptions in Texas.

Special Publication No. 19, positions and descriptions in Colorado, Utah, Nevada, Wyoming, Montana, South Dakota, and North Dakota.

Special Publication No. 24, positions and descriptions in Alabama and Mississippi.

Special Publication No. 30, positions and descriptions in West Virginia, Ohio, Kentucky, Indiana, Illinois, and Missouri.

Special Publication No. 31, positions and descriptions in Oregon, Washington, and California.

Special Publication No. 43, positions in Georgia.

Special Publication No. 45, descriptions in Georgia.

Special Publication No. 46, positions and descriptions in Maine.

Special Publication No. 54, positions and descriptions in Texas.

Special Publication No. 62, positions and descriptions in Rhode Island.

Special Publication No. 70, positions and descriptions in Kansas.

Special Publication No. 74, positions and descriptions in Idaho, Oregon, and Washington.

Special Publication No. 76, positions and descriptions in Massachusetts.

Special Publication No. 78, positions and descriptions in Texas (Rio Grande arc).

Special Publication No. 79, positions and descriptions in Indiana.

Report on triangulation of Greater New York.

<sup>1</sup> No check on this position.<sup>2</sup> Checked by vertical angles only.

ELEVATIONS.

The datum for all the elevations is mean sea level.

The stations are in three classes: First, those fixed directly by the spirit leveling, and of which the elevations are subject to a probable error varying from  $\pm 0.15$  to  $\pm 0.3$  meter; second, the stations in the main scheme fixed by reciprocal measures of vertical angles and which are subject to probable errors varying from  $\pm 0.2$  to  $\pm 1.1$  meters, and, third, the intersection stations, of which the elevations are fixed by measurements of vertical angles which are not reciprocal, the intersection stations not being occupied, and whose elevations are subject to probable errors which may be as great as  $\pm 3$  meters in some cases.

The accuracy with which each elevation in the main scheme is determined depends mainly upon the remoteness of that station from the nearest one of which the elevation is fixed by spirit leveling, as indicated in class 1 of the following table. Station Snow Mountain west is probably least accurately determined of all the stations in the main scheme.

## DESCRIPTIONS OF STATIONS.

This list may be conveniently consulted by reference to the illustrations at the end of this publication or to the index. All azimuths given in the descriptions are reckoned continuously from true south around by west to  $360^\circ$ , south being  $0^\circ$ , west  $90^\circ$ , north  $180^\circ$ , and east  $270^\circ$ . Where magnetic azimuths are given they are indicated as such. The distance between the station and reference mark is measured horizontally unless otherwise stated in the description.

In general, except where the contrary is specifically stated, the surface and underground mark are not in contact, so that a disturbance of the surface mark will not necessarily affect the underground mark. The underground mark should be resorted to only in cases where there is evidence that the surface mark has been disturbed.

The name and dates given in each description immediately after the county refer to the chief of party by whom the station was established, the date of the establishment of the station, and the date when the station was last recovered.

Any person who finds that one of the stations herein described has been disturbed or that the description no longer fits the facts is requested to send such information to the Director, Coast and Geodetic Survey, Washington, D. C.

## MARKING OF STATIONS.

The old type of station mark referred to in the following notes and descriptions consists of a disk and shank made of brass and cast in one piece. The disk is about 85 mm. in diameter and has a polished center surrounded by the raised letters "U. S. C. & G. S." and a raised flange around the edge. The shank is 25 mm. in diameter and 75 mm. long, with a slit at the lower end into which a wedge is inserted so that when it is driven into a drill hole in the rock it will bulge at the bottom and so hold the mark securely in place.

## GENERAL NOTES IN REGARD TO STATION MARKS.

*Note 1.*—A three-eighths-inch copper bolt 3 inches long is cemented into a drill hole in the rock, and directly above the bolt in the same drill hole is cemented an old-type station mark, described in the preceding paragraph. A cross in the top of the copper bolt and another in the polished center of the disk mark the station.

*Note 2.*—This marking is similar to that described in note 1, except that the copper bolt and the disk are in separate bowlders and the bowlder containing the bolt is at some distance beneath the surface. The cross on the disk is directly above the one on the bolt. The dimensions of the bowlders are given in the description of the station.

*Note 3.*—The station is marked by an old-type station mark, described above, cemented into a drill hole in the rock. No underground mark was used.

## REFERENCE MARK.

*Note 4.*—This mark is a drill or punch hole in the top of a three-eighths-inch copper bolt 3 inches long, which is leaded or cemented into a drill hole in a rock with the top of the bolt flush with the surface.

## PRINCIPAL POINTS.

**Mount Helena** (Napa County, Calif., W. Elmbeck, 1876; 1908).—On the summit of Mount Helena, about 12 miles to the northward of Callistoga. The

station was originally marked by a fine drill hole and cross in the top of a one-half-inch copper bolt 5 inches long, which was cemented in a drill hole in bedrock, and by a brick pier 3 bricks square and 48 inches high, built over the bolt. When visited in 1908 it was found that the pier had been dynamited. Other instrument piers are at the following distances and directions from the station: Collimator pier, 2 bricks square and 61 inches high, 2.27 meters northwest; transit pier, 2 by 3 bricks and 39 inches high, 17.04 meters southwest; latitude pier, 2 by 2½ bricks and 36 inches high, 17.74 meters southwest of the station, and 1.68 meters east of the transit pier; vertical angle pier, 2 bricks square and 44 inches high, 33.31 meters southwest of the station and 16.92 meters a little south of east of the latitude pier. A boundary mark between Lake and Napa Counties, a large drill hole in a basaltic rock, is 2.18 meters northwest of the station.

**Marysville Butte** (Sutter County, Calif., W. Eimbeck, 1876; 1904).—About 15 miles west of Marysville on the southeastern summit of the south butte of the Marysville Buttes, about 6 meters northeast of the highest part of the summit, and near the steep cliff on the north side. The station is marked by an old-type station mark, described on page 23, set in a drill hole in a small rock embedded in the concrete that fills a depression in the solid rock. Below the concrete and directly under the station mark is a three-eighths-inch copper bolt 3 inches long set in a drill hole in the solid rock. Three reference marks, each of which is a three-eighths-inch copper bolt 3 inches long set in a drill hole in the rock, are at the following distances and azimuths from the station: 2.470 meters, 246° 48'; 2.635 meters, 5° 06'; and 2.915 meters, 103° 07'.

**Snow Mountain west** (Glenn and Lake Counties, Calif., E. F. Dickens, 1892; 1904).—On the highest point of the southwest summit of Snow Mountain. The summit is about 300 meters long in a northwest and southeast direction and about 50 meters wide at the station and is covered with small broken stones. There are a few scrub pines just below the pitch of the ridge about 100 meters southeast of the station. The station is marked by a one-half-inch brass bolt 3 inches long in a drill hole in the solid outcropping rock, and by a concrete pier 12 inches square and 44 inches high having embedded in its top a brass bolt directly above the one in the solid rock.

**Snow Mountain east** (Glenn County, Calif., W. Eimbeck, 1876; 1904).—On the northernmost rock-croppings at the edge of the summit of the eastern peak of Snow Mountain, about 5 miles south of Mount St. John and near the corner of Lake, Colusa, and Glenn Counties. The station is marked by a half inch copper bolt cemented in a drill hole in a hollow at about the middle of the highest point of rocks, with the top of the bolt about a half inch above the surface and marked by a cross. The reference marks are all drill holes in rocks, the first being distant 5.16 meters in azimuth 59° 57', the second 3.33 meters in azimuth 165° 39', and the third 6.89 meters in azimuth 248° 38'.

**Kent** (Tehama County, Calif., O. B. French, 1904).—On a high ridge about 8 or 10 miles east by south from Mount Linn and about 18 miles by road in a northwesterly direction from Paskenta, on a peak locally known as Bald Rock, on a ledge on the east side of the summit and about 8 or 9 feet lower than its highest part. Four or five hundred feet to the westward of the station and about 50 or 60 feet lower is a large, prominent, rocky knob. The station is marked according to note 1. The reference marks are described in note 4. The first one is in a large rock distant 5.01 meters in azimuth 212° 40', the second in a flat ledge distant 70.19 meters in azimuth 285° 50', and the third on the largest part of the ledge distant 47.72 meters in azimuth 5° 17'.

**Lyons** (Tehama County, Calif., O. B. French, 1904).—About 5 miles east of Lyonsville post office on a ridge known locally as Bald Hill, about 300 yards from the summit of the ridge on the shoulder extending toward Lyonsville and in the middle of a large group of boulders. A lone fir tree stands about 50 meters south by east from the station. The station is marked according to note 1. Two reference marks described in note 4, are in large rocks and at the following distances and azimuths from the station: 29.69 meters, 126° 59'; and 20.22 meters, 332° 22'.

**Bally** (Shasta County, Calif., O. B. French, 1904; 1920).—On the northernmost of the two main peaks on the summit of Bally Mountain, a prominent and well-known mountain about 15 miles by road west of Redding. The station mark, described in note 1, is in the top of a rock on the north side of the most prominent group of rocks on the peak and 5 or 6 feet below the top of the

For notes in regard to marking of stations see p. 23.

group. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 4.29 meters,  $247^{\circ} 07'$ ; and 10.62 meters,  $154^{\circ} 49'$ .

**Round** (Shasta County, Calif., O. B. French, 1904; 1919).—On the highest part of what is known as Round Mountain just north of the post office of the same name. The station mark, described in note 1, is in a large boulder which projects about 6 inches out of the ground. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 28.72 meters,  $345^{\circ} 30'$ ; and 6.43 meters,  $57^{\circ} 13'$ . The south reference mark is in the most eastern rock of a prominent group of rocks near the south end of the summit.

**Spur** (Siskiyou County, Calif., O. B. French, 1904; 1919).—On the west slope of Mount Shasta at an elevation of about 9,100 feet, in a position best identified by approaching the summit from Igema, by the road leading through Kite Canyon. In ascending this route several prominent peaks are discerned ahead and from the right-hand one a narrow shoulder extends in a westerly direction, or toward Black Butte. The station is about 50 meters below an abrupt change of slope of the ridge of this shoulder, and about 1 mile from the peak mentioned above. The station mark, described in note 1, is in the top of a large rock flush with the ground. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 13.77 meters,  $165^{\circ} 53'$ ; and 8.10 meters,  $228^{\circ} 47'$ .

**Mears** (Shasta County, Calif., O. B. French, 1904; 1920).—About 4 or 5 miles west by south from Castella and about southwest from Castle Crags, on the southern summit of the highest rocky peaks in the region known locally as Gray Rocks. The station is about 20 feet below the highest part of the peak and near the bluff on the south and east sides, with a ledge 3 or 4 feet higher about 10 feet distant toward the southeast. The peak was approached from the south and the 30-foot bluff near the station surmounted by means of ladders. The station is marked according to note 1. Two reference marks, described in note 4, are located as follows: The first in a boulder near the trail to the station, and distant 7.92 meters in azimuth  $70^{\circ} 50'$ ; and the second, on a low boulder east of a high pointed rock, and distant 17.77 meters in azimuth  $143^{\circ} 03'$ .

**Boliver** (Siskiyou County, Calif., O. B. French, 1904; 1920).—On the north side of a large group of boulders about 60 yards northeast of the highest part of the summit of Mount Scott, known locally as Old Craggy or Boliver, which is the high peak about 5 miles in a southerly direction from Callahan. The station is marked according to note 1. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 6.57 meters,  $272^{\circ} 41'$ ; and 9.88 meters,  $107^{\circ} 47'$ .

**Soda** (Jackson County, Oreg., O. B. French, 1904).—On a peak known locally as Old Baldy, in the Siskiyou Range of mountains, about 20 miles by road and trail southeast of Ashland and 5 miles east by north from Pilot Rock, a prominent peak in the same range. The best approach is from Ashland via Soda Springs and Davis's ranch. The station mark, described in note 1, is in a large rock whose upper surface is flush with the ground. Two reference marks, described in note 4, are in boulders whose tops are but slightly above ground and at the following distances and azimuths from the station: 12.91 meters,  $299^{\circ} 53'$ ; and 23.95 meters,  $85^{\circ} 36'$ .

**Gazelle**—astronomic station (Siskiyou County, Calif., O. B. French; 1904; 1908).—About 250 yards north by east from the Gazelle railroad station near the center of the top of a very prominent knoll and about 40 feet northeast of the largest boulder on the knoll. The station mark, described in note 1, is in a rock below the surface of the ground. Three reference marks, described in note 4, are at the following distances and azimuths from the station: 19.20 meters,  $290^{\circ} 12'$ ; and 6.40 meters,  $137^{\circ} 39'$ . There is a concrete longitude pier, 7.330 meters east and 0.186 meter north of the station. This pier was recovered in 1919.

**Sterling** (Jackson County, Oreg., O. B. French, 1904).—In the Siskiyou range of mountains, about 25 miles southwest of Ashland and 2 miles west of Mount Sterling, on the northernmost summit of a ridge just south of the Silver Fork basin and at the western end of the long east-and-west valley which is just north of Mount Sterling. The station is about 80 or 90 meters southeast of the highest point of the summit in the center of a group of small boulders. The station mark, described in note 1, is in the top of a large rock. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 34.85 meters,  $18^{\circ} 13'$ ; and 20.44 meters,  $186^{\circ} 03'$ .

**Rust** (Jackson County, Oreg., O. B. French, 1904).—On the highest summit of the peaks known locally as the Black Buttes (Rustler on U. S. Geological Survey maps), about 20 miles north of Mount Pitt and 26 miles by road and trail from Big Butte post office via Parker's ranch. The station is marked according to note 1. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 11.995 meters,  $264^{\circ} 33'$ ; and 10.12 meters,  $337^{\circ} 53'$ .

**Onion** (Douglas County, Oreg., O. B. French, 1904).—On the highest part of the bare summit of Onion Springs Mountain, about 1 mile south of the Onion Springs, and best reached from Glendale via Galesville and Gilpatrick's ranch. The station mark, described in note 1, is in a rocky ledge. Two reference marks, described in note 4, are located as follows: One in a prominent ledge and 24.62 meters from the station in azimuth  $91^{\circ} 50'$ , and the other in an inconspicuous, low boulder at the western edge of the summit and distant 47.22 meters in azimuth  $182^{\circ} 47'$ .

**Black** (Douglas County, Oreg., O. B. French, 1904).—Near the northeast corner of the highest part of the summit of Black Rock, a high, prominent, rocky peak about 40 miles in a direct line east of Roseburg and north and northwest of some near-by higher wooded peaks. The station mark, described in note 1, is in the solid rock of the summit. Two reference marks, described in note 4, are also in solid rock and at the following distances and azimuths from the station: 13.78 meters,  $4^{\circ} 55'$ ; and 6.47 meters,  $297^{\circ} 45'$ .

**White** (Douglas County, Oreg., O. B. French, 1904).—On the highest part of the summit of White Rock, a prominent peak about 15 miles east of Roseburg. The station mark, described in note 1, is in a large boulder. A reference mark, described in note 4, is in a large boulder just east of a prominent ledge and is 34.44 meters from the station, in azimuth  $353^{\circ} 11'$ .

**Scott** (Douglas County, Oreg., O. B. French, 1904).—On the highest part of the summit of Mount Scott, about 20 miles northeast of Roseburg. The station mark, described in note 1, is in a large boulder. Two reference marks, described in note 4, are located as follows: One in a white rock at about the middle of a prominent ledge and 32.71 meters from the station in azimuth  $195^{\circ} 02'$ ; and the other in a rocky ledge near the edge of the brush and 18.17 meters distant in azimuth  $305^{\circ} 42'$ .

**Fairview** (Lane County, Oreg., O. B. French, 1904).—On the west side of the summit of Fairview Peak in the Bohemia Mountains, about 25 miles southeast of Cottagegrove and 6 miles by road from Mineral post office. The station mark, described in note 1, is in a boulder. Three reference marks, described in note 4, are in rock ledges and at the following distances and azimuths from the station: 6.69 meters,  $74^{\circ} 29'$ ; 2.92 meters,  $181^{\circ} 39'$ ; and about 175 feet,  $266^{\circ} 09'$ .

**Yellow** (Douglas County, Oreg., O. B. French, 1904).—On the highest summit of the timbered ridge about 10 miles west of Yoncalla. The station is marked according to note 2, the subsurface mark in a boulder 8 by 12 by 16 inches placed 18 inches beneath the surface, and the surface mark in a boulder 10 by 20 by 30 inches, the top of which is flush with the surface of the ground. A reference mark, described in note 4, is in a rock ledge and 22.62 meters from the station in azimuth  $334^{\circ} 37'$ . Two other reference marks, consisting of three-sixteenths inch copper wires 3 inches long set in boulders, are at the following distances and azimuths from the station: 21.04 meters,  $197^{\circ} 31'$ ; and 20.70 meters,  $107^{\circ} 02'$ .

**Spencer** (Lane County, Oreg., O. B. French, 1903).—This station is near a United States Geological Survey station. It is on the south end and highest point of the summit of Spencer Butte, about 4 miles south of Eugene. Two trees used by the Geological Survey are at the north end of the summit, which is in the form of a ridge. The station is marked according to note 1. Two reference marks, described in note 4, are in rocks near the station, one distant 5.338 meters in azimuth  $175^{\circ} 02'$ , and the other 4.570 meters in azimuth  $328^{\circ} 51'$ . The Geological Survey station is 7.970 meters from the station in azimuth  $176^{\circ} 12'$ .

**Roman** (Douglas County, Oreg., O. B. French, 1903; 1908).—On the most westerly of the two summits of the highest peak of the Coast Range, known as Roman Nose or Saddle Mountain, situated near the north line of Douglas County about 5 miles southwest of the junction of Wild Cat Creek with the Stuslaw River. It is on the highest point of the summit, about 6 feet from the southern edge of the bluff and 20 feet from the steep part of the slope east of the

station. The peak is bare except for a few low shrubs, and has a steep bluff on the south side and a gentle grassy slope on the north side. The station is marked according to note 2, the subsurface mark in a boulder 12 by 12 by 24 inches, 18 inches below the surface, set with the axis east and west, and the surface mark in a boulder measuring about a foot on each side. Two reference marks, described in note 4, are located as follows: One in the nearest outcropping of the solid rock 14.760 meters from the station in azimuth  $148^{\circ} 06'$ , and the other in a projecting boulder 6.775 meters from the station in azimuth  $205^{\circ} 33'$ . Arrows pointing to the reference marks are cut in the rock near each mark. An old burned stump is about 5 feet from the station in azimuth  $232^{\circ}$ .

**Mary** (Benton County, Oreg., O. B. French, 1903; 1908).—On the highest point of the grassy summit of Mary Peak, about south-southwest from Corvallis. The station is marked according to note 2, the subsurface mark in a flat stone 4 inches thick and 10 inches in diameter, 22 inches below the surface, and the surface mark in a boulder 18 by 18 by 30 inches, the top of which is flush with the surface of the ground. Two reference marks, described in note 4, are in boulders, and at the following distances and azimuths from the station: 13.77 meters,  $326^{\circ} 22'$ ; and 29.36 meters,  $58^{\circ} 11'$ .

**Peterson** (Linn County, Oreg., O. B. French, 1903).—About 4 miles southwest of Lebanon on the highest part of the most westerly of the two summits known as Peterson Butte. The station is marked according to note 1. Two reference marks, described in note 4, are located as follows: One in the lower part of the northerly sloping face of the largest rock on the south side of the summit, and 4.645 meters from the station in azimuth  $7^{\circ} 30'$ ; and the other in the ledge just east of the largest rock on the north side of the summit, and 3.270 meters distant in azimuth  $185^{\circ} 00'$ .

**Twin** (Linn County, Oreg., O. B. French, 1905).—On the farm of Mr. Gentry near the southwest corner of sec. 24, T. 14, R. 3 W., about 6 or 7 miles from Rowland. It is on the highest summit of a partly wooded ridge, the south slope being bare and the north slope wooded, and about 8 or 10 meters southeast of the highest point of the summit. The station is marked according to note 2, the underground mark in a stone about 2 feet below the surface and the surface mark in a large stone about 6 inches below the surface. Three reference marks, described in note 4, are at the following distances and azimuths from the station: 6.66 meters,  $314^{\circ} 42'$ ; 6.39 meters,  $53^{\circ} 57'$ ; and 6.87 meters,  $155^{\circ} 44'$ . The last-mentioned reference mark is near the highest point of the summit.

**Ridge** (Lane County, Oreg., O. B. French, 1905).—On the highest part of a ridge on land owned by Mr. J. J. Winn, about  $1\frac{1}{2}$  miles north of his residence, and about 10 miles by road in a northwesterly direction from Junction City. The station is marked according to note 2, with the subsurface mark 1.5 feet below the surface. Three reference marks, described in note 4, are in inconspicuous boulders flush with the surface of the ground, and at the following distances and azimuths from the station: 4.86 meters,  $164^{\circ} 32'$ ; 30.69 meters,  $278^{\circ} 43'$ ; and 9.73 meters,  $350^{\circ} 15'$ . A triangular blaze in a large maple tree is 11.63 meters from the station in azimuth  $92^{\circ} 16'$ , and a similar blaze in a large fir tree is 8.45 meters distant in azimuth  $213^{\circ} 33'$ .

**Rauch** (Lane County, Oreg., O. B. French, 1903).—About 12 miles west by south from Eugene,  $2\frac{1}{2}$  miles southwest of Llewellyn post office and about one-half mile west of the road leading from Llewellyn to Crow post office, on land belonging to Mrs. Frances Rauch. It is about 150 meters east of the summit on the north side of a sloping ridge about 300 feet higher than the valley through which the road runs, the first prominent ridge encountered in going from Llewellyn to Crow and the only ridge in the vicinity from which *Willamette south base* can be seen. The station is about 200 feet west of a point where the ridge becomes steeper. The station was marked according to note 2, the underground mark in a small, flat stone 2 feet below the surface and the surface mark in a rock about 12 by 12 by 18 inches flush with the surface. Two reference marks, described in note 4, are located as follows: One in a rock 10 by 10 by 18 inches on the highest part of the ridge and 11.96 meters from the station in azimuth  $286^{\circ} 02'$ , and the other in a rock 6 by 8 by 14 inches distant 12.22 meters in azimuth  $51^{\circ} 46'$ .

**Willamette south base** (Lane County, Oreg., O. B. French, 1903; 1908).—About 5 miles from Eugene and 220 meters south of the Eugene-Elmira road on land belonging to William Nelson. It is about 100 meters north of a large

gravel pit, 78 meters from the line fence between William Nelson and M. Nelson, and about in line with the west face of the barn belonging to William Nelson which is 86.79 meters north of the station. The station is marked with old-type station mark described on page 23, placed in the center of a 6-inch drain tile and both embedded in a pillar of concrete 2 feet long, 36 inches in diameter at the base, 18 inches in diameter at the top, and set in the ground so that the tops of the pillar and tile and station mark are all flush with the surface of the ground. Six inches below the foot of this pillar a cross in the top of a  $\frac{1}{2}$ -inch copper bolt, embedded in a block of concrete 10 by 24 by 24 inches, forms the subsurface mark. In 1906 a concrete pillar  $2\frac{1}{2}$  feet high, 18 inches square at the base and 12 inches square at the top, with the letters "U.S.C.S." on the south side, was set over the surface mark. The first reference mark is a  $\frac{1}{2}$ -inch copper bolt in a concrete block 12 by 12 by 18 inches, the top of which is flush with the ground, with a similar block and bolt directly beneath it as subsurface mark, distant 212.29 meters from the station in azimuth  $177^{\circ} 32' 02''$ . The second mark, similar to the first, is at the junction of the road fence and that dividing the farms of William Nelson and M. Nelson, and 225.16 meters from the station in azimuth  $200^{\circ} 19' 30''$ . The third reference mark, similar to the preceding two but with no subsurface mark, is in the line of the boundary fence 78.38 meters from the station in azimuth  $265^{\circ} 16' 42''$ . The fourth mark is a  $\frac{1}{2}$ -inch copper bolt leaded into a drill hole in a large stone in the southwest corner of the foundation of the main part of William Nelson's barn, and is 86.79 meters from the station in azimuth  $181^{\circ} 30' 16''$ .

**Willamette north base** (Lane County, Oreg., O. B. French, 1905; 1908).—One and one-half miles south and one-half mile west of Junction City in the east center of sec. 7, T. 16, R. 4 W., on land owned by Mr. William M. Pittney of Junction City. It is in the northeast corner of a field on the south side of the main east-and-west road, about 71 yards from the north-and-south fence to the east and 4 or 5 yards from the fence on the south side of the road, and almost opposite the main gate which leads into the barnyard corral of the farm across the road. The subsurface station mark is a three-eighths inch copper bolt 6 inches long, set in a block of concrete  $3\frac{1}{2}$  by 4 feet and 10 inches deep, placed 3 feet below the surface. The surface mark is an old-type station mark described on page 23, set in the top of a concrete pier  $3\frac{1}{2}$  feet square at the base,  $1\frac{1}{2}$  feet square at the top, and 2 feet 5 inches deep, the top of which is flush with the surface of the ground. Surrounding the station mark and embedded in the concrete is an 8-inch drain tile 1 foot long with its rim about flush with the top of the pier. Each of the three reference marks consists of two three-eighths inch copper bolts, 3 inches long, each set in the top of a concrete post 1 foot square, the subsurface post being 9 inches long and  $2\frac{1}{2}$  to 3 feet below the surface, and the surface mark about 2 feet long, with its top 4 inches below the surface. The first reference mark is 6 inches south of the fence on the south side of the road and about in the prolongation of the fence line on the west side of the corral mentioned above, and is 32.058 meters from the station in azimuth  $97^{\circ} 10'$ . The second mark is in the corral across the road, about 10 inches from the road fence and 6 or 8 feet east of the east end of the main road gate, and is 19.876 meters from the station in azimuth  $186^{\circ} 24'$ . The third mark is on the south side of the main road, 12 or 15 feet from the road fence, and 6 inches west of the north-and-south fence, at a distance from the station of 65.076 meters in azimuth  $271^{\circ} 26'$ .

**Seavies 2** (Lane County, Oreg., W. H. Burger, 1908).—In the same locality as *Seavies* (U. S. G. S.). (See p. 35.) It is on the south slope of the peak near the lower edge of the first timber from the top and almost in line with *Spencer* (see p. 26) and the tangent line to the west bank of the McKenize River at the big curve in the flat below the station. The station is marked by a drill hole in the rock and by piles of rock around the tripod erected at the station.

**Pisgah** (Lane County, Oreg., W. H. Burger, 1908).—Located north and east from Goshen on a hill known as Mount Pisgah, about 200 feet southwest, or toward Spencer Butte, from the highest point of the hill. The station is on top of a rock about 4 by 6 feet in area, projecting 16 inches above the ground, the largest one of a cluster of rocks, and, with the exception of a large rock on the west slope about 175 feet to the north, the largest rock in the vicinity. Station is marked by a one-half inch drill hole  $1\frac{1}{4}$  inches deep, 6 inches from the west edge of the rock and 23 inches from its south point.

For notes in regard to marking of stations see p. 23.

**Eugene astronomic station** (Lane County, Oreg., O. B. French, 1904: 1908).—This station is identical with the United States Geological Survey station. It is on the east end of Skinners Butte, near Eugene, Oreg., just above the reservoir and north of the railroad station, on the site of the old observatory of Oregon State University. It was learned in 1908 that the land was to be converted into a park and that the station would be demolished, so two marble reference stones, projecting 2 inches above the surface and bearing on the top the letters "U. S.," with a cross between, were set to preserve the station. The first, 5 by 5 by 18 inches, is 18.294 meters from the station in azimuth  $119^{\circ} 59'$ , and the second, 4 by 7 by 14 inches in size, is on the south brow of the hill 12.211 meters from the station in azimuth  $52^{\circ} 47'$ . A large concrete "O" on the brow of the hill overlooking the railroad station is in azimuth  $2^{\circ}$  from the station. The distance between the two reference marks is 17.625 meters, and from the first reference mark the Patterson School spire is in azimuth  $315^{\circ} 28'$ , and the spire of the Humphrey Memorial Methodist Church is in azimuth  $353^{\circ} 53'$ .

**Yam** (Polk County, Oreg., O. B. French, 1903; 1908).—On the highest point of the highest of a group of hills about 12 miles northwest of Salem, and about 10 meters south of a wire fence which passes over the summit. A slightly lower wooded hill is about a half mile northwest of the station and a group of hills is about halfway between the station and Salem. The station is marked according to note 2, the surface mark in a bowlder 15 by 18 by 18 inches with its top flush with the surface of the ground, and the subsurface mark in a bowlder 8 by 16 by 16 inches and 23 inches below the surface mark. Two reference marks, described in note 4, are in bowlders about 14 by 18 by 18 inches with their tops flush with the surface of the ground, and with a few loose stones piled about them for identification. One is in the line of the wire fence, 11.06 meters from the station in azimuth  $197^{\circ} 10'$ , and the other 8.59 meters from the station in azimuth  $329^{\circ} 07'$ .

**Hult** (Marion County, Oreg., O. B. French, 1903).—On a prominent bare hill about 6 miles by road and 4 miles in a straight line southeast of Silverton, just south of the road from Silverton to Hult post office and on the farm of Al Porter. It is on the northeast side of the hill and slightly lower than the summit, 17 feet from a line fence on the west, and 8 feet from another fence on the south. The surface and underground marks at this station are crosses cut in the tops of one-half inch copper bolts embedded in bowlders, the underground mark being in a bowlder about 12 by 14 by 14 inches, with its top 1.9 feet below the surface mark, which is in a bowlder about 14 by 18 by 24 inches, with its axis north and south. Two reference marks, described in note 4, are located as follows: One in a bowlder about 14 by 16 by 16 inches, set in the fence line 5.79 meters from the station in azimuth  $108^{\circ} 55'$ , and the other in a bowlder about 14 by 16 by 24 inches, set in the fence line 7.125 meters from the station.

**Barnes** (Multnomah County, Oreg., O. B. French, 1903).—On a cleared hill in azimuth  $304^{\circ} 40'$ .

about 4 miles west of Portland, between the Barnes and Cornell roads, and just east of the highest hill in this range, which hill is still densely wooded. It is on the south edge of the hill about 100 feet southeast of a fir tree and some small maple trees, and close to the north side of a large stump. The station is marked according to note 2, the surface mark in a stone 8 by 14 by 18 inches with its top flush with the surface of the ground, and the subsurface mark in a stone 6 by 12 by 18 inches  $1\frac{1}{2}$  feet below the surface mark. Two reference marks, described in note 4, and set at the roots of stumps on the sides facing the station are located as follows: One in a bowlder 15 inches in diameter, distant 15.80 meters from the station in azimuth  $156^{\circ} 11'$ ; and the other in a bowlder 12 inches in diameter 7.02 meters from the station in azimuth  $233^{\circ} 23'$ . A third reference mark consists of a cross in the top of a bowlder 10 inches in diameter buried 15 inches beneath the surface and of a copper bolt directly above the cross in a bowlder 14 by 14 by 18 inches set with its top flush with the surface of the ground. It is about 3 feet north of the main east-and-west fence line, about 30 feet east of where this fence crosses the highest part of the ridge, about 3 feet east of a fence extending northward from this fence and 44.95 meters from the station in azimuth  $184^{\circ} 35'$ .

**Larch** (Multnomah County, Oreg., O. B. French, 1903; 1916).—Southeast of Bridal Veil, a town on the Columbia River, on the highest peak of Larch Mountain and on the west point of a small rock ledge which is on the north end of a spur from the main summit. The ledge is about 20 feet higher than

the spur of which it forms the end, and descends abruptly on the north in a cliff about 100 feet high. It can be reached either from Bridal Veil or Latourell via Donahue's logging camp. The station is marked according to note 1. Two reference marks, described in note 4, are in the east summit of the ledge, one in rather a low place 10.89 meters from the station in azimuth  $298^{\circ} 51'$ , and the other near the east end of the summit 15.01 meters from the station in azimuth  $287^{\circ} 02'$ .

**Star** (Clark County, Wash., J. S. Hill, 1906; 1916).—On the most southerly of the two summits of Silver Star Mountain, on the line between Clark and Skamania Counties, about 35 miles northeast of Vancouver. The station was marked according to note 3. Two reference marks, described in note 4 are at the following distances and azimuths from the station: 5.910 meters,  $305^{\circ} 43'$ ; and 5.160 meters,  $26^{\circ} 11'$ .

**Davis** (Cowlitz County, Wash., J. S. Hill, 1906).—About 14 miles northeast of Woodland on the highest point of a hill on a north-and-south ridge which may be reached from Woodland by following the road up the Lewis River to the Fisher place and packing from there. The station is marked according to note 3. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 5.61 meters,  $15^{\circ} 02'$ ; and 5.37 meters,  $96^{\circ} 51'$ .

**Red** (Skamania County, Wash., J. S. Hill, 1906).—On the highest point of a bald, red hill near the sources of the Little White Salmon and Lewis Rivers and not far from Klickitat Pass. It is best reached from White Salmon on the Columbia River via Guler post office, Ice Cave, Peterson's prairie, Goose Lake, Steamboat Lake, and the Indian race track, being about 1 mile southwest from the last place and  $1\frac{1}{2}$  miles west of Steamboat Lake. There is a Forest Service lookout station with its south wall about 2 meters north of the station mark. The station is marked according to note 3. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 7.400 meters,  $96^{\circ} 14'$ ; and 5.422 meters,  $188^{\circ} 46'$ .

**Warren** (Columbia County, Oreg., O. B. French, 1903).—About a mile southwest of Warren, a station on the Northern Pacific Railway, on a slight elevation or ridge near the west side of a pasture owned by Mr. E. Harnes and about 250 meters north of an east-and-west road. The station is marked according to note 2, the surface mark in a bowlder 8 by 24 by 24 inches with the letters "U. S." cut in the north side and the subsurface mark in a stone 6 by 12 by 18 inches buried 18 inches below the ground. Three reference marks, described in note 4, are in the north-and-south fence line to the west of the station. The middle reference mark of the three is 246.7 meters north of the north road fence and the other two are each about 30 meters distant from the middle mark, one north and the other south. They are at the following distances and azimuths from the station: 23.87 meters,  $98^{\circ} 15'$ ; 37.46 meters,  $41^{\circ} 28'$ ; and 37.95 meters,  $142^{\circ} 48'$ .

**Lam** (Cowlitz County, Wash., J. S. Hill, 1906).—On the highest part of the heavily wooded summit of Elk Mountain, about 35 miles northeast of Woodland. The station is marked according to note 3. Two reference marks, described in note 4 are at the following distances and azimuths from the station: 6.28 meters,  $36^{\circ} 56'$ ; and 10.84 meters,  $319^{\circ} 02'$ .

**Len** (Skamania County, Wash., J. S. Hill, 1906).—In the northwestern part of Skamania County, about 10 miles north of Mount St. Helens and a short distance northeast of Spirit Lake. Spirit Lake can be reached by stage road from Castle Rock via Toutle and St. Helens, and from the south landing on this lake the peak on which the station is located appears as a rocky summit through a gap almost due north. The station is marked according to note 3. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 3.260 meters,  $215^{\circ} 15'$ ; and 12.220 meters,  $188^{\circ} 04'$ .

**Toutle** (Cowlitz County, Wash., O. B. French, 1905).—On the top of a conical hill, the highest point of a long ridge, known locally as Gum Mountain, between the north and south forks of the Toutle River and about 20 miles east of Castle Rock. The summit was heavily timbered in 1905 and lines of sight were cleared. The station is reached from Castle Rock via Toutle and St. Helens and the main road left at a point about  $2\frac{1}{2}$  miles east of St. Helens at Muniker's place, from where the station is about 3 miles distant in a southerly direction. The station is marked according to note 2, the underground mark in a stone 12 inches in diameter 2 feet below the ground and the surface

For notes in regard to marking of stations see p. 23.

mark in a bowlder 12 by 18 by 24 inches. The reference marks are copper bolts set in the center of triangular blazes on each of three stumps on the sides facing the station, the first being 9.24 meters from the station in azimuth  $104^{\circ} 22'$ , the second 9.13 meters, in azimuth  $165^{\circ} 16'$ , and the third 7.90 meters, in azimuth  $345^{\circ} 34'$ . Two blazed trees are at the following distances and azimuths from the station: 18.24 meters,  $152^{\circ} 52'$ ; and 26.44 meters,  $257^{\circ} 50'$ .

**Huck** (Lewis County, Wash., O. B. French, 1905).—On a high, bald summit, known locally as Huckleberry Mountain, and about 8 miles northwest of the highest point of the Deschutes Mountains in this region. The station is on a level place on the summit and about 60 feet north of a sharp rocky point of about the same height. The station is marked by a one-half inch drill hole 1 inch deep in the top of a bowlder 8 by 8 by 10 inches set flush with the surface of the ground. The reference marks, three in number, are similar drill holes in solid ledges along the west side of the ridge a little below its top, and at the following distances and azimuths from the station: 13.65 meters,  $40^{\circ}$ ; 7.30 meters,  $60^{\circ}$ ; and 5.60 meters,  $136^{\circ}$ .

**Bel** (Pierce County, Wash., O. B. French, 1905).—On a high rocky peak known as "Bel Jacket," about 10 or 12 miles a little south of west of Mount Rainier, and about 9½ miles by road from Ashford. From Ashford there is a wagon road leading to Messler's place about 5 miles distant, then a trail in the direction of Bald Rock and Eagle Rock, which leads to a small lake from where the peak may be seen about one-half mile distant a little to the west of north. The station is marked according to note 3. Three reference marks, described in note 4, are at the following distances and azimuths from the station: 7.26 meters,  $328^{\circ} 46'$ ; 5.24 meters,  $16^{\circ} 22'$ ; and 5.94 meters,  $188^{\circ} 29'$ . A drill hole is 16.89 meters from the station in azimuth  $15^{\circ} 01'$ .

**Hal** (Lewis County, Wash., O. B. French, 1905).—On the highest point of the most western one of the high, bald summits of the Deschutes Mountains near the northern line of Lewis County and due south of Tacoma. From the north the mountain appears as a symmetrical cone and is best approached from Yelm, a town on the Northern Pacific Railway, via Peter Stone's ranch, which is about 14 miles southeast of Yelm and a short distance north of the station. The station is near the south point of the hilltop and marked according to note 3. Three reference marks, described in note 4, are located as follows: The first in a large bowlder, 10.55 meters from the station in azimuth  $166^{\circ} 24'$ , the second in a broad sloping ledge 4.81 meters distant in azimuth  $333^{\circ} 35'$ , and the third in about the highest point of rocks 2.71 meters distant in azimuth  $13^{\circ} 07'$ .

**Rain** (Thurston County, Wash., O. B. French, 1905).—About 10 meters northwest of the highest point of a prominent high hill about 4 miles south-southeast of the town of Rainier, about 1,200 feet above it, and just visible over the top of the timber from the town. It is probably in sec. 33, T. 16, R. 1 E., and it is about a mile west-northwest of the ranch on the top of the ridge owned by N. N. Bungard. The station is marked according to note 2, the subsurface mark in a bowlder about 10 by 12 by 12 inches and 15 inches below the surface of the ground, and the surface mark in a bowlder 12 by 20 by 20 inches. Two reference marks, described in note 4, are located as follows: One in a large bowlder at the highest part of the hill, 8.75 meters from the station in azimuth  $8^{\circ} 54'$ , and the other in a bowlder at some distance down the slope of the hill and 13.78 meters from the station in azimuth  $218^{\circ} 42'$ .

**Hurst** (Pierce County, Wash., O. B. French, 1905).—Near the north end and highest part of the timbered hill about 400 meters slightly south of west from the railroad station at Hillhurst, a town on the Northern Pacific Railway, and about one-half mile southwest of the store and post office. The hill is across the road south from the Cottage Grove Farm, owned by Mr. Bucholtz. The station is marked at the surface with an old-type station mark, described on page 23, set in a concrete block 12 inches square and 18 inches deep, and underground by a one-half inch copper bolt 4 inches long set in the solid ground or native cement 3 feet beneath the surface. There are two reference marks, one of which is a copper bolt set in the only large rock in the neighborhood, 40.34 meters from the station in azimuth  $252^{\circ} 40'$ , and the other is a similar copper bolt in a bowlder 10 by 12 by 12 inches flush with the surface of the ground, with a smaller bowlder 8 by 10 by 10 inches directly below it, and is 13.52 meters from the station in azimuth  $150^{\circ} 41'$ .

For notes in regard to marking of stations see p. 23.

**Pen** (Pierce County, Wash., O. B. French, 1905).—About one-half mile south of Graham, a station on the Tacoma Eastern Railroad, about one-half mile northwest of Mr. Hansen's house, and 75 or 100 meters to the westward of the highest part of a flat, partly cleared summit. The station is marked according to note 2. Three reference marks, described in note 4, are at the following distances and azimuths from the station: 18.93 meters,  $242^{\circ} 50'$ ; 17.80 meters,  $37^{\circ} 58'$ ; and 23.15 meters,  $160^{\circ} 53'$ .

**Tacoma south base** (Pierce County, Wash., O. B. French, 1905).—About 10 miles south of Tacoma and 2 miles south of Spanaway Lake, on land belonging to William Sekor, in the prolongation of Pacific Avenue of Tacoma. From the top of the hill in South Tacoma this street is nearly a straight line and Tacoma base line lies along it. The station is on the highest bench near the south side of Sekor's property and near the highest point of the bench, being about 10 feet west of a small but prominent knoll. It is 178.5 meters from the fence on the south side of the field and 154.8 meters from the fence on the west side. The station is marked underground by a cross in the head of a one-half inch copper bolt 3 inches long set in a block of concrete  $2\frac{1}{2}$  feet square and 6 inches thick 3 feet beneath the surface, and at the surface by an old-type station mark, described on page 23, set in the top of a concrete cube  $2\frac{1}{2}$  feet on an edge which has a 4-inch drain tile 2 feet long at the center with its top flush with the surface of the concrete. There are three reference marks, each consisting of a copper bolt set in a concrete block 18 inches square and 6 inches thick buried 3 feet below the surface, and of a similar bolt above it in a concrete block 18 inches square and 30 inches deep, its top 2 inches below the surface of the ground. They are at the following distances and azimuths from the station: 49.658 meters,  $263^{\circ} 50'$ ; 38.938 meters,  $347^{\circ} 25'$ ; and 61.153 meters,  $173^{\circ} 25'$ .

**Tacoma north base** (Pierce County, Wash., O. B. French, 1905).—On Fern Hill, 4 miles south of Tacoma and about one-fourth mile north of the crossing of Pacific Avenue and the Puyallup Electric Railway. It is on a prominent knoll just south of the house owned and occupied by H. A. Wilhelm, 8.5 meters south of his south line and 19 meters east of the east line of Pacific Avenue. The subsurface mark at the station is a cross in the head of a one-half inch copper bolt 3 inches long set in a block of concrete 30 by 30 inches and 6 inches thick, 3 feet beneath the surface. The surface mark is an old-type station mark, described on page 23, set in a concrete cube  $2\frac{1}{2}$  feet on an edge which has a 4-inch drain tile 2 feet long at the center with its top flush with the surface of the concrete. There are three reference marks, each consisting of a one-eighth inch copper wire embedded in an underground block of concrete 14 by 14 inches and 6 inches thick set 3 feet below the surface, and of a surface mark consisting of a similar wire in a block 14 by 14 by 30 inches set with the top flush with the surface of the ground. They are located as follows: The first, just north of Dr. Rynning's north fence and 4 feet east of the east line of Pacific Avenue, 92.325 meters from the station in azimuth  $10^{\circ} 19'$ ; the second, south of the back part of Wilhelm's house and just south of his south fence, 47.757 meters from the station in azimuth  $259^{\circ} 51'$ ; and the third just south of Wilhelm's south fence and 2 feet east of the east line of Pacific Avenue, 19.672 meters from the station in azimuth  $117^{\circ} 04'$ .

**Burn** (Pierce County, Wash., O. B. French, 1905; 1919).—On a prominent ridge 2 or 3 miles southwest of the central part of the city of Tacoma, in a section of the city called Oakland, west of that part of the valley which is traversed by the Northern Pacific Railway in an east-and-west direction and almost in line with the east-and-west portion of the track, about three-fourths of a mile from its western end. It is on a summit about one-half mile west of a prominent schoolhouse, about 300 meters southeast of a house, and about 30 meters north of a private road leading from the house to the schoolhouse, which road is a continuation of Proctor Street. The station can be reached by the American Lake south car to Proctor Street. The station is marked according to note 2, with the subsurface boulder about 2 feet below the surface. Three reference marks, described in note 4, are located as follows: The first near a trail along the ridge and 23.53 meters from the station, in azimuth  $160^{\circ} 44'$ ; the second on the north edge of the road 25.13 meters distant, in azimuth  $320^{\circ} 00'$ ; and the third near the beginning of a slope 25.47 meters distant, in azimuth  $85^{\circ} 34'$ .

**Kin** (Pierce County, Wash., O. B. French, 1905).—On the top of a prominent hill in the southeastern part of Tacoma, just south of McKinley Park, in the

For notes in regard to marking of stations see p. 23.

block between Thirty-second Street and Wright Avenue and K and L Streets and very nearly halfway between Thirty-second Street and Wright Avenue. It is directly in line with the gable ends of the N. P. B. A. Hospital, a large brick building a couple of hundred yards to the westward of the station. The station is marked according to note 2. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 24.55 meters,  $215^{\circ} 48'$ ; and 18.47 meters,  $294^{\circ} 50'$ . This station has probably been lost, due to local improvements.

**Wash** (Pierce County, Wash., O. B. French, 1905).—Lost.

**Bos** (Pierce County, Wash., O. B. French, 1905; 1919).—In the flat about 2 miles east of Tacoma and one-third of a mile south of the trestle leading from the city across the marsh to the mills on the east side of the valley. It is about 75 meters northeast of a small white house at the north end of the strip of fast land which extends farthest into the marsh and on a very slight elevation, clear of trees and buildings, on the edge of a slough. The station is marked according to note 2, the lower mark in a small boulder 15 inches below the surface and the upper mark in a boulder about 10 inches in diameter projecting 3 inches above the surface of the ground. There are no reference marks, but a broken-topped fir tree is about 60 meters from the station, in azimuth  $331^{\circ} 44'$ , and the west corner of the small white house is 77.72 meters distant, in azimuth  $13^{\circ} 54'$ .

**Gull** (Pierce County, Wash., J. J. Gilbert, 1891; 1921).—On Commencement Bay, north of Tacoma, and about 1 mile southeast from Brown Point Lighthouse, on the bold bluff about 125 feet high, which is conspicuous on approaching the point from Tacoma. The station is about 15 feet from the edge of the bluff and in range with the tower of the Lowell School in Tacoma and the left tangent of the tall, dark, cylindrical building with a dome roof, which belongs to the Tacoma Lumber Co.'s mill, and bears about southwest from the station. The station is marked by a standard bronze tablet set in concrete and stamped on the face "Gull 1921," and the underground mark is a bottle buried  $2\frac{1}{2}$  feet below the surface. There is a standard bronze reference mark set in a concrete post 7.347 meters from the station in azimuth  $255^{\circ} 03'$ .

**Dron** (Pierce County, Wash., O. B. French, 1905; 1921).—On Commencement Bay, about one-half mile southeast of Brown Point Lighthouse and about one-half mile west of station *Gull*. It is on the highest part of a bluff point about 60 feet above the water and 20 or 25 feet inland from the edge of the bluff, in a thicket of madrona trees, some of which were felled to clear the line to station *Neill*. The station is marked by a standard bronze station mark set in a mass of concrete and stamped on the face "Dron 1921," and the underground mark is a cross in the top of a copper bolt set in a boulder. There is a standard bronze reference mark set in a rock 4.42 meters from the station in azimuth  $175^{\circ} 08'$ .

**Smelt** (Pierce County, Wash., O. B. French, 1905; 1921).—On a ridge in the extreme northwestern part of Tacoma just south of Point Defiance Park. To reach the station take the Point Defiance Park car to North Forty-ninth Street, walk about 5 blocks west and climb the hill at the end of the street, the station is on the projection of North Forty-ninth Street, not far from the west edge of the main ridge, considerably below the highest point, and at about the same elevation as the small knoll some 300 feet west of the station. The station is marked as described in note 2, except that the top of the mark has been torn away leaving only the shank in the concrete. The reference mark is a copper slug set in a stone in place 53.16 meters from the station in azimuth  $236^{\circ} 33'$ .

**Neill 2** (Pierce County, Wash., O. B. French, 1905).—Lost.

**Tacoma astronomic station** (Pierce County, Wash., J. F. Pratt, 1892; 1905).—A stone pier near the north end of Wrights Park, Tacoma. A brick pier 17 inches square and  $5\frac{1}{2}$  feet long, used for latitude observations in 1894, is 12 feet 3 inches due east of the station.

#### SUPPLEMENTARY POINTS.

**Corning tower** (Tehama County, Calif., O. B. French, 1904).—The tower at the south end of the Maywood Colonization Building, a wood and plaster structure, just across the street from the Maywood Hotel and southwest from the railroad station.

For notes in regard to marking of stations see p. 23.

**Corning astronomic station** (Tehama County, Calif., W. H. Burger, 1908).—On the vacant lot just west of the Maywood Colonization Building at Corning. (See Corning tower, above.) The station is not marked but the following distances and azimuths to different parts of the Maywood Colonization Building were measured. Tower, 23.40 meters,  $247^{\circ} 24'.2$ ; northwest corner of the porchlike part of the building known as the Arcade, 31.40 meters,  $207^{\circ} 55'.2$ ; and southwest corner of the same Arcade, 16.64 meters,  $242^{\circ} 17'.8$ .

**Redding courthouse** (Shasta County, Calif., O. B. French, 1904; 1908).—The center of the top of the dome of the courthouse upon which stands the statue of Justice. The statue is eccentric to the center of the dome by about  $1\frac{1}{2}$  feet. A triangle with a small hole at the center is cut in the floor of the dome directly below the center of the dome and may be used as the station.

**Redding astronomic station** (Shasta County, Calif., O. B. French, 1904; 1908).—On a prominent hill about three-fourths of a mile south by west from the railroad station at Redding. To reach the station follow the railroad track south to milepost 259, which is marked at present by a board nailed to a telegraph pole, where will be found a United States Geological Survey bench mark, a metal tube with a brass top, and from here the station is west about one-fourth of a mile. The station is on the brow of a hill somewhat toward the south edge and not quite at the highest point. A live oak about 6 inches in diameter is on the edge of the hill just north of the line to the Geological Survey bench mark and a leaning pine tree about a quarter of a mile distant is in line with the Redding courthouse. The station is marked according to note 1, in the top of a large boulder projecting 4 inches above the ground. Two reference marks, described in note 4, are at the following distances and azimuths from the station: 20.22 meters,  $115^{\circ} 49'$ ; and 9.99 meters,  $188^{\circ} 17'$ .

**Redding south base** (Shasta County, Calif., W. H. Burger, 1908).—About 15 feet east of the railroad track at Redding and opposite a large steel oil tank. The station is marked only by a nail in the top of a wooden stub and by the three instrument stubs.

**Redding north base** (Shasta County, Calif., W. H. Burger, 1908).—Near the northwest corner of the cemetery south of the railroad station at Redding and about 15 feet east of the track. The station is marked only by a nail in a wooden stub and by the three instrument stubs around it.

**Hill** (Shasta County, Calif., W. H. Burger, 1908).—On the east brow of a ridge just north of the ridge on which *Redding astronomic station* is located (see above), and almost on the line between that station and the courthouse at Redding. The station is marked only by a wooden stub and the three instrument stubs surrounding it.

**Central Point astronomic station** (Jackson County, Oreg., O. B. French, 1904; 1908).—About 2 miles north of Central Point, near the intersection of the Southern Pacific Railway and the county road and in the northwest corner of the field which is just east of the county road and south of the private road leading to the house occupied by George Mims. The station is about 30 meters from the railroad. (See *Central Point latitude station*, below). The underground mark at the station is a three-fourths inch drill hole in the top of a triangular granite rock, set in cement 15 inches below the surface of the ground. The surface mark is an old-type station mark, described on page 23, set in the top of a granite rock which projects 2 inches above the surface and which is embedded in a mass of concrete 30 inches square and 12 inches deep. The reference mark, a United States Geological Survey bench mark, is at the intersection of the railroad and the county road, just east of the rail on the east side of the road and 28.15 meters from the station in azimuth  $31^{\circ} 55'$ .

**Central Point latitude station** (Jackson County, Oreg., W. H. Burger, 1908).—Near *Central Point astronomic station* (see above) and marked only by a wooden pier. The following distances and azimuths were measured: Astronomic station, 4.77 meters,  $116^{\circ} 41'$ ; United States Geological Survey bench mark (reference mark of astronomic station), 23.82 meters,  $41^{\circ} 18'$ . The north and west fences of the field are, respectively, 6.18 meters and 15.55 meters from the station.

**Rose** (Douglas County, Oreg., O. B. French, 1904).—On the highest point of the highest bald summit of a ridge about  $1\frac{1}{2}$  miles north of Roseburg. The station is marked according to note 2, the underground mark in a mass of concrete 1 foot below the surface and the surface mark in a boulder 9 by 14 by 18 inches flush with the surface of the ground. Two reference marks, described in note

4, are at the following distances and azimuths from the station: 16.71 meters,  $12^{\circ} 24'$ ; and 7.49 meters,  $125^{\circ} 23'$ .

**Burg** (Douglas County, Oreg., O. B. French, 1904).—On a high, bald summit about 3 miles southeast of Roseburg. As seen from the iron bridge over the river just west of the railroad station, it is the highest and most distant peak visible up a small valley. The station is marked according to note 2, the underground mark in a mass of concrete 13 inches below the surface, and the surface mark in a boulder 10 by 12 by 14 inches set flush with the surface of the ground. The reference mark, described in note 4, is in a boulder just over the edge of the hill, 10.24 meters from the station in azimuth  $112^{\circ} 45'$ .

**Roseburg latitude station** (Douglas County, Oreg., O. B. French, 1904).—On the point of a spur across the river from the town of Roseburg, about 100 feet west from the end of the bridge and 60 feet above it. The station is marked according to note 1, set in a ledge of rock. Two reference marks, described in note 4, are located as follows: One in a prominent ledge 18.18 meters from the station in azimuth  $30^{\circ} 17'$ , and the other in the side of a ledge flush with the ground, 32.30 meters from the station in azimuth  $109^{\circ} 05'$ .

**Springfield Methodist Church** (Lane County, Oreg., W. H. Burger, 1908).—The lower and less prominent of the two churches at Springfield.

**Springfield Christian Church** (Lane County, Oreg., W. H. Burger, 1908).—The taller and more prominent of the two churches at Springfield.

**Deady Hall, west tower** (Lane County, Oreg., W. H. Burger, 1908).—Deady Hall is one of the two larger buildings of the University of Oregon at Eugene and has large square towers at both the east and west ends.

**Geary School spire, Eugene** (Lane County, Oreg., W. H. Burger, 1908).—The Geary School is the public school located at West Fourth and Madison Streets, Eugene.

**United Brethren Church spire, Eugene** (Lane County, Oreg., W. H. Burger, 1908).—At East Eleventh and Ferry Streets, Eugene.

**Patterson School spire, Eugene** (Lane County, Oreg., W. H. Burger, 1908).—The public school located one block west of the southwest corner of the campus of the University of Oregon, at Eugene.

**Baptist Church spire, Eugene** (Lane County, Oreg., W. H. Burger, 1908).—At East Eighth and Pearl Streets, Eugene.

**W. O. W. Hall spire, Eugene** (Lane County, Oreg., W. H. Burger, 1908).—The old Episcopal Church located at West Eighth and Lincoln Streets, Eugene, which is now being used as a hall by the Woodmen of the World.

**Courthouse flagpole** (Lane County, Oreg., W. H. Burger, 1908).—At East Eighth and Oak Streets, Eugene.

**Methodist Church spire** (Lane County, Oreg., W. H. Burger, 1908).—The Humphrey Memorial M. E. Church located at West Tenth and Willamette Streets, Eugene.

**Seavies (U. S. G. S.)** (Lane County, Oreg., O. B. French, 1904).—This station is identical with the United States Geological Survey station of the same name. It is on the most southern of the high hills, about 6 miles northeast of Eugene and about 30 or 40 feet southwest of and slightly lower than the highest part of the hill. The station is marked by a square stone 4 by 4 by 24 inches with its top a little below the surface. The old Geological Survey signal was still standing in 1904, anchored in place by rocks, and was not disturbed.

**Monument, General Land Survey** (Multnomah County, Oreg., O. B. French, 1903).—The initial intersection of the First Standard Parallel and the Willamette Meridian, a short distance southeast of *Barnes*. (See p. 29.) The station is in a fence corner and is marked by a stone post projecting  $1\frac{1}{2}$  feet above the ground.

**River** (Multnomah County, Oreg., O. B. French, 1903).—Near the junction of the two suburbs of Portland known as Arbor Lodge and Peninsula, on the east bank of the Willamette River about a mile east of Columbia University. It is on a slight elevation, the highest in the vicinity, and in the fence line on the north side of the boulevard along the river bank. It was placed as far east as possible and still keep the Oregonian Building in view. The station is marked by crosses cut in the tops of two boulders, one placed near the surface of the ground and the other directly beneath at a depth of 1.7 feet, each stone bearing the letters "U. S. C. S." cut in the top.

For notes in regard to marking of stations see p. 23.

**Oregonian** (Multnomah County, Oreg., O. B. French, 1903).—The tall iron pole at the southeast corner of the tower of the Oregonian Building, at the northwest corner of Sixth and Adler Streets, Portland.

**Portland longitude station** (Multnomah County, Oreg., C. H. Sinclair, 1887; 1905).—This station has been destroyed.

**Portland latitude station** (Multnomah County, Oreg., C. H. Sinclair, 1887; 1905).—This station has been destroyed.

**Rocky Butte** (Multnomah County, Oreg., C. Rockwell, 1889; 1903).—On the north side of the highest part of the brush-covered summit of the butte, about 2 miles northeast of Montavilla. The station is marked by a hole drilled in a large round-topped boulder.

**Harney** (Clarke County, Wash., C. Rockwell, 1881; 1903).—On the north bank of the Columbia River, about  $1\frac{1}{2}$  miles above the United States wharf at Vancouver, on the sloping bare bluff immediately above the road leading from Vancouver up the river. It is almost in front of the "Harney House," on land formerly owned by Gen. Harney, and about 80 meters east of the fence inclosing the race track. The underground mark consists of a glass bottle placed 3 feet below the surface, with the neck up, the center of the neck marking the station, and three other bottles placed on their sides at a depth of about 1 foot and at distances of about 6 feet from the center, with the necks of the bottles pointing toward the center. The surface mark is a small drill hole 2 inches deep in a basaltic boulder, weighing about 350 pounds, placed with its top flush with the surface of the ground. The following bearings to the right of magnetic north were read at the station: East chimney of Harney House,  $27^{\circ} 05'$ ; triangle on tree,  $74^{\circ} 28'$ ; white house on south side of river,  $172^{\circ} 55'$ ; ventilator on barn,  $220^{\circ} 06'$ ; and corner of race track fence,  $276^{\circ} 47'$ .

**Balch** (Multnomah County, Oreg., C. Rockwell, 1881; 1906).—This station was occupied for azimuth in 1886. It is immediately northwest of the city limits of Portland, about a mile south of the Willamette River, on the first small level bench of the spur making out from the ridge west of the Cornell road, and about 255 feet above the road. The station is marked underground by a broken-necked bottle placed neck up 2 feet below the surface, and by a cross in the top of a copper bolt set in concrete 6 inches above the bottle, and at the surface by a cross on an old-type station mark described on page 23, set in concrete, which is inscribed with the letters "C. & G. S." The reference marks are the remains of two brick piers built in line to the west of the station, with their foundation about 20 inches below the surface, the nearest edge of the first pier being about 1 meter west of the station.

**Dash** (Pierce County, Wash., G. Davidson, 1857; 1905).—Lost.

**Piner 2** (King County, Wash., O. B. French, 1905; 1913).—On the southeast point of Maury Island, about 25 feet above high tide and 30 or 40 feet inland from high-water mark. A group of four piles is 30 or 40 meters east of the station, and a large rock, the largest in the vicinity, is in the water 50 or 60 meters south and a little west from the station. The station is marked by a three-fourths inch drill hole in a large stone set flush with the surface, and underground by a similar drill hole in a stone 2 feet below the surface of the ground. Two reference marks, each consisting of surface and subsurface stones, are at the following distances and azimuths from the station: 4.61 meters,  $86^{\circ} 55'$ ; and 4.65 meters,  $167^{\circ} 45'$ . This station could not be found in 1919 and the evidence seemed to be that it had slid over the bank.

**Robinson 2** (King County, Wash., J. S. Lawson, 1867; 1919).—On Robinson Point, on Maury Island, about 300 meters southwest of the scaffold light, on a bluff about 20 feet above high tide and 30 feet inland from high-water mark. The station is 95 meters southwest of the light keeper's dwelling, 42 meters southwest from the southeast corner of the light keeper's shed or barn, and about 2 meters west of the fence which extends southwest from the corner of the shed. A large madrona tree at the top of the bluff is 15 or 20 meters southwest of the station. The station is marked underground by a one-half inch drill hole in a stone buried 1 foot deep and at the surface by a similar hole in a stone, directly above the lower mark, set with its top flush with the surface of the ground. One reference mark is a one-half inch drill hole in a solid stone which is in line with the fence running southwest from the shed, and is 2.93 meters from the station in azimuth  $26^{\circ} 25'$ . The other reference mark consists of surface and subsurface stones, the lower one  $1\frac{1}{2}$  feet beneath the surface, and is 10.62 meters from the station in azimuth  $185^{\circ} 06'$ .

For notes in regard to marking of stations see p. 23.
