? WHY THE WEATHER ? Mailed December 21, 1935

DEATH VALLEY

By Charles Fitzhugh Talman
Authority on Meteorology

The tourist season is now on in Death Valley. Although this California desert is notorious the world over for its terrific summer heat, the weather from November to March or April, inclusive, is usually quite comfortable. On an average November day the temperature goes up to 74 and falls to 48. Temperatures below freezing have been recorded in November and in each of the winter months. At the large hotel operated in the valley there is a fireplace in every bedroom, and open fires are often enjoyable in the evening.

Very different are the conditions in summer. Rarely does the temperature fail to reach 100 on a summer day, while readings from 110 to 120 are common. Here is the record of maximum temperatures for a certain week in 1913:

July 8	128	July 12	130
9	129	13	131
10	134	14	127
11	129		

These were "shade" temperatures, measured with an accurate thermometer installed in a standard Weather Bureau screen placed four feet above alfalfa sod. The weather station is located at Greenland Ranch, alias Furnace Creek Ranch, near the eastern edge of the valley, where it is pretty certain the temperature does not rise so high as in the lower central district. Hence, although the above-mentioned reading of 134 on July 10, 1913, which was for some years a "world record", has been surpassed at a place in the Italian Sahara, it probably does not represent the worst Death Valley can do in the way of heat.

The average rainfall of the Valley, a little over an inch and a half a year, makes it the driest known place in North America.
